Making the Teacher Relevant and Effective in a Technology-Led Teaching and Learning Environment

Safdar Ali Shah[92]

Director Academics, National University of Sciences and Technology,Islamabad, 44000, Pakistan

Abstract

Growing use of technology in the process of teaching and learning has made the role of teacher subservient if not irrelevant. The teacher has been reduced to the level of an informer and a facilitator. Added to these are the commercial trends which have made the teacher a paid service provider being compensated for his efforts; thus making the noble profession of teaching a commercial enterprise. It has also relegated the traditional function of the teacher as a guide and a mentor, influencing and shaping the lives of students, building their character on higher moral principles. The increasing use of technology has depersonalized the whole process of teaching and learning, taking away the moral high ground and pivotal position the teacher always held. This is a challenge faced by the teachers in a technology-intensive environment. This paper aims at analyzing these factors with a view to exploring ways to make the teacher relevant and effective in a technology-led teaching and learning environment.

Keywords: Teaching technology; teaching and learning; character building; teacher leadership

1. Introduction

Technology has greatly transformed the dynamics of teaching and learning. It is restructuring education, teaching, and learning, in ways that impact everything (Minocha, Schroeder, & Schneider, 2011). It has not only changed the process of education, it has also affected the teacher-taught relationship and the value system governing these relations. Recent studies on the impact of technology on students, conducted by Pew Research Center and Vicky Rideout, show that "technology is deeply altering how students learn," that digital technology hampers the attention spans of students and their "ability to persevere in the face of challenging tasks" and also highlight that "technology was as much a solution as a problem." (Richtel, 2012). The real challenge is the fact that technology has almost relegated education that it was envisaged to support (Schacter, 1999). The teacher is getting marginalized in the process and is under tremendous pressure to outperform and remain relevant to the students excited and allured by technology surrogates. While technology is satisfying the increasing appetite for new information, it has serious limitations in attainment of higher levels of learning in cognitive, affective and psychomotor domains, not to mention moral uplift of students and acquisition of tacit knowledge. It can only be possible if we keep technology in a subservient position in the process of education and help the teacher regain the leadership in the changing dynamics of education in the new millennium.

2. Impact of Technology on Education

Traditionally, the teacher was a guru and a guide, controlling the entire process of teaching and learning. The students were invariably passive recipients of information provided by the teacher who also determined the pace and direction of learning. The students would ask questions and seek clarifications but seldom challenged his authority or leadership. However, there has been a paradigm shift in the process for teaching and learning with the introduction of applied disciplines, and more so with the advent of technology, allowing greater access to information and sources of knowledge. "The instructor is no longer the king of the classroom but rather a middleman between information and student." On the other hand, "the student has now become an active informational architect, procuring, rearranging and displaying information, instead of a passive sponge soaking up knowledge." (loraevanousk, 2011)

Technology has been used in education in four different ways: as a part of the curriculum, for delivery of teaching contents, as an aid to instructions and as a tool to enrich learning experience. Its role is more pronounced in student-centered learning or constructivist approach wherein the "students are active participants in their learning; they learn at their own pace and use their own strategies; they are more intrinsically than extrinsically motivated; learning is more individualized than standardized". (Walle, Virak, Cnudde, & Mono). It includes project-based learning, problem-based learning and inquiry-based learning. Here, the teacher is made to take a back seat and become a facilitator and a collaborator. This methodology seems to work better with problem solving and project work. Although "facilitation" can be a form of leadership in certain pedagogical models where the teacher remains on the sidelines and directs the process of learning, allowing greater freedom to the students, it falls short of the leading role of the teacher.

The combination of education and technology has created "more stimulating learning environment" and new possibilities to make the process of education more innovative and enjoyable. There have been numerous studies, mostly at school level, to ascertain the impact of technology on education but few are conclusive and definite. Some important conclusions are as under: (loraevanousk, 2011)

- Easy access to information.
- Greater interest in learning.
- Increased retention of information.
- Robust information storage.
- Better presentation of information.
- Teaching made interactive.
- Knowledge sharing made easy.

Whereas there are many admirers of technology who are simply overawed by its range and reach, there is no dearth of dissenting voices, such as Clifford Stoll, the author of Silicon Snake Oil (1996) who talks about "depersonalization of education and the substitution of 'real people' with technology". He strongly urges that "students need to be interacting more frequently with teachers and other students--not technology". (Stoll, 1996)

Although technology can be used effectively in both pedagogical practices—teacher-centered and student-centered--there is no hard evidence to favor one against the other. Moreover, most of the studies are school-based; thus cannot be taken as authority for all levels and types of education. John Hattie's 2009 publication Visible Learning: A Synthesis of over 800 Meta-Analyses Relating to Achievement, is based on the effects of a large range of strategies for learning. Its findings are somewhat unexpected for many and merit reconsideration of our approaches to teaching. He places teacher (Expert teacher against experience teacher and a novice) at the centre stage of what he calls "active" teaching. It is excellence in teachers that make the greatest differences. Among the top fourteen influences, as many as eleven are related to the teacher, with greatest size of influence. (Hattie, 2003)

There are others who talks about Digital Nativism, Digital Delusion, and Digital Deprivation (McKenzie, 2007), and "clutter of online information, the social media hype, the overwhelming technologies, the misguidance and misinformation online" (Buehler, 2013). While Buehler talks about seven deadly delusions in the domain of business, McKenzie forcefully refutes the technology Pied Pipers, like Prensky (who advocates "digital nirvana" of video-game learning) and warns of digital deprivation due to lack of contact with the real world: "A Digital Waste Land is a poor substitute for the rich flavors, smells and touches of the real world. Leading psychologists have signaled their concern in reports like Fool's Gold. FaceBook, MySpace and Second Life are poor substitutes for face to face communities and the playground." (McKenzie, 2007)

Technology has travelled a long distance and opened new avenues of learning. From Computer Based Teaching (CBT) and Computer-Aided Communication (CMC) to E-learning and Web-Based Training (WBT), education technology has helped create innovating learning environment. Its singular achievement has been in the field of distance learning in which several people can learn simultaneously from different locations. However, its success largely depends on good student-teacher interaction, proper use of technology, meticulous planning and effective management. Thus, technology may work wonders but may not be able to substitute the teacher and his ability to guide the students and equip them with knowledge, skills and values to face the challenges of the real world.

While technology is a sharp and powerful tool, its effectiveness depends on the ability of the teacher to determine the needs of the students, design and develop the contents and make strategies to deliver them effectively.

3. The Challenges

The dynamic environment of technology poses new challenges for teachers to maintain academic ascendancy over the students and master teaching technologies as well. Mastery over the subject or professional knowledge and capacity to absorb change can still make the teacher the leader of educational experience. His ability to transmit knowledge and culture can keep him relevant, provided he keeps their interest and curiosity alive. Some of the challenges are discussed hereunder:

3.1 Digital Divide

There are two types of Digital Divide: Technology Divide and Generation Divide. Both the divides impact the teaching and learning processes. The teacher has to overcome and bridge these divides to remain effective. While "Technology Divide" is beyond the control of the teacher, the "Generation Divide" is manageable at the individual level.

 "A digital divide is an economic inequality between groups, broadly construed, in terms of access to, use of, or knowledge of information and communication technologies (ICT)." (Norris, 2003) It is closely linked with social disparities and economic inequalities. It is a challenge for the teachers teaching in institutions which attract students from diverse communities and social backgrounds. What the teacher can do is devise ways and means to ensure that digital inequalities do not put socially dispossessed students at a disadvantage against those who have greater access to technology.

The teachers and students invariably belong to different generations with separate mind-sets, attitudes, work ethics, etc. We know of Generations X, Y and Z. The generation gaps do pose new challenges but may not make the older generation irrelevant as suggested by enthusiasts like Prensky, who speaks of Digital Nativism and terms the pre-iPod generation as Digital Immigrants. (McKenzie, 2007) Barring such extreme views, the fast-moving technology will continue to challenge generations of teachers.

3.2 Personal Learning Environments (PLE) and Self-Regulated Learning (SRL)

PLE represents a paradigm shift in teaching and learning (Elliott, 2010). In PLE structures, "the learner constructs knowledge socially with the help of knowledgeable peer mentors and teachers"(McLoughlin & Lee, 2010). It is particularly relevant to on-line and distance learning scenarios. However, the role and competencies of the teacher are considered critical components of PLE design, delivery and management, including effective use of technology (Shaikh & Khoja, 2012). Recent studies in this area reassert the importance of teacher's role in the process; especially in cases where learners do not get started despite PLE and find it difficult to attain learning objectives. Likewise, success of SRL also depends of the competence of the teacher.

3.3 Transmission of Cultural heritage

Transmission of cultural heritage and value system always formed part of the philosophy and process of education. Cultural deprivation of a single child was considered "irreparable loss to all humanity". (Smith, 1979) Its ownership rested with the schools (state) and teachers. During the 20th century, there rose many strong voices against "indoctrination" of the youth. Questions were raised over types of values to be taught, when to be taught and where to be taught. It became difficult in multi-cultural societies that adhered to separate sets of values. However, there are exponents of universal or living values who want them to be included in the curriculum. In higher education sector, where education is less encumbered by moral trappings, because of built-in freedom, institutions still inculcate and value intellectual honesty, professional ethics, tolerance, team spirit, etc, to prepare their graduates for competitive job markets. Teaching of "global citizenship" and additional foreign languages is encouraged. All these activities demand an active involvement of teachers and educators, in line with Greek word Pedagogy which means "to lead the child".

3.4 Transmission of Tacit Knowledge

The term "tacit knowledge" was introduced by the Hungarian polymath Michael Polanyi with the assertion that "we can know more than we can tell." (Polanyi, 1966) . It is the inherent knowledge which is deeply ingrained in individuals (and organizations with such individuals) and is difficult to articulate and transmit. It has acquired significance with the studies in the field of Knowledge Management, especially pertaining to processes and practices in business and industry, where "know-how" plays an important role (Nonaka & Takeuchi, 1995). In the field of teaching and learning, tacit knowledge, or insight and experience of teachers, especially in the domains of processes and skills, play an important role. In such cases, the teachers being the repositories of tacit knowledge become key players because acquisition of tacit knowledge lies in some form of shared experience.

3.5 Teacher Training

There have been two main philosophies of teacher education: teacher-based, in which teachers are trained to be experts in knowledge or exceptionally well-educated, where effectiveness depends on their "ability to interest, motivate and instruct"; and competency-based to prepare him as a guide in the learning process to engage the students in discovery. (Jalalzai, 1993) With ever-increasing role of technology, teacher training is getting more and more complex and challenging. Besides learning educational philosophies, pedagogical theories and practices, the teacher has to learn the use of technology in teaching strategies--most importantly, getting feedback and modifying the design and measurement of learning objectives. Thus, technology-related training is a must for new generations of teachers. Added emphasis on competencies has weakened the focus on academic excellence and ability of the teacher to mold minds and characters.

3.6 Caring Touch

Computer-based and web-based learning has depersonalized the process of education, where teacher and students become virtual entities, with limited human interaction or considerations. Whereas electronic linkages are expanding, human bonds are weakening. "Most strategies focus on goals and outcomes; very few focus on real student and his problems as a person."(Harrison & Killion, 2007). Students frequently need teacher's attention for positive reinforcement, guidance, counseling and direction. Jeremy Boggs talks of three roles for teachers using technology: Instructor as a Role Model, Instructor as Tech Support and Instructor as Cheerleader. Of these, he terms cheerleader as the most important for positive reinforcement in higher education. (Boggs, 2009) Success of a teaching strategy thus lies in teacher's ability to intervene and lend a personal touch to personalize the process. That is a challenge for teachers working with technology-driven processes.

4. Analysis

Technology has transformed education; and has the potential to influence it even more in the foreseeable future. Regardless of his position as "a sage on the stage" or "a guide on the side," his role still remains important if we consider the old maxim: "student learning depends first, last, and always on the quality of the teachers." While it opens new opportunities for students, it gives the teacher new communication tools and a wider reach. It can have "real impact on education if used intelligently with effective teaching practice." (Harrison & Killion, 2007). Surprisingly, instead of sidelining the teacher, new researches in teaching strategies tend to place him at or around the centre stage to manage complexities of the evolving scenarios and learning environments.

4.1 Teacher Competencies in Technology-led Environment

Studies in PLE perspective have identified the teacher roles and competencies as critical components (Minocha et al., 2011). Since the process of teaching is dynamic, the teacher has to excel in these competencies to deal with the changes effectively (Shaikh & Khoja, 2012). Many studies, such as Global Teacher, 2010, see teacher as a role model, leader, manager and change agent. Based on these studies, Sheikh and Khoja (2012) have summarized these competencies as follows:

- **Planning and Design (Designing/Planning Role)**. Roles identified: planner, designer, instructional/learning designer, programmer.

- **Instruction and Learning (Instructive/Cognitive Role)**. Roles identified: lecturer/instructor, demonstrator, theorizer, master artist, learner, critic, agitator, motivator, mentor.
- **Communication and Interaction (Social Role)**. Roles identified: coordinator, facilitator, partner, connector/communicator, moderator, convener, salesperson, collaborator, participant, collector.
- **Management and Administration (Managerial Role).** Roles identified: leader/change agent, administrative manager/bureaucrat, curator, coach, guide, concierge, goal setter, evaluator.
- **Use of Technology (Technologist Role).** Roles identified: alchemist, sharer, network administrator, technician, technologist, media publisher/editor.

Educational potential of wikis is being explored and developed for collective cognition. There is a role and space for the teacher in these initiatives as well:

When learners and teachers engage in collective cognition and across online as well as offline contexts, multiple activity structures come into play. For teachers, the complexity of the learning environment increases dramatically. At the same time, the practices we have examined point to the need for a teacher's space in the wiki. This space is not a fixed position in a structure but is an activity space in which wiki features make it possible for the teacher to trigger, stimulate, monitor and guide online as well as offline activities conducive to learning. How to develop such activity spaces is a question that guides our continued research on the educational use of wikis. (Lund & Smørdal, 2006)

4.2 Student as Apprentice

There are many domains of knowledge and professions where students learn best as apprentices, such as medicine. Likewise, there are many skill-based domains which involve "know-how" or "technique" more than the theoretical knowledge, such as sports and arts, where guided practice leads to higher attainments. Much talked about web-based teaching methodologies are not relevant at all in many areas. So, while talking about the teacher, we should not limit teacher's role and scope of activities to classroom environment of a particular level of education only, or divorce him from real-life experiences. Moreover, if learning is based on experience, vicarious experience and aided discovery can be more rewarding.

4.3 Teacher as a Powerful Influence

". . . Excellence in teaching is the single most powerful influence on achievement." Based on numerous studies, John Hatties has drawn a set of possible influences on the achievements of students. Major influences, with highest effect size, are in the hands of the teacher. Thus, excellence of teacher is the most powerful influence, which makes the greatest difference as seen below: (Hattie, 2003)

Table 1 - Possible Influences on the Achievement of Students

Influence	Effect	Source of Influence
Feedback	1.13	Teacher
Students' prior cognitive ability	1.04	Student
Instructional quality	1.00	Teacher
Direct instruction	.82	Teacher
Remediation/feedback	.65	Teacher
Students' disposition to learn	.61	Student
Class environment	.56	Teacher
Challenge of Goals	.52	Teacher
Peer tutoring	.50	Teacher
Mastery learning	.50	Teacher
Parent involvement	.46	Home
Homework	.43	Teacher
Teacher Style	.42	Teacher
Questioning	.41	Teacher

4.4 Teacher-Student Relationship

Rudolf Steiner (1861-1925) considered sympathetic relationship between the teacher and the taught as the secret of effective education, while Giovanni Gentile believed in a spiritual relationship between the two. (Smith, 1979) It is a neglected area in modern teaching-learning strategies, especially is the affective domain. Technology has dangerously weakened the student-teacher relationship. Teachers tend to ignore the significance of affective attributes and a relationship based on mutual respect. Expert teachers, on the other hand, treat their students as persons and show care and commitment to build a human bond with them. "By having such respect, they can recognize possible barriers to learning and can seek ways to overcome these barriers." (Hattie, 2003) In Germany, the Supervisor is called "Doktor-Vater" or "Doktor-Mutter" meaning father or mother. The very title lends a personal touch to teacher-student relationship, which "is the foundation of effective instruction". (Lickona, 2004)

4.5 Excellence of Character

Aristotle talked about two kinds of human excellences: excellences of thought and excellences of character. Many educators from ancient, medieval and modern times have supported the need of character building and the role of teacher in shaping that character. Technology has given us amazing access to information and ideas, thus, facilitating excellences of thought. However, the flux of information carries distortions and misrepresentations, besides socially and morally repugnant material, which has created new moral challenges. While there is a need to guide the students to sift facts from fabrication and safely navigate through clutter and chaos, there is a need to strengthen him morally and spiritually to withstand the new hazards brought in by technology. There is none other than the teacher who can help the students through these turbulent times. Neil Hawkes espouses value-based education which "creates positive culture for teaching and learning that is so vital for successful education in the 21st century." (Hawkes, 2012) Thomas Lickona says that character and academics should be thought simultaneously. (Lickona, 2004)

5. Conclusion

Education is a very comprehensive and purposeful activity, which includes "all the elements of experience—cognitive, contactive and affective. (Saiyidain, 1992) It involves mental, moral and spiritual uplift of students or a desirable transformation. It cannot be restricted to passing on information or knowledge only. More than knowledge, it is the understanding of principles and application of knowledge which is important. Superior or expert teachers exhibit genuine interest in their students and lead them through vicarious experience and guided discovery or inquiry. They engage them intellectually, emotionally and spiritually, and mold their character by inculcating universal values. They guide them to excellence through aesthetic education creating opportunities for experiencing beauty in its diverse forms and manifestations.

Present day teacher is required to prepare the students for a highly competitive globalised world, equipped with far better professional, soft and life skills than ever before. It is too serious a matter to be left to the students alone. The teacher cannot sit back and leave the students at the mercy of the environment. He has to take the lead. Research after research tells us that best result can be achieved through leadership role of the teacher. Even in student-centered strategies, competences of the teacher are considered crucial for success. (Shaikh & Khoja, 2012) Hattie's synthesis, based on thousands of studies, shows that quality feedback is the single most powerful influence for improvement among students—and it is totally teacher dependent or teacher led. (Hattie, 2003) Therefore, "the effective teacher must be a leader who can inspire and influence students. . . This teacher empowers students and gets them to do things of which they did not think they were capable." (Sandy, 2005)

Technology has a powerful presence in the modern-day educational environment, with ever-expanding possibilities for innovative strategies. It can yield best results if it is used as a tool and a technical support to connect and communicate. There is a need to guard against its depersonalizing effects and lure to take the teachers and students into a virtual world—divorced from reality and life. The teachers therefore should respect and lead the students as persons, guide them and help them compete in the globalised environment. Only as leaders and role models can they influence the students morally and inculcate such virtues and values which can help them steer through the stormy times. As leaders, they will remain effective and relevant in technology-led environment.

Malaysian Teachers' Perception of Applying Technology in the Classroom

Samira Nikian, Faizah Mohamad Nor and Marzila A. Aziz[93]

Language Academy, Universiti Teknologi Malaysia (UTM), Skudai, Johor, Malaysia

Abstract

Although application of technology in the classroom has been introduced for the last two decades, some teachers are still resistance to use technology in the classroom. This study is designed to investigate Malaysian teachers' perceptions of using technology in the classroom. In this study perception is regarded as interpretation of events among Malaysian teachers due to past experiences, current understanding, present situation and information. Qualitative research is used as the mode of inquiry for this research study. The main mode of data collection is the questionnaire that elicits information on the respondents' views of the use of technology on the classroom. Participants for this study were seven local English teachers in Malaysia. The findings indicate that although Malaysian English teachers were using technology and have positive perceptions towards using technology in the classroom, they feel it is crucial for them to undergo training in this aspect. They view time constraint and access to equipment as the main obstacles to implementing technology in the classroom. This research concludes that although Malaysian teachers are faced with some difficulties in implementing technology in the classroom, they see a value in technology and want to use technology in the classroom.

Keywords: Technology, Malaysian teachers, perceptions.

1. Introduction

The idea of applying technology in the classroom comes from the United States but the efficiency of Technology programs is still a controversial topic.

"Technology is only a tool; it allows us to develop dialogue and interaction, but is a means, not an end in and of itself. Tech-based global education has the capacity to improve critical thinking and cultural pluralism but requires far more than just fancy technology; it requires careful, thoughtful curriculum development and the support of organizations whose goal is to build authentic global communities online" (Klein, 2010, p. 86).The introduction of computer technology among the society has changed the way people live, work and learns. The application of technology has improved the teaching and learning in many schools especially in the last two decades. The latest studies on the use of technology for teaching and learning shows promising results for teachers, students and education.

Using technology in the classroom prepares learners to be autonomous and active in their learning. By using technology such as computers, learners will be able to create their own knowledge based on past experiences with new information (Bitter and Pierson, 2005).

Creating each technology is for a specific purpose so Winner (1980) felt that educators should deconstruct the "purpose" of a given technology in the classroom according to the biases and systems in each classroom. Scholars (Winner,1980, 2000; Bromley, 1998; Postman, 1998) have called on teachers to pay more attention to the objective of using technology in a purposeful and meaningful way before applying it in the classroom.

We need to remember that using technology in the classroom will only be useful if it is applied to meet its purpose (Bromley, 1998; Klemm, 2007).

2. Background and Theoretical understanding

There are two contrasting perspectives in support for and against using technology in the classroom; constructive and critical. Constructivism means "how people learn and what needs to be learned" (Duffy and Jonassen (1992). Constructivist Andrea Gooden (1996) perceives technology as a toolbox filled with skills for better learning by creating new materials not a tool for performing a particular task. Constructivists consider the advantages of classroom technology while critical theorists perceive technology as a tool, an agent of change, and also as an object with political motivation that causes isolation so critical theorists tend to add or delete technology into an environment to change that environment. Critical theorists believe that using technology in the classroom has a significant role in the students' interpretation of materials.

3. Classroom Technology Use

Teachers repeatedly use technology if they receive enough equipment and supports (Yan and Zhao, 2006) but recent findings (Cuban, Kirkpatrick, and Peck, 2001; Russell, Bebell, O'Dwyer, and O'Connor, 2003; Solomon and Wiederhorn, 2000; Zhao and Frank, as cited in Yan and Zhao, 2006) reveal that. Yan and Zhao (2006) suggest that technology adoption lies with teachers' goals and perceptions. The results of their study show that teachers are more pessimistic about using technology in the classroom because of the lack in training needs in applying technology. The result of their study suggest that maintaining the status quo and avoiding disturbance have a higher priority on the hierarchy of teachers' goals after balancing the costs and benefits of using technology (Yan and Zhao, 2006). Some researchers (Snoeyink and Ertmer, 2001–2002; and Zhao et al., 2006) believe that teachers' adaptation of technology are influenced by their skills and beliefs about technology. From the perspective of Zhao and Frank (2003) teachers' beliefs, pedagogy, and technology skills influence on technology integration into the school culture.

Beliefs are personal, are difficult to address in staff development, and take time to change. Even if they do changes, the process can take years. Cuban (1990) observed that teachers will use technology based on their personal perspectives about curriculum and instructional practice. Although billions of dollars (NCES, 2008) and much focus have been put on technology in education (ISTE, 2010; NCES, 2008), instruction has not changed much (Cuban et al., 2001).

The use of technology in the classroom is also much related to their attitudes towards the technological barriers inherent in the traditional deployment of technology in schools. These barriers reflect the school culture and affect a teacher's personal belief system or self-efficacy and the ultimate impact of using technology in the classroom. Brzycki and Dudt (2005) believe that there are some difficulties and challenges such as time, support, models, infrastructure, and culture that persist and even reappear with new technologies in applying technology in the classroom.

The barriers of implementing technology are classified into First- order or extrinsic factors and second-order or intrinsic barriers (Brickner, 1995; Ertmer, 1999). First-order barriers include environmental or institutional issues

and resources while second-order barriers related to a teacher's personal instructional beliefs, experiences and strategies. Teachers are faced with many difficulties due to these intrinsic which affect their decision-making processes and classroom practices (Ertmer, 1999).

The majority of teachers believe that first-order barriers prevent teachers from using technology in the classroom. In support for this, Cuban, Kirkpatrick, and Peck (2001), and Bauer and Kenton, (2005) cite time to learn and prepare instruction as barriers that hinder teachers from utilizing technology in the classroom. Poor professional development (Koehler and Mishra, 2005) and access to equipment (Yan and Zhao, 2006) also contribute to first order or extrinsic barriers.

4. Importance of the Study

Previous research have shown that using technology improves the learning experience and students' academic performance. In Emdin's (2008) opinion, by integrating technology into the curriculum, education practices will be improved and teachers will be able to expound upon the textbook and prepare more authentic and student-centered classroom learning materials. Stoll (1999), however disagreed with using technology because this sends students the message that "illegible handwriting, grammar, analytical thought, and human dealings don't matter" (p. 158).

The reason for placing focus on technology is to produce definite outcomes (Masgoret and Gardener, 2003; p. 4). Many schools provide technology in the classroom to create more academic opportunities for students' academic development and growth. However, using technology in the classroom depends on the way technology is allied by teachers (Sinclair, 2009).

There are a few studies on teachers' perceptions of applying technology in the classroom. Malaysian teachers' perception of using technology in the classroom practices is described in the current study. The teachers were located at multiple schools in Johor Bahru.

5. Methodology

Quantitative survey methods cannot describe the interaction as among perceptions and actions (Brookhart and Freeman, 1992; Richardson, 1996). As such qualitative research is used for the mode of inquiry for this study. One of the unique components of qualitative research is the small number of participants in the study (Russel, 2003). However, while the number of participants may be fewer than is found in quantitative studies, the depth of questioning and the richness of the data that qualitative research uncovered cannot be compared to quantitative research (Slauen White and Simpson, 1998). The pool of participants in this study was small, thus effort to focus in-depth on the findings and themes coming out of the data was possible .

Survey questionnaire in this study (Appendix A) was adapted from UTAUT Survey Study URL: http://www.educ.uvic.ca/tie/utaut/. The UTAUT Model was developed by Venkatesh et al. in 2003. The questionnaire composed of two parts. Part I relates to the personal information of participants. Part II comprises questions on the use of technology in teaching. Definition of technology also encompasses computer hardware (e.g. scanners, cameras, and videoconferencing tools), software applications (e.g. word processing, excel, internet, PowerPoint, webpage construction) and any technology specific to the teaching area.

Regarding the academic degrees earned by the participants, most of them hold a Master of Arts (MA) degree majoring in Teaching English as Second Language while some of them possess a Bachelor Degree. With respect to the age range, the majority of the participants are 20-29 years old and some of them are in their 30s. The teaching experience of the participants varies from three to eight years. six of the participants are female while one is a male.

6. Analysing the Data

Data analysis is a complicated process used to try and make sense of the data. It involves "consolidating, reducing, and interpreting what people have said and what the researcher has seen and read. Analysis involves working with data, organizing them, breaking them into meaningful units, synthesizing them, searching for patterns, discovering what is important and what is to be learned, and deciding what you will tell others". (Merriam, 1998; p.145) .Glesne and Peshkin (1992) pointed out that "data analysis is the process of organizing and sorting data in light of increasingly sophisticated judgments and interpretations" (p.130). The purpose of data analysis is to locate crucial meanings, patterns, and themes within what the researcher has extracted as the theme through the questionnaire.

7. Findings

The reason for conducting the current study is to determine Malaysian teachers' perceptions of applying technology in the classroom and the challenges they may face in implementing technology. The results are categorized under several major themes, i.e. skills in handling technology for instruction in the classroom, difficulties and challenges in applying technology in the classroom and perceptions of using technology in the classroom.

Skills in handling technology for instruction in the classroom

Almost all the participants reported that they use the technological devices every day. All of them use the Internet regularly, all of them claim they have the necessary knowledge for using the technology, and again, the participants are in unison in their view that it is easy to become skillful at using these technology.

All but one of them have the experience of using the computer to deliver presentations, all have used the Internet to access curriculum, and all of them have used the computer to deliver design and also to perform database. Most of the participants claim they can also accomplish tasks using technology quickly.

These findings show that the participants have a sound knowledge in the use of technology and in using these technological devices in the classroom, for teaching and learning purposes. This is because all the participants of this study belong to the category of "digital natives", whom Presky (2001, cited in Bennett et al, 2008) defines as the generation born in the years between 1980 and 1994 and are familiar with and rely much on ICT in their daily lives.

Difficulties and challenges in applying technology in the classroom

Almost all of them felt that time to learn computer skills is not the obstacle to implementing the use of technology in the classroom. They felt that they have enough time to learn computer skills. However, almost all of them felt that it was difficult to use technology in the classroom and this is related to several factors. The participants were in unison when identifying the lack of computers as the major obstacle to using computer-based teaching in the classroom. The next major constraints reported by the participants are insufficient time (6 participants), the absence of access to equipment (5 participants) and the lack of technical support (4 participants).

Insufficient time would usually relate to the amount of time a teacher needs to prepare his teaching and learning resources for use with his learners. The finding that time is a constraining factor, is consistent with the findings of Peirson (2001), Carlson and Reidy (2004) and Friedman (2006). The absence of access to computers has, time and time again been the complaint of many teachers in schools in Malaysia. Computers are insufficient not just for the use of the students, but also for the teachers who would need them to prepare their computer-based lessons. Other equipment that include the LCD projector, the server, and all other related technological devices that are required to make computer-based teaching a success, are also usually hard to come by. The lack of technical support, in the form of technicians who would assist in the set up of these devices in the classrooms and to help maintain these

resources, is another challenge that would need sound financial back-up from the schools or the Ministry of Education.

The participants have all ruled out that personal beliefs would hinder their use of technology in the classroom. This, again, is attributed to the fact that these participants are all digital natives who would not have any inhibitions or fear or negative beliefs about the use of technology as they are familiar with ICT. All but one also felt that administrative support was also not a problem.

Thus, this study concludes that insufficient time, and access to equipment as well as the lack of technical support are the main obstacles in using technology in the classroom.

Perceptions of using technology in the classroom

Although there were several variables that constrained the use of technology among these teachers of English, they had positive perceptions of the implementation of technology in enhancing learning. Most of the participants felt that computer instruction is useful and most have also expressed their intention to use technology in their teaching. Although they are adept in their use of technology, all of them hoped to attend more training in the use of computers as this would motivate them to apply more technology for instruction in the classroom. This finding is also similar to that reported by Roach (2010).

8. Limitations of this study

Despite the researcher's aiming to design a quality research study, it is important to note that this research study has limitations in its design and implementation. The research was limited in several ways. The primary limitation was related to the sample size. It should be noted that the sample size was not large enough. If a larger-scale quantitative study was to be developed, a larger number of participants could be surveyed—either teachers from different regions.

It would be more reliable if the researcher used multiple data sources such as interview, reflective journals and observations as additional instruments. Moreover, the analysis of the data was limited since the students were neither questioned nor interviewed. Using data from multiple sources would have allowed triangulation, and thus benefit the overall results of this study

9. Conclusions

In general, we can conclude that these participants, who are teachers of English, are very familiar with the use of ICT and have no qualms with implementing technology in the classroom. However, the only drawbacks they have in using technology would be the lack of computers, insufficient time in preparing technology-based lessons and the lack of technical support. Although there were constraints faced by these teachers, they were motivated in undergoing more training in the use of technology in the classroom and were in general, positive towards the use of computers in education.

13th International Educational Technology Conference

Management of Academic Information System (AIS) at Higher Education in The City Of Bandung

Etin Indrayani[94]

Lecturer in Institute of Home Affairs Government (IPDN)
Sumedang-Jawa Barat Indonesia
e-mail : etin@uptik.ipdn.ac.id

Abstract

The purpose of this research is to describe and analyze; 1) the planning and the organizing of academic information system (AIS) at higher education in the city of Bandung; 2) the implementation of AIS at higher education in the city of Bandung; 3) The monitoring and the evaluation of AIS at higher education in the city of Bandung; 4) the quality of information produced by AIS at higher education in the city of Bandung ; 5) the quality of AIS at higher education in the city of Bandung and 6) the effectiveness of Academic Information Systems Management in Bandung. This research is descriptive research that taking place in the city of Bandung with all higher educations in the city of Bandung for the populations. The used selected sample is purposif sampling technique, it is higher educations that organize graduate program and adopt ICT into their academic information system. The samples come from 18 higher educations, 988 persons are lectuters and 1581 persons are students. Data is obtained by using questionnaire and it is processed by using descriptive statistical technique.

The results shows that the effectiveness of the planning and the organizing of academic information systems at higher educations in the city of Bandung has been largely effective. The effectiveness of the implementation of the academic information systems is good enough. The effectiveness of the process of monitoring and evaluation of the academic information system indicates that the number of higher educations that still ineffective in their monitoring and evaluation systems is quite significant. The output of academic information system of all higher educations in the city of Bandung is good. In addition, all higher educations have a good quality information system program.

Keywords: Higher Education, Academic Information System, Information and Communication Technology, Effectiveness

A. Background

The utilization of information and communication technology (ICT) in education is an absolute necessity that must be undertaken and utilized by higher educations if they want to improve the quality of education. For higher educations, as well as other modern institutional, utilization of information technology is not only serves to help management (supporter), but also serves to improve (enabler) in the decision-making process at various levels of college management (Indrajit and Djokopranoto, 2006). The effective utilization of information and communication technology in the management of education in higher educations will be realized when supported by the development of an effective management information system (Hanna, 2003).

The use of ICT as a supporter or an enabler among higher educations, particularly in the city of Bandung, has already become a must either at higher educations or at some higher educations that have students and a simpler affair. The utilization of ICT for management of institutional power support is an important factor in the effectiveness of service management, and it seems to be a modern institution lifestyle that can be proud of in the community (Allen and Fifield, 1999; O'Brien, 2005; Kartiwa, 2008). There are many problems encountered by many universities in Bandung city related to ICT applications in the management of institution, such as an ineffective system made up, non technical problems that have no connection with the system or brainware problems.

The effectiveness of the implementation of ICT in the management of higher education needs more attention as its central role in the process of managerial decision-making or other decisions (Chamblin and Steger, 2000; Ramsden, 2004). To improve the effectiveness of this implementation which would obviously affect the effectiveness of the achievement of the education institution, the factors that affect the effectiveness of the implementation of ICT in institutional management, particularly in terms of academic administration need to keep be researched. It is intended that the process of academic management in higher educations could more effective and efficient then it would support the achievement of high performance of institutions.

From the entities and the properties, academic information systems refer to a set of systems and activities that are used to organize, to process, and to use information as a source within an organization (Sprague and Carlson, 1982). The output of the information resulted from this system will provide information to the leaders or the decision makers that can be classified in different utilization and different purposes. (Levin, Kirkpatrick, and Rubin, 1982) They are :

a. Academic Information System for the pupose of resulting reports in a various activities such as academic, finance, personel, the distribution of students to all kinds of majors.

b. Academic information system for the purpose of answering the "what if" question. This information system use database to be shared to other users.

c. Academic information system for the purpose of supporting decision making, evaluation, and the development of the system. This system provides information for all kind higher educations.

The purpose of this research is to describe; 1) the planning and the organizing of academic information system (AIS) at higher education in the city of Bandung; 2) the implementation of AIS at higher education in the city of Bandung; 3) The monitoring and the evaluation of SIA at higher education in the city of Bandung; 4) the quality of information produced by AIS at higher education in the city of Bandung ; and 5) the quality of AIS at higher education in the city of Bandung. and 6) how far the effectiveness of Academic Information Systems Management in Bandung.

B. **Methodology**

By using descriptive research analytical method, the population in this study involved 37 higher educations in the city of Bandung which adopt ICT in their academic and administrative system that runs undergraduate (S1) program. While for the institutional sample, I used proportionate random sampling and it is involved 18 higher educations consisting of 8 universities, 3 institutes, and 7 colleges. For faculty sampel, 988 persons are lecuters and 1581 persons are students. To measure effectiveness on this study, it was used Cobit tool modification for the instruments (IT Government Institut, 2000). The data collecting tool is a good validity and reliability closed-open questioner. Measurement of the samples was done using the formula of Yamane (1967: 258)

The data obtained from the study then analyzed with descriptive analysis. Descriptive analysis seeks to expose data or answers given by students as respondents to the number of questions posed in the form of a questionnaire, so that the results will clarify issues that will be examined.

C. The Result and Discussion

1. Planning dan Organizing of AIS

These sub variables are divided into 5 indicators, they are:

a. the existence of the strategic planning of AIS and how far of the implementation;

b. Socialization and training to the users of AIS;

c. Organizing of AIS and its effectiveness;

d. Human Resources management of AIS (from the recruitment to the dismissal); and

e. The ownership and the effectiveness of the AIS software owned by the colleges.

From the data, it is recocnized that the effectiveness of planning and organizing of higher education academic information systems whether is good or not, where 3 higher educations (16.7%) are considered very high, 12 higher educations (66,7%) are categorized high, the 2 universities (11.1%) are categorized under high, while 1 higher education (5.6%) is considered low.

Table 1. The Effectiveness of Planning and Organizing of AIS

		Frequency	Percent	Valid Percent	Cummulative Percent
Valid	Very High	3	16,7	16,7	16,7
	High	12	66,6	66,6	83,3
	Average	0	0	0	83,3
	Low	2	11,1	11,1	94,4
	Very Low	1	5,6	5,6	100,0
Total		18	100,0	100,0	

 The planning and organization of information systems is one of the processes that should not be ignored in the process of management information systems. The planning of information systems is the most important step in the process of the establishment of information system in institutions. The most important factor is a long time that is required in providing and integrating relevant data into the operations of the institution, the difficulty of finding a competent operator, and the size of funds and managerial resources needed to run it.

In designing information systems, besides the devices that process the data in information systems management that is an important component, designing information system that does not start from a comparative analysis of the availability of the device. Stoller and Van Horn (Certo & amp; Certo, 2006: 543) mention that in designing information systems, it should begin with an analysis of the type of decisions that will be generated in each unit manager. In all higher educations in the city of Bandung, the planning process of information systems is initiated from strategic plan. Almost all of the Colleges consider that the strategic plan of AIS is important as the basis of policy and implementation of the AIS in the institutions. The strategic plan is a reference to the process of developing a blueprint management system as a whole.

The socialization and training of the users of the AIS is also important as a part of the planning process. This is very important in the framework of the preparation and conditioning situation, then culture of AIS could begin to established systematically (Leidner and Kayworth, 2005).

2. The Implementation of AIS

Implementation of AIS dig up how far the academic information systems in the institutions is run, what kind of encountered problems, and how the process of solving them. The Data show that the implementation of the AIS in higher educations has already given you an idea of their effectiveness. There are 9 higher educations (50.0%) that are categorized into very high, 6 higher educations (33.3%) categorized into high, the 2 higher educations (11.1%) categorized into under average, and 1 higher education (5.6%) categorized into low.

Table 2. The Effectiveness of The Implementation of AIS

		Frequency	Percent	Valid Percent	Cummulative Percent
Valid	Very High	9	50,0	50,0	50,0
	High	6	33,3	33,3	83,3
	Less High	2	11,1	11,1	94,4
	Low	1	5,6	5,6	100,0
	Total	18	100,0	100,0	

In its implementation, the academic information system in higher education is faced with many problems. Generally higher educations are able to effectively run the system. Some problems that arise related to the technical implementation of the system can be solved properly. Process that run in solving problems is conducted actively and preventive by the Manager and the full support of the leadership of the campus.

3. Monitoring dan Evaluation

Subvariable of monitoring and evaluation attempts to dig up data about the existence of a unit of work carrying out the duties and functions of the monitoring and evaluation of AIS of Institute. In addition, it is also photographed the process of monitoring and evaluation.

Considering the indicators above, note that the effectiveness of monitoring and evaluation at 13 higher educations (72.2%) is very high, while in 5 higher educations (27.8%) is still low.

Table 3. The Effektiveness of Monitoring dan Evaluation of AIS

		Frequency	Percent	Valid Percent	Cummulative Percent
Valid	Very High	13	72,2	72,2	72,2
	High	0	0	0	72,2
	Less High	5	27,8	27,8	100,0
	Low	0	0	0	
	Total	18	100,0	100,0	

The existence of a special unit that performs the task of monitoring and evaluating system is very important in order to ensure the system is running well. Academic services efforts at both the lecturers and students will be more aware in the presence of this institution. A routine and well-planned monitoring and evaluation activities conducted periodically and thorough is a guarantee that AIS is running effectively.

4. The Quality of Data/Information Resulted by AIS

There are 5 (five) indicators describing quality of data variable/information generated by AIS of higher educations, they are:

a. Effectiveness of information;

b. Confidentiality;

c. Compatibility;

d. Readability; and

e. Reliability.

Referencing to those five indicators, it can be explained that the quality of data/information generated by AIS at 5 higher educations (27.8%) is very high, while in 13 higher educations (72.2%) is high.

Table 4. The Quality of Data/Information Resulted AIS

		Frequency	Percent	Valid Percent	Cummulative Percent
Valid	Very High	5	27,8	27,8	27,8
	High	13	72,2	72,2	100,0
	Less High	0	0	0	
	Low	0	0	0	
Total		18	100,0	100,0	

5. The Quality of Academic Information System Program

There are four (4) indicators that are unearthed in the respondents related to the quality of academic information systems run, namely:

   a. Efficiency;

   b. Availability of data/information;

   c. Integrity; and

   d. Network security/system.

By all four indicators above, it shows that the quality of academic information systems program at 5 higher educations (27.8%) is very high, while in 13 higher educations (72.2%) is high quality

a.   Table 5. The Quality of Academic Information System Program

b.

		Frequency	Percent	Valid Percent	Cummulative Percent
Valid	Very High	5	27,8	27,8	27,8
	High	13	72,2	72,2	100,0
	Less High	0	0	0	
	Low	0	0	0	
Total		18	100,0	100,0	

A good quality information assure the confidentiality of information, according to what the user wants, readeable, and reliability are indicator of the quality of the output. Reviewed from these aspects, it appears that information products issued by AIS of higher education has already met these criteria. This is a great asset for institutional decision-making process both routine and generic.

6. The Effectiveness of Academic Information System Management

To see the responses of the respondents as a whole for the effectiveness of the management information system of academic, we must make some category at first. In Table 6 below is a recap table of the evaluation of effectiveness of academic information systems management.

In General, there are different valuation between a group of institutions, lecturers and students, except for the components of the implementation and the monitoring of evaluation of AIS. For implementation of AIS, there is a discrepancy of evaluation between the institution and the group of student-lecturers. Most of froup of institutions evaluates it into very high, while most users (student-lecturers) evaluate it into high. For monitoring evaluation, most students and institution evaluate it into high and less high.

Implementation of the automation of academic information systems in all higher educations has been well planned. Planning process is already listed in the institutional strategic plan. In addition, many people also already have a strategic plan for management information systems in General. Research college sample is already to plan the implementation of academic information systems based on ICT which is part of the institutional management information system in General.

Moreover, the process of organizing has been running well. There is a certain unit that carries out the administration of the academic information systems manually and automatically through ICT. Any organization or institutional dealing with AIS at higher education generally have an adequate organization fittings and running as what specified by institutions.

Table 6. The Recapitulation of The Evaluation of The Effectiveness of Academic Information System Management Based on Organizer, Lecturers and Students

The Component of The Evaluation of The Effectiveness of AIS Management Based on Sample Group	Very High	High	Less High	Low
a. Planning and Organizing of AIS				
▪ Institution	0,0	81,2	18,8	0,0
▪ Lecturers	2,1	64,5	33,0	0,4
▪ Students	1,9	66,5	29,5	2,0
b. The Implementation of AIS				
▪ Institution	50,0	31,2	18,8	0,0
▪ Lecturers	27,8	50,4	20,8	0,9
▪ Students	15,1	45,0	34,5	5,5
c. Monitoring dan Evaluation of AIS				
▪ Institution	12,5	50,0	37,5	0,0
▪ Lecturers	37,1	45,6	16,5	0,9
▪ Students	0,8	46,7	46,5	0,8
d. The Quality of Information Resulted by AIS				
▪ Institution	0,0	93,8	6,2	0,0
▪ Lecturers	1,9	56,2	40,9	1,0
▪ Students	1,7	64,3	33,7	0,3
e. The Quality of Academic Information System				
▪ Institution	18,8	75,0	6,3	0,0
▪ Lecturers	9,5	65,5	25,0	0,0
▪ Students	8,1	61,0	30,3	0,7
Average	16,26	66,24	17,52	0,0

Regarding the implementation of academic information systems at higher education, half of the respondents expressed that the implementation is very high. The other half spread between high and less high. This just illustrates that generally the process of academic administrative service run by the system has been running, although there are some higher educations that expressed his discontent (18.8% institution stated the implementation is less high).

On the monitoring and evaluation system, it seems that not all institutions do it well. As in the table above, it is mentioned that only half of respondents stated that the intensity of the monitoring and evaluation system is very high. Although there is 12.5% stated it was high, but there are some of them (with significant proportions of 37.5%) stated it was under average. While for quality of the information, it seems that most of the users of data/information in higher education said that it is high (93,8%), and the rest (6.3%) stated that it was under average.

While on academic information systems quality assessment in general, the reference criteria in assessing the effectiveness of the system is efficiency, availability, integrity, and security of networks/systems. In terms of the efficiency, the effective AIS is a system that is able to optimize performance even excels with fewer resources. The criterion of availability is how far does system capable in providing academic information/data needed by the stakeholders (Dean, Assistant Dean of Academic Affairs, Academic Unit, students, parents of students, or other).

Cohesiveness is a condition in which all devices associated with the system. All process such as the process of data management in all fields and units, organizing each fields and work units that deal with data/information, and resulting integrated product are managed by a certain unit. While network or system security is the ability of the system to protect itself from damage intentionaly or unintentionaly that comes from an internal or external, and being able to predict the demands of progress of software/hardware, and trend of the changes of software and hardware, as well as the policy change of institution.

By this high effectiveness of academic information systems management of higher educations, it could explain that the college already has a separate unit that handles academic administration. There are bureau, department, or certain unit affiliated in businesses that each of them has a raw data management system for academic students manually or automatically through ICT tools. In addition, academic Information management system has already and are being pioneered in all higher educations for long time. There are some status that can be attached to the higher educations that run information systems management, they are. a) Management of information systems that has already completed; b) transfer processes to the integrated information systems; and c) the automation of information system management that has just begun. Of the three status, there are only 3 higher

educations that have a complete academic information systems management in the design of integrated automation information management, while the rest are moving to the stage of an integrated system, and just begun in the process of automation. However, the manual system that has been applied by higher educations, which are not complete yet in doing their automation management information system, has been quite well established and reliable in serving academic affairs. This is one of the important achievements for institutions in maintaining the continuity of the performance that exist at the moment. This is also an asset for the higher educations to continue in improving their performance in the future. Management information systems for effective academic will provide many opportunities for institutionss to allocate more resources to other more important affairs. By an effective academic information systems management, a higher education has a great opportunity to make the right decisions and to solve the problem efficiently, able to save time, effort, and costs. A routine managerial tasks of the college was to produce information for the decision-making basis that will also be necessary for the planning process, to execute a program or to assess the effectiveness . Davis and Olson (1985) said that most employees on duty producing the information, using documents, writing reports, analyzing data to be used in the process of planing should be supported by an effective management system. Besides it, academic affair is also important. Academic Affairs are the main suppliers of the materials of the college decisions related to academic that is a core business of a college.

Management information systems need to be supported by a context that supports the effectiveness of the management of academic information systems, it is ICT culture. ICT culture gives a spirit for the people and the environment that exist in the institutional system. Belief, values or norms and customs that exist and thrive in the institution will influence people in terms of interactions and patterns of behavior (Lavonte et all, 2005; Moa et all, 2001). Academic Affairs personnels who aware to ICT literacy, aware to the importance of ICT, and are able to use of it, will affect the performance of the academic information system and will certainly have an impact on the performance of higher educations.

Concerning research results, the effectiveness of AIS in supporting performance will decrease its contribution if the facilities and ICT infrastructure means is not in adequate condition. Limitation of ICT infrastructure and facilities at a number of higher educations is examined mainly due to budget constraints in meeting the support required devices. ICT investment in the process of AIS management in cost that much though ICT investment has become a trend in every organization today (Thatcher, and Oliver, 2001). Some universities are still in the early stages of the implementation of ICT.

Other things found in the study that apparently state universities has the highest score compared to a private universities. It indicates that the effectiveness of AIS in state universities is better than that in private universities.

The development MIS in higher education, especially developed in state universities is already in extended level. A developed system is not only function as base of institutional data management institutional, but also is able to make information system management as a tool of management. MIS has been set as back office and the front desk devices that serve institution consumers (civitas academic) and stakeholders effectively. The system can become one of the internal system instruments that able to control and to report the processing and academic administrative services, and even able to give alternative solutions to the problems.

The development of academic information system by a college is one of the answers upon the demands of good and clean institutional management (good governance). Well-organized institutional data, an effective management process, and easy-accessed data will able to show a transparent institutional management process. Besides, interconnectedness and mutual dependence among sub-systems will be more effective if the data traffic exchange of data and information run smoothly. Information or data produced by academic information system is needed to run human resource, financial, fasilities and infrastructure, and performance report of higher education management system. Academic performance data is an input in decision making process in institutions. For example, merit system development that developed by institution use academic performance data produced by AIS as its reference.

In management information system, there is an academic information system developed by state universities that has been much provide facilities in determining institution strategic decisions. Clear description related to situation, condition and prediction of institution produced by a system could be mile stone in setting vision at the future and reference in making a strategy to achieve the vision. Moreover, the spirit of information transparency is also a base to develop this information system. As a public institution, higher educations must open theirself at the works or anything that need to be known by public as one of their responsibilities to the public. Fair access institution to the public has many advantages. People would be able to understand all problems faced by the institutions. In addition, the developed management information system will provide a significant contribution in good image of the institution.

In general, why state universities in Indonesia are more advanced compared to private universities? In terms of the ease of establishment, the government provides much accesses to public to participate in education particularly to higher educations, yet they can fulfill the terms. It can be conclude that most private universities just manage their money from the students, because there is a little money come from the external institution or donations mechanism, and consequently, the development of private universities strongly influenced by the amount of their student and the age of institutions and the management capability. Most private universities is still struggling with classical problems, how to get students as many as they can, compete fiercely with other colleges which is now competing to get a maximal students due to the legal entity policy.

In terms of financing, although higher education must independent in self support needs, direct and an indirect government subsidy are still large disbursed to state universities. It indicates that state universities could be unimpeded get indorsement funds to finance programmes compared to private universities.

 Moreover, to compete with private universities in obtaining funds from the government, the availability of resources physicaly or human, state university is clearly better. Good relationship of state university and the decision makers is also one non technical factor that make easier for state university to obtain fund from the third parties including from the government. As a result, it is

proven that only 44% of 84 higher educations in Bandung that has achieved ICT-based AIS. It means that is around 56 % colleges that have not use ICT as technology-based AIS management. The low utilization of technology-based AIS as the result of the great amount of investment cost. For tool procurement, tool maintenance, providing human resources, education, system updates, and the security system which need a great amount of cost. It would be a reason for some colleges to not use ICT as one of enablers in managing AIS.

The great support of fund for state university will make them easier to provide facilities and infrastructure. Thus, this explains why AIS culture and the quality of human resource in state university are better than that in private university. Besides, the capability of state university to employ their qualified human resources can also be considered high. It because the status of civil servant of their employees who run AIS is still an attraction thing for potential job seekers. A good career prospec and the better future make them safer, and automatically it will support working climate.

D. CONCLUSION AND RECOMENDATION

The effectiveness of academic information system planning and organizing in most colleges in Bandung is effective. Regarding the effectiveness of the implementation of academic information system, most of them is in good condition. However, this is different with the effectiveness of monitoring and evaluating process of their academic information system. The number of college that was ineffectual in its monitoring and evaluating system is still significant.

Regarding the output of academic information system, all colleges in Bandung are capable of producing output. Reviewed from academic information system program, all colleges have a good quality information system program. Of all data above, in general the quality of academic information system management, all colleges in Bandung is high.

For further study, it is recomended research the mature ICT of higher education. Hopefully this research will be able to answer or explain the capability of information systems to support the vision and mission of institutions. Moreover, to explain the capability of the developed system can support to improve the quality of performance of institutions.

Marketing Education Online: A Case study of New Zealand Higher Education Institutions

Rubaiyet Hasan Khan[95a]

a Lecturer, *AIS St. Helens, 28a Linwood Avenue, Mount Albert, Auckland 1025, New Zealand.*

Abstract

Social Media interaction, an off shoot of web 2.0 environment has caused a paradigm shift in the way we communicate in a society. The modality of the purchase decisions has been radically influenced by this mode of communication. It is only a matter of capitalizing on this opportunity and having the best strategy in the current environment to succeed in changed market environment. Marketers should start focusing on developing high quality marketing strategies conforming to this new environment. This study investigates Social Media Marketing attributes of Higher Education institutions from New Zealand. It uses a customized tool namely *Social Media Marketing Attributes (SMMA) Analysis* to benchmark the practices from the institutions. Very little participation in using Social Media as a communication channels for marketing has been identified. A number of strategies are recommended to align the marketing with the demand and make the best use of this effective medium namely Social Media. The findings of this study have practical implications for the organizations working in this industry; where they can use the findings in developing effective customer centric marketing strategies.

Keywords: Social Media Marketing, Higher Education Institution, Services Marketing, Internet Marketing.

1. INTRODUCTION

The Internet is a medium of communication that was developed in the late 20th century. We have experienced the growth of an entire new industry that has changed the social structure, business culture and even individual attitudes because of the wide use of this medium. The communication achieved through this medium has made the world a global village. Physical distance has been conquered by using constant communication through the Internet using websites, emails, Internet phones, and lately the Social Media that provides an opportunity for two way communications between the producer and the consumers. This medium has been recognized as an important medium for marketing by many researchers in their studies (Belch & Belch, 2007; Keegan & Green, 2008) but the growth of marketing by using this particular tool has reached its highest pinnacle with the availability of Social Media through the Internet. Many businesses have started exploring this opportunity and have started playing around with the strategies to utilize this new found opportunity to achieve micro-customization of services for their customers. We have seen businesses cash in using this new found tool and achieve unprecedented communications success (Smith & Zook, 2011, p.31). We also see scepticism from corporations and managers in using this medium as a vehicle for their advertisements (Kelly, 2012). Overall, this medium has caused waves of changes in the marketing world but impacts are still uncertain and require further investigation before this can really be proven as an effective tool for marketing. Nevertheless, the enthusiasm with this medium demands in-depth analysis and exploration and many industries are trying their luck with this bidirectional flow of information. The travel, tourism and hospitality industry that was one of the first to have used this powerful tool certainly set benchmarks for the usage of this tool in marketing. The Education industry being a service oriented industry also has very similar characteristics as the Travel and Tourism industry, where the students are their customers and they opt to make their purchase decision based on the information available (Shanka, Quintal & Taylor, 2006). This gives us reason to believe that this medium might prove to be as effective as in the cases of TripAdvisor, Webjet etc. in the travel and tourism industry, where they have successfully incorporated Social Media as a tool for spreading the word and used the personal recommendations as a tool for success in their marketing efforts. This study takes into account the usage of Social Media Marketing in Higher Education institution.

1.1 Research problem statement

The extent of globalization has certainly influenced the nature of business processes in the education industry. With a history of internationalization since the beginning of the education industry; it has been a common practice to seek

---

international education overseas. Many have travelled continents to seek new knowledge and entrepreneurship under the pioneers of technology, innovation and renowned scholars. The availability of technology such as Internet has made it possible for the education providers to offer educational services in an unprecedented way. Today courses are being delivered thousands of miles apart over the Internet and it is possible to follow the learning processes on a regular basis even though the learners and the teachers are geographically distant. This new form of education has not only changed in the supply side the demand i.e. the learners has also evolved and they have started considering many new factors in choosing their education destinations. Brand in the form of referrals from the people they know is a key determining factor in this process (Malmarugan, 2008). The fact that the word of mouth has been indicated as a key influencing factor in making purchases in this industry points us towards the media that are now commonly used in carrying out this task. The success and effectiveness of education providers depends on how well their marketing and public relations efforts are implemented and understood.

The importance of marketing as a key for success even in the education industry has been mentioned by Brown (1984) when he developed the model of "Steps in marketing programs". In his model, the marketing mix of a marketing strategy includes the "four Ps" factors of Product, Price, Promotion and Place in educational programmes. In the case of educational institutions it has always been a struggle to disguise these marketing efforts and putting their services at a much higher level than the commodities. The recent political changes in the world and liberalization of trades has changed this scenario and commodified education as a service (Mohammedbhai, 2002). This redefinition of the services opens up the market for education services to be exported as goods. The variation in cultural, societal, regulatory and economic aspects of the customers (students) of educational institutions makes it a big challenge for the market planners and managers to streamline the marketing efforts and find the right segment for the products they offer, the price they can offer, the channel they can use and develop the right promotional plan targeted towards the right segment of customers. In today's globalized world it is almost a fruitless exercise to come up with a global marketing plan that fits all the segments scattered all around the world. With a globalized approach in delivering their services the educational institutions need a marketing strategy that will enable them to customize the strategies at a micro level. This calls for development of tool that understand the needs and wants of the customers at an individual level.

The New Zealand Market Development Board recommended opening up the international education market following the shift from 'aid' to 'trade' approach by Australia in 1987 (Alvey, Duhs&Duhs,1999; Harman, 2004). This has remarkably transformed this sector in New Zealand and introduced a new sector for foreign currency earnings for New Zealand (Martens & Strake, 2008). Tougher competition from other providers in the English-speaking world has made it difficult for New Zealand to keep up its numbers of foreign students in recent years. There has been a declining trend in the majority of the source countries of Foreign Fee Paying students (EducationNZ, 2010). Australia-New Zealand's direct competitors for Asian students, the UK and Canada, are now improving their visa accessibility for foreign students and have invested heavily in the promotion of their educational services, particularly in the Chinese market. As a result, New Zealand could be losing its comparative advantage in this industry. Major market players in this industry are looking for ways to have paradigm shifts to reach their customers and secure their share of the global education market.

1.2 Research objectives
This research endeavors to identify the practices and expectations of the usage of Social Medium as a channel for marketing Higher Educational institutions. The research looks in to the following objectives to understand the practices of Social Medium in marketing;

- Is there a demand for Social Medium as a preferred medium of marketing communications from the consumers end?
- What is the Higher Educational institution marketers' opinion about using Social Medium as a channel for marketing?
- What are the current practices prevailing in using Social Medium in marketing Higher Educational institutions?

In considering the above mentioned objectives the research further investigates the trends in other similar industries in using the Social Medium but focuses on the education industry. New Zealand being one of the latest countries to offer international education as global destination makes it an interesting case to study since it had good opportunities to implement a Social Media marketing strategy in formulating their national marketing strategy as a preferred destination choice.

1.3 Significance of the study

Foreign students play a major role in the sustained economic growth and continue to impact positively in creating a multicultural nation in New Zealand (Bedford, 2006). A diverse student population enriches the learning environment and study experiences of the local students. But the choice of destinations now demands a higher degree of resource mobilization as it involves motivating the consumers on a one to one basis since Higher Education is considered as a high involvement choice (Gary, 1991). This study investigates a novel tool that has potential to gain a ripple effect in the market and establish a long term brand value through word of mouth. This is achieved through engaging the potential customers by mobilizing existing ones in creating this ripple. To the best of this researcher's knowledge this is one of the pioneering studies about the medium of Social Medium usage in marketing particularly by the education industry of New Zealand. The findings of this study will establish a benchmark for these highly disorganized industry standards by using this social medium in marketing. This standard might contribute towards the growth in this potential sector to compete in this highly competitive international market. The marketers need evidence that the customers of the Higher Educational institutions have gone through a paradigm shift and trust their peers more than the claims made by reputable institutions. This study provides the opportunity to collect this evidence and recommend possible strategies in this new marketing environment. This study could potentially present an advantage for New Zealand Higher Education organizations to optimize fully their Internet marketing strategy and cash-in to this opportunity as a market leader in utilizing Social Medium as a marketing tool. The findings of this study will be particularly beneficial for universities and other Higher Education institutions as it directly investigates the needs and demands for their potential customers (students). The findings of this study also indirectly influence the policies governing the market development for education industry by the New Zealand government and contribute towards their strategy formulation. The academic world also benefits by recording the application of various Social Media theories and testing various hypotheses through this conceptual framework.

1.4 Research scope and limitations

Due to limitations of time and budget, the study was only focused on a snapshot at a particular time. Any wider impacts through the development of different international factors of decision making (e.g. the world economy, culture, comparative status of the New Zealand institutions by world standards) could not be incorporated in the study.

2. Literature review

The fairly new field of Social Media Networking has created a ripple in the business world and is a subject of considerable interest among the practitioners as well as academicians as discussed in chapter one. This section aims to establish a knowledge gap in this field and propose the focus of this study through a comprehensive review of the current literature about the theories and practices in this field.

2.1 Marketing defined

The definition of Marketing is a highly debated subject among the academicians and the practitioners who actually apply the theories in the field (Hunt, 1976; Dann, 2010; Morgan, 1996). It really is a matter of conceptualizing the contextual aspects that should perhaps define the scope of a marketing effort. Wiebe (1952) for example, asks, *"Can social products be marketed?"*. If marketing is simply a process of accommodating exchanges between two or more parties (Chartered Institute of Marketing (CIM), 2005) can this be generalized for any business or social transactions? Should marketing be considered solely as a business function or can various other social behavioral theories be applied to understand the processes better and as a result relate this understanding with the phenomenal changes that are being reported by various marketing practitioners due to the availability of Social Media networks among the consumers. Is this a myth? Or are we really experiencing a paradigm shift that is redefining the processes of how we, as consumers, make our decisions of choice and purchase?

2.2 Higher Education in New Zealand

New Zealand: a player in the international education market enjoys a new entrant status among all its competitors. The economic reforms by the David Lange government in mid 1980s transformed the domestic labour market creating demands for "White collared" jobs. The skill requirement variation led more and more students to seek tertiary education resulting in new enrolments in the Higher Educational institutions. Enrolment has risen from roughly 120,000 in 1985 to 431,573 in 2011 (Education counts, 2011). This fourfold increase in the student numbers can be rationalized in two basic influences. One of course, was the increase in domestic demand due to the policy changes but the major contribution towards these additional numbers coming was when New Zealand opened up

their market for Higher Education from 1990 as a possible destination. The Higher Educational institutions including the universities, polytechnics and private tertiary educators became good candidates as destinations for international students in a globally competitive market. This new approach of delivering the services in a competitive market transformed the age old universities and their business processes. Suddenly the universities were competing for their share of the market not only internationally but also for the domestic market. Universities and other Higher Education providers had to have a strong marketing team and effective strategies to market their courses in the market. This has lead to a continuous process of innovative marketing strategies resorting towards latest technologies to reach their markets. Recent news reports shows considerable interest in using Social Media by the Higher Education institutes (Scoop, 2013) there are demands from their students. But before these claims can be generalized it is necessary to rationalize the decision through considerable research and practical studies of the return on the investment in this media. Managers certainly will be skeptic in adopting a media without testing it further.

2.3 Social Media as a vehicle for marketing
This section addresses the first research question of this study. Social Media as noted by Google (2013) makes up most of the current web traffic. Facebook followed by YouTube are the top two web sites that attract the most visitors all around the world. And the unprecedented growth of the Internet as reported by Internet World Stats (2013) of 566% over the last twelve years established this medium as one of the most accessed medium the nature of this medium being less resource demanding (cheap), accessibility (24/7 availability), ability to provide interactive communication makes it one of the richest medium for marketing. Many practitioners and market leaders have effectively used Internet to gain considerable profits through better reach and market penetration. Social Media as one of the offsets of this rich media carries all the attractive characteristics and in addition to that it introduces the novelty of interactivity and consumer generated contents to add additional value to the marketing efforts.

The theoretical framework of rationalizing the popularity of this medium has been the focus of many recent researchers (Gaudin, 2010; Contractor, 2009 and Evans, 2008). This research limits its scope of analysis with the context of Higher Educational institutions and attempts to relate the summary of their analyses with the purchase funnel of the students making their decision about destination of their study.

2.4 Student decision making on choice of institution
As a result of the transformation of educational services it is becoming a commercialized product, strongly influenced by the expectations of its consumers. The other key characteristic of educational services is it is inseparable from the service provider. This poses an extra challenge to the marketers as that will force them to bring their consumers to them or take the services to their customers. This is a life changing decision for the customers and considered as a high involvement choice (Gary, 1991; Mazzoral, 1998; Mazzoral and Soutar, 2002). The students are influenced by a complex matrix of factors that includes both intangibles and tangibles. Intangible factors may include the brand of the institution, the quality and relevance of the courses that they offer or even the reputation of the educators involved in those institutions. Lamb et. al. (2008). investigated the decision making process and proposed a few tangible elements that can be used for marketing efforts. He termed them as 'cues' that include physical facilities, staff profiles and their publications that sends the signal to the prospective learners to choose their destination institutions. Lamb et.al. (2008) proposes that these cues can be marketed aggressively to achieve the expected marketing outcome.

The focus on tangibility is perhaps an easy way of pushing the prospective students through the purchase funnel but it will not be prudent to question this strategy's affectivity when thinking about a long term competitive advantage through a well designed marketing strategy. In a high involvement purchase decision perhaps the students might put more emphases on the intangible factors as mentioned earlier. And it is perhaps the referral process through word of mouth that will be given more importance compared to the claims made by the degree offering institutions on their websites. Many researchers have identified this source of information as more credible than the latter one (Crotts, 1999; Perdue, 1993). With the availability of Social Media spreading this word has become much easier than it was in the past. One cannot emphasize more, the power of the post purchase feedbacks in an educational institution's marketing context.

2.5 Theoretical relevance of the Social Media marketing

Psychological Ownership theory

Asatryan and Oh (2008) using the example of the hospitality industry explained the affinity towards feedbacks from a Psychological Ownership Theory perspective. Consumers tend to grow an affinity towards the organizations that they receive service from and take ownership of the feedback that they leave on their sites. This comment shows justification why Social Media users might be inclined to actively spread by word of mouth, their experiences about a school if suitable platforms are provided. And this is perhaps where the greatest possibilities for Higher Educational institutions exist in gaining a long term intangible asset through the branding process from their customers, the students.

Social Exchange theory

The Social Exchange Theory formulated by Emerson (1976) considers the cost benefit analyses as the basis of any social interaction. To get involved in a social behaviour one should have vested interest within an interaction. Both the parties should feel obliged to attain a social interaction through benefits for each. The social interactive environment should be designed in the virtual world in such a way that the parties involved can identify these benefits. For example, the leading Social Media, Facebook, creates its tangible benefits through a sense of personal information sharing within their networks, LinkedIn creates the same through building professional networks. Any organization attempting to make marketing advantage should carefully consider the inner strategy of benefit design and choose the relevant media to their marketing objective.

Social Network Analysis

The traditional social network theory (Wasserman and Faust, 1994) treats the members of a community as nodes of communication and the nature of interaction between these nodes will determine the affectivity of each edge. The mathematical modelling, using this theory, will determine the reach of each of the networks. Social Media reach can be estimated using this theory.

McLuhan's Media Theory

One of the major aspects of interest for the marketers in the Social Media context is the content generated by the users of Social Media. This is important because it is the content created within a context that will have an elaborated impact in the potential market. McLuhan (1995) explained, this generation of contents by dividing the media into two distinctive categories. He explained that 'cool' media requires the viewers to make considerable effort and involvement to understand the context whereas the 'hot' media will require comparatively lesser effort. Perhaps this author's famous quote, "the media is the message" explains this best in apply this theory in a Social Media context. This why the marketers should be very careful in determining the right media for the message they are sending. One might speculate having the right media is more important than the message in it. As the messages being generated by the users will be determined by the Social Media that they are using. A "Like" and a "Comment" on the Facebook will have much elaboration compared to the 140 character limitations on Twitter. An update on class cancellation may be effective on Twitter but this might not be a very effective medium to generate interest about a particular course or service within a Higher Educational institution.

2.6 The framework for study

The above discussion using the relevant theories of Social Media clearly indicates that an existing robust framework is available for creating a basis of an exploratory study about affectivity of Social Media usage and benchmarking a standard for future practices. The discussion summarizes that a Social Media decision, in order to measure its effectiveness can be measured in three distinct areas asking the following questions:

- Firstly, effectiveness will involve whether the players will have sufficient incentive to get involved in these interactions?
- Secondly, whether the reach can be estimated of a particular media that the marketers will be using?
- Finally, whether the message that the marketers are trying to send will fit into the medium that they are trying to use?

The marketing goals will be achieved if a Social Media marketing strategy of a Higher Education institution can push the consumer through the final decision making process, i.e. purchase decision. Due to the ever changing environment of this particular sector it has become very important to understand how to employ this powerful tool, i.e. Social Media on the Internet to motivate the consumers to consume and stay competitive in the global market.

3. Methodology

The framework of this study guides the research for collection and analysis of relevant data. A customized tool was developed (Appendix I) to compare and contrast the Social Media Usage of the New Zealand Higher Education institutions. The tool was named *Social Media Marketing Attributes (SMMA) Analysis tool*. For every institution using Social Media, 1 point was allocated, and for every negative answer, 0 points were allocated. Further categorization of the institutions was carried through allocating points on the depth of involvement of these institutions in using Social Media for their marketing and communication purpose. An overall score for each institution was analysed after totalling the score for each institution. Institutions from the New Zealand tertiary sector were randomly selected from the New Zealand Qualifications Authority (NZQA, 2012) website. A simple random sampling technique was selected to ensure representation of the entire population. An overall population size was determined by simply identifying the total number of institutions listed on the NZQA website. The total number of enlisted organisations was nineteen hundred and four. The sample size decision in of the study was decided by using the table developed by Krejcie and Morgan (1970). The minimum sample size determined for the study was 320. The analysis was carried out on 349 sample institutions from this list.

4. Results

New Zealand has three types of Higher Education institutions: universities, polytechnics and private tertiary educators (PTEs). Out of this population, a sample size of 349 institutions was chosen for this study. All the university websites (8), polytechnics (13) and three hundred and twenty eight private tertiary educators' were investigated in this part of the study. The private tertiary educators were picked up randomly from the New Zealand Qualifications Authority (NZQA) website.

The representation in the sample as summarized in the following table 4-A is in line with the total population where majority of the population of Higher Education institutes are privately owned followed by a limited number of polytechnics and universities in New Zealand.

-
-
- Table 4-A: Sample representations of different types of Higher Education institutes

Type of the Institutes	Sample representation (n)	Percentage	Mean Score
University	8	2.29 %	3.375
Polytechnic	13	3.72%	2.230
PTEs	328	93.98%	0.948
Overall	349	100%	1.05

Proportionately the types in the sample representation could be summarized as Universities: Polytechnics: PTEs = 2: 4: 94. That also reflects the population characteristics. Different types of organizations clearly demonstrated a varied performance on the scale. Out of a total score of 5; Universities scored the highest (3.375) followed by Polytechnics (2.230) and PTE scoring the least (0.948). This shows that while the universities are much more proactive in using this Medium compared to the other two groups they still can improve their performance by increasing their involvement in this Medium. Overall mean average of only 1.05 out of a total of 5.00 is considered to be a very poor performance and indicates the lack of attention and efforts to use this Medium as a mode of communication.

Further to this analysis the research was interested in categorizing these institutions based on their performance and the nature of participation within the Social Media pages. Since there are many forms of Social Media including Facebook, Twitter, Blogs, MySpace, YouTube etc. the comments recorded were generalized comments made by the surveyors on overall performance. In order to keep the comments unbiased a code book was used by all the surveyors and three surveyors were used for the same sample and results were averaged to make the assumptions as close to reality as possible.

Analysis on the usage and practices of Social Media needed further in depth look rather than just who are using this medium. Following table 4-B summarizes the nature of the usage of this medium as a communication and marketing channel. This also gives a snapshot of different categories of usage among the sample that rightly represents the population.

- Table 4-B: Social Media Marketing Attributes (SMMA) analysis of Higher Education institutes from New Zealand

SMMA Analysis of Higher Education Institutes from New Zealand		
Categories of Usage	Nos using Social Media	Percentage having Social Media
Type 1 (Score 5)	1	0.29
Type 2 (Score 4)	9	2.58
Type 3 (Score 3)	87	24.93
Type 4 (Score 2)	28	8.02
Type 5 (Score 1)	9	2.58
Type 6 (Score 0)	215	61.60
Total Counts	349	100

Out of the 349 educational institutes surveyed only 134 institutes had some sort of Social Media presence one way or another. This represents only 38.40 % of the total institutes surveyed. Since the researcher could not find any similar surveys in the literature review it could not be compared with a benchmark standard but less than half of the organizations using this easily accessible, readily available medium for marketing communications show some degree of scepticism and to some extent distrust.

Among the 134 institutes who are using this medium only 1 (0.29%) had more than one pages and the marketing department and various other departments are actively posting updates and news to influence user interaction among this channel. This reflects a clearly defined Social Media Strategy that seems to be rare in most of the organizations that have been surveyed. Another type of organization that has been identified in this survey represented a group, which had more than one page/channel on Social Medium. They posted regular updates which were being posted by different departments and they seem to have been running their efforts independently. This shows a lack of overall integrated strategy for Social Media marketing among these organizations. They represented about 2.5 % of the total organizations surveyed. The third category that was identified included organizations that had a single page/channel running on this media and the students were interacting with each other commenting on various events and news that are posted by their institutions. This represented major portion of the sample i.e. 33%. A fourth type of Social Media behaviour was observed in another category where there were initiatives by the institutes of participation in the Social Media though a single page/channel but they are used for intermittent organizational notices but are seldom noticed by the target audience and commented upon. This represented 2.5% of the samples. A fifth category that had no Social Media activities represented 215 (61.60%) who seem to be the single major portion of the sample. The following table 4-C summarizes the results described above;

Table 4-C: Categorization of the types of Institutions.

Categories	SMMA Analysis Score Schedule	Representation on the sample	Type Representation
Category 1	Actively marketing through posting regularly from the marketing department and has more than one page	0.29%	100% University
Category 2	Has more than one page that accommodates learning activities in various courses through discussion	2.58%	44% University, 22% Polytechnics and 33% PTE
Category 3	Has a single page only that accommodates interaction between students commenting on the institution	32.95%	2% University, 6% Polytechnics and 92% PTE
Category 4	Has a single page providing institutional updates but very little interaction among the students	2.58%	100% PTE
Category 5	No Social Media pages	61.60%	0.5 % University, 2% Polytechnics 97.5% PTE

In the above categorization institutions scoring of 3 and 4 in the Social Media performance were grouped together as they demonstrated very little difference in their level of involvement with the Social Media communications. Type of institutions included in each of these categories also gives a distinctive profile which can be correlated with their overall marketing efforts. Majority of the institutions from category 1 and 2 were Universities or Polytechnics having a robust administrative structure and ensured government funding that probably induces them to have a well maintained marketing team and infrastructure to use the latest medium of communications in their communication channels and marketing media. Above results when summarized indicates very little current interest in committing resources towards *Social Media Marketing.* This provides us with an indication of what the higher educational institution marketers thought about this medium as a marketing tool, our second research question. Their lack of interest clearly demonstrates the distrust on this tool.

- **5. Discussions on findings**

Extending the analysis in Table 4-C, each of these categories can be utilized to establish the types of activities that they are doing and explore a link with the Constantidines's (2004) model where he proposed that the organizations can influence their consumers' purchase decision in two basic approaches; through *Active involvement* and *Passive influence* using Social Media.

Table 5-A: Social Media Marketing Strategy Analysis of the Higher Education institutions from NZ.
- (Source : Developed by the author after Constantidines, 2004)

Category	Activities	Social Media front	Type of involvement
Category 1	PR and Direct Marketing; Reaching the new influencers; Personalizing customer experience; Tapping customer creativity; Listening in.	Blogs Twitter Facebook YouTube MySpace	Both Active and Passive
Category 2	PR and Direct Marketing; Reaching the new influencers; Personalizing customer experience; Listening in.	Facebook pages YouTube Twitter	Both Passive and somewhat active participation
Category 3	PR and Direct Marketing; Personalizing customer experience; Listening in.	Facebook page	Mostly passive a few active strategy
Category 4	PR and Direct Marketing; Listening in.	Facebook page	Passive and One active strategy
Category 5	X	X	Social Media marketing strategy absent

Table 5-A explains different types of strategies adopted by the Higher Education institutions from New Zealand. This summary indicates that there are still opportunities for this medium in this industry if the demand from the customer end can established through a research. The above section addresses the third research question of this study.

Social Media is a very interactive dynamic medium that provides with a lot of opportunities. At the same time it creates challenges for the marketers to develop conforming marketing strategies. Previous researchers have certainly supported this claim that this conformation needs to be carried out in order to stay competitive in the market (Kreutzer & Hinz, 2010; Mangold & Faulds, 2009). Affectivity of traditional media and current marketing strategies using unidirectional communications and mass marketing efforts have been questioned as the target audience seem to have lost trust on this medium (Constantinidines & Fountain, 2008). Customers seem to value this new media more through direct involvement and looks at this from a sense of ownership as they also generate the contents within them (Mangold and Faulds, 2009).

Although New Zealand Higher Education institutions compete in a global market, the findings from this study questions the current media that they are using and their effectiveness. There have been very few studies carried out in the New Zealand market that enlightening with the choice of medium for marketers in this industry. Khan & Ali (2011) claims that the choices in this market seem to be very unpredictable and often on a make shift basis that lacks overall strategic goals. This research also discovered similar trends where lack of attention towards a strategic choice might have contributed towards the low usage of this medium within the New Zealand Higher Education institutions. The greatest challenge that using interactive Social Media creates is establishing the context where the target audience are motivated enough to involve themselves in the discussion. Without their participation this medium perhaps is left with a dead effort. This is perhaps why we see, almost 36% of the samples from categories 3 and 4, although they were involved in Social Media marketing in one way or another, were failing to create the so called "Buzz" that is targeted in using this medium for marketing purposes.

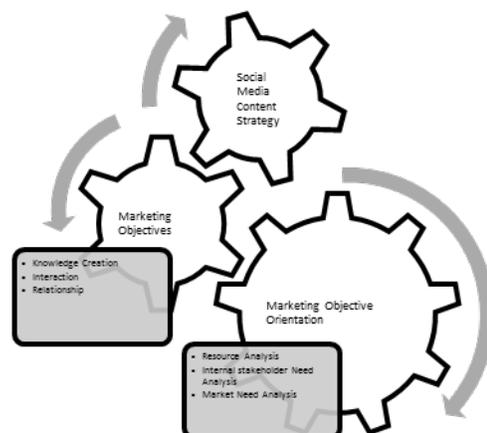
The following Figure 5-A discuss a process model development based on the Grőnroos (2004) framework to work out a value creation process within these Higher Education institutions.


Figure 5-A: Conceptual framework for building Social Media Content strategy for Higher Education Institutions from NZ.
Source: (Developed by the author based on Grőnroos (2004).

Grőnroos (2004) describes three major elements in an effective Social Media strategy: Knowledge Creation, Interaction, and Relationship. The participants could find themselves involved in all these three aspects in order to take part in the Social Media interaction and start adding value to the marketing efforts of the institutions. These objectives are very contextual and need to be customized based on the institutions' internal stakeholder (shareholders, teachers and administrators) needs, market (students) needs. As well they are based on actual resource analysis where a practical analysis was carried out to establish the market readiness for a dynamic medium such as Social Media. If all these relationships are assessed in creating the marketing communications objectives the stakeholder participation should ensure the constant conformation of the Social Media contents which will help the choice of the right platform for the organization to communicate constantly with the prospective customers.

-
- **6. Conclusion**

The study gives a snapshot of the supply side of the information for Higher Education institutions' Social Media strategy for New Zealand. In answer to the research questions set forth, we can conclude that there is a clear demand from the consumer end for this medium to be used as a marketing channel. Higher educational institutions lack confidence on this medium thus the lack of current use. And due to the distrust and lack of commitment the resource mobilization for identifying clear effective strategy in using this medium is evidently absent among the current practices by the higher educational institutions from New Zealand.

Information gathered and analysed in this study will be a valuable resource in understanding the strategy formulation process in these institutions. But in order to establish an overall picture of this media further study is required on the demand side of this medium. The data can be used to triangulate an overall picture of the current state of strategies of Social Media marketing of these institutions. Further studies may include focuses on inter-industry comparison of Social media usage in marketing, a time series analysis of development of this medium as a marketing tool.

Maternal weight gain and correlation with birth weight infants

S. Lumbanraja[a], D. Lutan[a], I. Usman[a,96]

Department of Obstetrics and Gynecology, Universitas Sumatera Utara, Medan, Indonesia

Abstract

Objective: Maternal weight gain affect the infant birth weight. Aim of this study was to describe maternal weight gain during all trimester of pregnancy and its correlation with the birth weight.

Methods: Pregnant women who got antenatal care in Adam Malik General Hospital and Sundari Hospital, underwent body weight measurement during routine examination at first, second and third trimester and also at delivery time at those hospital. Baby birth weight also measured after delivery.

Results: Maternal weight gain increased its peak point at the second and third trimester with overall total weight gain ranged at 5 – 20 kg during pregnancy. Baby birth on normal weight ranged at 2500 – 4000 grams (SD + 399,86). Maternal weight gain was more higher in the primi gravida group compared with multi and grandemulti gravida groups. There is correlation between maternal weight gain with baby birth weight with $p = 0,03$ ($p<0,05$, CI 95%), even the correlation was weak.

Conclusion: Maternal weight gain in the second and third trimester showed statistically significance difference with baby birth weight. Adequate total maternal weight gain based on IOM recommendation considered for resulting a better outcome and better birthweight of the babies.

Keywords: Maternal weight, infant birth weight, body mass index

Introduction

The gestational period determine the quality of human resources and depend on the intra uterine condition. Healthy pregnant women with a good nutritional status certainly improves the outcome of baby. Low birth weight rate in developing countries were higher four times than developed countries. More than 9 million babies die each year, 98% occur in developing countries and most of them caused by low birth weight. Therefore, optimal maternal weight gain is essential for better outcome.

In 1987, The Global Safe Motherhood Initiative was launched for improving the coverage of Antenatal Care and counseling around the world. This Program concentrated on Nutritional status and Maternal weight gain during pregnancy. Institute of Medicine (IOM) in 2009, issued a new revision of maternal weight gain recommendation from the earlier version of 1990 according to Body Mass Index (BMI) pre-pregnancy.

Aims of the present study were 1). To compare maternal weight gain in all trimester and total weight gain during pregnancy, 2). To evaluate the relationship between total maternal weight gain and infant birth weight.

Patients and Methods

Patients

Pregnant women who were getting ante natal care in Adam Malik General Hospital and Sundari Hospital between August 2012 and January 2013 were eligible for this study. All eligible patients were on delivery time got body weight measurement before and 24 hours after baby birth. And then, maternal weight gain during first, second, and third trimester were collected from the Antenatal record from outpatient care.

Statistical Analysis

---

96 Corresponding author.
E-mail address: apokrifmail@gmail.com

All data were analyzed with the Statistical Package for the Social Sciences. Correlation between maternal weight gain and infant birth weight were computerized by using Pearson test. P values < 0,05 were considered significant.

Results

Patients Characteristics

104 eligible pregnant women were get ante natal care and delivered at Adam Malik General Hospital and Sundari Hospital in Medan.

Table 1 showed distribution of subject based on age, parity, pre-pregnancy body weight, height, body mass index and gestational age. As results, most of subjects were on 20-35 years with normoweight in body mass index. Most of them were on 38 weeks of gestational age.

Table 1

Patients Characteristics

	Total (n=104)
Age (years)	
<20	7 (6,7%)
20-35	84 (80,8%)
>35	13 (12,5%)
Parity	
Primi	44 (42,3%)
Multi	59 (56,7%)
Grandemulti	1 (1,0%)
Pre-pregnancy body weight (kg)	
Mean	53,06 ($\pm$ 7,09)
Height (cm)	
Mean	155,85 ($\pm$ 5,8)
Body Mass Index	
Mean	21,78 ($\pm$ 2,06)
Gestational Age	
37 weeks	5 (4,8%)
38 weeks	54 (51,9%)
39 weeks	31 (29,8%)
40 weeks	14 (13,5%)

Table 2 showed relations of age and maternal weight gain each trimester. As results, maternal weight gain in third trimester have statistically significance difference between pregnant women from 20-35 years group, with p-value 0,01 ; 5,45 (p-value < 0,05, CI 95%). On the other hand, no statistically significance difference between maternal weight gain in the first and second trimester between age group with p-value 0,150, and 0,415 respectively (p-value < 0,05, CI 95%).

Table 2
Relationship between maternal weight gain each trimester

	Age			
	<20 (SD)	20-35 (SD)	>35 (SD)	*p-value*
Trimester				
First	0,43(1,13)	0,93(0,91)	0,92(0,93)	0,150
Second	5,00(2,84)	5,33(1,93)	4,50(2,96)	0,415
Third	4,64(2,17)	5,75(2,19)	5,45(2,05)	0,014

Table 3
Maternal weight gain each trimester

Body weight (Kg)	Minimal	Maximal	Mean	SD
Trimester I	0	3,50	0,90	0,92
Trimester II	0	10,00	5,21	2,14
Trimester III	0,5	10,50	5,45	2,24
Total increase in Weight	5	20,00	11,56	3,50

Kruskall-Wallis test p=0,0001

Table 3 showed maternal weight gain in each trimesters. As results, there is statistically significance difference between maternal weight gain in each trimester with Kruskall-Wallis test obtained $p < 0,0001$. In overall pregnancy, total maternal weight gain ranged at 5-20 kg (11,56 $\pm$ 3,5)

Table 4
Average of total maternal weight gain and baby birth weight according to gestational age

Gestational Ages		Maternal weight gain (Kg)	Anova Test P value	Birth weight (gr)	Anova Test P value
37 week	Mean	13		3430.0	
	Std. Deviation	2.72	0.351	426.61458	0.113
	Minimum	9.5		2850.00	

	Maximum	17.0	3800.00
38 week	Mean	11.23	3068.52
	Std. Deviation	3.43	316.57011
	Minimum	5	2500.00
	Maximum	20	3800.00
39 week	Mean	12.26	3127.74
	Std. Deviation	3.32	327.35006
	Minimum	6	2650.00
	Maximum	19	4000.00
40 week	Mean	10.75	3185.71
	Std. Deviation	4.27	388.00702
	Minimum	5	2500.00
	Maximum	18	3800.00

Table 4 showed average total maternal weight gain and baby birth with gestational age when delivery. As results, no statistically significance difference with ANOVA test between both of gestational age and total maternal weight gain with p-value 0,351 (p>0,05), and gestational age and baby birth weight with p-value 0,113 (p>0,05). On the other hands, we found statistically significance difference between baby birth weight and gestational age at 37 and 38 weeks with p-value 0,023 (p<0,05).

Table 5
Relationship between maternal weight gain with parity in each trimesters.

	Primi (SD)	Parity Multi (SD)	Grande multi (SD)	*p-value*
Trimester				
First	0,86(0,92)	0,91(0,93)	2,0	0,444
Second	5,51(2,13)	5,01(2,15)	3,5	0,365
Third	6,08(2,18)	5,03(2,18)	2,0	0,018

Table 5 showed relationship between maternal weight gain with parity in each trimesters. As results, there is no statistically significance difference with maternal weight gain with parity in each trimester with p-value 0,44; 0,36; and 0,018 respectively (p>0,05, CI 95%).

Table 6
Maternal weight before and 24 hours after delivery

| | Body weight(Kg) | | | |
	Minimum	Maximum	Mean	SD
Before delivery	48,0	83,0	64,75	8,85
24 hours after	42,0	78,5	59,92	8,81

paired t-test, p = 0,0001

Table 6 showed significance difference between maternal body weight before and 24 hours after delivery with average differences of 4,83 Kg from paired t-test with p-value < 0,05.

Table 7

Infant birth weight

| | Body weight (gr) | | | |
	Minimum	Maximum	Mean	SD
Infant	2500.0	4000.0	3119	399.86

Table 8

Correlation between total maternal weight gain and infant birth weight

| | Body weight(Kg) | |
	r	p
Total maternal weight gain with infant birth weight	0,213	0,03

From this study, babies were born at normal weight ranged at 2500-4000 grams as seen in Table 7. Table 8 showed that there is significant correlation between total maternal weight gain with baby birth weight with p-value 0,03 (p<0,05) but shows a weak correlation (r=0,2).

Discussion

Women with normal body mass index before pregnancy promised a better outcome for pregnancy itself, also for the outcome of baby birth. Pregnant women with inadequate maternal weight gain were often result on low baby birth weight and increase perinatal morbidity and mortality. On the other hands, over increase of maternal weight gain also resulted on poor fetal outcome and affect the methods of delivery later.

Our study shows that patient with normal body mass index before pregnancy resulted in adequate baby birth weight, as far poor prognosis can be alleviated. Our study showed that maternal weight gain increase significantly during second and third trimester, with total maternal weight gain ranged at 5-20 kg.

This maternal weight gain was proper with the IOM recommendation about maternal weight gain during pregnancy. Ota, et al (2011), and Yang, et al (2005) found the same result with our study. Maybe, it is because of decreasing emesis symptoms in second trimester and also increasing of uterine size and volume, so does the other maternal organic tissues. Maternal weight gain also affected by Leptin, a protein-like produced by adipose tissue that regulate appetite and body weight.

There is significance difference of maternal weight gain before and 24 hours after delivery. Based on parity, it seems that maternal weight gain showed significance changes in primigravida in the third trimester. Higher parity showed higher maternal weight gain compared with other groups.

Finally, our study showed there is correlation among total maternal weight gain with baby birth weight with p-value = 0,03 (p<0,05, CI 95%), but poor correlation (r=0,2). Total maternal weight gain seems predict birth weight of baby. Unfortunately, baby birth weight not only influenced by maternal weight gain, but also amniotic fluid increases, placental tissue, maternal oedema, and maternal tissue enlargement.

In conclusion, our study shows that maternal weight gain should be based on IOM recommendation and also consider optimal maternal age in order to get sufficient baby birth weight. Adequate maternal weight gain resulted on low morbidity and mortality in fetal and also maternal.

Media, moral education and professional ethics of journalists in Slovakia

Vasil Gluchman[97]

University of Presov, 17 novembra 1, Presov, 08078, Slovakia

Abstract

Is the media a reflection of our times and is the world really what the media presented to be, or is it just fiction, a virtual reality? Is the image of reality with its moral problems which we watch every day in media merely a kind of virtual morality or is it morality itself, real and genuine? According to author, media "create" reality, including morality, be it real or just virtual (tele-morality), and, undoubtedly, have a great influence on modern man's way of thinking and acting including children and young generation and their moral education. A very often the influence of media is not acceptable for moral education and morality of society.

Keywords: media, morality, moral education, Slovakia, professional ethics, journalists

Introduction

"Within the past thirty years, the world has produced more information than in the course of the preceding five thousand years... A single print-out of a Sunday issue of *The New York Times* contains more information than an educated person in the 18ᵗʰ century could acquire throughout their whole life. Every day, various media (magazines, book, documents, diskettes, CD-ROM) have twenty million words of technical information printed on them. Even a reader able to read eight hours a day, a thousand words a minute would need a month and a half to go through all the information issued in one day. Within this time, he would slide back in time by five and a half years... A piece of information that, for a long time, was rare and expensive is now over-abundant and has become a source of pollution. On the one hand, the better it sells, the cheaper and cheaper it becomes; on the other hand, though, it becomes more and more contaminated" (Ramonet, 2003, p. 188). The times we live in are, thus, often justly called the information or media age.

Media and Moral Education

Information can be contaminated in many different ways. From deliberate alteration, via biased obfuscation and manipulation, the choice of information, to trivialisation of values by selection and formulation of the content of broadcasting, newspapers or magazines. Media, and especially television, show death and violence daily, be it murders, bombings, assaults, thefts, accidents, usually causing death or "at least" serious injury, or catastrophes in the form of earthquake, fire, flood, etc. which cause high casualties and huge material loss. Violence and death, in this way, become a common, everyday issue of our life; "thanks to" media and especially television, we get used to violence, criminality and various forms of violent death being a natural, or even inseparable, part of our life and present. "Television" is said to be especially "a source of entertainment, it mainly lives on blood, violence and death" (Ramonet, 2003, p. 148).

Rightfully, a question arises of what this means for ethics and morality. Is the media a reflection of our times and is the world really what the media presented to be, or is it just fiction, a virtual reality? Is the image of reality with its moral problems which we watch every day in media merely a kind of virtual morality, or is it morality itself, real and genuine? By virtual morality I especially mean the issue of morality, presented in media, mainly on television,

in newspapers and magazines. Mark Poster is of the opinion that the start of the information age will lead to destruction or questioning existing ethical principles. In his opinion, ethics, as we know it, is questioned by its virtual influence on complicating reality. If a need for new ethical rules for media or the culture brought by media, arises, then, according to him, it would be better to remove the previous system of ethics. He claims that this problem did not exist while media were set in a certain time and space, but the birth of new technologies and their combination more and more erases the border between real and virtual relationships. Media, in the internet era, change our ethical surroundings, it can connect many things which, in real life, exist separately and transform the cultural bases of ethics by removing borders existing in time and space around local communities (Poster, 2003, pp. 181-187).

Undoubtedly, we can agree with the author in that media are able to artificially connect many things which, in real life, exist separately and, to some extent, transform the cultural basis of ethics by removing the borders in time and space. As an example to support his opinion, Poster mentions an event that was once referred to in *The Los Angeles Times*. A surgeon carried out a sex-change operation and broadcast it on the internet. Poster claims that the ethics of sex change is questioned by many people but, as long as it stays within the walls of the operating theatre, it does not incite moral emotions. According to the newspaper, the ethical problem was caused due to the existence of media which made it possible. What is important is that the action which, in a certain context, could be considered acceptable, provoked moral discussions due to media making it accessible by broadcasting it (Poster, 2003, p. 187). I do not quite agree with the author on this point, as the actual moral problem of sex-change existed independently from media broadcasting. The importance of media could lie in making the problem visible, raising a discussion around it and, another problem is, whether it was something to be put on the internet or directly broadcast by electronic media. This is what I would consider an even more serious moral problem.

Another typical phenomenon of the present media age is television "educating" us to go through intense emotions right in front of TV cameras. What was, in the past, restricted to private, intimate experience and especially sorrow, troubles or humiliation, now becomes public "thanks to" TV channels, their presenters and cameras. Protagonists present their sorrow and sadness of tragedies or loss of their relatives, strife and humiliation right in front of cameras and microphones. Presenters, in an effort to gain exclusive and spectacular shots or statements, do not hesitate to bother the participants of the tragedy in the hardest instances of their lives when they have just lost their closest relatives, the roof over their heads and, possibly, all their property. Instead of compassion, consideration and moderation towards the sorrow of the mourners, they choose an approach that is borderline scavenging, all in an effort to bring as authentic reports as possible. "Thanks to" these reports, we witness media in their misery and scavenging of television. Tears in front of cameras, sighs, voices of the victims or their relatives full of grief, shots of bloody and crippled human bodies including the actual process of dying are all offered almost live, with their exclusivity being emphasized that the channel in question has managed to capture and it is a very bad influence especially for moral education of young people. Their message for the viewer's often sounds incredibly arrogant, insensitive and inhuman: Look, we are number one in the media market because we offer shots you cannot find anywhere else. Do you want to see death live? Do not go anywhere because, after the inevitable advertisements for the newest mobile phone with the most convenient deal, fastest internet connection, best washing powder, toothpaste or hair-dye, the sexiest deodorant or perfume, etc., we will offer it exclusively even with the immediate message of the dying person to our viewers. Our viewers can exclusively hear his last words. We will interview him for the last time before he dies. It might be for the first time in his life, but that does not matter; he can enjoy his 15 minutes of fame while he is dying. Someone might find this absurd but this is reality presented by TV channels in an effort to astonish and shock their viewers. At first it could seem that this is a service they are providing the victims and their relatives with, as they incite compassion with their fate but, in the end, the outcome of this is an even higher level of ambivalence to tragedies, violence and victims as, thanks to TV channels, tragedies, criminality, and violent death are becoming an everyday reality to which our TV channels teach us to get used to directly in our living rooms.

In an effort to sustain the attention of a "fickle" viewer, they do not try to find about the causes of these tragedies, violence, etc., but only slide on the surface, look for information that has potential to become a cause-célèbre, to attract attention for a few minutes, hours or days and then, quickly, something else, new that would again astonish, shock, or incite strong emotions in viewers while the reporters are left cold-blooded and professionally ambivalent towards all this dying, death, suffering and pain of others. They only do their job. Then it becomes possible for a TV reporter to, without inhibition, stick a microphone in front of a paramedic's face, pester a doctor about the injuries of the victim in question which lead to his death and a cameraman not hesitate to film the face of a dying man scared to death. Not a bit of compassion for the dying person, not a bit of respect and human dignity for him or his family, just

a professional performance which is, however, expressive enough about the moral level of these journalists, but also those who decide about the content of these kinds of programs and those who have allowed their broadcasting.

Wolfgang Huber, with regard to this, talks about "culture of violence" spread by electronic media. He cautions that the way violence is presented on TV requires ethics not only on the side of media producers but also the consumers and their moral education. We live in a mediated reality; our image of reality is formed much more by media than our own unfiltered experience. This mediated reality is a manifestation of developed industrial societies where everybody lives in an artificially generated environment: politicians, actors, journalists, etc. Television brings death as an important part of our evening, daily into our privacy. Presentation of acts of violence and catastrophe has, however, a high rating among viewers. He cautions that media not only take away the dignity of the victims but also decrease the ethical sensitivity towards violence and affirms their bad influence for moral education in society (Huber, 1996, pp. 14-17). Media and journalists, according to Huber, have the responsibility for their actions, not the actions they bring the information of. They are responsible for the consequences resulting from their revealing and for the image of the event they are presenting. The journalists (in context their professional ethics) presenting violence for the sake of viewer ratings and publicity must be held responsible for their actions. They have to be aware of the fact that they are touching upon the integrity of people who have become a means for their success and publicity regardless of whether they are still alive or have died (Huber, 1996, p. 27). It is one of the main tasks of the professional ethics of journalists.

The American journalist Bernard Goldberg, on the basis of his long-term work for the American news channel CBS, has come to the conclusion that you must never, never underestimate how low the leadership of news channels, and especially TV channels, is willing to stoop to increase the viewer rating (Goldberg, 2002). Naturally, a distorted image of our reality, morality and life is created; life where we are constantly surrounded by tragedies, violence and death and, on the other hand, we are forced to accept tragedies, criminality and violent death as the most important phenomena which took place on a particular day or are taking place around us. In this way, virtual morality presented by TV channels is created, which tends to distort the reality we live in thanks to the power of electronic media. Just like a marketing slogan from a TV magazine: "Read what you live!" Simply, to find out what our life is like, we have to learn it from media. We could, then, slightly correct the well-known solipsistic claim of George Berkely, according to which "to be means to be perceived". At present, it could read "to be means to be on the TV screen". That means that what has not been captured by the lens of a TV camera or has not appeared on a TV screen does not seem to exist. Events gain legitimacy and historical value (real or fictional) only thanks to the TV screen. Media "create" reality, including morality and moral education, be it real or just virtual (tele-morality), and, undoubtedly, have a great influence on modern man's way of thinking and acting including children and young generation. According to Denis McQuail, the information, images and ideas provided by media can, for most people, be the main source of realizing the shared time (history) and the present social position. Media are also a store for memories and maps from which we can find out where we are at any moment (our identity); and, also, they provide us with material for future reference. Media, to a significant extent, constitute social reality (McQuail, 2010, pp. 82-83).

Media, however, only present a section of reality, several stones of the mosaic of the era we live in; nevertheless, they are presented to us in such an intense and convincing way that they have the power to impose upon the viewer or reader that events happened exactly how they were presented and that it was the most important thing that happened on that day in Slovakia or in the world. Television logic overpowers life logic. The transmission is right and truthful; it is reality that is false (Ramonet, 2003, p. 141). The role of media, with regard to its relationship towards reality, could be compared to the metaphor of the Platonian cave where, on its back wall, we can see a reflection or shadows of what is happening outside, in front of the cave. When it comes to reality or "reality" constructed by media; we, however, cannot be sure of whether it is actual reality or just its reflection having been created or mixed for us by media. Many times could we see for ourselves that media are able to present fiction as reality or to construct their own "reality" to make it more interesting, or sexier, as one of the advisors to the former British Prime Minister Tony Blair claimed, with regard to altering information about the threat posed by Iraq towards Great Britain and the world, when they wanted to convince the British public and parliament of the need for fast action against the regime of Saddam Hussein.

In the past, there were no opinion polls and in the conditions of the only state or, later, public TV channel, viewer ratings and profit were not a criterion for evaluating journalists' work; thus, news reporting and journalism paid more attention to real, or at least what appeared to be topical matters and entertainment programs were supposed to provide relaxation for the viewers or listeners. It could be said that media, in the past, fulfilled positive tasks, besides negative ones, to a much larger extent with regard to education (including moral education) and spreading culture.

At present, when the "survival" of commercial TV channels and their individual programs depends directly on viewer ratings and advertising revenue, it seems that everything and anything is allowed in media which is not directly prohibited by law or for which a TV channel has not been handed several multi-million fines by the Committee for Retransmission and TV Broadcasting. Until then, even death live or stripping at castings for a trashy reality show, etc., is possible without reasoning on their negative influence and consequences for moral education children and young people.

Evidence to the fact that we, as viewers, have accepted this game of TV channels and that we want to be seen and to medially exist is given by our willingness to go through our joy, troubles, sorrow and pain in front of cameras and, consequently, watch it and be proud we have been on TV. How else can we explain the fact that children anonymously invite their parents, or other close relatives invite each other to a TV studio to tell them that they love them (Mail for You – a popular Slovak TV program) or to quarrelling in front of TV cameras or blaming each other for an unsuccessful marriage (Wife Swap), from talking about their unfulfilled sexual desires and disagreements (Divorced with Kids – a Slovak dating show), to presenting their incompetence in bringing up their own children (Supernanny) or incompetence in producing any musical sound (Pop Idol – the world-wide syndicated talent show which is in Slovakia called "Slovakia searches for a Superstar"). It looks like many people, in this media age (and especially TV age) under the influence of television and its image of the reality we are said to live in, lose all inhibition, ability to judge the situation and be aware of the humiliation they present in front of cameras and the audience. They want to be on TV at any cost, even when it harms them as a result. Then it is possible, in some exceptional cases, that pathological individuals are able to murder someone just to be written about in newspapers and magazines or talked about on TV. Luckily enough, we have not had such a case in Slovakia but, thanks to strong Americanization of our popular mass culture we can expect this to happen any time soon. Some indication of TV channels being able to make murderers or attempted murderers into TV stars can already be seen in our country. An example can be found in the program Reflex which recently showed the story of a daughter who, during a trivial argument, tried to murder her mother and, after a period of time, they both claimed how sorry they were about what had happened and the mother pleaded for her daughter's mercy as she was pregnant. An interesting change of events: the daughter, who only through luck, did not become the murderer of her own mother, is now the one who needs compassion because her deed was due to her carelessness and she is pregnant.

Television, besides the tendency to present tragedies, criminality and violent death, also tends to trivialize our life. A dog cemetery in Prague where celebrities bury their pets, various "elite" parties where 1 or 2-year old children of celebrities are made into stars because they need to be exposed on the media scene, as well as pets of these celebrities often become the center of TV attention. TV channels, according to this pattern, produce "celebrities" out of peculiar individuals, most of whom are here today, gone tomorrow and, rarely, hang around much longer than that but, still, with a very limited shelf-life. Such attention of media and, especially, television and its durability has very negative consequences for young generation and its moral education because of fall down real moral values and emphasizing especially consumerism and hedonism in the present-day life.

Real life and everyday issues of our present are paid very little attention. Real successes of people in business, science and research, education, culture, medicine and health care, etc. is, for the present media age, not interesting enough; these common matters are not said to attract the attention of viewers or readers. Therefore, they are usually offered "appetizers" to be digested as soon as possible without any stomach irritation or constipation because they must be ready to accept many more, similarly easy-to-digest "appetizers" tomorrow, the day after tomorrow and, actually every day and, especially, stay loyal to the TV channel, newspaper or magazine in question. People, as they say, want to have fun and, thus, they should be entertained no matter what. A TV channel that, in the past, also had educational goals (including moral educational aims) in an effort to cultivate its viewers and a human personality as such has become a medium focused on providing entertainment for the broadest masses, which, as a result, means the simplest form of fun, offering escape from reality through easy solutions to what to buy, how to dress, what to cook and where to go on holiday so that TV channels sustain the highest possible ratings and, thus, have the highest profit from advertisements. Advertisements and the profit they offer is the Alfa and Omega of the present media. Petr Dvořák, the former director of the Czech TV channel Nova expressed a similar view when he said that "profit is the king" (Nádoba, 2007).

It is questionable whether it is possible to say that TV channels in Slovakia broadcast some sort of culture and education or whether it is only cheap entertainment focused on commercial success. According to Ignacio Ramonet, on present TV, mainly films, sports, games, and programs full of rudeness and vulgarity (i.e. trashy reality shows) are shown (Ramonet, 2003, p. 116). That means that it is in no way a feature specific to Slovakia but a trend which has been experienced and verified by many foreign production companies. Why is that? It seems to also reflect the

cultural and moral level of viewers but it cannot be said that it is a symptom of the decline of civilization and morality, as we can probably come across similar behavior in every era of history, although the manifestation is specific to the time.

A special chapter is formed by TV reality shows which can have various focus and content, some offer a better form of entertainment (such as dancing shows or final rounds of singing competitions) than others which only offer very questionable quality with exhibitionist performers or even shows marketed with charitable intentions (the dance show Bailando). The main aim, however, lying behind these charitable events is the profit to be gained from advertisements and SMS voting. Naturally, TV channels also promote themselves emphasizing their "good will" on the Slovak TV scene.

The objectivity of news and its content which we are offered by media is one thing but the image of the world, including morality (and moral education) around us, created by these media is, in my opinion, much more important. It is, however, questionable whether media created it at their own discretion or just feed people's interest in fairy tales. Even the story of Princess Diana, her unsuccessful marriage, love affairs, charity work and tragic death is actually a modern media fairy tale for adults (soap opera). There is, however, a much more important issue with a strong ethical and moral dimension: how is it possible that it is tabloids which have the highest costs, the highest readerships or viewer ratings? Opinion forming newspapers and magazines do not even come close in competition with tabloid newspapers and magazines. Why is it? Are we so immoral, so corrupted? Or is there a different reason? But why? We could partly agree with Ignacio Ramonet that high viewer ratings of reality shows, soap operas and similar light entertainment TV genres (and, we could also say high sales of tabloid newspapers) says more about the society who actually watches and reads them than about what they really express (Ramonet, 2003, p. 193). According to Ramonet, media are based around three main topics: death, love and humor (2003, p. 46). We could agree that it is more or less variations of these topics that we mainly find on TV. However, it is, then, questionable whether we as well, under the influence of media, do not reduce our lives to these three areas, as these three topics of life are essential in the virtual morality.

Ignacio Ramonet claims that, in the television industry, information is also a commodity (2003, p. 9); thus, its primary aim is not to be truthful but to sell well, i.e. able to create the potential to maximize profit in the short or medium term. According to him, it is not the contents that plays the decisive role in the sales figures or viewer ratings of a particular medium, but fantastic headlines (Ramonet, 2003, p. 13). Simply, people want food and fun. As people are often forgetful and impatient, or disloyal, they need to be provided with newer and newer ways of fun all the time not to be bored with monotonous offerings and make them switch to the competition. Media, and electronic media in particular, also have power, including some degree of political power which we could also witness in the 1990s. Only when the Slovak TV channel Markíza had sided with the anti-Mečiar (the former Slovak Prime Minister) opposition, formed the media party SOP (Strana občianskeho porozumenia – Citizens' Understanding Party), did the opposition manage to defeat Mečiar and his party. Similarly, in the elections of 2002, the same channel helped the ANO party (Aliancia nového občana – Alliance of New Citizens) get into parliament. Experience, however, shows that the influence on citizens' consciousness must be permanent, as political preferences are very fickle and short term. As an example, we could mention Russia where, in spite of decades of ideological propaganda, the Communists lost the very first elections in the 1990s after they had lost their ideological monopoly on television.

Media and politics have, for various reasons, a lot in common, mainly because they have the power to manipulate public opinion. Nevertheless, there are other similarities. Giorgio Agamben points out the emptiness of politics, which could also be said for media. Evidence of the emptiness of politics and the subsequent absence of ideas and values can also be seen in the unification and, possibly, trivialization of ideas and values. Or have they just been transformed in the face of the future? It is hard to say. A manifestation of this could be seen in the overlapping of public and private matters (thanks to media and politics). Agamben, with regard to this, writes about selling out human emotions and, according to him, the silence in Italian society is a consequence of the media noise. A question for psychologists, sociologists and philosophers arises as to why people want private matters to become public (tabloid media) and, vice versa, public matters to become private (politicians)? The first ones want to know about things that are none of their business and are trivial for them, the other ones do not want us to know about things that concern us and are anything but trivial. Around that a "media noise", as Agamben called it, is created. However, in most cases, the noise is nothing but dressing-up which reveals less than it covers. Have media revealed anything important in Slovakia? No, nothing. The same can be said about media as Agamben wrote about politicians: they try to pretend to be objective, impartial, to show respect and fairness, etc. In most cases, however, they are only concerned with increasing sales figures and the interest of businesses to place advertisements; thus, in the end, in the

profit for the owners or publishers (Agamben, 2000, pp. 93-95). Naturally, truthfulness of information is, in this case, a by-product which is only used when it helps to, in the case of media, increase viewer ratings and sales and, in the case of politicians or political parties, voting preferences. Otherwise, it is something that could work as a "break" or an obstacle on the way to economic or political success in the close future. In this respect, Ramonet has come to a remarkable conclusion: "In our intellectual environment, media truth is the truth that matters. What is this truth like? If print media, radio or television claim an event true, then it is considered true. Even if it is not the case. Now, the truth is what is considered true by media as a whole" (Ramonet, 2003, p. 64). His opinion on how to find out whether the information is truthful is also interesting. He suggests comparing the information provided by various media. Simple and easy, is it not? Possible problems arising from this recommendation can, however, be seen in Orwell's novel *1984*, where the task of the Ministry of Truth was to lie and alter all information in media, and even go as far as to present the newest lie as the only truth in all media. Lying, in this way, became legitimate and institutionalized into the form of one and only truth, however, only valid until the next lie appeared (Orwell, 2013).

We can fully agree with Agamben in that the predominance of information, the noise of media leads the viewers, listeners or readers to the point where they are unable to perceive the information pouring from all around about what is happening in the whole world, about where something trivial has happened such as David Beckham's new hairstyle, their first party in the home in Los Angeles, Paris Hilton's imprisonment for drunk driving and her talk show appearance after she had been released and was fined 1 million dollars, etc. This, then, leads to apathy, carelessness and resignation towards what is happening around us. We often know more about Hollywood stars or Slovakia's so-called celebrities than about our own neighbors, colleagues at work, etc. It seems we live, through media, someone else's life, or are neighbors of stars who, in various forms, come directly to our living rooms every day to "tell" us who they went with to a great party, where they went shopping, what they bought and how much it cost. This great amount of information also brings great opportunity to manipulate the viewers, listeners and readers. Is there a direct relationship between the amount of information and the degree of freedom? I think that while, during totalitarianism, the effort to manipulate individual and public opinion was realized by concealing information, as, also in Slovakia, there were a lot of areas which were never mentioned or written about; in democratic societies, there is a tendency to manipulate by superiority of information. The louder the noise, the less you can hear a sensible word. Ramonet, with regard to this, has stated that "...television is a medium of the simple and, thus, having too much information almost automatically brings some form of misinformation. A profusion of news – often raw – broadcast in "real time" often stimulates the TV viewer (or the radio listener) and provides him with an illusion he is informed. However, after a period of time, it almost always proves to be a trap" (Ramonet, 2003, p. 162).

Media are one of the strongest points of present world globalization and, "thanks to" media, the world of morality (and also moral education), or virtual morality (including virtual moral education) is also becoming globalized. Media "educate" us to experience tragedies and catastrophes in various parts of the world. Within a very short time, within several minutes, we witness floods in China and India, a mining tragedy in the USA, terrorist attacks in Iraq, a flight accident in Brazil, etc. We find out about the catastrophes that have taken place on the other side of the world sooner than we learn about many other things, having happened much closer and with a much stronger impact on our own life. Globalization makes us almost direct participants in world events; however, deprives us of experiencing our own life and living it to the fullest, and, in a way, trivializes our own life, the relationship to our relatives and the values we respect and pursue. How many of us live a life similar to that of South- or Central-American soap opera characters, American sitcom heroes, Hollywood celebrities or even Slovak glitterati? Then, we can have the impression that we do not live a life worthy of the media age because we have not managed to appear on the TV screen. This seems to motivate many individuals to look for any possible way to attract the attention of media and enjoy their Warholian 15 minutes of fame. According to Denis McQuail as long as values and ideas are concerned, in a secularized society, media tend to "take over" the influence originally possessed by parents, religion, school, siblings and friends. As a consequence, we are actually addicted to media in the whole area of our broader "symbolic environment" (i.e. "images in our heads "). And it does not matter to what extent we are able to create our own, personal version of this environment. We tend, more and more, to share the same media sources and the same "media culture", because media probably create the elements we share with others (McQuail, 2010, p. 83).

Conclusion

Denis McQuail claims that media, on the one hand, are a source of power, a means of potential influence, an environment where events of public life take place, a source of social reality interpretation, the primary key to fame and the environment which sets the publicly accepted form of normality (McQuail, 2010, p. 17). Yes, we can agree that the present Slovak media partially and, to various extents, really fulfill these implications. It is, however, questionable to what extent and by what means they, for instance, create social reality and the criteria of normality within morality in present-day Slovakia and what is their influence on moral education of young people in Slovakia. I seem to be fairly skeptical on this issue, as Slovak virtual morality interpreted by the most significant Slovak media at present is a very reduced, simplified and, to a substantial extent, distorted image of our reality and also moral education in Slovakia. We could surely agree with his opinion that media also have an indisputably positive potential, i.e. they can provide space for mutual communication within the public, pay attention to socially disadvantaged or unjustly handicapped individuals and groups, uphold the law and punish crime, support the existing moral norms and avoid what gives rise to strong public disapproval (McQuail, 2010, p. 170). Undoubtedly, Slovak media also have this potential; however, it is questionable to what extent they actually use it and whether the ability to positively influence is marginal to their interest and attention.

Meslek Yüksekokulu Öğrencilerinin Visual Basic Programlama Dersine Yönelik Öz Düzenleme Stratejilerinin Karşılaştırılması

Aslıhan BABUR YILMAZ[a][98]

aAmasya Universitesi, Bilgisayar Teknolojleri Bölümü, Bilgisayar Programcılığı Programı,05100, "Amasya", Turkey

Özet

Bu çalışmada Visual Basic programlama dersi alan birinci ve ikinci öğretim öğrencilerinin öz düzenleme strateji alt boyutları (öz yeterlilik, öz yansıma, yineleme, değer verme, başkalarıyla çalışma, zaman, çaba, dışsal hedef, içsel hedef, hedef belirleme, yardım, üst biliş, strateji, düzenleme, açımlama) arasındaki fark incelenmiştir. Çalışmada, Pintrich ve diğerleri (1991) tarafından geliştirilen MSLQ (Motivated Strategies for Learning Questionnaire) ölçeğinden yararlanılarak Haşlaman T.(2005) tarafından geliştirilen Özdüzenleyici Öğrenme Stratejileri Ölçeği kullanılmıştır. Elde edilen verilerin analizinde bağımsız örneklem t-testi kullanılmıştır.Birinci öğretim ve ikinci öğretim öğrencilerinin istatistik sonuçları incelendiğinde, öz yansıma ve yardım puanları arasındaki fark anlamlı bulunmuş, diğer alt boyutlar arasında çıkan fark ise anlamlı bulunmamıştır.

Anahtar Kelimeler: Öz düzenleme,Özdüzenleyici öğrenme, özdüzenleyici öğrenme stratejileri

Abstract

In this study, the difference between first class students who studying at the Department of Computer Programming in Amasya University, about Visual Programming course for the sub-dimensions of self-regulation strategies (self-efficacy, self-reflection, repetition, valuing working with others, time, effort, external target, an internal target, goal setting, help, metacognition, strategy, editing, paraphrasing) were analyzed. In this study, by utilizing MSLQ (MotivatedStrategiesfor Learning Questionnaire) which developed by Pintrich et al (1991), and so Self Organizing Learning Strategies Scale which adapted by Haslaman T. (2005) was used. Independent samples t-test was used for the analysis of the data obtained. When statistical analysis of the results of the daytime education's students and evening education's students were examined, the difference between the scores of self-reflection and help was found meaningful but others were not found meaningful.

Keywords: Self-regulated learning, self-regulated learning, self-regulated learning strategies.

Giriş

Öz Düzenleme

Bireyler, hayatlarını kontrol etme ve düzenleme gücüne sahiptir.Cüceloğlu' na göre, başarının anlamı kendi yaşamınızda var olmaktırBireyin kendi hayatını yönlendirmesi, insanın kendi hayatını yaşaması,hayatın en önemli boyutudur. Kendi yaşamında var olmayan insan mutlu olamaz. Cüceloğlu' na göre kendi yaşamımızda var olabilmek için şu özelliklere sahip olmak gerekir.

- Zamanı verimli kullanmak
- Seçimlerini bilinçli yaparak planlamak
- Hedef belirlemek
- Amacını keşfetmek
- Kendini ve yeteneklerini bilmek(öz düzenleme)

Dolayısıyla Cüceloğlu' nun bu sözlerinden, öz düzenleme becerilerinin farkında olmayan ya da öz düzenleme becerileri zayıf olan bireyin başarı kazanmasının zor olduğunu söylemek mümkündür.

"Öz" kelimesi TDK' da "varlığın aslını kuran şey; temel özellik" olarak tanımlanmıştır. Öz düzenleme ise kişinin kendi varlığının, özelliklerinin farkında olması olarak tanımlanabilir.Öz düzenleme becerileri, bireylerin eğitim bilgiye ulaşabilmesi, bilgiyi özümsemesinin yanı sıra yaşam boyu öğrenmelerini etkileyen önemli bir unsurdur.

Ülkemizde öz düzenleme ile ilgili çalışmaların son zamanlarda yoğunlaşmasına rağmen öz düzenleme kavramı, 1986 yılında Bandura' nın Sosyal Öğrenme Kuramı sayesinde dikkat çekmiştir. Bandura (1977)' ya göre de insanların davranışları, sadece dışsal pekiştireçler ve cezalarla kontrol edilemez yani insanlar davranışlarını büyük ölçüde kendi kendilerine düzenlerler.Bireylerin birbirlerinden etkilenmesi, öz düzenleme, öz-yeterlilik, üst biliş stratejilerini kullanma gibi birçok beceri sosyal etkileşim ile şekillenmekte ve öğrenilmektedir.

Pajares' in (2002) görüşü Bandura' yı destekler niteliktedir.Bireyler davranışçı yaklaşımın aksine tepkisel organizmalar olarak değil, öz örgütleyici (self-organized), etken, öz yansıtıcı (self-reflective) ve öz düzenleyici (self-regulating) canlılar olarak ele alınmalıdır.

Öz düzenleme,Bandura'nın sosyalbilişsel kuramının dayandığı altı ilkeden birinioluşturmaktadır. Bu ilke insanların ne kadar çalışacaklarını, ne kadar uykuuyuyacaklarını, neleryiyeceklerini, neler içeceklerini ne kadarkonuşacaklarını, toplumda nasıl davranacaklarını vb.birçokdavranışlarınıkendilerinin kontrol etmesi esasına dayanır (Senemoğlu, 2004).

Sosyalbilişsel kuramcılara göre öz düzenlemeyi öğrenme, sadece kişisel süreçler iletanımlanamaz. Bu süreçlerin çevresel ve davranışsal olaylar tarafından daetkileneceği dikkate alınmalıdır. Öğrenme ve sosyal etkileşim arasındaki ilişkiyi inceleyen Greeno (2009), bilmenin bireyi, araçları, çevredeki diğer kişileri ve bilginin uygulandığı etkinlikleri içeren bir süreç olduğunu belirtmektedir ve birey ile çevre arasındaki bağıntıya dikkat çekmektedir. Öğrenmenin sosyal bir etkileşim sürecinde bireysel gelişimle oldukça ilişkili olduğunu göstermektedir.(Akt.ALTUN)

Sosyal bilişsel kuramcılardan biri olan Zimmerman (1986), öğrenicilerinkendi öğrenmesüreçlerinde meta-bilişsel, motivasyonel ve aktif olmaderecelerine göre öz düzenleyici olaraktanımlanabileceklerini belirtmiş,öğrenicilerin kalifiye bir öz düzenleyiciolabilmeleriiçin öz düzenleyici stratejilerinin kullanımına, performans becerilerindeki özyeterlik algılarına ve kendi akademik amaçları hakkındaki düşüncelerine dikkat çekmiştir. Bu tanımdaki öz düzenleyicistratejiler öğrenme stratejileri,bilgi ve yetenek elde etmekle doğrudan bağlantılıolan bilgiyi transfer etme, organize etme,yardım arama, tekrarlama gibi metotları içerir.

Pintrich (2000) öz düzenleyici öğrenmeyi öğrenenin, öğrenme hedeflerini belirlerken aktif ve yapılandırmacı bir süreç izlemesi ve ardından hedefleri doğrultusunda kendi üstbiliş, motivasyon ve davranışlarını izlemesi, kontrol etmesi ve düzenlemesi olarak açıklamıştır. Pintrich bu tanımlamayı yaparken öz düzenleyici öğrenme modellerinin hemfikir olduğu dört kabulden yola çıkmıştır. Bu kabuller;

- Öğrenenler kendi öğrenme süreçlerinde aktif ve yapılandırmacı bir süreç izler.
- Öğrenenler hedefleri doğrultusunda kendi üst biliş, motivasyon ve davranışlarını izler, kontrol eder ve düzenler.
- Sürecin olması gerektiği gibi olup olmadığı ve süreçte birtakım şeylerin değişip değişmeyeceğinin belirlenmesi için bazı kıstas ya da standartlar vardır.
- Öz düzenleme etkinlikleri bireyin başarı ya da performansı ile bireyin kişisel ve çevresel özellikleri arasında aracıdır.

Öğrencilerin öğrenmelerinin, öz düzenleyici olarak nitelendirilebilmeleri için akademik amaçlar doğrultusunda öz yeterlik algılarına dayalı belirli stratejilerin kullanımını içermelidir (Zimmerman 1989). Bu tanım öz düzenleyici öğrenme stratejilerinin, becerileri uygulamadaki öz yeterlik algısının ve akademik hedeflere bağlı kalmanın önemini vurgulamaktadır.

Öz düzenleyici öğrenme stratejileri; öğrencilerin bilgi işleme süreçlerini planlama, düzenleme, geliştirme, değiştirme gibi üst bilişsel stratejileri (Zimmerman ve Martinez-Pons, 1986; 1988); akademik görevler üzerindeki çabalarının kontrolünü ve yönetimini sağlayan stratejileri (Pintrich ve De Groot, 1990) ve öğrenmede kullanılan materyalleri anlamayı, öğrenmeyi ve hatırlamayı içeren yineleme, ayrıntılandırma, düzenleme gibi bilişsel stratejilerdir (Zimmerman ve Martinez- Pons, 1986; 1988). Özyeterlik bireyin belli bir davranışı istediği düzeyde ortaya koyma ya da kendi öğrenme kapasitesine ilişkin inancıdır (Bandura, 1986). Hedefler ise notlar, sosyal saygı ya da mezun olduktan sonra iş bulma fırsatlarını gibi davranışları içermektedir (Zimmerman 1989). Ancak genellikle bilişsel ve üst bilişselstratejilerle ilgili bilgiler öğrencilerin başarılarını arttırmak için yeterli değildir, öğrenciler bu stratejileri kullanma, kendi biliş ve çabalarını düzenlemeye güdülenmelidirler (Pintrich ve De Groot, 1990). Bu doğrultuda öğrencinin öğrenme isteğini artırma konusunda bile öz düzenleme yapabileceği ileri sürülebilir.

Öğrenenin öğrenme sürecindeki bu etkin ve lider rolü tüm öz düzenlemeli öğrenme kuram ve modellerinde görülmektedir. Bu alanın önde gelen isimleri süreçte herkesin içsel yeteneklere sahip olduğu konusunda birleşmektedirler. Buna ek olarak, bugün gelinen noktada, öz düzenlemeli öğrenmenin, öğrencilerin seçme, birleştirme ve bilişsel becerilerini en etkili şekilde düzenleme yetenekleri olduğu noktasında birleşildiği görülmektedir. (Boekaerts, 1999).

Öz düzenlemeli öğrenmenin döngüsel bir süreçtir.Alan yazın incelendiğinde, Zimmerman'ın (1998) döngüsel modelinin kavramsal açıdan temel teşkil ettiği görülmektedir. Bu modelde öz düzenlemeli öğrenme sürecinin üç evreden oluştuğu görülmektedir: Önceden düşünme (forethought), performans denetimi (performancecontrol) ve özyansıma (self- rejection).

Önceden Düşünme (Forethought)

Bu evre, öğrenenin başarısını etkileyecek inançları,yargıları ve düşünceleri içeren ve öğrenme aşamasınıhazırlayan içsel bir süreçtir.Öğrenen, herhangi bir öğrenme ünitesi ile karşılaştığında önceden düşünme evresi başlamış olur.Önceden düşünme evresinin alt süreçleri hedef belirleme, taktikselplanlama, özyeterlik inancı ve içsel ilgidir(Bembenutty ve Zimmerman, 2003).

Hedef belirleyebilme:

Öğrenenin öğrenme sürecindekullanacağı taktiklerin seçiminde öncelikli aşamadır. Öz düzenlemeli öğrenme becerisine sahipöğrenciler, öğrenme sürecinde hedeflerinive kullanılacak taktikleri devamlı olarak üretebilmekte vedenetleyebilmektedirler.

Özyeterlik inancı:

Kavramsalolarak, kişinin belirli bir işi başarmayailişkin kendi eylemlerini gözönünde bulundurarak yaptığı yargılamadır. Akademik başarı bağlamında iseözyeterlik,öğrencinin öğrenme sürecindeki bilişsel becerilerine ya da akademik çalışmaperformansına duyduğugüveni içermektedir (Pintrich, 2000).

Hedef yönelimi:

Pintrich (2000) tarafından kişinin kendi belirlediği standartlarıkullanarak bir işi öğrenmesi ve ustalaşması, bir işi yapmak için gerekli başarı notuya da başka dışsal nedenler ve kendini başkaları ile karşılaştırabilme yeteneği olmak üzereüç boyutta tanımlanmıştır.

Zimmerman (2002) ise hedef yönelimini, bir kişinin kendifaydası doğrultusundaöğrenme sürecine değer biçmesi olarak tanımlamıştır. Genelbeklenti kuramında hedef yönelimi içsel hedefyönelimi ve dışsal hedef yönelimi olarakiki başlıkta ele alınmıştır. Bu kurama göre, içsel hedef yönelimi;öğrenmeye, uzmanlaşma,mücadele etme ve merak gibi hedefler doğrultusunda yaklaşılmasıdır.Dışsal hedef yönelimi ise, öğrenmeye başarı notu, ödüller ya da başkaları tarafındantakdir edilme gibi hedefler doğrultusundayaklaşılmasıdır (Mcwhaw, 1997, 46).

Performans Denetim Evresi (Performance Control)

Performans denetim evresi iki temel boyuttan ve bu boyutlara ait alt süreçlerdenoluşmaktadır: Kendinidenetleme ve kendini izleme.

Kendini denetleme, performans denetim evresisürecindeki belirli yöntem vetaktiklerin kullanımının düzenlenmesini ve denetimini içerir. Bu kontrol sürecindekullanılan belli başlı yöntemler ise, zihinde canlandırma, kendi kendine öğrenme,dikkat yoğunlaştırma ve görev taktikleridirKendi kendineöğrenme, öğrenme sürecinde öğrencinin kendine rehberlik etmesidir(Cobb, 2003). Dikkat yoğunlaşması ise, öğrencinin öğrenme sürecinde dikkatinidağıtacaketkenlerle mücadele etmesini sağlayan taktikler geliştirmesidir (Chung, 2006). Butaktikler çok fazla çaba gerektirmeyen içsel ayarlamalardır (Cobb, 2003Akt: Özmenteş,2008).

Öz düzenlemeli öğrenme sürecinde dikkatyoğunlaşmasıgüdüsel inançlarlayakın ilişki içerisindedir. Görev taktikleri ise öncelikli hedeflerin belirlenmesinde kullanılan taktikleriiçerir. Görev taktikleri aynı zamanda öğrenme ve performansın en gerekli ve temelöğelerininanlaşılmasını sağlar. Böylece öğrenen, öğrenme sürecinde hedefe ulaşmakiçin sadece gerekli olan yolu izleme şansı bulur (Chung, 2006).

Kendini izleme, öğrenenlerin öğrenme sürecinde elde ettikleri ürünlereilişkin veri toplamalarıdır. Kendiniizlemede başarılı olan kimseler performanslarındakiiyi ya da kötü yönleri kolayca ayırabilmektedirler (Cobb,2003).

Öz Yansıtma Evresi (Self-Reşection)

Kendine yansıtma evresi performans sonrasında öğreneninperformansına ilişkin değerlendirmeve tepkilerini içerir ve kendini yargılama ve öztepki süreçlerinden oluşur.(Zimmerman, 2002;Chung, 2006).Kendini değerlendirme ve yükleme kendiniyargılama sürecinin alt süreçleridir. Kendini değerlendirme, öğrenenin izlediği performansını,kendisine ait geçmiş performanslarla, diğer kişilerin performanslarıyla yada belirgin performans ölçütleri ilekarşılaştırması ve bu konuda bir yargıya ulaşmasıdır (Zimmerman, 2002).Kendini yargılamanın bir

başkasüreci olan yükleme ise, öğrenenin başarı yada başarısızlığının nedenlerine ilişkin inançlarıdır (Zimmerman,2002).

Öztepki süreci ise kendini değerlendirme ve yüklemeler ile çokyakından ilişkili olup, özdoyum ve uyum sağlama altsüreçlerine sahiptir. Özdoyum, öğrenenin elde ettiğisonuçlardan aldığı doyum ya dadoyumsuzluktur. Özdoyumun yükselmesi güdüyü arttırırken, az olması durumuöğrenme sürecindeki çabaları zayıflatmaktadır. (Schunk, 2001'den aktaran; Zimmerman,2002).

Kısaca, Zimmerman'ın döngüsel öz düzenlemeli öğrenme modelinde öncedendüşünme evresinde öğrenenin,öğrenme etkinliklerine hazırlandığını, performans denetimevresinde öğrenme etkinliklerinin yürütüldüğü vedenetlendiğini, kendine yansıtma evresinde ise, öğrenenin performansını ve öğrenmeürünlerini değerlendirdiği evre olduğunu söylemek mümkündür.

Öz Düzenleyici Öğrenen Özellikleri

Öz düzenleme becerilerine sahip olan bireylerden beklenen bazı özellikler vardır. Bu özellikler Winne' ye (1997) göre birkaç adımda gerçekleşir. İlk adımda birey, problemle karşılaştığında ön bilgi ve becerilerini gözden geçirmeli, problem çözümü için hedeflerini belirlemeli ve hedeflere yönelik olarak bilşsel, duyuşsal veya davranışsal yöntemleri uygulayarak çözüm üretebilmelidir.

Bu çalışmada öz düzenleme stratejileri açısından Görsel Programlama dersi alan birinciöğretim ve ikinci öğretim öğrencilerinin öz düzenleme stratejileri alt boyutları arasındaki fark incelenmiş ve aşağıda yer alan sorulara yanıt aranmıştır.

1. sınıf birinci öğretim ve ikinci öğretim öğrencilerinin öz düzenleme strateji alt boyutlarından;
   o öz yeterlilik puanları arasında anlamlı fark var mıdır?
   o öz yansıma puanları arasında anlamlı fark var mıdır?
   o yineleme puanları arasında anlamlı fark var mıdır?
   o değer verme puanları arasında anlamlı fark var mıdır?
   o başkalarıyla çalışma(akran) puanları arasında anlamlı fark var mıdır?
   o zaman puanları arasında anlamlı fark var mıdır?
   o çaba gösterme puanları arasında anlamlı fark var mıdır?
   o dışsal hedef puanları arasında anlamlı fark var mıdır?
   o İçsel hedef puanları arasında anlamlı fark var mıdır?
   o hedef belirleme puanları arasında anlamlı fark var mıdır?
   o yardım puanları arasında anlamlı fark var mıdır?
   o üst biliş puanları arasında anlamlı fark var mıdır?
   o strateji puanları arasında anlamlı fark var mıdır?
   o düzenleme puanları arasında anlamlı fark var mıdır?
   o açımlama puanları arasında anlamlı fark var mıdır?

Yöntem

Çalışma Grubu

. Çalışma örneklemini Amasya Üniversitesi Meslek Yüksekokulu Bilgisayar Programcılığı Bölümü Görsel Programlama dersi alan I. Sınıf birinci öğretim ve ikinci öğretim öğrencileri oluşturmaktadır. Araştırmada yer alan 49 öğrenciden 25'i kız, 24'ü erkektir

Veri Toplama Aracı

Araştırmada Pintrich ve diğerleri (1991) tarafından geliştirilen MSLQ ölçeğindenyararlanılmıştır. Bu ölçeğin orijinal hali iseBüyüköztürk, Akgün, Özkahveci ve Demireltarafından (2004) Türkçe'ye çevrilerek geçerlik vegüvenirlik çalışmaları yapılmıştır.Ölçekte veriler; kişisel bilgiler ve özdüzenleyici öğrenme stratejileri ölçeği (ÖÖSÖ) olmak üzere ikibölümden oluşanbir form ile toplanmıştır. Kişisel bilgiler bölümünde cinsiyeti,

sınıfı,bilgisayar kullanım süresi,ailede başka bilgisayar kullanan olup olmadığı, varsa kimler olduğu, hangiprogramlama dillerini bildiği,haftada kaç saat programlama dersine çalıştığı ve en son aldığıprogramlama dersi sorulmuştur. ÖÖSÖ bölümünde ise 15alt bölüm ve 77 maddeden oluşan ölçeyuygulanmıştır. Toplam 77 maddeden oluşan ölçeğin ön denemesiHaşlaman T. (2005)tarafından Hacettepe Üniversitesi MeslekYüksek Okulu Bilgisayar Programlama Bölümü birinci ve ikinci sınıföğrencilerinden elde edilenveriler üzerinde yapılmıştır (n=98). Katılımcılar ölçekte yeralan her birmaddeye ilişkin katılma düzeylerini, "beni hiç yansıtmıyor" (1) ile "beni tam olarakyansıtıyor" (10) arasındadeğişen Likert tipi onlu derecelendirme ölçeği üzerinde işaretlemişlerdir.

BULGULAR VE TARTIŞMA

İki farklı örneklem grubunun ortalamaları karşılaştırıldığından bağımsız iki örnek T –testi kullanılmıştır. Ortalama puanlar dikkate alındığında 1.sınıf birinci öğretim ve ikinci öğretim öğrencilerinin;

- öz yeterlilik puanları arasında bir farklılık gözükmektedir. Bu farklılığın anlamlı olup olmadığını belirlemek amacıyla T testi uygulanmış ve fark anlamlı bulunmamıştır (t(47)=1.36, p>.05).
- öz yansıma puanları arasında bir farklılık gözükmektedir. Bu farklılığın anlamlı olup olmadığını belirlemek amacıyla T testi uygulanmış ve fark anlamlı bulunmuştur (t(47)=2.20, p<.05).
- yineleme puanları arasında bir farklılık gözükmektedir. Bu farklılığın anlamlı olup olmadığını belirlemek amacıyla T testi uygulanmış ve fark anlamlı bulunmamıştır (t(47)=2.20, p>.05).
- değer verme puanları arasında bir farklılık gözükmektedir. Bu farklılığın anlamlı olup olmadığını belirlemek amacıyla T testi uygulanmış ve fark anlamlı bulunmamıştır (t(47)=1.28, p>.05).
- akran puanlarıpuanları arasında bir farklılık gözükmektedir. Bu farklılığın anlamlı olup olmadığını belirlemek amacıyla T testi uygulanmış ve fark anlamlı bulunmamıştır (t(47)=2.62, p>.05).
- zamanlama puanları arasında bir farklılık gözükmektedir. Bu farklılığın anlamlı olup olmadığını belirlemek amacıyla T testi uygulanmış ve fark anlamlı bulunmamıştır (t(47)=0.69, p>.05).
- çaba gösterme puanları arasında bir farklılık gözükmektedir. Bu farklılığın anlamlı olup olmadığını belirlemek amacıyla T testi uygulanmış ve fark anlamlı bulunmamıştır (t(47)=1.36, p>.05).
- dışsal hedef puanları arasında bir farklılık gözükmektedir. Bu farklılığın anlamlı olup olmadığını belirlemek amacıyla T testi uygulanmış ve fark anlamlı bulunmamıştır (t(47)=1.00, p>.05).
- içsel hedef puanları arasında bir farklılık gözükmektedir. Bu farklılığın anlamlı olup olmadığını belirlemek amacıyla T testi uygulanmış ve fark anlamlı bulunmamıştır (t(47)=1.00, p>.05).
- hedef belirleme puanları arasında bir farklılık gözükmektedir. Bu farklılığın anlamlı olup olmadığını belirlemek amacıyla T testi uygulanmış ve fark anlamlı bulunmamıştır (t(47)=1.64, p>.05).
- öğrencilerinin yardım puanları arasında bir farklılık gözükmektedir. Bu farklılığın anlamlı olup olmadığını belirlemek amacıyla T testi uygulanmış ve fark anlamlı bulunmuştur (t(47)=2.68, p<.05).
- biliş puanları arasında bir farklılık gözükmektedir. Bu farklılığın anlamlı olup olmadığını belirlemek amacıyla T testi uygulanmış ve fark anlamlı bulunmamıştır (t(47)=1.03, p>.05).
- strateji puanları arasında bir farklılık gözükmektedir. Bu farklılığın anlamlı olup olmadığını belirlemek amacıyla T testi uygulanmış ve fark anlamlı bulunmamıştır (t(47)=1.48, p>.05).
- düzenleme puanları arasında bir farklılık gözükmektedir. Bu farklılığın anlamlı olup olmadığını belirlemek amacıyla T testi uygulanmış ve fark anlamlı bulunmamıştır (t(47)=1.72, p>.05).
- açımlama puanları arasında bir farklılık gözükmektedir. Bu farklılığın anlamlı olup olmadığını belirlemek amacıyla T testi uygulanmış ve fark anlamlı bulunmamıştır (t(47)=1.72, p>.05).

SONUÇ VE ÖNERİLER

Birinci öğretim ve ikinci öğretim öğrencilerine uygulanan ÖÖSÖ 'nin on beş değişkenle ilgili T testi sonuçları incelendiğindeöz yeterlilik, yineleme,değer verme,başkalarıyla(akran) çalışma, zaman, çaba gösterme, dışsal hedef, içsel hedef, hedef belirleme,üst biliş, strateji, düzenleme ve açımlama puanları arasında anlamlı bir fark bulunamamıştır. Ancak gündüz öğrencilerinin gece öğrencilerine göre yardım ve öz yansıma puanlarının daha yüksek olduğunu söylemek mümkündür.

Bireysel farklılıklar göz önüne alındığındaöz yansıma ve yardım puanlarında farklılık çıkması olası bir durumdur.Ancak gece öğrencilerinin öz yansıma değerlerinin yüksek çıkması amacıyla, öğrencilerin öğrenme süreci

içerisinde aktif olabilecekleri ve kendi öğrenmesini değerlendirebileceği ortamlar sağlanmalıdır (Üredi & Üredi, 2007).

Öğrencilerin başarılı olabilmek için öz düzenleme becerilerini geliştirmeleri gerekmektedir. Bu amacı gerçekleştirmek iöin de öğrenme ortamlarının düzenlenmesi gerektiğini belirtmekte fayda vardır. Bir öğrenme ortamı iyi yapılandırılmış ise öğrencilerin öz düzenleme becerilerini geliştirmek için fazla çaba sarfetmelerine gerek yoktur(Bernacki vd diğerleri, 2011). Bu nedenle öğrenme ortamlarının öğrencilerin ilgilerini çekecek, onların süreçte aktif olmasını sağlayacak, olabildiğince anlaşılır biçimde tasarlanması gerekir.

Abstract

The rapid evolution of technology has changed the face of education, especially when technology was combined with adequate pedagogical foundations. This combination has created new opportunities for improving the quality of teaching and learning experiences. Until recently, Augmented Reality (AR) is one of the latest technologies that offer a new way to educate. Due to the rising popularity of mobile devices globally, the widespread use of AR on mobile devices such as smartphones and tablets has become a growing phenomenon. Therefore, this paper reviews several literatures concerning the information about mobile augmented reality and exemplify the potentials for education.

Keywords: Augmented reality; mobile augmented reality; education

Introduction

Basically, a traditional method of education was carried out through face-to-face instructions where the knowledge and learning activities were all arranged and conveyed by the teacher (de Freitas, Rebolledo, Liarokapis, Magoulas & Poulovassilis, 2010; Liu, 2010). In addition, the learning material were also based on static material such as papers (Chao & Chen, 2009; Huang, Wu & Chen, 2012; Taketa, Hayashi, Kato & Noshida, 2007) in which static materials do not show any information in a dynamic way such as motion or continuous movement (Craig & Grath, 2007; Kühl, Scheiter, Gerjets & Gemballa, 2011). Although sometimes these existing methods work effectively, however there is an increasing interest of educators and researchers in introducing more useful methods to improve the teaching and learning experiences. As technology becomes increasingly widespread in the past few years, the integration of technology has influenced and revolutionized the way we teach and learn.

The transformation of teaching and learning caused by technology has certainly provides an exciting opportunities to design learning environment that are realistic, authentic, engaging and extremely fun (Kirkley & Kirkley, 2004). Besides, researchers also found that technology have always held a great promise for increasing student engagement and level in understanding the learning content (Di Serio, Ibáñez, & Kloos, 2012; Kreijns, Acker, Vermeulen, & Buuren, 2013; Roca & Gagné, 2008) among the key elements that leads to better academic results. Therefore, there has been a considerable concern over the use of emergent technology to support learning process. Indeed, there are many different technologies that have been integrated in the educational arena, among others such as the use of computer, multimedia, internet, e-learning, social web, simulations and more recently mobile devices and immersive environments such as games, virtual worlds and augmented reality (Dror, 2008; Martin, Diaz, Sancristobal, Gil, Castro & Peire, 2011).

As mentioned by the Emerging Technology Initiatives of New Media Consortium (NMC) in the most recent Horizon Reports (NMC 2010, 2011 and 2012), Augmented Reality (AR) is one of the emerging technologies that might have potential and impact on learning and education. Besides that, the emergence and widespread ownership of mobile devices has lead to an increased interest to integrate the benefits of mobile learning and AR applications. The advancements of AR is now a growing rapidly on mobile device, reflected by the increase in handheld computing usage in recent years across the world and resulted in creating a subset of AR: mobile AR. Due to the

fact that educational research concerning mobile AR learning system is in its infancy and in an embryonic stage (Martin et al., 2011), this article is intended to provide an overview on information about Mobile Augmented Reality (MAR) and its potential used in education.

2. Understanding Augmented Reality

2.1 Definition and Taxonomy

Educators are always looking for a new way to teach students and Johnson, Smith, Willis, Levine and Haywood (2011) argue that AR is one of the new technologies which considered as having potential for pedagogical applications. Although in recent years AR is becoming increasingly widespread and has garnered much attention, the term AR has been defined in different meanings by researchers. Early on, as mentioned by Milgram, Takemura, Utsumi and Kishino (1994), they defined "augmented reality" into two approaches: broad and restricted approach. In term of broad sense, AR was defines as "augmenting natural feedback to the operator with simulated cues" while restricted approach highlight and defined AR as "a form of virtual reality where the participant's head-mounted display is transparent, allowing a clear view of the real world". Researcher such as Azuma (1997) tended to present a definition of AR based on a system that fulfills three basic criteria: (1) combination of real and virtual, (2) interactive in real time, and (3) 3D registration of virtual and real objects. A similar definition is proposed by other researchers (Höllerer & Feiner, 2004; Kaufmann, 2003; Zhou, Duh & Billinghurst, 2008), who define AR based on its features which the real and computer-generated information are combined in a physical world, interactively in real time, and display virtual object intrinsically align to real world orientation.

Besides that, Klopfer and Squire (2008) give an even broader perspective on AR, stating it as a situation in which a real world context is dynamically overlaid with coherent location or context sensitive virtual information. A less inclusive definition is provided by Martin et al., (2011) who indicated that the term AR is a system that is basically merging information such as images with video streamed from a webcam while as El Sayed, Zayed, and Sharawy (2011) states in their recent article, they describe AR as technology of adding virtual objects to real scenes through enabling the addition of missing information in real life. Even though a number of available AR experiences and applications have been increasingly receiving attention and continues to grow at an accelerating rate however, a consistent definition of AR does not exist (Mehler Bicher, Reiß & Steiger, 2011). Therefore in order to define AR, the commonly accepted definition by relevant studies always refers to a helpful visualization called "Milgram Reality-Virtuality Continuum" (see Fig 1.) by Milgram et al. (1994).

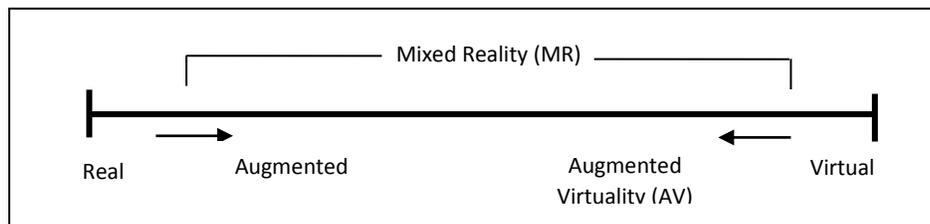
Milgram Reality-Virtuality Continuum is a scale ranging from a completely real environment (reality) which we can observed when viewing a real world to a completely virtual environment (virtuality). Within this continuum the space between real environment and virtual environment is called mixed reality (MR). It is straightforward to define MR as an environment where the real world and virtual world are blending together. As we can see from Fig. 1, MR consists of two main elements: one side is augmented reality and the other side is augmented virtuality (AV). AR is a combination of real and virtual object and contains a small amount of virtual data while AV is a concept where elements of reality being added to a virtual environment and contains more digital data.


Fig. 1. Milgram Reality-Virtuality Continuum

2.2 Affordances of AR

Although AR is a new technology but the affordances and benefits to support learning were worth to mentioned and discussed. According Chien, Chen and Jeng (2010), AR has an ability to encourage kinaesthetic learning. Furthermore, since AR use 3D registration of virtual and real objects, it could allow user to view the learning

content in 3D perspectives. This affordance can help students who usually encounter difficulties to visualize the phenomena that are not possible to view in real world or complex concept. AR can support students by inspecting the 3D object or class materials from a variety of different perspectives or angles to enhance their understanding (Chen, Chi, Hung, & Kang, 2011). Squire and Klopfer (2007) also suggested that AR in a form of games can stimulate student' prior knowledge and increase the student level of engagement in academic activities. Moreover, AR also can enhance collaboration between students-students and also student-instructors (Billinghurst, 2002) as a result the transfer of learning can be maximized (Kaufmann & Schmalstieg, 2003). Additionally, in Di Serio et al., (2012) study, AR technology also has showed a positive impact on the motivation of middle-school students. It's proved that AR environments could boost students' motivation and interest, which in turn could help them to develop a better understanding in learning contents.

3. Mobile Augmented Reality

3.1 Introduction

In the present day, in conjunction with widespread use and emergence of mobile devices such as smartphones and tablets from a decade earlier provides individual people with communication, work, entertainment, internet access and even learning and instruction. A number of studies have found that mobile devices play a major role in education nowadays and sees the impact and advantages of these device in regards to the potential for pedagogical perspectives (Chen, Kao, & Sheu, 2003; Denk, Weber, & Belfin, 2007; FitzGerald, Adams, Ferguson, Gaved, Mor & Thomas, 2012; Hwang, Yang, Tsai, & Yang, 2009; Uzunboylu, Cavus, & Ercag, 2009; Zurita & Nussbaum, 2004). Interestingly, because of the development and rapid increase in mobile phone usage have made mobile augmented reality (MAR) possible (Azuma, Baillot, Behringer, Feiner, Julier, & MacIntyre, 2001; Papagiannakis, Singh & Thalmann, 2008) and beginning to expand rapidly. Therefore, in the next section, we want to introduce and discuss about some of the exemplary uses of MAR in education.

3.2 Mobile Augmented Reality application in Education

In 2006, Wagner, Schmalstieg, and Billinghurst developed an educational game based collaborative handheld called Virtuoso. Besides the AR version, the game was also implemented in Macromedia Flash on a desktop PC and as a paper game without any technology. The aim of this game is to sort a collection of artworks according to their date of creation along a timeline with 3 different conditions: a paper, a PC and a PDA. The results showed that although the players were tested with 3 different game conditions, there was no significant differences in educational outcomes were found. Interestingly, the players have paid more attention toward the conditions is in how space was used which players preferred paper and PDA version because of it allow them to collaborate more effectively over than PC version. Besides that, they also chose the PDA interface as the most enjoyable among the three conditions (Wagner et al., 2006)

The CONNECT is a project that use MAR technology based system developed to support students learning science both in the formal and informal learning environment. The CONNECT concept required student to wear a head mounted display (HMD) and related computer-mediated learning platform in order to visualize and interact physically and intellectually with learning environment that deal with instructional materials, through "hands on" experimentation and "minds on" reflection. In addition, student can also perform experiments that are not possible in school. To evaluate the usability and effectiveness of the CONNECT project, a study have been conducted with learners with physical disabilities (Arvanitis, Petrou, Knight, Savas, Sotiriou, Gargalakos, et al., 2007). The interesting finding from the study was that comparing the tests of the disable students with able-bodied students showed that they had almost the same results and this finding provides some support for the conceptual premise that the CONNECT project have the potential to improve the landscape of education especially for disabilities students

Schmalstieg and Wagner (2007) introduced Studierstube as a framework for the development of handheld Augmented Reality. Two mobile AR games were developed: "medien.welten" and "Expedition Schatzsuche". In medien.welten case study was designed for a target group of high school students aged 12-15. For this game, a group of players (two or three students) receiving one handheld that show a map of the exhibition and specify the current position of the players and lists of solved and remaining tasks. In Expedition Schatzsuche game, each of the subjects had been given their own handheld to play the game. The game concept was to answer the quest composed of puzzles and other tasks related to the exhibits. The evaluation was conducted through interview, observation, and

logging data in a case study with 12 students, all at age 12 years old who used handheld devices to discover historical artifacts. The results indicate that the students were very motivated and highly satisfactory (Schmalstieg & Wagner, 2007)

Squire and Klopfer (2007) collaborate with environmental science faculty at Massachusetts Institute of Technology by developing an augmented reality simulations called Environmental Detectives. This game required student to play the role as an environmental engineers and to give students experiences in conducting the environmental investigation in real world. Each pair of students can see their location on a map since there were given a mobile device equipped with GPS. After they used the application, its showed that Environmental Detectives can assists students to understand the socially situated nature of scientific practice.

In 2009, Dunleavy, Dede and Mitchell designed Alien Contact!, a MAR game that focus to teach math, language arts, and scientific literacy skills to middle and high school students. Alien Contact! was designed based on Massachusetts state standards and nurtures multiple higher-order thinking skills. In Alien Contact! as the students move around to their spot fields for example, a map on their handheld will displays virtual objects and people that exist in AR world superimposed on real space. The concept of the game is based on the scenario that aliens have landed on earth and working in a teams (four students per team) which consist of four roles: Chemist, Cryptologist, Computer Hacker, and FBI Agent. The students can interview virtual characters, collect digital items and solve science, math and language problems to answer the question and determine why the aliens have landed on earth. The objectives of this research are to determine how teachers and students feel toward teaching and learning within AR simulation environment and how they used the application. The results obtained from the study documented high student engagement across the three case study sites (Dunleavy et al., 2009)

In 2009, Ardito, Buono, Costabile, Lanzilotti and Piccinno presented a MAR game called Explore! with the aim to support during a visit and explorations of middle school students to archaeological sites in Italy. This game was played by groups of 3-5 middle school students in which each group was given 2 cell phones and the site's map on a paper. The concept of the game required students to explore important places in the sites supporting by some hints given on the cell phone by the game application. They can also discover the 3D reconstruction of how the places may have looked by using cell phone. The evaluation of field study using Explore! involved for a total of 42 students where19 students played the paper-based version of the game and another 23 students, played the mobile version. From the result of the study, its show those students enjoyed playing the game with Explore! but in term of learning, there are no significant differences were found between the two versions.

In 2009, Huizenga, Admiraal, Akkerman, and Dam have conducted a research by integrating the MAR games called Frequency 1550. This hybrid reality game was developed by The Waag Society to facilitate children to gain historical knowledge about Medieval Amsterdam. The research seeks to address student engagement in the game, historical knowledge, and motivation for History in general and the topic of the Middle Ages in particular. In order to answer their research questions, the children in 10 of the classes played the mobile history game whereas the children in the other 10 classes received a regular, project-based lesson series. For children who played the mobile history game, the game procedure start by forming a group of four or five children and divided into 2 teams: a city team (CT) consisting of two or three pupils who walk through the city and a headquarter team (HQT) consisting of the other two or three pupils who operate from behind the computer in the main building. They switch places after lunch so that each child has participated in both the CT and HQT at the end of the day. From the results of the study, they found that children who played the game to be engaged and to gain significantly more knowledge than those who received regular project-based instruction. For motivation aspect, no significant differences were found between the two groups.

Juan, Alem and Cano (2011) presented mobile AR game, ARGreenet that aim to increase people awareness of how important of recycling is and how to do it. In their study, they compared the ARGreenet with the basic mobile phone game for recycling topic. The participants involved in this study involved a total of 38 children where all of them experienced both games but in a different order. The evaluation aspects consist of the knowledge of recycling that the children perceived, the level of engagement, fun and easy to use, perceived willingness to change behaviour and comparison toward AR and non AR games. Based on the results of the study, there is no significant difference between the two games; however 69.4% of the children preferred the ARGreenet game, which they perceived it as easy to use and more engaging and fun than basic mobile phone game. In addition, the findings also show that the games had a positive influence on their intentions to change behaviours (Juan et al., 2011)

In a recent article, Tang and Ou (2012) carried out an experiment using AR and mobile technologies as an assistant tool for learning butterfly ecology. By integrating AR in this project, students can breed their own virtual caterpillars on host plants using the programs on their smart phones, and become familiar with butterfly's life cycle

by observing their growth. The campus AR butterfly ecological learning system was designed based on the learning unit of "Butterfly's Life Cycle" in nature science for the fourth-grade students in elementary schools. After using the AR system, the participants were randomly selected and assigned to experimental group and the control group. The statistical tests indicate that the learning effectiveness of experimental group was better than the control group. Therefore, it was shown that by using the AR butterfly ecological learning system can effectively help students enhance their learning.

Santoso, Yan and Gook (2012) from Institute of Ambient Intelligence (IAI) work together with Sungsan Elementary School (SES) by developing a Digital Edutainment Content based on Tangram toy as an existed edutainment media. The tangram toy edutainment content was used because of its value that can enhance student spatial cognitive ability. The application was developed using ipad version where the built-in camera will be activated automatically once the user chooses an AR session. After that, user needs to point the camera to the colourful marker on the book then the software will start looking and track the marker and displays the 3D virtual object of each marker.

Since history maybe considered as one of the hardest subjects for students, Martín, Díaz, Cáceres, Gago and Gibert (2012) presented an educational application called EnredaMadrid to cope with this complexity. The objective of EnredaMadrid is to teach the history of the city in the 17th century to students in the activity through previous online training and a later physical technological gymkhana. This application was built using mobile device based on geolocalisation and AR technology. The evaluation session toward the technology used in EnredaMadrid was carried out through questionnaire and the results indicate that AR is the most positive element in EnredaMadrid. Moreover, students stated that AR definitely contributes to make learning more fun and motivating and they believe that AR is the most appropriate tool to learn the history of the city (Martín et al, 2012).

Table 1. A summary of selected studies on MAR

Researcher	Application	Participant	Topic
Wagner et al. (2006)	Virtuoso	48 participants (aged 20- 43)	Art
Arvanitis et al (2007)	CONNECT	5 disabilities students (aged 15-18)	Science

4.0 Conclusion

As information technologies transform, educators have always looked to adopt new technologies into their classroom to enhance student learning experience. AR is one the growing technologies that have a great pedagogical potential and have been increasing recognized by educational researchers. With capabilities of merging virtual and real worlds together have give birth to new possibilities in improving the quality of teaching and learning activity. The effectiveness of AR can be further extended when it combine with other type of technologies such as mobile device. When AR is connecting to innovative technology such as mobile device, the term Mobile Augmented Reality (MAR) arises.

As has been presented earlier, MAR learning based systems are more focus mostly on games or simulation and with the ability of mobile devices which has the features and properties such as portability, social interactivity, connectivity, context sensitivity and individuality (Huizenga et al., 2009) have make a learning experience more meaningful. Based on the previous studies that has been discussed previously, most of the participants had never experienced an AR and MAR, however overall participants felt motivated, enjoyed and the research show a positive educational effects on participants that leads to students to achieve higher levels of engagement in learning performance.

In conclusion, although most of previous studies showed a positive impact and encouraging results, it is advisable to focus also on pedagogical and learning theory when implementing and developing the AR application since the educational value of AR are not solely based on its features. Expect that there will be many more research on AR and MAR in the future because this technology has a vast potential implications and benefits especially in learning environment.

Mobile Learning: A Good Practice

Dawood Salim Al Hamdani[100]

P.O Box 44, Sohar, 311, Sultanate of Oman

Abstract

With advances in learning technology and communication, information is growing rapidly. In the past, books and teachers were the most frequent sources of information; nowadays there are many resources through which information can be accessed from the Internet, PCs and mobile devices.
Mobile learning can be defined as the use of mobile devices as mediator in the process of learning and teaching. The term learning from mobile implies the use of mobiles devices as tool to deliver learning materials. The learning with mobile indicates the use of mobile devices as tool/cognitive tool to promote higher order thinking skills, as discussed in more detail somewhere in this paper.

Keywords: Mobile learning; constructivist approach; instructional desgin

Introduction

With advances in learning technology and communication, information is growing rapidly. In the past, books and teachers were the most frequent sources of information; nowadays there are many resources through which information can be accessed from the Internet PCs and mobile devices. Such sources are widely available, and are easy to access.

Mobile devices such as personal digital assistant (PDA), mobile phone, and Tablet PC are nowadays more user friendly and user convenient than before. They are coming with major improvement in memory storage, interactivity features and high data transfer speed.

Mobile devices are neutral to teaching and learning theories; they can be used with traditional learning theories such as behaviorism and new learning theories such as constructivism. For example, in the application of the field of behaviorism, which focuses on repetition in the curriculum content, studies show drill and practice learning materials have a positive role in helping students to learn (Ally, 2004 and Quinn, 2000). However, many researchers in technology, as well as the author view the optimum utilization of mobile devices is in the uses in developing of higher thinking skills and problems solving. Strommen and Lincoln (1992) state, "The key to success lies in finding the appropriate points for integrating technology into a new pedagogical practice (constructivism) so that it supports the deeper, more reflective self-directed activity children must use if they are to be competent adults in the future." Ehrich, McCreary, Ramsey, Reaux, & Rowland (1998) contend that technology integration can effectively support constructivism. The author presumes that constructivism is the proper theory for the activating of the role of technology in the learning process and see technology is the best way to apply the principles of constructivist learning. Herrington, Herrington, Mantei, Olney and Ferry (2009) maintain that despite the significant potential of

E-mail address: dalhamdani@gmail.com

mobile technologies to be employed as powerful learning tools in higher education, their current use appears to be predominantly within a didactic, teacher-centered paradigm, rather than a more constructivist environment. The purpose of this paper to shed light on the practice of using of mobile phones as a cognitive tool to enhance students' learning in frame of constructivist approach.

2. Mobile learning

Mobile learning can be defined as the use of mobile devices as mediator in the process of learning and teaching (Alexander, 2004). In general this use can be seen as learning from mobile and learning with mobile. The term learning from mobile implies the use of mobiles devices as tool to deliver learning materials specially designed to this purpose. The learning with mobile indicates the use of mobile devices as tool/cognitive tool to promote higher order thinking skills, as discussed in more detail somewhere in this paper.

3. Practice aims and scope

The aim of this practice design was to develop innovative pedagogies using mobile technologies, to enhance teaching and learning in higher education and to make further recommendations for teaching staff professional development. Specifically the study looks at the possibility of using mobile devices in the students' hands to enhance teaching and learning, implement resource based learning activities over a period of 4-8 weeks in teaching communicative language teaching course for forth year English teachers at Sohar University in Oman.

4. The Country and the University Context

Oman, with a population of only two million people is a small but nonetheless progressive and developing nation in the Middle East. With fossil fuel reserves dwindling in the foreseeable future the government has decided to strive to attain a knowledge-based economy to reduce dependence on the current resource based economy. By far the biggest factor currently holding us back is the lack of a well-grounded educational system in the country. The public school system in the country has only been in existence for the past forty years. Before that Oman only had three primary schools.

There are universal primary and secondary education for both boys and girls. University attendance is on the increase. Currently Sohar University has over five thousand students registered in Diploma, Bachelor and Masters programs in five faculties staffed by more than two hundred and seventy lecturers and professors. Fully 70% of our students are young women seeking to gain their rightful place in the new society that Oman is building.

Technology is in its way to be integrated into teaching and learning at Sohar University. Moodle, the most popular Learning Management Systems (LMS) is used under names SULMS and it is recommended to teachers to use in their teaching. Most students at Sohar University have computers/laptops and have at least a mobile device (mobile phone). For example, the snap shot survey for mobile device ownership by the students in the study shows that twenty students own one mobile, sixteen own two mobiles and ten have three mobiles. However, mobiles usages are not supported during classroom teaching sessions due to the absence of pedagogies, instructional method and lack of ability to integrate technologies into teaching.

5. Constructivist-mobile learning environment

5.1 Method of instruction: constructivist approach

Constructivism, in general, maintains that knowledge is constructed by the individual from within rather than being transmitted to the learner from another outside source. Therefore, learning is seen as a process of actively constructing knowledge by integrating experiences into the learners' prior knowledge; the learner plays an active role in building his/her knowledge. Vygotsky (1978), the founder of social constructivism, emphasizes the importance of the interaction with the others such as peer, teachers and parents to build knowledge. He also emphasizes the need for tools such as language and computer to mediate knowledge construction. Campbell (2004) argues that the best learning occurs in the middle of social interaction. The adoption of constructivist approach in rich-technology environment, promotes the full potential of technologies in enhancing learning. The following section sheds light on technologies that are best serve the constructivist approach.

The proposed constructivist-mobile learning environment is characterized by new roles of teacher and learner, specially designed learning activities and use of mobile as a tool. Switzer and Csapo's (2005) maintain mobile devices allow learner opportunities for collaboration in the creation of products and for sharing them among their peers. Patten, Arnedillo, Sanchez and Tangney (2005) argue that the advantages of mobile learning can be gained, through collaborative, contextual, constructionist and constructivist learning environments.

5.2 New roles for the teacher and the learners

Constructivist-mobile learning environment imposes new roles for the teacher. Unlike traditional "top-down" teaching, Vygotsky (1978) would advocate a bottom-up teaching approach where the teacher facilitates, as opposed to directs, what and how students learn concepts both in and out of the classroom. In the learning setting with the use of mobiles, the teacher should contribute a major role in establishing the learning environment for her/his students. Teacher' role is as facilitator, coacher and co-learner. Her/his responsibility is to help and guide learners throughout their knowledge acquisition. Such a role of providing guidance for learners is, according to Vygotsky, to motivate learners to excel beyond their current skills level (i.e. activating learners' zone of proximal development.); learners are viewed as knowledge constructors.

5.3. Learning activities

The useable knowledge is best gained in learning environments which feature the following characteristics:

- authentic contexts that reflect the way the knowledge will be used in real-life,
- authentic activities that are complex, ill-defined problems and investigations,
- access to expert performances enabling modeling of processes,
- multiple roles and perspectives providing alternative solution pathways,
- collaboration allowing for the social construction of knowledge,
- opportunities for reflection involving meta-cognition,
- opportunities for articulation to enable tacit knowledge to be made explicit,
- coaching and scaffolding by the teacher at critical times and

- authentic assessment that reflect the way knowledge is asses in real life (Herrington and Oliver, 2000).

The activities used in the practice depict some of the above-mentioned characteristics of authentic learning activities. They afford the learners to interact with the e-learning materials and interact with the others in cooperative manner seeking knowledge. The activities promote learners to use the cognitive thinking skills, especially the higher ones, as in Bloom's Taxonomy and enhance their motivation. Riischoff (2009) maintains that "learning activities are always social activities with learners cooperating and working together."

5.4. Instructional events design

The design of learning environment events was based on constructivist principles and with the use of activities as above mentioned. Jonassen (1994, p.35) proposed that knowledge construction may best be facilitated by constructivist learning environments that:

- provide multiple representations of reality, which avoid oversimplification
- focus on knowledge construction, not reproduction
- present authentic tasks (contextualising rather than abstract instruction)
- provide real world, case based learning environments rather than pre-determined instructional sequences
- foster reflective practice
- enable context- and content-dependent knowledge construction
- support collaborative construction of knowledge

The following brief events of instruction were implemented in the practice. In each session, the participants, first, were introduced to the session topic; divided into groups. Each group was assigned a task separately. The students were given time to discuss the tasks among themselves in groups and the instructor provided guides and clarification, when needed. The students brainstormed required information to do the activities and used their mobile phones while performing tasks. At the end of each session, the students presented and shared their findings with class and discussion was elicited. The works were posted in SULMS (Moodle), as resources to be used in future.

6. The practice Design and instrumentation

To gain a clearer picture of how mobile phone was used in this practice as a tool to enhance students' learning in Communicative Language Teaching (CLT) course, a questionnaire was developed to provide information on the frequency of the following themes:

1. Students' ICT backgrounds
2. Mobile phones use in classroom and out classroom
3. Mobile phones promote of thinking skills
4. Mobile to support cooperative work
5. Problems faced while using Mobile phones

7. Findings

This section aimed to find out how students use their own mobiles inside classroom session and outside classroom for the purpose of learning the course materials. It looks at the findings of the above-mentioned themes.

7.1 Students' ICT backgrounds

7.1.1 Students' ICT skills

The participants seem to have good commands of ICT skills. For examples, as in table (1), Nineteen (19) of them have both IC3 certificates and computer course, Eleven Table (11) of them have ICT3 certificates, Eight (8) of them have computer course, see the table for more detail.

Table 1. Students' ICT skills

ICT Skills items	No of Students
ICT3 and Computer courses	19
ICT3	11
Computer Courses	8
ICT3 and ICDL*	1
Nothing	1

* ICDL: the International Computer Driving License

7.1.2 Use of Social Interaction Technologies

The table (2) shows that the participants are familiar with some social interaction technologies such as FaceBook and email. For examples, all of the students have emails, 25 of them have FaceBook accounts and 13 of them have Twitter Accounts.

38. Table 2. Social Interaction Technologies

	A blog	FaceBookt	Twitter Account	Website	An email
No of students	1	25	13	4	40

7.1.3 Ownership of Mobile Phone

As mentioned somewhere in this paper, there were 40 students participated in the practice. Twenty percent of the students own one mobile, sixteen percent own two mobiles and ten percent have three mobiles, see table (3). However, mobiles usages are not supported during classroom sessions. The table below shows the bands of mobile devices owned by the participants.

39. Table 3. Ownership of Mobile Phone

Samsung	Nokia	BlackBerry	iphone	Sony
22	20	11	4	2

7.2 Mobile phones use in classroom and out classroom

Overall, respondents were overwhelmingly used their mobile phones in their learning to do the assigned course activities. Table (4) and table (5) show that most use of mobile phones is to: search for information, access dictionary and look for vocabulary, and less use to read articles and access SULMS (Moodle). On average, the students used their mobile phones to translate texts and check their spelling. It is interesting to note that there is no significant difference between in-class use and out-class use of mobiles, see table (6).

Table 4. Mobile phones use in classroom

In classroom use items	Mean	S. D.
Read articles	2.78	1.14
Access SULMS (Moodle)	2.93	1.33
Translate texts from Arabic to English and vice versa.	3.08	1.37
Check spelling	3.7	1.32
Access information	3.78	1
Look for vocabulary	3.95	1.13
Search for information	4.07	1.02
Access dictionary	4.1	0.98

Table 5. Mobile phones use outside classroom

Outside classroom Items	Mean	S. D.
Access SULMS (Moodle)	2.75	1.3
Read articles	3.05	1.3
Check spelling	3.53	1.22
Translate texts from Arabic to English and vice versa.	3.55	1.32
Access information	3.72	1.11
Look for vocabulary	3.95	0.96
Access dictionary	4.05	0.99
Search for information	4.1	0.98

Table 6. Difference in use

Paired Samples Test	t	df	Sig. (2-tailed)
IN-CLASS - OUT-CLASS Mobile Use	-0.309	39	0.759

7.3 Mobile phones to promote of thinking skills

Table 7. Mobile phones and thinking skills

Thinking skills Items	Mean	S. D.
To rearticulate (paraphrase) information	3	1.11
To critique what is available on the net	3.23	1.14
To remember information better	3.4	1.08
To organize my information/answer	3.45	1.24
To use the acquired information in activities	3.47	1.06
To scan and scam for needed information	3.58	1.01
To memorize something and repeat it.	3.6	1.15
To understand ideas/concepts better	3.68	0.94
To produce a good work	3.7	0.94
To select the right information	3.75	1.06

The participants do think that mobile phones some extent have a role in helping them with thinking skills, as show in table (7) mostly helped them in selecting the right information. For example, table (8) shows that most students see the mobile phones have helped them memorizing and repeating materials; memorization and reparation are low thinking skills.

Table 8. Mobile phones and memorization

To memorize something and repeat it.	Not at all	A little	Some	Quite a bit	Very Much
No of response	1	7	10	11	11

In addition, table (9) shows most students indicate that mobile phones contributed to produce good works for their activities. The ability to produce a good work is considered to be higher order skill.

Table 9. Mobile phones and good work

To produce a good work	Not at all	A little	Some	Quite a bit	Very Much
No of response	1	2	13	16	8

7.4 Mobile to support cooperative work

This section surveyed the ways students use the mobile phones to cooperate and collaborate with each other during course activities. Table (10) shows that above average, the students viewed their mobile phones have allowed and facilitated cooperation among them such as such sharing, exchanging information, developing new ideas and communicating better.

Table 10. Mobile Phone and cooperative work

Cooperative work items	Mean	S. D.
Fill the gap for missing information	3.4	1.19
Explain something to someone	3.8	0.97
Learn different viewpoints from my class mate	4	1.01
Discuss information with my friends/group	4.1	1.24

Correct my understanding/information	4.1	1.01
Find more information from others	4.13	0.91
Share information	4.18	0.96
Exchange information with friends	4.18	1.01
Have new ideas	4.22	0.97
Communicate with the others better	4.3	0.97

7.5 Problems faced while using Mobile phones:

This question gauged students' perceptions on the some problems facing them while using mobile phones. Table (11) shows that the participants ranged the slow internet connectivity (bandwidth) as the first problem and the lack of available content specifically designed for the course as last problematic.

Table 11. Problems with mobile phone

Problems items	Ranking
Slow internet connectivity (bandwidth).	1
Inconvenient word input	2
Hard to use the keyboard	3
Charges for mobile connectivity.	4
The lack of available content specifically designed for the course	5

8. Discussion

The picture produced from practice data seems to indicate that there is a majority of students, who engage in more active roles and cooperative and cooperative tasks using their mobiles phones during learning activities of the courses. With a good and simple design, it was possible for the students to use their own mobiles into their learning constructing their own knowledge and understanding of the course materials with the instructor's guide and support.

8.1 Mobile phones use in classroom and out classroom

The ability to use of mobile phone as tools is an important factor when implementing technologies into constructivist approach. It seems that students have used mostly mobile phones to research knowledge and accessing dictionary. Online dictionaries are considered as cognitive tools helping students to better understanding of prose. Interestingly, there a moderate use of the mobiles by the students to access SULMS and access information that require fast data transferring speed.

8.2 Mobile phones to promote thinking skills

One main point can be taken from this practice's results with regards of promoting thinking skills. Mobiles have helped the students with their thinking skills, higher ordered thinking and low ordered thinking skills. Though constructivist approach with use technologies promotes higher ordered thinking skills, however, the lower ordered thinking skills are not undervalued, here.

8.3 Mobile to support cooperative work

Among the other uses of mobiles in study, use of mobiles was in supporting students' cooperation and collaboration become the highest identified. A good explanation for the high use can be put forward. WhatsApp Messenger is available for free; the students send and received multimedia messages and at different length at no cost.

9. Conclusion

Within Sohar University, it seems that at least in the sample of this study, all students are acquainted with technologies and use them frequently. In this practice, students used their own mobile devices as tools to acquire knowledge enthusiastically. It shows a successful attempt of integrating technologies and constructive learning approach during the teaching of CLT course. The students reported mobile phone helped them to manage the course information, to promote more of their thinking skills and to cooperate with each other.   This simple practice design might be applied by other instructor to integrate technologies into teaching in similar or different situations.

Nature exquisiteness based digital photography arts project for creativity enhancement among low achievers students. (PROSFD[ak])

Siti Nuur Adha Mohd Sanif[101], Zaharah Hussin, Fatiha Senom, Saedah Siraj & Abu Talib Putih

Department of Educational Foundations & Humanities, Faculty of Education, University of Malaya, 50603 Kuala Lumpur, Malaysia

Abstract

This study was conducted to examine the effectiveness of project-based learning in digital photography for creativity enhancement among a group of low achievers students in a secondary vocational school. Drawing on the Isman Instructional Design Model as the module design process, this study employed a quasi-experimental method. A group of 40 low achiever students were selected as sample of a single case study design in this study and it was conducted in 16 R & D sessions within 3 weeks. Researchers modified the project module PROSFak using the modules of Curriculum Plan; picturing Peace: Creative Digital Photography Project by ArtsBridge. The implications of the study for the Ministry of Education (MOE), teachers and students were also discussed.

Keywords: Photography digital, creativity, project based-learning, Isman instructional design model, quasi-experimental

Introduction

Nature exquisiteness based digital photography arts project (PROSFD[ak)] is a project-based learning that is design aptly to suit the need of vocational secondary school students who have difficulties in academic learning. Using digital cameras, students are able to produce works of photography to express the value and beauty of the environment. This art project is potentially powerful in attracting and motivating students who have less focus on the conventional teaching and learning activities in schools.

The purpose of PROSFD[ak] is to facilitate students in developing skills and competencies on information and technology, such as basic skills and skills of the digital age in order to equip them to face a better future (Chan, 2010). In addition, this project-based learning assists students to understand and apply the knowledge in their own field. Through these skills, students are able to manage their learning independently and in more effective ways. Furthermore, PROSFD[ak] is able to build students' awareness of environmental conservation through encouragement on aesthetic appreciation of beauty of nature.

Photography is the process of producing images by the action of light or image using the tools; recorder, which is recognized as a camera. As a technique, photography was first introduced in 1839 with the invention of the daguerreotype by Louis-Jacques-Mande Daguerre (Mary, 2010). The original term words of photography was from British, photography is a use from two Greek words, namely *phos* mean light and *graphic* mean painting brush, or *graphe* which brings meaning 'painting with light' (John Ingledew, 2005). This implies painting with light is to understand the stem of photography.

Today, the growing technologies changed film photography to digital photography with first digital cameras production in 1981 by Sony Mavica and Kodak in 1991. Nowadays, the use of a digital camera is to use electronics to record light rather than using light sensitive paper and exposing the paper to sunlight (Mary, 2010).

Before photography exists, the medium of communication is through imagination and existing experience. Photographic documentation of the ingredients should be easy, fun and makes a story easily understood. A professional photographer, Joseph Meehan (2008) says the content of photography may bring a story, make a fact, convey feelings, control atmosphere with a more expressive power than the dramatic results of digital imaging use technology today. What we understand is that there are traits in photography from the aspect of the delivery of notice, as if it has been equalled, even rivalling delivery system that uses text.

E-mail address: nuuradha@um.edu.my

Digital photography is one of the visual culture elements that is based on visual media such as images, sculptured and art of dance. Since the 18th century, photography has become a medium to capture image as memory and the proof of existing (Sontag, 1977). Photography communicates through images, various information and meanings may be found in a picture. Mary (2010) argues that a photographer uses the medium to inspire or to elicit information for record storage, journalism, and scientific documentation.

Photography has the potential to assist students' learning particularly in spurring their interest to learn. This is because, unlike the conventional learning tools, the images or subject was made directly through slides, film and another visual tools via photography (Mitchell & Weber, 1999). Photography also teaches students ethics and experiences through pictures such as pictures depicting the battle of remorse, cruelty, fear and human civilization. The words that we often hear; "a picture tells a thousand stories."

In 2000, the Malaysian Ministry of Education released a circular letter of the promotion of photography activities among school children. The purpose of the promotion of photography activities among school pupils is to make room for the pupils in the school to develop their potentials in a holistic and integrated manner to produce individuals who are intellectually, spiritually, emotionally and physically balanced. Guided by the circular letter, the researcher uses photography as a subject of learning to encourage students' creative work in appreciation of art education.

PROSFDak enhances students' understanding and achievement in terms of learning basic digital photography techniques, elements of design, discussion and understanding of pictures through digital photography module guides. Therefore, the present study investigates the impacts of PROSFD[ak] on the understanding and achievement of low achiever students on arts and creativity.

Through this digital photography arts project, students can communicate through pictures as a non-verbal communication. With non-verbal communication, the meaning from the messenger can be easily understood by the recipients (Hashim, Mohammed Isaac and David, 2009). In this project, the students will go through several processes namely understanding, interest, desire, individual sensitivity, communication skills and ethical responsibility. This project also will attract students to understand and have interest in Visual Arts Education, as where exciting learning frameworks will be highlighted to attract students in arts education session. This is aligned with the learning of Visual Communication; Graphic Design, Posters, Music, Logo and Mascot, Calligraphy, Typography, Packaging, Environmental Graphics, Illustration, Computer Graphics, and Multimedia in KBSM Visual Arts syllabuses (2006).

Arts education encourages students to explore various mediums, use their imagination and take a risks in intellectually, forming visual intelligence, engage in self-instructional projects, explore the symbolic function in art, have dialogue with others about the creative process and the results of their work, and build self assessment skills (Cromwell, 2000). Other benefits of arts education is to appreciate nature, appreciate the grace of God, sharpen the mind, good emotions shape, and build multi-sensory skills (Ghazie Ahmed Hashim Osman Ibrahim, 2007). Therefore, nature exquisiteness is chosen as a theme for this digital photography project.

Aminudin (2004) argues that students who are active in extra-curricular activities are more likely to have good academic achievement. Thus, participation in PROSFDak could encourage low academic achieving students to be active in extra-curricular activities. Activities participated by the students will not have a negative impact on their academic achievement. Co-curricular activities are aimed to diversifying the knowledge and experience to intellectual development of students, talents, body and also to development student leadership, aesthetic value, self-esteem and positive social values (the National Education Policy, Ministry of Education, 2012). Arts Education will produce students who are independent, develop students' talents, able to express their views, practice good values in society and realize the career opportunities in the arts field.

2. The Aim of Research

The aim of this research is to enhance creativity among a group of low achievers students and to determine students' creativity and interest in the field of digital photography. The study also aims to investigate the impact of PROSFDak on the academic achievement of students' technical skills through the examination of test scores, literacy and oral language skills. By focusing on the lack in literature, photography technical gives potential and benefit to art education specifically for social aspects to ensure the effectiveness in students' development and learning in school life (Albertson & Davidson, 2007). This study will use some aspects of photography for students to learn as process and practice approaches in teaching studio environment, cultural and historical context to understand art and photography. This study also uses design process by employing the Isman instructional design model for teaching and learning.

To achieve this aim, the researchers have set four research objectives. The first objective is to investigate to what extent the project-based learning in digital photography is effective in enhancing creativity among a group of low

achievers students. The second objective is to examine possible differences in terms of creativity in the production of works of art in nature exquisiteness based digital photography arts project from boys and girls. The third objective is to find to what extent the nature exquisiteness based digital photography arts project is effective in cultivating students' interest in art education. The fourth objective is to investigate possible significant differences in students' ability to create images using creative imagination by pre and post-activities design.

3. Significance of the Study

Guided by the goal of art education, the findings of the study will manure and shape the younger generation understanding in culture, have high aesthetic values, to be imaginative, critical, creative, innovative and inventive. These also contribute to the development of self, community and nation to meet the government's intention to provide an educational career path more clearly to students. To achieve this, the government proposes to rebrand vocational secondary schools to vocational colleges. Not only that, this transformation also involves changes in technical and vocational curriculum, the learning, the certification, trainers, and infrastructures. The result of the study can also be used by educators to improve the technical and vocational education in development pupils' creativity through Vocational and Technical Transformation (VOCTEC) on technical schools and vocational schools in Malaysia.

4. Scope and Limitations

In this study, a group of 40 students in a vocational secondary school in the state of Johor was randomly selected. This study was conducted over 16 sessions of teaching and learning activities, and 3 weeks to allow 8 measurements, there are 2 sessions for each measurement for the completion of this entire lesson plan.

5. Instruments

Researchers used two instruments in this study; questionnaires and rubric assessments. Questionnaires are used for identifying students' achievement and information related to the art of digital photography and the effects of PROSFD[ak] learning module. Researchers used Likerts scale, interpretation of Cronbach Alpha (α) to measure the reliability of the items and questionnaires. The instruments were administered to 40 form four technical students. The second instrument is a Rubric assessments form used for Pre-activity and Post-activity. The rubric of students' creativity measurement is based on photographic basic technique and composition principles of digital photography. This rubric is used by researchers as a process to determine, obtain, and provide useful information for researchers to make judgments about further action (Siti Hayati, 2011). Rubric assessment that is used as a system or process covers the activities of gathering information about the strategies and teaching and learning activities for researchers to analyze and decide accordingly to plan activities more effectively. To determine the validity of the content in the rubric of pre- activity and post-activities, three experts in the field of art and photography education validated an instrument that was adapted and built.

The teaching and learning of this single treatment group is done through both indoor and outdoor classes using the PROSFD[ak] project module which was modified from Curriculum Plan; picturing Peace: Creative Digital Photography Project by ArtsBridge (2005). Researchers used method of discussion, practical and technical skills, problem solving skills, as well as medium and appropriate instructional media research. Researchers make a full use of media and technology equipment such as digital cameras, flash-lights, computers, software editing Photoshop, lighting and studio equipment.

6. Theoretical Framework

Isman Model

This study employs the Isman Model to formulate PROSFD[ak] module in teaching and learning activities to enhance creativity among low achieving students. The major goal of Isman model is to plan, develop, implement, evaluate, and organize fully learning activities to ensure the effectiveness of PROSFD[ak] module in improving students' performance (Isman, 2011). This model is designed to store information into long-term memory and respond to the form of environmental conditions to motivate students through active experience and contents.

The Isman model was also used and implemented in a study by Norlidah, Saedah, Mohd Khairul Azman & Zaharah (2013) on the effectiveness of Facebook based learning in enhancing creativity among Islamic Studies students in the secondary educational setting in Malaysian. The findings of the study suggest that there were significant differences between the treatment group and the control group, which imply that Facebook based learning, has enhanced students' creativity level in writing, problem solving and producing missionary motto.

Step 1 Input	Identify needs Identify contents Identify goals-objectives Identify teaching method Identify evaluation materials Identify instructional media	Designing module based on exquisiteness based digital photography arts project for creativity enhancement among low achievers students (PROSFD[ak]).
Step 2 Process	Redesigning of rubric assessments.	Using validity and expert panel to redesign the PROSFD[ak] module for creativity enhancement among low achievers students.
Step 3 Output	Rubric post-activity Analyze results	Measured and analyze finding PROSFD[ak] module based on model *Picturing Peace* by ArtsBridge. Lesson from PROSFD[ak] module for creativity enhancement among low achievers students and teacher also.
Step 4 Feedback	Examine	Examine rubric finding analysis: 1) Pre-activities rubric 2) Implementation of real R & D 3) Post-activities rubric 4) Measurement
Step 5 Learning	Learning and teaching process R & D Teaching PROSFD[ak] modules	Pre-and post-activities have been conducted to test the effectiveness of PROSFD[ak] learning modules to enhance creativity among low achievers students.

7. Findings and Discussion

The effectiveness of nature exquisiteness based digital photography arts project for creativity enhancement among low achievers students (PROSFD[ak]) was analyzed based on early finding from pre-activities and post-activities of PROSFD[ak] learning modules. The result of the post-activities shows that average creativity level score are 40. After the treatment of PROSFD[AK] module lesson, data from post-activities were analyzed by comparing mean achievement score between the pre-activities and post-activities. The independent sample *t*-test was performed to trace if there exists any enhancement in creativity level after treatment. The results show that there is significant enhancement in creativity level after treatment. Next, the researchers compared the creativity in production artwork according to gender and effectiveness of digital photography arts project in students' interest for art education. The module suggests that was no difference for enhancing creativity in producing art works between of both genders.

The effectiveness of PROSFD[ak] module based learning in enhancing creativity among low achievers students also analyzed across creativity level in post-activities. A *t*-test was performed to determine if there were significant differences in ability to create images using creative imagination before and after the learning of PROSFD[ak] modules. Findings from the experiment conducted among 40 participants suggest that PROSFD[ak] module based learning has enhanced creativity level among low achievers students. Table 2 to Table 5 show the results of t-test comparison of pre/post-activities towards across enhance creativity level used PROSFD[ak] learning modules.

Findings from experiment conducted among 40 participants in the single group suggest the effectiveness of nature exquisiteness based digital photography arts project for creativity enhancement among low achievers students (PROSFD[ak]).

Table 2

t-test Comparison of Pre-Activities and Post-Activities Achievement in Creativity used PROSFD^{ak} Module Lesson

Group	n	Mean	SD	*t*	Significance Value
Pre-Activities	40	19.3	4.5	-14.97	.05
Post-Activities	40	39.1	7.2		

Table 2 shows that the pre-activities mean score for achievement (n = 40) is 19.3 (*SD* = 4.5), while post-activities (n = 40) is 39.1 (*SD* = 7.2). The difference in mean score between pre-activities and post-activities is 19.8. This indicates that PROSFD^{ak} module lesson is able to increase achievement in creativity among low achieving students. Hence, there is significantly higher score with value *t*(78) = -14.97, *p* <.05.The finding shows that the null hypothesis is rejected. Therefore there is a significant difference in creativity achievement used PROSFD^{ak} module lesson.

Table 3

t-test Comparison of Post-Activities Achievement in Creativity production artwork by gender

Group	n	Mean	SD	*t*	Significance Value
Male	19	41.2	7.4	1.78	.05
Female	21	37.2	6.7		

Table 3 shows that post-activities achievements mean score for creativity production artwork by gender male (n = 19) is 41.2 (*SD* = 7.4), while gender female (n = 21) is 37.2 (*SD* = 6.7). The different in mean score between gender male and female is 4. This indicates that PROSFD^{ak} module lesson is able to increase achievement in product creativity artwork among low achieving students. Hence, there has higher significantly score with value *t*(38) = 1.78, *p* <.05. The finding shows that the null hypothesis is accepted. Therefore there is a no significant difference in creativity achievement production artwork by gender.

Table 4

t-test Comparison of Post-Activities toward Interest in Art Education

Group	n	Mean	SD	*t*	Significance Value
Post-Activities	40	39.1	7.2	30.4	.05
Interest in art education	40	4.4	0.6		

Table 4 shows that the post-activities mean score for achievement (n = 40) is 39.1 (*SD* = 7.2), while interest in art education (n = 40) is 4.4 (*SD* = 0.6). The difference in mean score between post-activities and interest in art education is 34.7. This indicates that PROSFD^{ak} module lesson is able to increase interest in art education among low achieving students. Hence, there is significantly higher score with value *t*(78) = 30.4, *p* <.05.The finding shows that the null hypothesis is rejected. Therefore there is a significant difference in post-activities and interest in art education.

Table 5

t-test Comparison of Pre-Activities and Post-Activities Achievement in Ability to Create Creativity used PROSFD[ak] Module Learning

Group	n	Mean	SD	t	Significance Value
Pre-Activities	40	19.3	4.5	-14.97	.05
Post-Activities	40	39.1	7.2		

Table 5 shows that the pre-activities mean score for achievement (n = 40) is 19.3 (SD = 4.5), while post-activities (n = 40) is 39.1 (SD = 7.2). The difference in mean score between pre-activities and post-activities is 19.8. This indicates that PROSFD[ak] module lesson is able to increase students' ability to create creative imagination using PROSFD[ak] module learning among low achieving students. Hence, there is significantly higher score with value $t(78)$ = -14.97, $p < .05$. The finding shows that the null hypotesis is rejected. Therefore there is a significant difference in ability to create creative imagination using PROSFD[ak] module learning.

8. Implication and Conclusions

This paper has examined the nature exquisiteness based digital photography arts project for creativity enhancement among low achievers students (PROSFD[ak]) by employing the Isman model. The effectiveness of the modules was tested and it was found that the module was effective for low achievers students. In addition, it was found that the three null hypotheses were rejected because there were significant differences in achievement between pre-activities and post-activities using the PROSFD[ak] module learning. The outcome of this study will hopefully enhance the process of teaching and learning in art education particularly in vocational secondary school through the promotion of the use of photography lesson to enhance creativity among students and for career opportunities in the arts field.

Need For Mobile Learning: Technologies and Opportunities

İdris GÖKSU[a102], Bünyamin ATICI[b]

aMardin Artuklu University, Vocational Higher School of Midyat 47500, Mardin, Turkey
bFirat University, Faculty of Education 23119, Elazig, Turkey

Abstract

Along with the fast developments in mobile technologies, the need to learn mobile learning has become more important. The easy usage and easy accessibility of these mobile devices have made them more significant than ever. This study gains importance in extend of the need for mobile learning and meeting the new learning conditions. In addition, handling the current and the future mobile learning and suggesting some new ideas about it are also considered as important topics.

Keywords: mobile learning, mobile devices, mobile technologies, augmented reality

INTRODUCTION

Along with the development of information and communication technologies, their positive impacts particularly on universities and their extensive use, new and strategic methods have been developed related with them. The inclusion of e-learning in the learning process and its becoming widespread as a component of traditional education has caused positive changes in extend of pedagogical, technological and economic aspects (Birch & Burnett, 2009). The need to access to the information regardless of time and place has increased the effects of mobile technologies and mobile learning, and it has also brought new strategies to learning process (Uysal & Gazibey, 2010).
A great number of researches have been done and plenty of methods that can facilitate learning have been developed for years. In fact, the Chinese Philosopher Confucius summarized learning 2400 years ago as his following quote:
　　"I hear and I forget. I see and I remember. I do and I understand."

The fact that learning through mobile technologies we mostly use nowadays as a means of getting the necessary information comply with Confucius' description of learning suggests that these devices should be used in learning environments and they should be given more importance. Particularly, using mobile telephones more than the computers and their accessibility to the popular pages such as Facebook, Youtube, and Twitter indicate that they have the potential to be used in learning environments. In recent years, the efficiency of constructivism learning method, the transition from computer based learning to web based learning and the improvement in technologies have made mobile learning as one of the most popular learning styles (Yamamoto, 2011).
The researches show that the data transferred through mobile networks have increased dramatically. This increase in data transferring points out that people are using mobile technologies more often and they usually prefer to use these environments in order to access information. In Figure 1, the uploading and downloading traffic in mobile devices can be seen clearly.

Definition of Mobile Learning

Along with the fast developments in mobile and computer technologies, new methods in this area have also emerged besides traditional ones. As a result of this, mobile learning methods and especially web based distance learning have gained importance (Yildirim, Goktas, Temur, & Kocaman, 2004).

Distance education is a method that has appeared as a result of the distance between teachers and students (Moore, 1973). On the other hand, Bates (2006) suggested that distance education is neither good nor bad, but trying to get the benefit of educational technologies is an important subject. Distance education is an educational method rather than a philosophical approach. It is a method that students study on their own wherever they want without coming face to face with teachers. This education method has developed correspondingly with technology since its emergence. With the developments in technology, the lack of interaction in the distance education system has started to disappear, and the trends of both individuals and governments towards distance education have changed immensely. Therefore, the technology with its changes has influenced the individuals in distance education environments (Bates, 2006). E-learning and distance education has been supported by governments due to the economic competition, lifelong learning, social equality and accessibility, better education, cost effectiveness, commercializing of education and geographic reasons (Bates, 2006). Bates (2006) has also suggested that neither e-learning nor distance education can solve the problems, but they perpetually go on developing (Bates, 2006). One of the methods used web based distance education is mobile learning. There is no definite explanation for mobile learning in education; however, it can be defend as easy and flexible learning due to the fact that it occurs regardless of time and place using portable mobile devices (Kıcı, 2010). Keagen (2005) stresses the mobility of mobile learning while defining it. Mobile learning enables students to learn outside the class through mobile phones or tablet PCs, and it can be accepted as perfect form of flexible learning (Seppala& Alamaki, 2003). In general, mobile learning can be defined as a type of learning that takes place through portable devices which provide its users to meet their needs within seconds in terms of accessing ever-changing data and communicating with others without sticking to anything and anywhere.

Mobile Devices

Along with the developments in information technologies, wireless communication and mobile devices have been started to be used in order to support the traditional learning (Wang at al., 2004).

Wireless communication techniques may help student obtain the necessary information. Besides this, it also teachers and the learning systems can direct students to the information by using these techniques. Therefore, students can use their mobiles or PDAs (Personel Digital Assistant) in order to access to the information they need (Wang, Liu, Horng, & Chen, 2003).

In our modern life, it is possible to outline the mobile devices used in mobile learning as the following:

a) Laptop: Laptops and another kind of it, known as notebook, are some of the portable devices that are mostly used in our daily life. These laptops can have all the properties of a normal PC. Due to being manufactured through advanced technology, being made up of valuable pieces of this technology, and their difficulty during installation, their cost is quite high. These laptops enable users to obtain the information they want by means of such wireless connection types as USB, wireless network, Bluetooth and infrared devices independent from time and place.

b) Tablet PC: Tablet Pc is the most popular computer of our time which is a portable personal computer typically smaller than a notebook computer but larger than a smart phone, and it is easy to transfer the data by means of its internet and memory device. It is a kind of computer usually having 7 or 10.1 inch-touch screen.

c) PDA (Personal Digital Assistant): Personal Digital Assistant, also known as palmtop computer, is a mobile device that functions as a personal information manager such as keeping addresses or names. It has the ability to connect to the internet and, it is also portable. With the developments in electronics and computer technology, the size of computers has become smaller and features of them have increased. The production of computers having the features of camera, video and GPS have expanded, but it has also started to give its place to smart phones.

d) Smart Phone: It is a kind of communication device that has been designed by adding the features of PDA. Due to the fact that smart phones have mobile operating system and many applications, they are very common devices used actively in all areas for different purposes. As it can be seen from the Figure 2, the number of smart phone users is increasing day by day.

Mobile Technologies

In order to provide the mobile devices with online communication or communication with the other mobile devices, there are four different communication or connection technologies used, and these are *GPRS*, *Wireless(Wi-Fi)*, *Bluetooth* and *Infrared*. These communication technologies are available in some mobile devices. The mobile devices that do not have these technologies are supplied with communication ability by using one of the transferring technologies such as USB, Compact Flash Card and PC Card (PCMCIA). *Wi-Fi,* which is mostly preferred in mobile devices, is a technology that provides devices such as personal computers, play stations and digital audio players with wireless internet. The other technology that increases the applications and efficiency in mobile devices is *Augmented Reality (AR)*. AR technology, having developed in a very short time, has proved to be innovative and efficient technology in order to solve some kinds of problems. AR can be defined as an interactive device between human and computer, which has been developed by a computer in real world environment (Nee,Ong, Chryssolouris, & Mourtzis, 2012).

AR technology can be used in smart phones (Android, iPhone), tablet PCs (Android, iPad), desktops and internet-based applications. It is though that AR technology will be used actively in mobile applications and it will bring different approaches in learning. Traditionally, orientation educations are given by tour guides or they are given on line. However, these methods do not erect conscious learning. With AR technology, the mobile learning carried out by means of smart phones that include video camera and internet connection or thorough a GPS technology makes learning conscious, easy and unlimited. The AR technology is very important technology in terms of being user-centered, visualizing the processes it does and providing real-time feedback. This technology arouses interest among learners and reinforces learning (Chou,& ChanLin, 2012).

Mobile Cloud Computing technology is a kind of service that provides common data sharing among the data processing devices through its performance to deliver data online. MCC offers a wide range of opportunities for mobile service sector by making computing recourses available in mobile devices on a data network (Yang, Cao, Tang, Li & Chan, 2012). Mobile learning devices and technologies instantly provides interaction between the learners and the teachers, among classmates or with learning systems (Wang, Liu, Horng, & Chen, 2003).The learning devices are able to be used intensively in managerial and educational processes in many associations, and

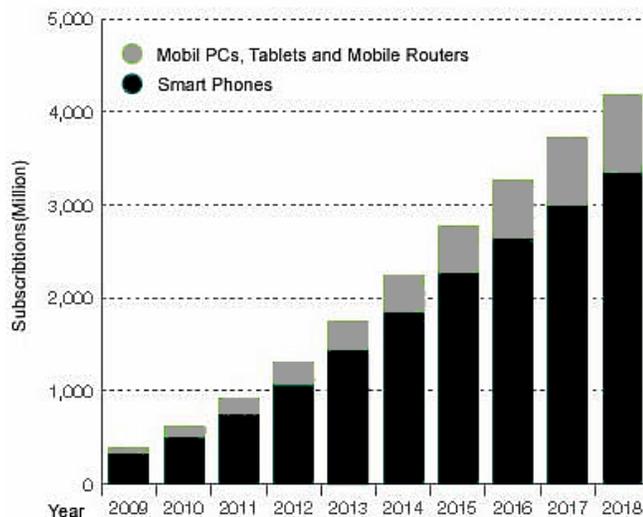
they also play an important role in developing interaction within the classes or outside the classes in educational institutions. Ericsson, being one of the leading communication technology companies in the world, estimates in the report published in 2012 that the number of people using mobile devices will exceed 4 billion in 2018 (Ericsson, 2012). It is possible to see in Figure 2 that the use of mobile devices has been widespread particularly in recent years.


Figure 2.Smartphone, PC, Mobile Routers and Tablet Subscriptions with Cellular Connection 2009-2018(Ericsson, 2012)

It is thought that however much mobile technologies and devices improve, it is not possible to get to the expected performance and success as long as they are not used in learning environments depending on the theoretical base. Therefore, the design of mobile learning environments and environment becomes more of an issue.

The design of mobile learning environments

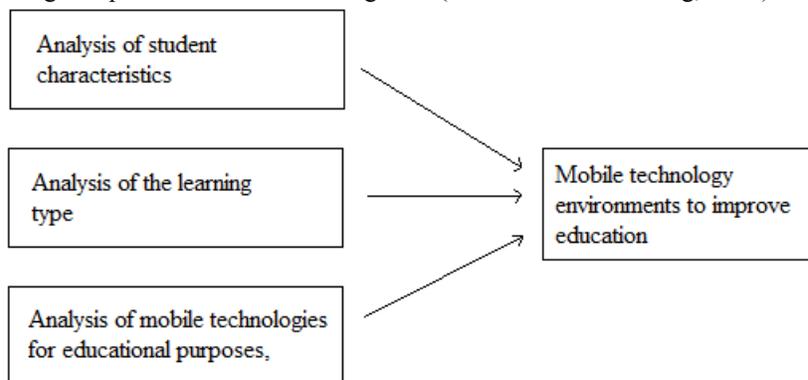
The researches carried out for years in the realm of education have been done in order to provide effective, productive and permanent learning. Besides this, mobile learning, which has recently been one of the main focuses of the educators, is believed to have influenced the learning process. Mobile learning environments have importance in providing effective learning according to such certain approaches as Knowledge Objects and Learning Objects. According to Trifonova, mobile learning should support and guide students and teachers about when and where the learning situations are necessary (Trifonova, 2003).The technologies to be used in mobile learning environment should have the following components as showed in Figure 3 (Dickersen & Browning, 2009):


Figure 3.Educational Development Components (Dickersen & Browning, 2009)

Not being lost in hyperspace in the process of accessing to the required data is very significant issue in terms of practicality for the users.   Not being lost in hyperspace is defined as the users know where they are on the net and know how to get the intended pages (Conklin, 1987). Using surfing items and tools that will help the users find the information they want, paying attention to the individual differences among them and using simple interfaces are important aspects in the extend of preventing users from getting lost in hyperspace (Conklin, 1987).

Mobile usage is a developing field. The researchers studying on computer-human interaction suggest that to understand the psychological, agronomical, collaborative and social factors which define how the human-being work in order to produce computer systems are important (Kukulska-Hulme, 2007).

Before attempting to use the mobile technologies in education, the other aspect that is supposed to be studied is technology roadmap. By using this technology roadmap, it is possible to practice and implement the predictions about the mobile technologies, to provide long term planning and management, and also to increase the effectiveness and productiveness. This effectiveness and productiveness will increase the quality of education, as well. Therefore, a technology roadmap is needed. This roadmap will play an important role as a bridge in accessing to future targets in mobile learning in terms of product, service and technology (Uysal & Gazibey, 2010).

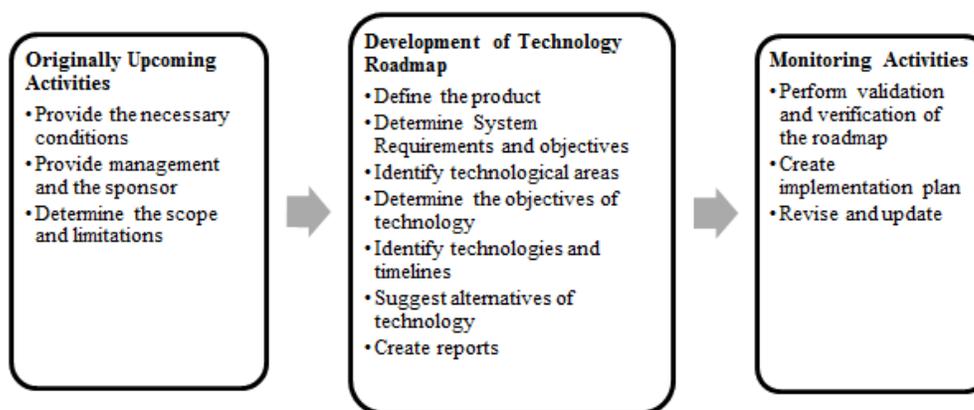
The features of Technology Roadmap may include the processes shown in Figure 4:


Figure 4.The Phases of Technology Roadmap(Garcia, & Bray, 1997)

Mobile Learning Applications

When looking at the developments in mobile technology, it is possible to see METIL (Mixed Emergenging Technology Integration Lab) that has put the mobile applications such as Microsoft Mobile Learning Project, Mobile Sports Pulse, TUSK, Johnson & Johnson, Allogy, which were all established in the USA in 2006 in order to research and develop modern technology, into effect.

Besides this, many mobile learning projects have been put into practice in Europe for teachers' education, pedagogical development, and educational support and research.

*Table 1.*Some Mobile Learning Projects in Europe *(Unesco, 2012)*

FIELD OF INTEREST	INSTITUTION	COUNTRY
Teachers' Education and Pedagogical Development	MoLeNET	England
Management Support	UnivMobile	France
	Mobilskole	Norway
	Yorkshire Coast College, Mobile Oxford	England
Instructional Support	Mobile in Salford, University of Leeds Medical School, Priory School, Apps for Good	England
	Distance Learning for Apprentices	Turkey, Spain, Portuguese germany and Denmark ,
	REACH	Turkey, Italy, Norway and Spain
	Presemo	Finland
	WapEduc	France
	ENVI GAME	The Czech Republic
	BlackBerry Academic Program	In many Countries
Research	MOTILL	Hungary, Ireland, Italy, England

In Turkey, some universities, companies, and public institutes have been developing and using some applications about mobile learning. By means of the project called Fatih Project in Education (2006-2010) prepared by Ministry of National Education, it is thought that mobile devices will be used more extensively, the tendency to mobile learning will increase and also the objectives mentioned in Table 1 will be implemented.

Table2.Objectives of Fatih Project in Education (MEB, 2012)

OBJECTIVES OF FATIH PROJECT IN EDUCATION
• To develop life-long learning, make the individuals improve themselves through e-learning, to improve the e-content they use
• Every student graduating from a high school should have the ability to use information technology and basic knowledge
• By means of using internet effectively, one out of every three should get the benefit of e-education services,
• Offering every individual opportunity to use and learn information and communication technology
• One out of two should be internet user
• To make the internet a safe environment for all the community

The Advantages of Mobile Learning

Lifelong learning, peripheral learning, learning when needed, autonomous learning, situated learning and learning depending on the conditions, which are known to be applied through distance learning, were not be able to implemented completely due to some difficulties and limitations. Therefore, Mobile Education have helped a great deal to these learning situations and types (Bulun, Gülnar, &Güran, 2004;Sharples, 2000; Vavoula ve Sharples, 2009). According to Sharples, the more the learning becomes student-centered and individualized, the better and the more personalized the new technologieswill be (Sharples, 2000).In Table 3, the implementation and realization of lifelong learning through new technologies has been shown.

Table 3.Comparing Communication and Information Technology to Lifelong Learning (Sharples, 2000)

Lifelong Learning	New technology
Individual	Personal
Learner-centered	User-centered
Static	Mobile
Collaborative	Network
Available everywhere	Available everywhere
Lifelong	Permanent

Mobile learning provides students with individual study and online resource opportunities. Being easy updateable, being assessed by the students and providing feedback can also be considered as some of its advantages (Jacob&Issac, 2008). It is possible to support the activities of students and teachers thanks to the developments in mobile technologies. (Trifonova & Ronchetti, 2004).It is a great freedom for the learners to start and stop or even interrupt learning process whenever and wherever he/she wants. Until recently, it was common to experience some problems such as cable need in order to access to web-based learning environment, nondurable batteries and difficulty to access to the internet. Thus, it was almost impossible to create the desired free atmosphere for learning (Bulun, Gülnar, & Güran, 2004). However, today, by means of the tablets whose functionality has increased, more developed smart phones, durable batteries, accessing to the internet easily have made mobile devices more usable.

Results and Discussions

In this information age, the importance of information is increasing more and more, and this has led the institutions to look for new methods in order to access the information. Some experts define the devices, especially the internet which plays an important role in the process of transferring information as a technology so as to implement different approaches in education. However, it should be known that these technologies are not produced for educational purposes or transferring information. Otherwise, it is possible to encounter some problems such as time loss in education due to the fact that they will be directly implemented in education without analyzing, determining a technology roadmap, assessing its suitability for education. On the other hand, even if these technologies have been developed with the imperialist approach, they have an important role in education in terms of efficiency and making learning an enjoyable activity after being aware of the fact that they know how to take the advantage of them.

In recent years, the projects that have been carried out for the purpose of both instructional support and increasing the functionality have increased the interaction between the teachers and students.

Using mobile learning environment gives learners an opportunity to access the information whenever and wherever they want. Therefore, mobile devices which are sometimes criticized as one of the learning tools and which are developing in extend of size and features have recently been used intensively and they have increased the effectiveness of learning environments. To adopt mobile technologies simply as a means rather than a target while preparing plans and programs will provide more effective usage. It is predicted that Augmented Reality will develop and it will increase the efficiency of mobile learning, and also it will be very common in educational institutions. In order to get the benefit of mobile devices, the first thing that should be done is to have one. Thus, along with obtaining these devices easily through some institutions and companies, getting a place in the culture shows that mobile learning applications can be applied to a wide mass. There have been many researches on distance education, e-learning and mobile learning for years. These researches have concluded that these kinds of learning have supported learning, increased the interaction and contributed to the persistency in learning; however, it has also been concluded that it is on its own, never adequate for learning.

[a]Chang Gung University of Science & Technology, Taiwan
[b]National Formosa University, Taiwan

Abstract

This study was designed to examine the pre- and in-service nursing professionals' perceptions of using computers to facilitate language learning as a way of consideration for future English for nursing purposes (ENP) instruction. Participants were 197 students in a nursing college in southern Taiwan. Findings revealed the differences in the student participants' overall perceptions of using computer technology to facilitate language learning, including (1) the participants felt benefited using computers to aid their language learning mostly in the area of reading skills development, followed by vocabulary skills, listening skills ,and writing skills.; (2) statistical significance was noted in terms of students' perceptions of computer-mediated learning in English speaking based on their division/rank using an ANOVA test; (3) a Pearson Product-Moment Correlation analysis revealed a statistically significant, positive association between participants' perceptions of using computer to facilitate language learning and their self-evaluation of their macro English proficiency.

Keywords: Computer-Mediated Langue Learning; Nursing Education; English for Specific Purposes

Background & Introduction

1.1 Challenges Facing Nursing Communities

As good knowledge and good communication are essential, nurse education, and nursing communities are faced with several dilemmas and challenges in terms of discipline-specific language learning and pedagogy. At school, the majority of subject-specific textbooks and professional journals are written in English, though many more have been translated into local language(s) for better comprehension. In addition, many academic lectures are delivered via the means of English. Students are urged to read and write in English as they will be expected to do so in the future. Consequently, those who receive more adequate language education/training can be a value added readiness as soon as they enter the workforce. At the work place, nursing professionals are counted on reading and following doctors' orders, writing nursing notes, and entering records, often times in English. Nurses who are proficient in English language can better address their patients' needs via effective communication. Both the student and in-service nurses recognize the necessity of English and how unequivocal important it is for professional success, better job opportunities, and updating their medical knowledge.

In the process of acquiring abilities and knowledge of the second language (SL) or foreign language (FL), similar to many other professional disciplines, English learners in the nursing communities often have to make switches between what have been described as the goal-oriented needs (Belcher, 2009). That is, what they need to know with their knowledge in order to succeed in their school subjects and/or professional careers. The former is known as the EAP, English for academic Purposes and the later is known as the EOP, English for Occupational Purposes (Dudley-Evans & St. John, 1998). The best fitted EOP for nursing professionals is the English for Nursing Purposes, or ENP, that can be furthermore divided into pre-experience, in-service, and post-service types. Perceived needs and perceived effectiveness of the English language by the pre- and in-service professionals seem to have been driving the current research on English for Nursing Purposes.

1.2 Purpose of the Study

This study was designed to provide insight into how pre- and in-service nursing professionals' demographic profiles contributed to their perceptions of computer-mediated language learning, how participants' perceived effectiveness of computer-mediated learning impacted their English learning, and how self-evaluation of English proficiency impacted their perceptions of using the computer to facilitate language learning.

1.3 Research Questions

The researchers sought answers to these following questions:

1. Are there any meaningful relationships between students' perceptions of computer facilitated learning and computer facilitated *language* learning?
2. Are there any significant differences in students' perceptions of computer facilitated language learning based on demographics?
3. Are there any meaningful relationships between participants' perceptions of using computer to facilitate language learning and their self-evaluation of their macro English proficiency?

Literature Review

2.1 Computers and the Nature of Teaching/Learning

It is not uncommon to see computer uses in disciplines such as foreign languages, mathematics and sciences, just to name a few. For instance, in an English composition class the computer can be used for providing and receiving useful and just-in-time feedback that can contribute to the quality of student writing. It can also be used for facilitating the process of writing so that students and teachers or students and students can interact with the content in meaningful ways that are difficult with pencil and paper in a traditional classroom (student engagement/ skill mastery). The technology used in linguistic expression, be that speech or text, is expanding our capabilities to interpret, understand and infer ideas in other symbol system (Kozma & Johnston, 1991). Taking advantage of today's virtual reality technology, students in Asia are able to take an interactive field trip (Yu, et al., 2008) to The Franklin Institute Science Museum in Philadelphia, Pennsylvania, USA, without having had to travel one-half way around the globe. Educational uses of technology cannot go unnoticed, and the list of technology coming to classrooms can't be overstated.

Because technology continues to advance in capacities and capabilities (Yu et al., 2008), the computer is gaining popularity in mainstream classrooms. Students are getting accustomed to reading electronic texts on a e-reader or on a personal computer, a mobile device, and have found themselves closer to home by sharing and exchanging files and scholastic ideas through familiarized instant messengers (IM), web blog, bulletin board systems (BBS), and/or, if not "the" most popular, social networks. Every day computers become more capable of storing, processing, and analyzing larger amounts of data faster and in a much more effective and organized manner. Teachers can easily craft and/ or edit their lesson plans and tests and can generate more complex yet meaningful student records with computers. By doing so they may even be able to cut down on the paper consumption! In addition, Yu et al (2008) and Vogel & Klassen (2001) state that the adaptive nature of computer technology permits teachers to cater to students' learning needs, addressing a variety of learning styles and abilities. Software companies have also been striving to produce more affordable, yet high-quality programs to meet the needs in a diverse environment. Teachers who teach with technology seem to be able to better promote the emerging educational trends of collaborative (partnering) learning, cooperative learning, and autonomous (individualized) learning (Annand & Haughey, 1997; Kozma & Johnston, 1991; Vogel & Klassen, 2001; Wheeler, 2001).

2.2 Computer-Facilitated Language Learning

In the early 1980s, technology and personal computers became more accessible and affordable to most people; educators (Phillips, 1987; Underwood, 1984) believed that computer-mediated language learning for instructions should be used more widely in language classrooms. According to Girard, Mandera and Marchini (2001), computer-mediated language learning can be defined as a strategy of learning combined with technology, and language application software to enhance learners' language proficiency by allowing students to manipulate utterances, encourage problem-solving skills, and create simulated learning environments through Internet service providers. Second language learning needs to be integrated with the computer because it promotes (1) learning with vast language data, (2) simulates real-life situations, (3) encourages interaction in class, and (4) promotes individualization in a large class (Warschauer & Healey, 1998). Lai and Kritsonis explained that computer-mediated language instruction can also (a) improve practices for students through experiential learning, (b) encourage learning

motivation, (c) enhance student achievement, (d) increase authentic materials for study, (e) encourage greater interaction between teachers and students and students and peers, (f) emphasize individual needs, and (g) enlarge global understanding" (Lai & Kritsonis, 2006). Despite some of the disadvantages and challenges of using technology and computers as supplementary learning tools in teaching, educators believe that technology and computer-mediated learning instruction help language learners to discover the target language at their own pace and have the potential for promoting communication and teamwork among students (Chen, 1995; Cavalier & Klein, 1998). As technology becomes more advanced, many ESL instructors are now incorporating language lessons with multiple media into their classrooms. Yu, Williams, Lin, & Yu (2007) revealed that "the potential of multimedia is to foster the level of interactivity as a form of learning and to offer many possibilities for enriching the knowledge" (p.219). As Teririll (2000) stated "[English as a second or other language] ESOL teachers and learners across the country are integrating computers, Internet and multiple media with ESOL instruction. The world has changed because of the Internet [and other electronic devices] and ESOL has changed with it" (p. 2).Using computers and multimedia, such as Internet, web page and streaming audio, with a web-based instruction, provide a learning environment that facilitates positive interdependence and collaborative team work for students (Lee, 2000).

The usefulness of computer-mediated language learning to second language learners in education has been widely studied. In 2003, Zha et al.(2006) examine ESL learners' communicative competence in a computer-mediated language learning environment. They used both qualitative and quantitative statistical methods to analyze 956 electronic discussion messages that were posted by those elementary ESL students. The results of this study suggested that electronic discussion boards can be used to promote language learners' writing skill as well as the target language usage. Kang (1995) conducted a study on the effectiveness of different instructional approaches on Korean students' English vocabulary learning. The results indicated that students performed significantly higher in a retention test when using a computer-based context instructional approach and concluded that a computer-mediated learning environment would enhance learners' vocabulary learning. Warschauer (1996) concluded that "electronic discussion can be a good environment for fostering use of more formal and complex language, both lexically and syntactically" (p. 22). The World Wide Web (WWW) and electronic mail (e-mail) communication media also have a tremendous impact on enhancing students' language competency. In 1996, Rosen conducted a study on how students used computers with Internet access as the language learning medium to improve their English language proficiency. The result indicated that students using the Internet as a primary tool in learning English scored slightly higher on the TOEFL test compared to students using the direct instruction method in learning English. Wang (1996) investigated the effectiveness of using e-mail as a writing tool for dialogue journaling. Fourteen students who were enrolled in intermediate level reading and writing class participated in this study. The findings indicated that students in the e-mail group generated more language functions in each writing session than students in the paper-and-pencil group and concluded that using e-mail as a language learning tool facilitates language learning.

Even if some might argue, the teaching of English for Specific Purposes is well developed in the Western countries. In non-English speaking countries, there has been a recent increase in the number of higher education institutions and in increase in the number of students attending there institutions. This increase in the number of university structures, especially of scientific and technological expertise, is not accompanied by any development in teaching programs, and in particular as pertains to the teaching of English for Specific Purposes. The current situation regarding the teaching of this specialty at vocational or technical faculties in the non-literary institution is characterized especially by a lack of human recourses and adequate teaching material (Harrabi, 2010). In a what is typically regarded as a medical/nursing science oriented academic institution, very little time is available for English courses. The primary goal of teaching/learning English is to enable students to read medical and/or scientific texts written in English. Thus, the reading skill is always the most emphasized, whereas the writing skill is ranked second, listening skill being the third, and the least attended speaking skill.

Since the nature of computer technology has granted enormous as well as exciting opportunities for health care education, it is imperative for us to investigate English learners can make effective of computer technology for their academics that further leads to much more successful careers.

Methodology

3.1 Research Design
This quantitative study involved a combination of descriptive and correlational research. A descriptive design was used to identify the differences in the student participants' overall perceptions of computer facilitated teaching/learning and their perceptions of using computer technology to facilitate language learning. A correlational (associational) design was also used to help investigate the possible relationships between the variables under study. In this study, the variables were: 1. participants' demographics, 2. participants' overall perceptions of computer facilitated teaching/learning, 3. participants' perceptions of using computer to facilitate language learning, and lastly, participants' self-evaluation of their macro English proficiency.

3.2 Sampling of the Participants
The accessible student population for the study was approximately 2000 nursing major students enrolled in a regional campus of Taiwanese Nursing Institute during the 2010-2011 academic year, fall semester. These students were fairly evenly divided into 40 classes, 22 classes of which were 4-year and 2-year college students and the remaining 18 classes were continuing education students. The researchers used a convenient sampling technique to select the subjects for the study. In the end, 197 students participated in this study, accounting for approximately 1/10 of the overall population. The participants varied in their age, the length of their professional work experience, experience of using computers for learning, and were at different stages of their degree, as far as their class rank was concerned. Mass majority of the participants were female nursing students, accounting for nearly 93% (183 of 197). The youngest participant was 18 years old, with the oldest participant being 32. The mean age of the students in this study was 20.56 years. Nearly all of the participants were full time students and one tenth of the participants were employed either full-time or part-time as nurses. Most of them had worked in the range of 0~5 years.

As shown in Table 1, three quarters of the participants were 4-year college students, and less than a quarter of them were continued education students.

Table 1. Frequency and percentage analysis of the participants by division/rank

Division/Rank	Frequency	Percentage
4-yr College Freshmen	49	24.90
4-yr College Sophomores	36	18.30
4-yr College Juniors	34	17.30
4-yr College Seniors	32	16.10
Continued Education	46	23.40
Total	197	

3.3 Instrumentation
A fairly large scale self-report survey was used to collect data for this study. The instrument was developed by the researcher based on information obtained from the review of literature in the area of computer-facilitated instruction/learning (Mazdayasna & Tahririan, 2008; Kenny, 2000; Kern, 2006), using the three abovementioned research questions as a guide:

The questionnaire was made available monolinqually in student's native language, Mandarin Chinese in order to avoid receiving any false response due to misinterpretations of the item(s). It contained 47 itemized descriptions that are made up of a number of sections:

First section included a mix of multiple-choice and open-ended questions. Participants was asked to specify demographic variables such as gender, age, class rank, grade point average (GPA), employment status, their experience in computer use for learning.

The remaining questions were in four-point Likert scale format, with number 1 being Strongly Disagree (SD) , number 2 being Disagree (D), number 3 being Agree (A), number 4 being Strongly Agree (SA), and Not Applicable (NA). Subsequent sections measured the perceptions of computer-facilitated teaching/learning, the perceptions of

using computer technology to facilitate language learning in the area of English Listening, Speaking, Reading, Writing, and Vocabulary learning. Last section asked the students to self-evaluate of their macro English proficiency.

3.4 Validity and Reliability of the Instrument
In order to establish the content (face) validity of the instrument, the researchers presented it to a panel of experts, who were asked to validate the content of the survey instrument by ensuring the overall inclusiveness of all the variables under investigation and to verify that it addressed all the research questions. The experts were also asked to review the survey for things such as unclear instructions, confusing, ambiguous or repetitive items, and overly complex or difficult sentence structure. The researchers then revised the instrument based on the constructive feedback received from the reviewers.

To establish the reliability of the survey instrument used, the researchers employed a test/retest method using 25 students, the number of students in a regular class size. These students were not the subjects for this reported study. The identical survey was completed by the participants twice. There was a waiting window of one week between the first and second administration of the instrument. In addition to the test/retest method, the researchers also performed Cronbach's Alpha reliability test. Cronbach's Alpha values for various sections of the instrument ranged from 0.82 to 0.91.

3.5 Data Collection, Procedures & Analyses
The researchers asked selected students to participate in the study. Upon arrival to each class, the researchers introduced themselves, explained the purpose of the visit, emphasized that participation was totally voluntary, and then administered the questionnaire to the participants. Voluntary participation was ensured both through explicit verbal and written explanations. The participants could withdraw from the study at any time and that their participation would in no way influence their academic standing in the class where the questionnaires were distributed. Participants were informed verbally and in writing that they could decline to answer any items on the questionnaire. The subjects gave their consent by completing and returning the questionnaire. Data analyses included the used of summary descriptive statistics, cross tabulations, test for equality of variance, t tests, correlations, ANOVA and post hoc tests.

Findings

4.1 Survey Responses
A total of 240 students were enrolled in the selected classes. Among which, 197 students participated in the time of the study, resulting in a participation rate of 82%.

In this study, the means for Likert scale items were interpreted using the scale shown in Table 2.

Table 2. Interpretation of Likert Scale Mean Score Values

Interpretation of Mean Score Values	
Scale	Description
1.00-1.49	Strongly Disagree
1.50-2.49	Disagree
2.50-3.49	Agree
3.50-4.00	Strongly Agree

4.2 Results

Research Question 1: Are there any meaningful relationships between students' perceptions of computer facilitated learning and computer facilitated language learning?

Perceived Effectiveness of CML & CMLL
The overall mean score of students' responses for items, which were used to assess the participants' perceived effectiveness of computer-mediated learning, was 3.21, indicating students in general held an "agreed" view of the overall effectiveness of computer-mediated learning. And the overall mean score of their perceived effectiveness of computer mediated language learning was 3.23. Similarly, students in general held an "agreed" view of the overall effectiveness of computer-mediated learning.

Table 3 shows the Pearson Product- Moment Correlation of students' perceived effectiveness in the area of computer-mediated learning and computer mediated language learning (r = .55, p. < .01). The result revealed that there was a statistical significant, *moderate* positive association between the two variables.

Table 3. Pearson Product-Moment Correlation of Students' Perceived Effectiveness of Computer-Mediated Learning and Computer-Mediated Language Learning

Variables	Computer Mediated Learning
Computer-Mediated Language Learning	.55*

* Correlation is significant at the .01 level (2-tailed).

Research Question 2: Are there any significant differences in students' perceptions of computer facilitated language learning based on demographics?

An independent sample T-test did not reveal a statistical significant difference between male students and female student, $t(197)$ = 0.116, p > .05, for survey items intended to solicit male and female students' perceptions about computer facilitated language learning. Their mean scores nearly stood identical (Male=3.24 vs. Female=3.23).

Table 4 shows the result of the homogeneity of variance assumption for the participants' perceived effectiveness of computer-mediated learning in English *speaking* based on division/rank. The test score indicated that the assumption was not violated with $p.$ > .05.

Table 4. Test Score for the Homogeneity of Variance Assumption of the Participants' Perceived Effectiveness of Computer-Mediated Learning in English Speaking Based on Division/ Rank

Levene's Test Statistic Based on GPA	p
1.49	.208

As illustrated in Table 5, a one-way analysis of variance (ANOVA) was used to examine if there were significant differences of participants' perceived effectiveness in computer-mediated learning in English speaking among groups based on their division/rank. The results indicated that there was a significant difference among groups F (4, 192) = 3.08, $p.$ < .05.

Table 5. ANOVA Test of Participants' Perceived Effectiveness of Computer-Mediated Learning in English Speaking Based on Division/Rank

Source of Variation	Sum of Squares	df	Mean Square	F	p
Between Groups	2.94	4	.74	3.08	.02*
Within Groups	45.95	192	.24		
Total	48.89				

*$p \le .05$.

In order to identify where the difference identified by the ANOVA occurred, the researcher performed a Tukey HSD post hoc test shown in Table 6. The test revealed that freshman students were significantly different (M = 3.01), from junior students (M = 3.33). Students with higher rank tended to perceive higher the overall effectiveness of Computer Mediated Learning in English speaking than students with lower rank.

Table 6. Post Hoc Test (Tukey HSD) of Participants' Perceived Effectiveness in Computer-Mediated Learning in English Speaking Based on Division/Rank

Base Group	Base Group Mean	Compare Group	Compare Group Mean	Mean Difference	p
Junior	3.33	Freshman	3.11	.22*	.03

*$p. \leq .05$.

Research Question 3: Are there any meaningful relationships between participants' perceptions of using computer to facilitate language learning and their self-evaluation of their macro English proficiency?

Self-Evaluation of Macro English Proficiency
The overall mean score of students' responses for items that asked students to self-evaluate their macro (Listening, Speaking, Reading, Writing & Vocabulary skills) English proficiency was 2.45. Students in general held a "Disagreed" or "Conservative" view.

Table 7 shows the Pearson Product- Moment Correlation between the two variables (r = .28, p. < .01), indicating a statistical significant, *low* positive association.

Table 7. Pearson Product-Moment Correlation of the Perceptions of Using Computers to Facilitate Language Learning and Self Evaluation of Macro English Proficiency

Variables	*Perceptions of Using Computers to Facilitate Language Learning*
Self-Evaluation of Macro English Proficiency	.28*

*Correlation is significant at the .01 level (2-tailed)

Discussion & Conclusions

This study supports researchers' claims that conducting classes in a computer-mediated learning environment can effectively facilitate students' knowledge construction (Kasper, 2002) and that adequate use of computer technology can strengthen learners' higher cognitive skills and complex thinking skills (Rakes, Fields & Cox, 2006) by providing significant evidence via students' responses agreeing that effective computer-mediated learning allows knowledge building (that helps relate facts to reality) and promotes in-depth and advanced learning. This finding also supports Cooper & Hirtle's (1999) observation as they reported that through a constructivist pedagogical approach, students could not only obtain the intended skills but in addition, acquire other skills necessary to solve the real world problems.

ANOVA analyses did not reveal any significant differences based on gender. It might be interpreted that there were no variant views about the effectiveness of computer-mediated teaching/learning among the participants in this female predominant (93%) industry. No significant differences were found among groups of employment as nurses and length working as nurses may have suggested that the great majority (90%) of the participants were full time students in school. Even the remaining students had been employed as either full-time or part-time nursing workers, almost all had accumulated experience of less than 5 years.

This study adds to the literature that there was a statistically significant, moderate positive association between students' perceived effectiveness of computer-mediated learning and computer mediated language learning. Correlational analyses between individual items of the two variables revealed that this association especially holds true between students' views of computer mediated learning and their believing that effective computer-mediated learning provides best help in the area of *English Listening*.

More specifically, itemized correlational analyses indicated a statistically significant positive association between "Computer mediated teaching/learning enhances the conventional face-to-face classroom experience" and "With the help of the computer technology, I think I can become more proficient in English in listening to instructions in real

situations (hospitals/clinics)." Similarly, the study found a significant positive association between "Computer mediated teaching/learning enables effective communication with the teacher and peers" and "With the help of the computer, I think I can become more proficient in English in listening to patients, colleagues, and fellow students." The possible explanations for the findings could be that the computers help stretch teaching/learning as well as communications beyond conventional classrooms. Aside from acquiring additional benefits and skills which were not intended for the purpose of the class(es), students are likely to choose more authentic learning tasks that are especially related to academics and practices.

Statistically significant, positive relationships were found between participants' perceptions of using computer to facilitate language learning and their self-evaluation of their macro English proficiency. Further correlational analyses revealed that computer mediated learning in English *writing* received the highest correlational scores whereas computer mediated learning in English *reading* had the lowest score, suggesting that the higher the participants' rated their own English abilities, the more they believe that the computer can facilitate more successful English learning in writing. The likelihood shifted downward in the case of English reading.

The mean score (M=2.45, "Disagree") for students' self-evaluation of their macro English proficiency was quite significantly lower than that in other categories, perceptions of computer mediated learning (M=3.21) and perceived effectiveness of computer mediated language learning (M=3.23), respectively. One possible explanation for this tangible finding was that students in Southeast Asia have always been taught to be humble or not to be overly confident. On the flip side of the coin, it might well be that students were simply too unconfident to manifest their true English abilities.

In summary, many factors other than those presented in this study might and could influence students' perceptions, as well as their perceived effectiveness of computer-mediated instruction/learning. It takes explicit knowledge, support and cooperative efforts among administrators, teachers and students to ensure teaching and learning are indeed benefitting from the computer technology.

Öğrenme Nesneleri Üzerine Bir İnceleme

İsmail TONBULOĞLU[a][104]

ᵃ Yıldız Teknik Üniversitesi, Enformatik Bölümü, 34349, İstanbul, Türkiye

Abstract

A Review on Learning Objects. Learning tools and learning environments have been changing with technology integrated learning and teaching approaches. One of the results of the changes is to utilize learning objects in learning environments. The previous studies in the field of education demonstrated the importance of using learning objects by placing emphasis on its characteristics which are considering learners' individual characteristics, reusability, improvability, portability. In this study, a literature review was conducted to examine studies on learning objects in Turkey. This study will contribute to the literature by identifying the need for development of using learning objects and helping researchers who would like to carry out study associated with learning objects.

Keywords: learning objects, learning object repository, instructional materials

Özet

Eğitime yansıyan çeşitli teknolojilerle öğrenme araçları ve öğrenme ortamları farklılaşmaktadır. Bu değişimin yansımalarından biri olan öğrenme nesneleri öğretim ortamlarında yer almaktadır. Eğitim üzerinde yapılan çalışmalarda bireysel özellikleri göz önünde tutabilme, tekrar kullanılabilme, geliştirilebilme, taşınabilme özelliklerinden dolayı öğrenme nesneleri ön plana çıkmaktadır. Araştırma kapsamında Türkiye'de yapılan öğrenme nesnelerine kapsamındaki çalışmalar incelenerek bir literatür taraması yapılmıştır. Çalışma öğrenme nesnelerine dönük yapılabilecek çalışmalar açısından ve öğrenme nesnelerinde geliştirilmesi gereken alanları ortaya çıkarmak açısından literatüre katkı sağlayacaktır.

Anahtar kelimeler: öğrenme nesnesi, nesne ambarı, öğretim materyalleri

Giriş

Eğitime yansıyan gerek teknolojik gelişmeler gerekse değişen öğrenme ortamları birçok etkenden dolayı farklılaşmaktadır. Eğitim ortamında meydana gelen farklılıklar öğrenme ve öğretme ortamlarına da yansımaktadır. Bir diğer farklılaşma ve değişim ise öğretim teorileri çerçevesinde gerçekleşmektedir. Birçok ülkede eğitime yönelik geleneksel bakış açısı hızlı değişime uğramaktadır (Koper, 2003). Değişimi ortaya çıkaran sebepler ise şu şekilde ifade edilebilir:

- Öğrenme için daha bireysel yaklaşımlara ihtiyaç talebi,
- Bireysel farklılıklara göre bilginin uzun süreli hafızada kodlanması,
- Ürüne dönüklük, tartışmaya ve işbirliğine olan ihtiyaç,
- Bilgi yığını meydana getirmek, depolamaktan çok, analiz etme, eleştirel yaklaşım gibi daha karmaşık becerilerin edinilmesine olan ihtiyaç,
- Edinilen, öğrenilen becerilerin geçerliliği, akreditasyonu ve hayat boyu öğrenme gerekliliği.

Eğitim ortamlarında meydana gelen değişiklikler eğitim araçlarında da kendini göstermektedir. Eğitim - öğretim kurumlarının birçoğu eğitimin kalitesini, etkiliğini ve verimliğini artırmak için gelişen teknoloji ve yaklaşımlardan faydalandıkları ve destek aldıkları görülmektedir. Bu yaklaşımlara örnek olarak çeşitli teknolojileri

kullanarak bireyin eğitim ortamına getirilmesi yerine; bireye özgü eğitim ortamını, bireyin istek ve ihtiyaçlarına göre şekillendirerek bireyin dahil edilmesi uygulamaları verilebilir. Bu yaklaşımdan yola çıkarak etkili, hızlı ve kalıcı öğrenmeyi gerçekleştirebilecek, oluşturmacı bir eğitim ortamı sağlayacak, yaşam boyu eğitim yaklaşımına katkı sağlayacak ve bireyselleştirilmiş öğrenme ortamlarını destekleyecek bir yapıya ihtiyaç duyulmaktadır. Böyle bir ihtiyacı cevaplama sürecinde geleneksek eğitim ortamında yer bulan "eğitim-öğretim materyalleri" bir değişime uğramış dünyada kabul gören "Öğrenme Nesneleri" adını almıştır(Türel, 2008). Öğrenme nesnesini Wiley (2000) "Öğrenmeyi desteklemek için yeniden kullanılabilen dijital kaynaklardır" olarak ifade etmiştir. Diğer bir tanımda Rehak ve Mason (2003) "Teknoloji destekli öğretim süresince kaynak teşkil eden, kullanılabilen veya yeniden kullanılabilen dijitalleştirilmiş nesneler" olarak ifade etmiştir.

Bir diğer açıdan DLNET(gidital Library Networkfor Engineering an Technology) öğrenme nesnelerinin, öğretimi ve öğrenmeyi kolaylaştıracak biçimde yüksek kalitede bilgi içeren yapılandırılmış kaynaklar şeklinde ifade etmektedir. Yapılandırılmış ifadesi ile öğrenme nesnelerinin geçerli bir hedef içermesini ve hedef kitleye yönelik olması gerekliliğini ifade etmektedir. DLNET öğrenme nesnesini tanımlarken "öğrenme" ve "nesne" kavramlarında içerdikleri özellikler şunlardır:(DLNET,2001; Aktaran:Karaman 2005);

- Konu gerçekliği ve doğruluğu.
- Öğretimsel değer.
- Hedefe ilişkin kaynaktaki bilgilerin ilgililiği.
- Kolaylıkla bulunması ile öğretmen ve öğrenciler tarafından kullanımı gibi dağıtım sonrası faydalarını ortaya koyacak nesne özellikleri.
- Öğrenme nesnesinin teknik olarak güvenirliği.

Öğrenme nesneleri hedeflenen ve amaçlanan kazanımlara odaklanılan küçük öğrenme birimlerini temsil eden bir ders, ünite yada bölümden daha küçük öğeler olarak ifade edilebilir(Macromedia, 2003). Örneğin tarihi bir olayı anlatan video, ders içerisinde konuya dönük egzersiz alıştırmaları derste kullanılan bir öğretmen, öğrenme nesnelerini öğretim ortamında yer vermiş olur(Van Lee ve diğerleri, 2002:Aktaran Karaman, 2008).

Öğrenme nesnelerinin tekrar kullanılabilirlik" ve "Üstveri" (metadata) özellikleri bu nesnelerin sürdürebilir bir şekilde kullanılabilmesini sağlamaktadır. Öğrenme nesneleri içerdikleri üstverilerle birlikte nesne paketleri oluşturmaktadır. Üstveri ise nesneyi tanımlayan, ifade eden, açıklayan ve konumunu ifade eden bir tanıtımsal bilgidir(Karaman,2005). Öğrenme nesnelerinin üsteveri (metadata) bilgileri içerik hakkındaki bilgileri de bize sağlamaktadır. Dilimler halindeki bilgilerin sunulduğu öğrenme nesnesleri en önemli ve güçlü yanı tekrar kullanılabilir özelliğini barındırmasındır(Duval ve diğerleri, 2011). Ayrıca SCORM uyumlu ve Üstveri yapısını içeren yapıda öğrenme nesnelerinin tasarlanması ve hazırlanması modüler eğitime, web tabanlı eğitime ve uzaktan eğitime entegre edilebilen, öğrenme araçları oluşturulmasını sağlamaktadır(Northrup, 2007). Öğrenme nesnelerinin eğitim öğretim ortamlarında tekrar kullanılabilir ve kolay ulaşılabilir olması açısından bu nesneler "öğrenme nesnesi ambarı" olarak isimlendirilen birikim alanlarında toplanmaktadır. Öğrenen bireyler öğrenme nesnelerine "Öğrenme nesnesi ambarları" üzerinden doğrudan ulaşarak da öğrenmeler gerçekleştirebilirler veya öğreticiler bu veritabanlarında bireysel olarak öğrenme nesnelerinden yararlanabilirler(Barritt & Alderman, 2004)

Öğrenme Nesnelerine Dönük Yapılan Çalışmalar

Güler (2010) "Öğrenme Nesnesi Tasarım ve Geliştirme Süreci: Bir Tasarım Tabanlı Geliştirme Örneği" isimli doktora tezinde öğrenme nesnesi geliştirme süreci gerçekleştirilerek bu süreçte yaşanan sorunların belirlenmesi, belirlenen sorunlar doğrultusunda sürecin tekrar tasarlanarak gerçekleştirilmesiyle sorunlara öneriler getirilmesi, bu önerilerin sınanması ve değerlendirilmesi amacıyla gerçekleştirmiştir. Öğrenme nesneleri geliştirme süreçleri tasarlanarak süreçte yaşanan sorunlar, sürecin etkililiği, çalışma grubunu oluşturan öğretmen adaylarının bu süreçteki öz yeterlilik algıları ve öğrenme nesneleri hakkındaki bilgileri ölçülmüştür. Literatür kapsamında önce öğrenme nesnesinin tanımına, kapsamına, özelliklerine ve kullanılabildiği ortamlar açıklanmış; öğrenme nesnelerinin tasarımı, kullanımı, geliştirilmesi ve değerlendirilmesiyle ilgili çalışmalara yer almıştır. Araştırmanın yöntemi tasarım tabanlı araştırma olarak belirtilmiştir. Araştırmanın çalışma grubunda öğretmen adayları yer almıştır. Çevrimiçi görüşmeler, sistemin forum kayıtları, sistem kayıtları, değerlendirme işlemine yönelik video kayıtları, eğitim yazılımı geliştirme öz-yeterlik algısı ölçeği ve öğrenme nesneleri hakkında bilgi belirlemeye yönelik ölçme aracı de veri toplama aracı olarak kullanılmıştır. Çalışma kapsamında tasarım, geliştirme, uygulama, değerlendirme ve tekrar tasarım basamaklarına yönelik veri analizleri ayrı ayrı belirtilmiş ve incelenmiştir. Araştırma bulgularından, öğrenme nesnesi geliştirme sürecinin, öğretmen adaylarının eğitim yazılımları geliştirme öz-yeterlik algıları ve öğrenme nesnesi hakkındaki bilgileri üzerinde anlamlı bir etkisinin olduğu sonucuna

ulaşılmıştır. Değerlendirmeler sonucunda, geliştirilen öğrenme nesnelerinin teknik anlamda ve içerik anlamında başarılı bulunduğu ifade edilmiştir.

Cebeci (2003) "Öğrenim Nesnelerine Giriş" isimli çalışmasında öğrenme nesneleri genel olarak tanıtımına, avantajlarına ve özelliklerine yer vermiştir. Öğrenme nesnelerinin farklı tanımlarına ve isimlerine yer verildikten sonra üzerinde uzlaşılan bir tanımının olmadığı belirtilmiş, tanımların geneline bakıldığında öğrenme nesneleri şu biçimde özetlenmiştir: "Bir öğrenim nesnesi, (learning object), bir kitabın bölümü, bir harita, bir etkileşimli bilgisayar yazılımı, bir video, bir şematik çizim, bir simülasyon gibi bir şeyleri öğretmek veya öğrenmek için kullanılabilen ayrışık veya bağımsız bilgi parçaları olup sanal olarak veya elektronik olarak kullanılabilir durumda olan herhangi bir şeydir". Öğrenme nesnelerinin temel yapısının iki bölümden oluştuğu belirtilmiş, bu bölümler şema ve örneklerle açıklanmıştır. Bu bölümlerden biri olan "tanımlayıcı bilgi" (metadata) üzerinde durulmuş, öğrenme nesnelerinin yeniden kullanılabilirlik, üretilebilirlik, uydurulabilirlik, satılabilirlik, esneklik, güncelleme-arama ve içerik yönetim kolaylığı özellikleri açıklanmış, öğrenme nesnelerindeki içeriklerin özelliklerine değinilmiştir. Öğrenme nesnelerinin kolay bir şekilde paylaşılması için tanımlamaların ve SCORM gibi standartların geliştirilmesi gerektiği vurgulanmıştır, yaygın kullanımı için ise çok farklı çeşitlerde öğrenme nesnelerinin üretilmesi ve öğretmenlerin bu konularda eğitilmeleri gerektiğini ifade etmiştir. "Eğitimciler, öğrenim nesnelerini kullanma konusunda rahatlık duymalı ve öğrenim nesnelerini bulma ve oluşturma konusunda çalışma ihtiyacı hissetmelidirler" şeklinde öğrenme nesnelerine dönük fikrini belirtmiştir.

Arslan (2011) "Flash ile Reusable Mobil Öğrenme Nesneleri Üretimi" isimli çalışmasında Flash CS5 programı kullanılarak yeniden kullanılabilir yani "reusable" öğrenme nesneleri üretiminin nasıl yapılabileceği bir örnekle yer vermiştir. Yazar önce neden bu programı seçtiğini anlatmış, sonra da kullandığı yöntem ve araçları belirtmiştir. XML dilini kullanarak, Flash'ta bir defa ürettiği içeriğin diğer dersler için basit bir şekilde çoğaltılabileceğini ve yeniden kullanılabilirliğinin artacağını ifade etmiştir. Ayrıca çalışmada geliştirdiği programı ve geliştirme aşamalarına yer vermiş, bu türde yeni öğrenme nesnesi şablonlarının oluşturulması önerisinde bulunmuştur.

Acun (2009) çalışmasında, öğrenme ve araştırmayı desteklemek için tasarlanan kaynakca.info sitesinin tasarımını ve uygulamasını ele almıştır. Çalışma kapsamında önce öğrenme nesneleriyle ilgili temel kavramlara ve Türkiye'deki uygulamalara yer verilmiş, sonra da sitenin tasarım ve uygulaması incelenmiştir. Bulgularda da site istatistikleri verilmiş, sitenin aylara göre ziyaretçi sayıları ve üye sayısı belirtilmiş, üye profillerinden bahsedilmiştir. Türkiye kaynakçası adı verilen sitenin Türkiye'de bir ilk olması ve sosyal- beşeri alanları içermesi yönüyle değerli olduğu belirtilmiştir.

Akkan ve diğerlerinin (2009) çalışmasında yaklaşık yüz adet öğrenme nesnesi içeren bir öğrenme nesnesi ambarı tasarlanmış, sonra da bu nesne ambarının teknolojik ve pedagojik açıdan değerlendirmesini araştırma kapsamında yapılmıştır. Araştırmada içerisinde öğrenme nesnelerinin tanımından ve avantajlarından bahsedilmiş, öğrenme nesnelerinin uygun tasarlanmalarının önemi literatürden örnekler gösterilerek vurgulanmıştır. Nesne ambarının pedagojik ve içerik açısından değerlendirmesini 64 eğitimci; teknoloji açısından değerlendirmesini ise 46 materyal ve web tasarım uzmanı gerçekleştirmiştir. Tasarlanan öğrenme nesnesi ambarının değerlendirilmesi amacıyla iki farklı anket geliştirildiği belirtilmiş, anketlerin güvenirlik katsayıları verilmiştir. Anketlere verilen cevaplar yüzde, frekans ve ortalama olarak değerlendirilmiş, sonuçlar tablolar halinde sunulmuştur. Bulgular incelendiğinde pedagojik açıdan nesnelerin sayı olarak yeterli görüldüğü, içerik geliştirme sisteminin daha sade olması gerektiği, öğrenme nesnelerinin etkileşimlerinin yeterli seviyede olduğu, matematiksel ilişkilerin keşfedilmesine ve eğlenceli bir öğrenme ortamının oluşturulmasına bu öğrenme nesnelerinin katkı sağlayabileceği ifade edilmiştir. Tasarım açısından ise nesne ambarı sade ve kullanımı kolay olarak ifade edilmiş, güncellenmesi ve sürekliliği açısından uygun özellikler taşıdığı belirtilmiştir. Öğrenme nesnesi ambarlarının pedagojik ve teknolojik açıdan incelenmesi önerisine yer verilmiştir.

Ceylan (2008) "Öğrenme Nesnelerinin Tasarımı ve Öğrenme Süreçlerinde Kullanımının Öğrencilerin Başarı Düzeylerine Etkisi İle Öğrenme Süreçlerine Katkıları" isimli yüksek lisans tezinden öğrenme nesnelerinin kullanışlılığı, eğitim süresince kullanımının başarıya etkisi, öğrencilerin kullanıma yönelik duygusal tepkileri ve kullanım sürelerini araştırmıştır. Literatürde önce öğrenme nesneleriyle ilgili kuramsal çerçeve ifade edilmiş, öğrenme nesnelerinin yapısı, özellikleri ve tarihi gelişimi belirtilmiş, ardından yurtiçi ve yurtdışından konuyla ilgili araştırmalar örneklendirme yapılmıştır. Araştırmada nicel ve nitel yöntemler birlikte kullanılmıştır. Deney ve kontrol grubuna ön test ve son testler yapılmıştır. Ayrıca çalışmadaki deney grubuyla ayrıca görüşmeler yapılmıştır. Veri toplamak için uygulama sınavları, raporlar, öğrenme nesnesi değerlendirme formu ve görüşme formu kullanılmıştır. Deney ve kontrol grubu arasında başarı açısından anlamlı bir farklılık oluşmamış, öğrencilerin öğrenme nesnelerini kullanırken sorun yaşamadıkları, olumlu bir tavır sergiledikleri belirtilmiştir.

Atasayar (2008) "Kavram Öğretimi Sürecine Yönelik İçerik Geliştirme Aracının Tasarlanması ve Kullanışlılığı" isimli yüksek lisans tezinde kavram öğretimi için hazırlanan öğrenme nesnelerinin üst verilerinin

belirlenmesi ve içerik geliştirenlere yardımcı bir öğretim aracının geliştirilmesi amacıyla gerçekleştirmiştir. Çalışmada kavram öğretimiyle ilgili yaklaşımlar ve kavram öğretiminin aşamaları belirtildikten sonra öğrenme nesneleri tanıtılmış, öğrenme nesnelerinin etiketlenmesi ve paketlenmesiyle ilgili standartlara ve araçlara yer verilmiştir. Araştırmada üstveri standartları, içerik paketleme aracı ve aracın kullanışlılık değerlendirmesine yer verilmiştir. Araştırmanın çalışma grubunu, öğrenme nesnesi yaklaşımlı içerik geliştirmekten sorumlu 3 kişi oluşturmuş, kontrol listesi, gözlem ve görüşme formları kullanılmıştır. Araştırma bulguları yorumlanarak, öğretmenlerin KÖSİG aracını kullanmak isteyecekleri ve içerik geliştirme sürecinde hazırlık sürecinin gerekli olduğu ifade edilmiştir.

Çağıltay ve diğerleri (2001) "Tekrar Kullanılabilen Öğrenme Nesneleri (TEKÖN) ve Örnek Bir Çalışma" isimli çalışmasında tekrar kullanılabilir öğrenme nesnelerinin kullanılma nedenleri, sağladığı yararlar ve eğitim açısından önemi vurgulanmıştır. Eğitim sistemlerinde bilginin bileşenlerinden ve öğretme- öğrenme stratejilerinden bahsetmiştir. TEKÖN'lerin çevrimiçi bir eğitim sisteminde kullanım örneğine yer verilmiş, Amerika'da Türkçe eğitimini hedefleyen bir yazılımı öğretme-öğrenme stratejileri doğrultusunda değerlendirerek konuya bir örnek ifade edilmiştir. Çalışma sonuçları şu şekildedir;

- Öğrenme nerede ve ne şekilde gerçekleşirse gerçekleşsin günümüzdeki modern bilgi teknolojilerinin etkin olarak kullanımı sayesinde desteklenebilir ve kalitesi arttırılabilir.

- Öğrenme nesneleri, bir öğrenme sistemi içindeki, SÖYLE ve GÖSTER işlemlerine ve SOR ve YAP eylemlerine yönelik olarak tanımlanmalıdır. Bu durumda tanımlanacak olan öğrenme nesnelerinin bir kısmı sistemin veritabanını oluştururken, diğer kısmı sistem üzerindeki insan ve bilgisayar iletişimine yönelik fonksiyonları ve sistemin kullanımına yönelik bilgisayar arayüzlerinin belirlenmesini sağlayacaktır.

- Bu aşamaların her birinde nesneye dayalı bir yaklaşımın izlenmesi mümkündür ve bu tür bir tasarım sistemin bütünü açısından, öğrenme nesnelerinin yaygınlaştırılmasını ve sistemin esnek bir yapıya kavuşturulmasını sağlayacaktır.

Çakıroğlu ve Baki (2006) "E-Öğrenme Ortamları İçin Tekrar Kullanılabilir Öğrenme Nesneleri Tasarımı" isimli çalışmasında tekrar kullanılabilir öğrenme nesneleri geliştirmek için tasarım öncesinde ve tasarım aşamasında neler yapılması gerektiğine yer vermişlerdir. Giriş bölümünde öğrenme nesnelerinin kullanılma sebepleri, öğrenci ve öğretmenlere sundukları olanaklar, öğrenme materyallerinin taşıması gereken özellikler, öğrenme nesnelerinin farklı tanımları ve sunduğu avantajlardan bahsedilmiş, eğitimde nasıl kullanıldığıyla ilgili örnekler verilmiştir. Öğrenme nesnelerinin tekrar kullanılabilmesini sağlamak için geliştirme aşamasından önce nesnenin hangi konularda kullanılabileceğinin öngörülmesi ve buna göre senaryo üretilmesinin gerekliliğinden bahsedilmiş, bu doğrultuda bir senaryo geliştirilmiş, farklı derslerde kulanılabilecek öğrenme nesneleri örnekleri verilmiştir. Ardından öğrenme nesnelerinin tasarım ve geliştirme aşamasında XML, Java gibi yazılım dillerinin kullanımının getireceği avantajlardan bahsedilmiş, tekrar kullanılabilirliğin nasıl sağlanacağı üzerinde durulmuştur. Öğrenme nesnelerinin pedagojik uygunluğunun eğitim bilimciler tarafından sürekli izlenmesi gerektiği belirtilmiş, farklı e-öğrenme ortamlarının geliştirilmesi gerektiği vurgulanmıştır.

Gürol ve Türel (2007) "Öğrenme Nesnelerinin Tasarımı" isimli çalışmasında öğrenme nesnelerinin tasarımında dikkat edilmesi gereken konular ve tasarım problemleri tartışılmış, çözüm önerilerine yer verilmeye çalışılmıştır. Öğrenme nesnelerinin sınırlılıklarının ve yaşanan sorunların genelde tasarım hataları sonucu ortaya çıktığı ifade edilmiş, öğrenme nesnelerinin yeniden kullanılabilirlik, parçalara ayrılabilirlik gibi özellikleri dikkate alınarak oluşturulması gerektiği vurgulanmıştır. Öğrenme nesnesi tasarımında öğretim tasarımının rolü ifade edilmiş, öğretim tasarımı teorilerinin öğrenme nesnesi tasarımına olumlu ve olumsuz etkilerine yer verilmiştir. Sadece öğrenme nesnesi tasarımına yönelik geliştirilen Cisco RLA Modeli ile Sallas ve Ellis'in "anlat, göster ve yap" model önerisi anlatılmıştır. Brown ve Voltz'un aktivite, senaryo, dönüt, iletim/sunum, bağlam ve etki prensiplerini barındıran tasarım yönergesi ile Morris'in tasarım yönergesi ifade edilmiş, Vercoustre ve McLean'ın nesne tasarımını ele alış şekli gösterilmiştir. Hem oluşturmacılık, hem de davranışçılık dikkate alınarak ileri sürülen nesne tasarımı önerileri yer alan çalışmada, nesneye yardım özelliğinin eklenmesine, önce öğretim hedefinin açıklanmasına, kontrolün öğrencide olmasına, öğrencinin çalıştığı yeri ya da aldığı notları daha sonradan görebilmesine, gezinti düğmeleri gibi tasarım öğelerinin benzer şekilde oluşturulmasına, farklı düzeylere hitap eden tasarımlara, konuyla ilgili materyallerin nesneye eklenmesine dikkat çekilmiştir. Nesne tasarımlarında klasik öğretim tasarımı modellerine bağlı kalmak yerine bu modellerin nesnelere yönelik uyarlanmış şekillerini ya da doğrudan nesneler için geliştirilen yeni tasarım modellerini uygulamalarda temel alarak çalışmak gerektiği vurgulanmıştır.

Karaman (2005) "Öğrenme Nesnelerine Dayalı Bir İçerik Geliştirme Sisteminin Hazırlanması ve Öğretmen Adaylarının Nesne Yaklaşımı İle İçerik Geliştirme Profillerinin Belirlenmesi" isimli doktora tezi

çerçevesinde bir öğrenme nesnesi ambarı (Atanesa) tasarlanmış, öğretmen adaylarının bu sistemi ve öğrenme nesnelerini nasıl kullandıkları ve bu konu hakkındaki görüşleri belirlenmeye çalışılmıştır. Araştırmanın ilk aşamasında nesne ambarı (AtaNesa) ve NYS adı verilen nesneye dayalı yazarlık aracının bulunduğu bir sistem hazırlanmıştır. İkinci aşamasında ise öğretmen adaylarının bu nesne ambarındaki nesneleri birleştirerek ders içeriği üretmeleri sağlanmış, bu doğrultudaki görüşler ve kullanım şekilleri incelenmiştir. Literatür kapsamında önce nesne yaklaşımı ve öğrenme nesneleri hakkında genel olarak bilgi verilmiş, nesne ambarlarının tanımlarından, işlevlerinden ve pedagojik boyutlarından bahsedilerek nesnelerin paketlenmesi ve içeriğin sıralanması ile ilgili genel bilgilere yer verilmiştir. Nitel ve nicel yöntemlerin birlikte yer aldığı araştırmada kimya bölümü öğretmen adayları ile uygulama gerçekleştirilmiştir. Çalışma neticesinde elde edilen bulgular doğrultusunda daha fazla ulusal ve özel nesne ambarı geliştirilmesi, nesne ambarlarının farklı kriterlerde arama yapmaya imkan sağlaması, geliştirilecek yazarlık aracının mümkün olduğu kadar basit olması, hazırlanan içeriklerin biçimsel ve anlamsal olarak tutarlı ve kaliteli olması, hizmetiçi ve hizmet öncesi eğitimlerde teknoloji kullanımı ve dijital kaynaklara erişim konuları üzerinde daha fazla durulması gerektiği önerileri yer almıştır.

Karaman ve diğerleri (2007) "Öğrenme Nesnelerinin Pedagojik Boyutu ve Öğretim Ortamlarına Kaynaştırılması" isimli çalışmada öğrenme nesnesi yaklaşımı ile davranışçılık, oluşturmacılık ve durumlu öğrenme yaklaşımları arasındaki ilişkiyi araştırılmıştır. Çalışmada öğrenme ortamlarına bu nesnelerin nasıl dahil edilebileceği, nasıl kullanılabileceği yönünde bilgilere de yer verilmiştir. Öğrenme nesnesi yapılanmasına dönük düşünler çalışmada aktarılmıştır:

- "Öğrenme nesnesi yaklaşımında öğretim, öğrenme nesnelerinin bir araya getirilmesiyle oluşur. Bu yüzden öncelikle öğrenme yaklaşımları temel alınarak bu nesnelerin nasıl bir araya getirileceğinin ortaya konması gerekir (Baruque ve Melo, 2003). Aslında en iyi sonucu verecek pedagojik bir modelin bulunmaması, öğrenme nesnelerinin kullanımı yönündeki en büyük problemlerden biridir (ADL, 2003)."

- "Nesneler, öğretmenler için iki şekilde faydalı olur. Birincisi daha az zaman harcadıkları için öğrencilerin bireysel ihtiyaçlarıyla ilgilenmeye daha çok zaman ayırabilir ve ikincisi ise gama ışınları ya da dopplerefekti gibi gerçek hayatta tasviri zor ya da imkânsız olan karmaşık kavramların sunumunda dijital simülasyonlar şeklindeki öğrenme nesneleri kullanabilir (Chapuis, 2003a)."

- "Öğretmenlerin öğrenme nesnesi bulma ve kullanmasına yardımcı olmak amacıyla onların örnek uygulama ve siteleri görme imkânına sahip olacağı oturumların düzenlenmesi, bu oturumlarda ortak çalışmalara karar verilmesi ve öğretmenlerin bu konuda çevrimiçi dersler almaya ikna edilmesi gibi çalışmalar yapılabilir (Bratina ve diğer., 2002)."

Yazarlara göre öğrenme yaklaşımlarının hemen hepsi öğrenme nesneleri modeliyle uygulanabilir prensipler içerir. Öğrenme nesnelerinin davranışçılıkla doğal bir uyum içerisinde olduğunu belirten yazarlar; bunun sebebini küçük adımlar, öğrenmenin aşamalılığı, dönüt ve tekrar gibi ilkelerin nesnelerin kullanıldığı ortamların tasarımına ve nesnelerin kullanımına rehberlik etmesi olarak belirmişlerdir.

Koplay (2005) "Çevrimiçi Eğitimde İçerik Yeniden Kullanımına Çözüm Olarak Bir Web Tabanlı Öğrenme Nesnesi Geliştirme Aracının Tasarlanması ve Gerçekleştirilmesi" isimli yüksek lisans tezinde öğrenme nesnelerinin yeniden kullanılabilirliğini sağlamak amacıyla bir üniversite ortamında web tabanlı eğitim için içerik geliştirmeye yönelik bir çözüm geliştirilmeye çalışmıştır. Kurum düzeyinde içerik geliştirmek için bir sistem geliştirilmiştir. Böylelikle öğrenme nesnesi geliştiren kişilerin sadece içeriğe dönük çalışmalarını amaçlamıştır. Literatürde yeniden kullanılabilirlik yönüyle öğrenme nesneleri ele alınmış, öğrenme nesnesi geliştirme yaklaşımlarından ve içerik modellerinden bahsedilmiştir. Kurumda uygulanan sistemin uygulama aşamaları anlatılmış, sistem özelliklerine yer verilmiştir. Bu sistem sayesinde konu uzmanlarının diğer teknolojilerden mümkün olduğunca soyutlanarak sadece kendi uzmanlık alanı olan konuya yoğunlaşabilmelerine imkan verilmiştir.

Türel (2008) "Öğrenme Nesneleri İle Zenginleştirilmiş Öğretim Ortamlarının Öğrenci Başarıları, Tutumları ve Motivasyonları Üzerindeki Etkisi" isimli doktora tezinde öğrenme nesnelerinin kullanımının, öğrencilerin akademik başarıları, tutumları ve motivasyonları üzerindeki etkisini araştırmıştır. Sürece ilişkin öğrenci ve öğretmenlerin görüş ve algıları değerlendirilmiştir. Literatürde öğrenme nesnesinin tanımından, avantaj ve sınırlılıklarından bahsedilmiş, öğrenme nesnelerinde olması gereken özellikler ve öğrenme nesneleri modelleri tanıtılmıştır. Hem nicel, hem de nitel yöntemlerin kullanıldığı bu araştırmada 7. sınıflara yönelik Fen ve Teknoloji dersi materyalleri Moodle sistemi üzerinden yayınlanmış; öğrencilerin akademik başarıları başarı testiyle, tutumları tutum ölçeğiyle, motivasyonları ise Keller'in geliştirdiği motivasyon ölçeğiyle ölçülmüştür. Araştırmadanın nitel veri toplama sürecinde ise öğrenci öz değerlendirme formlarından, öğretmen haftalık değerlendirme formlarından, gözlem ve görüşmelerden yararlanılmıştır. Bu uygulamanın avantajlı ve dezavantajlı yönleri ergonomi- ortam

açısından, ilgi ve motivasyon açısından, öğretim açısından ve teknik açıdan ele alınmış ve şekillendirilmiş, bulgular ışığında bu veriler analiz edilmiştir. Araştırmada öğrenme nesnelerinin akademik başarıyı ve öğrenmede kalıcılığı olumlu yönde etkilediği tespit edilmiş, tutum üzerinde sınırlı da olsa olumlu bir etkiye sahip olduğu belirtilmiş, motivasyonu da olumlu etkilediğine yer verilmiştir. Araştırma sonuçları çerçevesinde uygulama ortamına, öğretmenlere, Milli Eğitim Bakanlığına, öğrenme nesnesi tasarımına ve araştırmacılara yönelik önerilere yer verilmiştir.

Yalvaç ve Bayraktutan'ın (2004) "Elektronik Öğrenme Nesnelerine Erişim ve Metadata" isimli çalışmasında, öğrenme nesnelerinin tanımı yapılmış; temel yapısına, biçimine, getirdiği avantajlara değinilmiş ve metadataların sağladığı yararlar ifade edilmiştir. Konuyla ilgili öğrenme, e-öğrenme, nesne, erişim, metadata tanımlarıyla giriş yapılmış, metadata türleri tanımlayıcı, yapısal ve yönetimsel olarak vurgulanmıştır. Öğrenme nesnelerinin içerik geliştiriciler açısından sağladığı kolaylıklar özetlenmiş, öğrenme nesneleri örneklendirilmiş ve öğrenme nesnelerinin farklı biçimleri üzerinde durulmuştur. Elektronik öğrenme nesnesi verileri ve metadatanın birleştirilmesinin içerik geliştirmede sağladığı olanaklar maddeler halinde belirtilmiş, bu olanakların eğitimi modüler bir yapıya kavuşturacağı ve büyük kolaylıklar sağlayacağı ifade edilmiştir. Öğrenme nesnelerinin tanınması ve standartlaşması için geliştirilen Gateway to Educational Materials, Öğrenme Nesnesi Ambarları, IMS, ADLNet gibi uygulamalardan bahsedilmiştir. E-öğrenme nesnelerinin metadatalarının ulusal ve uluslararası standartlara uygun şekilde belirlenmesinin gerekliliği üzerinde durulmuş, bu sayede daha etkin ve verimli öğrenmelerin gerçekleşeceği vurgulanmıştır.

3. Sonuç

Literatürde öğretmenlerin, öğretmen adaylarının öğrenme nesneleri kullanım durumlarını gibi öğrenme nesnelerine dönük birçok çalışmanın yer aldığı görülmektedir. Ayrıca öğrenme nesnesi ambarı oluşturma çalışmaları da yer almaktadır. Fakat Öğretmenlerin öğrenme nesnesi üretim durumları ve sebepleri; öğrenme nesnesi ambarı kullanım durumları ve sebepleri üzerine çalışmalara rastlanamamıştır. Öğretim ortamında öğrenme nesnesi kullanımının etkin bir şekilde yapılabilmesi için öğretmenlerin öğrenme nesnesi üretim durumları ve sebepleri araştırılmalıdır. Ayrıca öğrenme nesnelerinin temel özelliği olan "tekrar kullanılabilirlik" ve "üstveri" yapılarının işlevsel bir hale gelmesi için öğretmenlerin bu özelliklerin etkin bir şekilde kullanıldığı öğrenme nesnesi ambarlarını kullanım durumları ve sebepleri üzerinde araştırmalara ihtiyaç vardır.

Ülkemizde pilot uygulaması başlayan FATİH (Fırsatları Artırma ve Teknolojiyi İyileştirme Hareketi) projesi ile birlikte standardize olmuş, öğretimsel nesnelere ve bunların biriminin, paylaşımının yapıldığı ortamlara ihtiyaç artacaktır. Öğrenme nesnesi üretimi, tasarımı, standartının yapılması gerekliliği gerek öğrenme ortamları açısından gerekse bireysel öğrenmeler açısından önemini daha da artıracaktır. MEB bakanlığı teşvik edici hizmet içi eğitimler, öğrenme nesnesi geliştirme kursları ve öğrenme nesnesi yarışmaları gibi etkinlikler düzenlemesi bu sürece olumlu katkı sağlayacaktır.

Okulda Dışlanmışlık Ölçeği Geliştirme Çalışması

Bayram ÇETİN[a], Azmi TÜRKAN[b][105]

aGaziantep University bcetin27@gmail.com

bGaziantep University azmiturkan@hotmail.com

Özet

Bu çalışmanın amacı eğitim kurumlarında öğrenim gören öğrencilerin okulda dışlanmışlıklarını ölçmeye dönük bir ölçme aracı geliştirmektir. 19 maddeden oluşan ölçeğin nihai formu Gaziantep il merkezinde eğitim-öğretim gören başarı ve sosyo-ekonomik düzeleri düşük, orta ve yüksek olmak üzere 3 lisenin 402 öğrencisi üzerinde uygulanmıştır. Elde edilen veriler üzerinden ölçeğin geçerliğine ilişkin bilgi elde edebilmek için döndürülmüş temel bileşenler analizi kullanılmıştır. Bu analiz sonucunda ölçeğin iki alt faktörlü bir yapıya sahip olduğu belirlenmiştir. Bunlar araştırmacılar tarafından bireysel dışlanmışlık ve sosyal dışlanmışlık olarak adlandırılmıştır. Madde geçerliğine kanıt olarak madde test korelasyonları hesaplanmıştır. Yapılan istatistiksel işlemler sonucunda ölçeğin bireysel dışlanmışlık alt faktöründe en yüksek madde yükü ,738 en düşük madde yükü ,416 iken sosyal dışlanmışlık alt faktöründe en yüksek ,771 ve en düşük ,538 olarak elde edilmiştir. Ayrıca ölçeğin güvenirliğine kanıt sağlamak amacıyla test tekrar test sonucu ,744 iken Crα güvenirliği ,918 olarak hesaplanmıştır.

Anahtar Kelime: Okulda Dışlanmışlık, Sosyal Dışlanmışlık, Bireysel Dışlanmışlık, Ölçek Geliştirme

Exclusion at school: development of a scale

Bayram ÇETİN   Azmi TÜRKAN

Abstract

The purpose of this study is to develop a scale for assessment of exclusion at school which is experienced by the students attending educational institutions**.** The final scale composed of 19 items which were applied to the 402 students from 3 high schools. These students are studying at schools in the centre of Gaziantep, and their levels of success and socio-economic background are low, medium and high. The principal component analysis rotated to varimax rotation was used to obtain evidence for validity of the scale. As a result of this analysis, it was found that the scale has a structure composed of two factors; a) individual exclusion and b) social exclusion. As evidence of the validity of the test, item correlations were calculated. As a result of the statistical procedures, it was revealed that the highest load factor in individual exclusion is ,738 and the lowest load factor is ,416. On the other hand, the highest load factor in social exclusion is ,771 and the lowest load factor is ,538. Furthermore, to give evidence in terms of the validity of the scale, the re-test and Crα reliabilities were calculated and these were found to be (re-test) ,744 and (Crα) ,918.

Keywords:Exclusion at School, Social Exclusion, Individual Exclusion, Scale Development

Giriş

İnsanoğlu yaradılışı gereği çevresiyle uyum içerisinde olmak, türünün devamını sağlamak amacıyla kendini bir gruba ait hissetmek ve kendi dışındaki bireylerle ilişki içinde olmak zorunda hissetmiştir. Bireylerin bir gruba ait olma ihtiyacını Twenge ve Baumeinster (2005), birinci dereceden yaşam ihtiyaçları olan barınma, yeme ve içme ihtiyaçlarının karşılanmasından sonra en temel gereksinim olduğunu dile getirmiştir. Diğer insanlarla bir arada

---

* Azmi TÜRKAN. Tel.: +905058176453;
E-mail address: azmiturkan@hotmail.com

olabilmeye ilişkin bu temel ihtiyaç, başkaları tarafından, gruptan veya toplumdan dışlanma durumlarında karşılanamamaktadır.

Dışlanma, ilgili literatürde faklı şekilde ifade edilirken, bir bireyin etrafındaki gruba dahil edilmemesi veya başka bireylerle ilişki kuramaması durumunun anlaşılması konusunda ortak bir kanıya varılmıştır (Leary, 2005). Diğer bir ifadeyle bir grup üyesinin ait olduğu grubun dışında tutulması, mevcut bir gruba bireyin kabul edilmemesi veya oluşmakta olan bir gruba dahil edilmemesi olarak nitelendirilebilinir.

Dışlanma kavramı bir çok kavramla birlikte veya bir çok kavramla aynı anlama gelecek şekilde kullanılabilmektedir. Bunlardan en sık kullanılanı sosyal dışlanma, psikolojik dışlanma ve sosyal reddetme kavramlarıdır (Williams, 2007). Bu kavramların aynı anlama geldiğini belirten bir çok araştırmacının (Ferris, Brown, Berry ve Lian, 2008; Oaten, Williams, Jones ve Zadro, 2008) olmasının yanı sıra farklı anlama geldiği görüşü de mevcuttur.

Dışlanma kavramın sosyal boyutta ilk olarak 1960'larda Fransa'da ekonomik kriz ve gerileme sonrası kullanılmaya başlanmıştır. Bu bağlamda dışlanma kavramı daha çok ekonomik bir olgu olarak karşımıza çıkmasının yanı sıra bireylerin fiziksel ve zihinsel engel durumu, suçlu ya da hüküm yemiş olması, hasta ve bakıma muhtac olması, uyarıcı madde kullanması ve asosyal olması gibi kavramlarla özdeşleştirilmiştir. Benzer şekilde Levitas ve diğerleri (2007) İngiltere'de dışlanma kavramının bir çok nedenin olduğu gibi daha çok ekonomik bir unsur olarak kullanıldığına vurgu yapmaktadır. Ayrıca Behrman'ın (2003) Latin Amerika ve Karayipler'de yaptığı çalışmaya göre dışlanmışlığı etnik, dini, coğrafi bölge farklılığı, sosyoekonomik gibi kavramlara dayandırmaktadır.

Dışlanma bir çok alan veya çevrede olduğu gibi eğitim kurumlarında da sık sık karşılaşılan bir durumdur. Marshall ve Calderón (2006) göre eğitimde dışlanmanın üç temel nedeni vardır. Bunlardan birincisi; bireyler arasındaki eşitsizlik. Bu eşitsizliği ekonomik gelirin düşük olması, etnik köken farklılığı gibi etmenlerle temellendirmektedir. İkinci önemli neden ise bazı marjinal grupların çıkarları için devletin bilinçli ve kasıtlı olarak uyguladığı politik tavırlardır. Son olarak bölgeler arası gelir eşitsizliğini göstermiştir.

Bireyler arasında oluşturulan rekabet ortamı, bireylere gelişimsel anlamda en çok katkının sağlandığı okullarda dışlanma kavramını doğurmaktadır. Yani bireylerin en verimli olabilecekleri ortamlar, oluşturulan sistemlerle bireyler arası rekabet duygusunu arttırarak bireylerin birbirleriyle iletişimini en aza indirgeyi hedeflenmektedir (Barro ve Xala-i-Martin, 1995).

Dışlanmışlıkla ilgili çalışmalara bakıldığında genel anlamıyla sosyal dışlanmışlık üzerine yapılan çalışmalar ağırlıkta yer almaktadır (Catanese ve Tice, 2005; DeWall ve Baumeister, 2006; Şahin, 2008; Twenge ve Baumeister, 2005). Ayrıca eğitimde sosyal dışlanma ile ilgili yabancı literatüre rastlanmaktadır (Marshall ve Calderón, 2006; Behrman ve diğerleri, 2003; Wang, 2011 ve Popkewitz ve Lindblad 2000).

Bu çalışma, eğitim kurumundaki öğrencilerin okuldaki dışlanmışlıklarını belirlemek için "Okulda Dışlanmışlık Ölçeği" nin geliştirilmesi amacıyla yapılmıştır.

2.Yöntem

Bu bölümde, araştırmanın modeli, araştırmanın yapıldığı çalışma grubu, veri toplama aracının geliştirilmesi, verilerin toplanması ve çözümlenmesine yer verilmiştir.

2.1.Araştırmanın Modeli

Araştırmacı tarafından geliştirilen Okulda Dışlanmışlık Ölçeğini lise düzeyindeki öğrencilerin dışlanmışlık düzeyin ölçmeyi amaçlayan araştırmada betimsel tarama yöntemi kullanılmıştır.

2.2.Çalışma Grubu

Bu çalışmada amaçlı örnekleme yöntemlerinden başarı ve sosyo-ekonomik düzeylerine göre tabakalandırılmış örneklem seçme metodu kullanılmıştır. Araştırmaya 2012-2013 eğitim-öğretim yılında Gaziantep ili Şehitkamil ve Şahinbey ilçelerine bağlı başarı ve sosyo-ekonomik düzeleri düşük, orta ve yüksek olmak üzere 3 liseden toplam 402 öğrenci katılmıştır. Çalışma grubunda yer alan öğrencilerin cinsiyetleri ve sınıf düzeylerinin dağılımı Tablo 1'de gösterilmektedir.

Tablo 1. Cinsiyet-Sınıf Dağılımı

	Sınıf				Toplam
	1.sınıf	2.sınıf	3.sınıf	4.sınıf	
Erkek	84	71	34	29	218
Bayan	53	61	51	19	184
Toplam	137	132	85	48	402

2.3.Veri Toplama Aracının Geliştirilmesi

Okulda Dışlanmışlık Ölçeği (ODÖ)

Alan yazından elde edilen bilgiler dikkate alınarak araştırmacılar tarafından toplam 35 maddeden oluşan bir ölçek oluşturulmuştur. Ölçeğin deneme formunun hazırlanması aşamasında, yazılan tutum ifadeleri için bir ölçme ve değerlendirme, iki uzmandan görüş ve bir dil uzamının görüşü alınmıştır. Uzmanlardan, ölçekteki maddelerin, okulda dışlanmışlık düzeyini ölçmeyle ilgili maddelerin açıklamadaki yeterliğini ve kullanılan dilin açık ve anlaşılırlılığını değerlendirmeleri istenmiştir. Görüşler doğrultusunda, sözü edilen ölçütler dikkate alınarak ifadeler gözden geçirilmiş 35 maddeden oluşan ölçekten 5 madde çıkartılarak toplam 30 maddelik ölçek pilot uygulamaya hazır duruma getirilmiştir. Pilot uygulamada yer alan 30 maddenin her birini katılıp katılmama durumuna göre '5' Her zaman, '4' Genellikle, '3' Bazen, '2' Nadiren ve '1' Hiçbir zaman biçiminde 5'li likert olarak derecelendirilmiştir. Bunun yanı sıra ölçeğin başına, ölçeğin amacı ve maddelerin yanıtlama biçimi anlatan bir yönerge konulmuştur.

Kişisel Bilgi Formu:

Kişisel bilgi formu araştırmacı tarafından hazırlanmış olup cinsiyet, yaş, okul türü ve sınıfı sorulmuştur.

Okulda Dışlanmışlık Ölçeği Formu (ODÖF):

Öğrencilerin okulda dışlanmışlık düzeyini ölçebilmek için ODÖF geliştirilmiştir. Form 30 maddeden oluşmaktadır. Bu maddelerin 3'ü olumsuz iken, 27'i ise dışlanmışlıkla ilgili olumlu maddelerdir. Ölçekte olumlu ve olumsuz ifadeler karışık olarak sıralanmıştır.

2.4.Verilerin Toplanması ve Analizi

Araştırmaya, 2012–2013 eğitim-öğretim yılı içerisinde Gaziantep ili Şehitkamil ve Şahinbey ilçelerinde bulunan toplam 3 okulda öğrenime devam eden 402 öğrenci katılmıştır. Araştırmacılar tarafından geliştirilen "Okulda Dışlanmışlık Ölçeği" ilgili okullarda uygulanmıştır. Verilerin çözümlenmesinde temel bileşenler analizi kullanılmıştır. Temel bileşenler analizine ait değerlerin yorumlanmasından önce, bu analizin varsayımları olan örneklem büyüklüğünün yeterliği konusunda bilgi veren KMO (Kaiser-Meyer-Olkin) değeri ve değişkenler arasında korelasyon olup olmadığını test eden Barlett Testi (Barlett Test of Sphericity) sonuçları incelenmiştir. Ayrıca analizde faktör özdeğeri (eigenvalue) 1'den büyük olan faktörler dikkate alınmış ve faktör yüklerinin en az 0.40 olan maddeler alınarak asıl ölçek için seçilmiştir. Elde edilen veriler SPSS.20 ve İTEMANN 3.50 paket programları kullanılarak analiz edilmiştir.

3.Bulgular ve Yorum

3.1.Güvenirlik Çalışması

Ölçeğin yapı geçerliğine ilişkin kanıtlar için temel bileşenler analizi kullanılmış, güvenirlik içinse İTEMANN programında madde toplam test korelasyonu ve içtutarlılık anlamında bilgi veren Cronbach Alfa değeri hesaplanmıştır. Ayrıca 2 hafta arayla test tekrar test uygulaması SPSS 20 programıyla yapılmıştır.

Test-tekrar-test uygulaması 2012-2013 eğitim öğretim yılında Gaziantep il merkezi ve merkez ilçelerde bulunan toplam 85 öğrenci üzerinde yapılmıştır. Test tekrar test uygulamasına katılan öğretmenlerin cinsiyetlerinin ve sınıflarının dağılımı Tablo 2'de gösterilmektedir.

Tablo 2. Cinsiyet-Sınıf Dağılımı

		Cinsiyet		Toplam
		Erkek	Bayan	
	1.sınıf	14	16	30
	2.sınıf	12	8	20
Sınıf	3.sınıf	8	10	18
	4.sınıf	10	7	17
Toplam		44	41	85

Ölçeğin boyutlar bazında ve genel iç tutarlık (Cronbach Alfa) değeri ve test tekrara test sonuçları Tablo-3'te verilmiştir.

Tablo 3. Okulda dışlanmışlık ölçeğe ait iç tutarlık ve test-tekrar-test güvenirliği sonuçları

	İç tutarlık(Cronbach Alfa)	Test-Tekrar-Test
Bireysel	,855	,774
Sosyal	,882	,534
Genel	,918	,744

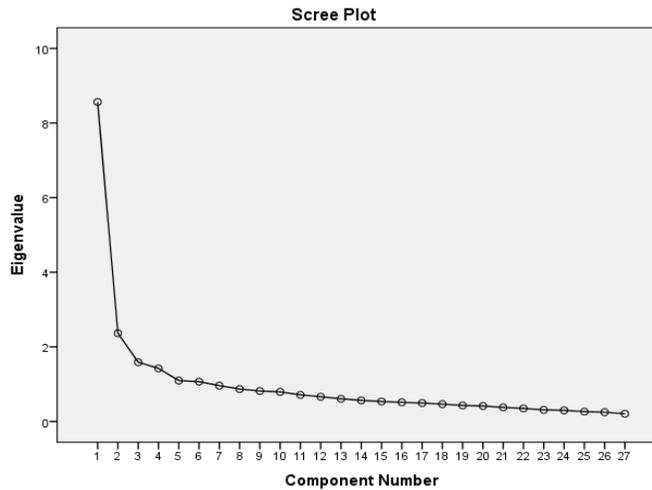
ODÖ için her bir maddenin madde-test (toplam) korelasyon katsayıları hesaplanmıştır. 30 madde için Cronbach Alfa değeri .891 hesaplanmıştır. Analiz sonucunda korelasyon katsayısı .20'nin altına düşen maddeler elenmiştir. Bu katsayılar aynı zamanda; madde ayırıcılık indisine eşittir. ODÖ ölçeğinde 13., 14. madde ve 16. maddelerin madde-test korelasyonu .20'nin altında kaldığı için ölçekten çıkarılmıştır. Tablo-3'te kalan 27 madde için hesaplanan genel iç tutarlık (Cronbach Alfa) katsayısı **.**918 olarak bulunmuştur. Ayrıca Tablo-3'te görüldüğü gibi iç tutarlık bireysel dışlanmışlık alt faktörü için ,855 ve sosyal dışlanmışlık alt faktörü için ,882 olarak hesaplanmıştır. Yine Tablo-3'te genel test-tekrar-test değeri ,744 bulunmuştur. Bireysel alt faktörü için test-tekrar-test ,774 iken sosyal alt faktörü için ,534 hesaplanmıştır. 27 maddeden oluşan ölçek güvenilir çıkmıştır.

3.2.Okulda Dışlanmışlık Ölçeğinin Faktör Analizi ile İlgili Bulgular ve Yorumlar

Temel bileşenler analizine ait değerlerin yorumlanmasından önce Kaiser-Meyer-Olkin (KMO) Testi ve Barlett Testi kullanılarak örneklem büyüklüğünün yeterliği ve normallik varsayımı kontrol edilmiştir. Tablo 4'de KMO ve Barlett Küresellik Testine ilişkin istatistikler verilmektedir.

Tablo 4.Okulda Dışlanmışlık Ölçeğinin KMO and Bartlett's Testi Sonuçları

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		,897
Bartlett's Test of Sphericity	Approx. Chi-Square	4874,744
	Df	496
	Sig.	,000

Tablo-4 incelendiğinde analiz sonucunda elde edilen değer 0.897'dır. Bu değer, örneklem büyüklüğünün analize devam etmek için iyi düzeyde olduğunu göstermektedir. Veri setinin normallik varsayımını karşılayıp karşılamadığı ise Barlett Küresellik Testi ile kontrol edilmiştir. Elde edilen değer, veri setinin normallik varsayımını karşıladığını göstermektedir.


Şekil 1. Okulda Dışlanmışlık Ölçeğinin Scree Plot (Çizgi grafiği/Yamaç Eğim Testi) Grafiği

Şekil-1'de de görüldüğü gibi, üçüncü noktaya kadar keskin düşüş devam etmektedir. Üçüncü noktadan sonra çizginin eğimi yatay bir seyre geçmektedir. Üçüncü noktaya kadar olan nokta aralıkları sayıldığında bunun iki olduğu görülür. Buna da dayanarak ölçeğin iki alt faktörlü olabileceğine karar verilmiştir.

Yapılan temel bileşenler analizi sonucunda; iki faktör altında toplanan maddelerin faktör yük değerleri incelenmiş ve faktör yük değeri 0.40'ın altında olan 1., 9., 11., 18., 23. ve 26. maddeler sırasıyla ölçekten çıkarılmıştır. Ayrıca ölçekte her iki boyutta yük değeri olan 15. ve 17. binişik maddeler ölçekten çıkarılmıştır. İki faktör altında toplanan 19 madde toplam varyansın %49,87'sini açıklamaktadır. Temel bileşenler analizi sonucunda iki faktör altında toplanan ve ölçekte kalmasına karar verilen maddelere ait faktör yük değerleri aşağıdaki Tablo-5'te gösterilmektedir.

Tablo 5. Okulda Dışlanmışlık Ölçeğinin Maddelerinin Faktör Yükleri

	Boyutlar	
	Bireysel Boyut	*Sosyal Boyut*
D5 Etrafımdakilerin çoğu bana uzak durmaktadır.	,738	
D4 Kimsenin beni anlamadığını ve bundan dolayı benimle konuşmak istemediğini düşünüyorum.	,737	
D3 Sosyal çevrem tarafından dışlandığımı düşünüyorum.	,710	
D10 Duygularımı (sevinçlerimi, hüzünlerimi..vb.) paylaşmak istediğimde kimse bunları duymak istemez.	,668	
D2 Arkadaşlarım benimle konuşmadıkları için içime kapanık biri olduğumu düşünüyorum.	,667	
D6 Arkadaşlarım benim problemlerimle ilgilenmezler.	,630	
D8 Etrafımda hiç arkadaşım yok.	,586	
D12 Düşüncelerimi rahatça ifade etmeme fırsat verilmez.	,577	
D7 Bir konu hakkındaki düşüncelerimi paylaşmama imkan tanınmaz.	,416	
D19 Marka kıyafetlerim olmadığından arkadaşlarım beni aralarında görmek istemezler.		,771
D29 Kültürel farklılığımdan dolayı okulda kimse benimle arkadaş olmak istemez.		,744
D24 Herhangi bir özel yeteneğim (Futbol, basketbol, resim..vb.) olmadığından dolayı arkadaşlarım beni aralarına almazlar.		,728
D20 Maddi yetersizliklerimden dolayı arkadaşlarımın beni aralarına almadıklarını düşünüyorum.		,702
D25 Derslerimdeki başarısızlığımdan dolayı genellikle dışlanırım.		,702
D28 Konuşma biçimimden dolayı arkadaşlarım benimle alay eder, beni aralarına almazlar.		,697
D21 Dünya görüşümden (insan hakları,çevresel duyarlılık…vb.) dolayı arkadaşlarım beni aralarına almazlar.		,671
D22 Siyasi tartışmalar yarattığımdan dolayı arkadaşlarım tarafından pek sevilmem.		,587
D30 Ailemin maddi durumu dolayısıyla her arkadaş grubuna dahil olamıyorum.		,538
D27 Fiziksel görünümümden dolayı arkadaşlarımın benden hoşlanmadıklarını düşünüyorum.		,538

Tablo-5 incelendiğinde ölçeğin bireysel dışlanmışlık alt faktör 2,3,4,5,6,7,8,10,12. maddeleri olmak üzere toplam 9 maddeden oluşmuştur. Bireysel dışlanmışlık en düşük madde yükü ,416 iken en yüksek madde yükü ,738 olarak hesaplanmıştır. Sosyal alt faktörü 19,20,21,22,24,25,27,28,29,30. maddeleri olmak üzere toplam 10 maddeden oluşmuştur. Bu alt faktör altında en düşük madde yükü ,538 ve en yüksek madde yükü ,771 olarak hesaplanmıştır.

Tablo-6: Boyut-Ölçek Korelasyonu

	Bireysel Dışlanmışlık	Sosyal Dışlanmışlık	Ölçek
Bireysel Dışlanmışlık	1	,569	,896
Sosyal Dışlanmışlık	,569	1	,875
Ölçek	,896	,875	1

Tablo-6'da her bir boyutunun ölçek ile olan korelasyonu incelenmiştir. Ölçeğin Bireysel dışlanmışlık alt faktörüyle olan ilişkisi ,896 Sosyal dışlanmışlık alt faktörüyle ilişkisi ,875 olarak hesaplanmıştır. Ayrıca boyutların birbiriyle ilişkisi ,569 olarak hesaplanmıştır.

4.Sonuç ve Öneriler

Eğitim ve öğretim sürecinde öğrenci başarısına üzerinde bir çok değişken vardır. Bu değişkenlerden bir tanesi de bireyin kendini bir gruba dahi hissetmesi yada grubun dışında kalmasıdır. Eğitim ortamlarında bu durumun tespit edilmesi için oluşturulmuş ölçek bireysel boyut ve sosyal boyut olmak üzere 2 alt faktörden oluşmuştur. Yapılan temel bileşenler analizi sonucunda ölçeğin bireysel boyutunda 9 ve sosyal boyutunda 10 olmak üzere toplam 19 madde bulunmaktadır. Ölçeğin iç tutarlılık güvenirlik katsayısı 0.918 olarak hesaplanmıştır. Ölçeğin geçerlik ve güvenirliğine ait bulgular, eğitim kurumlarında öğrenim gören öğrencilerin okulda dışlanmışlık düzeyini belirlemek üzere kullanılabilir nitelikte olduğunu işaret ederken, farklı bölgeler için ölçeğin geçerlik ve güvenirlik kanıtlarının elde edilmesi gerekmektedir. Geliştirilen Okulda dışlanmışlık ölçeğinin ilgili araştırmalar ve kurumlarca kolaylıkla kullanılacağı düşünülmektedir.

Diliman, Quezon City, 1101, Philippines*

Abstract

This study examined the effects of integrating instructional materials in Facebook on students' awareness and practice of laboratory safety. A quasi-experimental pretest-posttest two-group design was used in the study. The results indicate: 1.) The exposure to online social networking-based health education (OSNBHE) can improve students' awareness of laboratory safety (ALS) ($p < 0.05$); 2.) The exposure to OSNBHE can improve practice of laboratory safety (PLS) ($p < 0.05$); and, 3.) The ALS does not predict PLS ($R^2 = 0.09$, $CI = 95\%$).

Keywords: Online social networking; Health education; Awareness of laboratory safety; Practice of laboratory safety

Introduction

The discourse of academic disciplines in academic institutions can be an astonishing yet hazardous learning endeavor (NIOSH, 2006, p. 1). In scientific discourses, theoretical concepts and empirical applications of the scientific theories are both included. The latter involves experimentation either in "in-situ" or naturalistic settings or in "in-vitro" or laboratory settings. Experimentation is an essential scientific activity that aims to concretize the theoretical concepts in a scientific discourse (Brooker, Widmaier, Graham & Stiling, 2008, pp. 14-17; Catris & Salandanan, 2001, p. 9). The activities done in a scientific experimentation can range from simple (e.g., filtration of suspensions) to complex, (e.g., electrophoresis). Whether simple or complex, nearly all scientific experimentations and the use of apparatus, chemicals and facilities associated thereto are hazardous (Dyer & Andreasen, 1999). Furthermore, the amount of hours of laboratory activities that its users (viz., laboratory students) are allotted with can be tantamount to the length of time that these users are exposed to the various hazards in the science laboratory.

In the Philippines, a fraction of the allotted 200-220 hours for biology and chemistry in high school may be allocated for the conduct of scientific experimentation (IQAS, 2007). In the tertiary level, the number of hours allotted for scientific experimentations varies with the science course a student is enrolled in (CHED, 2005; CHED, 2007). Most of the students who are exposed to scientific experimentations in biology and chemistry are those in the secondary and tertiary levels of education. These students have ages ranging approximately from 12-22 years, hence are considered adolescents (Cabigon, 1999). These adolescent students have essential roles both in the causation and prevention or minimization of accidents as they have direct participation in laboratory activities which subsequently predispose them to various hazards and to the perennial effects of accidents arising from these hazards in the laboratory (Dyer & Andreasen, 1999; NIOSH, 2006).

The increasing prevalence of accidents involving students in the science laboratory calls for efficient measures to eradicate, or if not, lessen accident occurrences. One of these measures is the development of awareness and practice of laboratory safety. Harvard University (2012) emphasized, "....awareness is the most fundamental rule of safety". Thus, the provision of information on the awareness and practice of laboratory safety among students is seen as a primordial step in the attainment and maintenance of an accident-free laboratory (Dyer & Andreasen, 1999; Georgia State University, 2008; Harvard University, 2012, Penker & Elston, 2003; Zhao, Li, & Wen, 2007). Safety

[107] Corresponding author. Tel.:+ 632-9818500 local 3727; fax: + 632-9205471.
E-mail address: joshuarovie_daclan@yahoo.com

promotion, through health education, among adolescent students can be done in various teaching and learning approaches (Dyer & Andreasen, 1999; Syrek, 2011; Towner, 1995). However, studies have found out that more students are supplementing or replacing lectures, seminars, and course materials with educational resources that they can access via the World Wide Web or the Internet (Katz, 2008; Liu, 2010). Hence, contemporary learners are said to belong in a "Net-centric" (Baird & Fisher, 2006), "Digital Natives" (Prensky, 2001) and "Web 2.0" (Liu, 2010) generation.

Lenhart (2009) reported that 93% of teens use the Internet. In the Philippines, social networking is the single most popular online activity among Filipino Internet users, with about nine in ten (89%) have ever used online social networking sites like Facebook or Friendster (Labucay, 2011, p.12). In addition to its social utility, various studies have documented the positive effects of online social networking on learning outcomes such as improvement on interpersonal skills (Yu, Tian, Vogel & Kwok, 2010), acquisition of knowledge on medicine (Weicha, Cheti, Pollard & Shaw, 2006) and development of self-regulation which includes motivational factors in learning (Mario, 2009).

Statement of the problem and research hypotheses

This study investigated the effects of online social networking-based health education on the students' awareness of laboratory safety (ALS) and practice of laboratory safety (PLS). Specifically, it sought to answer the following questions:

Question 1:	Do students exposed to online social networking-based health education (OSNBHE) have higher posttest scores in the Awareness of Laboratory Safety Test (ALST) than of those not exposed?
Question 2:	Do students exposed to OSNBHE have higher posttest scores in the Practice of Laboratory Safety Test (PLST) than of those not exposed?
Question 3:	Does ALS positively and significantly predict PLS?

The research hypotheses of the study are the following:

Hypothesis 1:	The students exposed to OSNBHE have higher posttest scores in the ALST than of of those not exposed.
Hypothesis 2:	The students exposed to OSNBHE have higher posttest scores in the PLST than of those not exposed.
Hypothesis 3:	ALS positively and significantly predicts PLS.

Methodology

3.1. The Sample

The sample consisted of 16 college students, 6 males and 10 females, with the mean age of 18 years. They were enrolled in a chemistry laboratory course in a private college in Pasay City, Metro Manila, The Philippines, in the 1st semester of Academic Year 2012-2013. They were randomly assigned to either OSNBHE or NOSNBHE group. There were 10 students in the OSNBHE group, 4 males and 6 females. The NOSNBHE group had 6 students, 2 males and 4 females.

3.2. Research Design

The study utilized a quasi-experimental pretest-posttest two-group design to determine the effects of OSNBHE on students' awareness and practice of laboratory safety. Visually, the design is as follows:

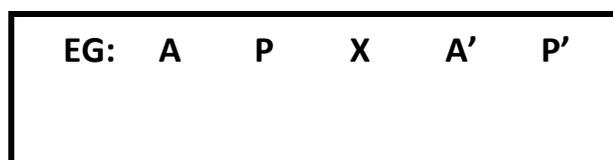
$$\text{EG:} \quad \text{A} \quad \text{P} \quad \text{X} \quad \text{A'} \quad \text{P'}$$


Fig 1. Research design of the study

Where;
EG: experimental group
CG: control group
A: Awareness of Laboratory Safety pretest for the experimental and control groups
P: Practice of Laboratory Safety pretest for the experimental and control groups
X: exposure to Online Social Networking-Based Health Education (OSNBHE)
-X: exposure to Non-online Social Networking-Based Health Education (NOSNBHE)
A':   Awareness of Laboratory Safety posttest for the experimental and control groups
P':   Practice of Laboratory Safety posttest for the experimental and control groups

3.3. The Instruments

The instruments used in the study were the Awareness of Laboratory Safety Test (ALST) and the Practice of Laboratory Safety Test (PLST). The construct and contents of the instruments were validated by three experts in the field of chemistry and laboratory safety. The instruments were also pilot-tested to chemistry laboratory students in a different university. Furthermore, the internal reliability of the both instruments was calculated utilizing Cronbach's alpha. The obtained reliability was 0.80 which suggests a satisfactory internal consistency and reliability (George, 2000).

3.3.1. Awareness of Laboratory Safety Test (ALST)

This is a researcher-developed checklist on the components of a laboratory design and their safety conditions and safe practices in the laboratory. This was utilized to assess the awareness of the students on the actual presence of physical hazards in their chemistry laboratory and their awareness on the ideal and safe practices during the conduct of experimentation. This consisted of 20 items on the awareness of safe laboratory conditions and 15 items on the awareness of safe laboratory acts -- both of which are answerable by yes or no.

3.3.2. Practice of Laboratory Safety Test (PLST)

This is a researcher-developed checklist on fundamental safe laboratory practices. This was used by the licensed chemist, the chemistry laboratory instructor of the respondents and the researcher, to evaluate the actual performance of safe laboratory practices of students during their conduct of laboratory experimentations. This is composed of 15 questions on the fundamental safe laboratory practices which are answerable by yes, no or N/A (not applicable).

3.4. Data Collection Procedure

The duration of the data collection procedure lasted for two weeks for both OSNBHE and NOSNBHE groups, from the administration of the pretests to the posttests of the ALST and PLST. The ALST and PLST pretests were administered on the first and second days of data collection for the OSNBHE and NOSNBHE groups, respectively. A licensed chemist also used the ALST to evaluate the presence of physical hazards in the laboratory anytime between the administration of ALST pretest and posttest. The answers of the chemist in the ALST served as the standard to which the answers of the OSNBHE and NOSNBHE respondents in the ALST pretest and posttest were compared with for correctness. Furthermore, the OSNBHE respondents provided their Facebook account names on the ALST pretest. In the PLST, the respondents of both groups were evaluated by the licensed chemist, the chemistry laboratory instructor of the respondents and the researcher on their actual performance of safe laboratory practices during the conduct of three chemistry laboratory experimentations (viz., Solubility, Acids and Bases, and Metals and Acids). The three experiments (i.e., one in the pretest and two in the posttests) that were performed were similar in both groups. The respective scores of each respondent on the PLST as graded by the three evaluators were averaged.

Once the two groups' scores were found comparable in the ALST and PLST pretests, the teaching methodologies were implemented to both groups. The OSNBHE respondents were invited to visit the researcher-made Facebook group page account entitled, "Awareness and Practice of Laboratory Safety", where discussions (thread), photos and videos on the awareness and practice of laboratory safety were incorporated/ uploaded in. The respondents were given a 48-hour period to accept the invitation to be officially part of the OSNBHE group. Furthermore, they were instructed to like the discussions, photos or videos after viewing any of these in order for the researcher to monitor their access to and use of the instructional materials. On the other hand, the NOSNBHE group was facilitated with a lecture-seminar on the promotion of awareness and practice of laboratory safety. The contents and presentation of the lessons in the lecture-seminar were similar to those on the Facebook group page for the OSNBHE group. To control teacher factor, the researcher facilitated both the lecture-seminar for the NOSNBHE group and video presentations and discussions in the group page for the OSNBHE group. Furthermore, the duration of the lecture-seminar was also similar to the duration of the video uploaded in the group page.

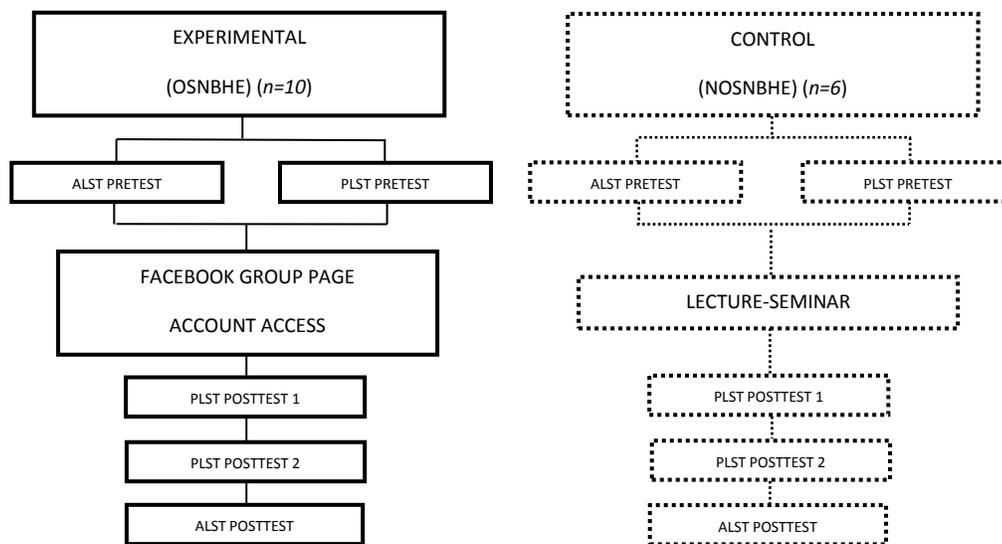
The PLST posttests were administered twice during the conduct of two laboratory experimentations of the respondents one week after the implementation of the teaching methods (viz., lecture-seminar for NOSNBHE group and visit to the Facebook group page account for the OSNBHE group) to evaluate the retention and application of the knowledge on the awareness and practice of laboratory safety of the students in each group. The ALST posttest, on the other hand, was administered on the second week of data collection after the two posttests of PLST had been administered to both groups. For the OSNBHE group, the survey-checklist on the OSNBHE was administered after the administration of the ALST posttest.


Fig. 2. Flowchart of data collection procedure of the study

Fig. 3. Photograph of proper laboratory decorum used in the OSNBHE.

Results

4.1. Awareness of Laboratory Safety

Table 1 enumerates the posttest scores of the OSNBHE and NOSNBHE groups in the ALST. A directional Wilcoxon rank sum test for the ALST posttest scores of the two groups concludes that the ALST posttest scores of the OSNBHE are not higher than the scores of the NOSNBHE group in the ALST posttest ($p = 0.0559$).

Table 1. Wilcoxon rank sum test for the ALST posttest scores of the OSNBHE and NOSNBHE groups.

NOSNBHE			OSNBHE		
Student	ALST posttest score (%)	Rank	Student	ALST posttest score (%)	Rank
A_1	89	9.5	B_1	94	15
			B_2	94	15
A_2	71	2	B_3	89	9.5
A_3	83	6	B_4	91	12.5
			B_5	94	15
A_5	89	9.5	B_6	74	3
			B_7	91	12.5
A_5	80	4.5	B_8	66	1
			B_9	89	9.5
A_6	80	4.5	B_{10}	86	7

To evaluate if there is a significant difference between the pretest and posttest scores of the OSNBHE group in the ALST, a nondirectional Wilcoxon signed rank test was performed on the said two scores. The result suggests that there is a significant difference between the two tests ($p < 0.05$). Hence, the exposure to OSNBHE can be inferred to have positively influenced the level of awareness of laboratory safety of the respondents in the experimental group. However, since the ALST posttest scores of the OSNBHE group are not higher than the ALST posttest scores of the NOSNBHE group and no significant difference is noted between the ALST posttest scores of the two groups ($p = 0.1118$), it can be deduced from the study that both the exposure to the lecture-seminar of the NOSNBHE group and the visit to the Awareness and

Practice of Laboratory Safety Facebook group page of the OSNBHE group were effective in increasing the level of awareness of laboratory safety.

4.2. Practice of Laboratory Safety

Table 2 shows the mean scores of the OSNBHE and NOSNBHE groups in the two PLST posttests. A directional Wilcoxon rank sum test for the PLST posttest scores of each respondent in the two groups indicates that the PLST posttest scores of the OSNBHE group are higher than the PLST posttest scores of the respondents in the NOSNBHE group ($p < 0.05$). Hence, it can be deduced from the result that the students exposed to OSNBHE performed laboratory experimentations more safely than the students exposed to NOSNBHE.

Table 2. Wilcoxon rank sum test for the PLST posttest scores of the OSNBHE and NOSNBHE groups.

NOSNBHE			OSNBHE		
Student	PLST posttest score (%)	Rank	Student	PLST posttest score (%)	Rank
A_1	60	5.5	B_1	71	8.5
A_2	60	5.5	B_2	71	8.5
			B_3	73	11
A_3	40	1	B_4	72	10
A_4	59	4	B_5	83	16
			B_6	69	7
A_5	46	2.5	B_7	74	12
			B_8	76	13.5
A_6	46	2.5	B_9	82	15
			B_{10}	76	13.5

A directional Wilcoxon signed rank test result indicates that there is a significant difference between the pretest and posttest scores of the OSNBHE in the PLST ($p < 0.05$). Thus, the experimental group improved significantly in their performance of safe laboratory practices on two laboratory experimentations after their exposure to OSNBHE. Furthermore, it can be inferred from the findings that the incorporation of instructional materials (e.g., discussions, photos and videos) in the Facebook group page can positively influence and is more effective in promoting practice of safe laboratory practices among students as compared to the conventional method of lecture-seminar.

Table 3. PLST pretest and posttest scores of the OSNBHE group.

Student	PLST pretest score (%)	Mean PLST posttest score (%)	D= post-pre	I D I	Sign of D	R
B_1	65	71	6	6	+	3
B_2	62	71	9	9	+	4.5
B_3	64	73	9	9	+	4.5
B_4	58	72	14	14	+	6
B_5	81	83	2	2	+	1
B_6	66	69	3	3	+	2
B_7	58	74	16	16	+	7.5
B_8	60	76	16	16	+	7.5
B_9	64	82	18	18	+	9
B_{10}	53	76	770	23	23	+

Through the utilization of nondirectional Wilcoxon signed rank test, it was found out that there is a difference between the PLST mean pretest scores and mean posttest scores of the respondents in the NOSNBHE group (p < 0.05). The difference, however, is not positively significant since the PLST mean posttest scores are lower than the PLST mean pretest scores.

4.3. Awareness and Practice of Laboratory Safety

The study further investigated if the awareness of laboratory safety (ALS) influences and predicts practice of laboratory safety (PLS). Since the OSNBHE and NOSNBHE groups' ALST posttest scores are comparable, both were included in the analysis. The posttest scores in the ALST of both groups were subjected to simple linear regression analysis with the mean posttest scores in the PLST of both groups.

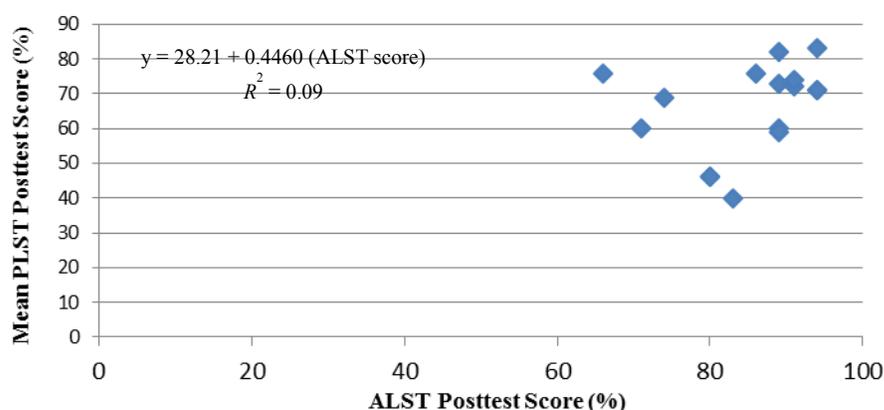
The linear regression equation for the PLST score in terms of ALST score is: PLST score = 28.21 + 0.4460 (ALST score). Results of the simple regression analysis indicate that the variation in the ALST scores does not significantly predict the variation of the PLST scores ($R^2 = 0.087$, $CI = 95\%$). Thus, it can be deduced from the findings that ALS does not significantly influence and predict PLS.


Fig. 4. Linear regression analysis of the ALST and mean PLST posttest scores of the OSNBHE and NOSNBHE respondents

Discussion

Various studies have suggested that online social networking can directly influence social learning and can positively influence academic learning and learning outcomes (Mario, 2009; Weicha, Cheti, Pollard & Shaw, 2006; Yu, Tian, Vogel & Kwok, 2010). This study investigated the effects of the use of Facebook as a medium of instruction on the development of awareness and practice of laboratory safety among adolescent students. The results of the study suggest that online social networking can significantly improve students' awareness and practice of laboratory safety. This positive effect can be influenced by various factors characterized by and can be offered to users by online social networking.

According to the study by Yu and Tian et al., (2010, p.1), online social networking applications, such as Facebook, offer an efficient platform for college students' socialization by expanding their network scope and maintaining close relationships. Apart from its social significance, Facebook has been posited to contribute essentially in the educational sector. Thus, online social networking is bi-faceted: social and educational. Online social networking sites (SNS) users learn social or interpersonal skills facilitated by the SNSs features or configurations that can enable users to: enhance and maintain friendships, build social networks/establish virtual relationships, diminish barriers to making friends, follow peer trends, share photos, for fun and leisure and to keep in touch with family. On the aspect of learning, Facebook allows connectivity of the faculty and other students in terms of friendship/social relationship, provide comments to peers/share knowledge, share feelings with peers, join Groups established for subjects, collaboration: notification, discussion, course schedule, project management calendar and to use educational applications for organizing learning activities (Yu et al., ibid.).

This study suggested at least equivalence, if not superiority, of the online method of instruction against the face-to-face method of instruction--a finding consistent with other recently published, well-controlled studies evaluating effectiveness of online learning in medical education (Weicha et al., 2006). In addition, this study posited the multi-faceted effects of online social networking on learning and self-improvement as confirmed by

related studies. In addition to its significance on the improvement of learning outcomes, social networking has been found out to essentially improve one's physical and psychological health. Recent research has illustrated that young people's online social networking behavior can bring them physical and psychological well-being (Ellison, Steinfield & Lampe, 2007; Steinfield, Ellison, & Lampe, 2008). Furthermore, several studies have investigated and affirmed the positive effects of online-based instruction to students' self-regulation, which includes metacognitive, motivational, and behavioral factors of one's learning process (Mario, 2009).

Lastly, this study contributed on the areas of theory, research, policy and practice on the use of online social networking as an alternative medium of instruction as compared to the teaching methodologies existent in an orthodox learning milieu. With online-based resources, students can have more opportunity to access, review and mimic lessons they uncover from these resources. Thus, the physical and time constraints a conventional classroom teaching is endowed with are overcome by the use of learning resources online. In the lecture-seminar method, students can only have a single opportunity to learn and interact with their mentor, thus the attainment of the retention of practice of laboratory safety among students poses to be a limitation in this method (Daniel, 1997; Lewis, Alexander & Farris, 1997).

Conclusion

After the treatment the following conclusions were obtained: 1.) The exposure to the OSNBHE can improve students' awareness of laboratory safety; 2.) Students exposed to OSNBHE performed laboratory experimentations more safely than students exposed to NOSNBHE; and, 3.) The awareness of laboratory safety does not influence and predict practice of laboratory safety.

Open Wonderland: A Potential 3-D MUVE for Teaching and Learning

Mohd Hishamuddin Abdul Rahman[a], Noraffandy Yahaya[a][108], Noor Dayana Abdul Halim[a], Danakorn Nincarean Eh Phon[a]

[a]Department of Educational Sciences, Mathematics and Multimedia Creative, Faculty of Education, Universiti Teknologi Malaysia, UTM, Johor Bahru, 81310, Johor, Malaysia

Abstract

The use of 3-D MUVEs in education is still in its infancy in Malaysia, particularly in Universiti Teknologi Malaysia. In order to promote the utilization of this technology, this article revolves around the features of 3-D MUVEs which are highly beneficial in teaching and learning, where some of the features are not offered in most of 2-D applications that are commonly used today. Additionally, this article also focuses on promoting the use of an open source 3-D MUVE, Open Wonderland as an alternative for infamous Second Life virtual world as an appropriate platform for conducting virtual learning activities.

Keywords: 3-D MUVE; virtual world; virtual learning environment; Open Wonderland

Introduction

Online learning with 2-D applications

Learning activities have experienced many levels of changes. In the past, it was conducted in the classroom, where teacher and students meet each other face-to-face (Zhang, Zhao, Zhao & Nunamaker Jr., 2004). However, this scenario began to change when technology became available as a medium for teaching and learning since late of the 20th century. This is due to the increment of current technology capability, particularly the Information and Communication Technology (ICT) (Mahmud, Ismail, Abdul Rahman, Kamarudin & Ruslan, 2012).

* As we all know, ICT has produced tones of applications that can be utilized in teaching and learning. It has being said that among those applications, there are several which are quite popular among educators, namely online chat (Sins, Savelsbergh, van Joolingen & van Hout-Wolters, 2011), online forum (Rienties, Giesbers, Tempelaar, Lygo-Baker, Segers & Gijselaers, 2012) and social networking site (Baker, Wentz & Woods, 2009). These applications, which are categorized as the Web 2.0 technologies, have given a bunch of benefits to the learning process. It is due to its capabilities in facilitating and accelerating the process of communication, information's searching and sharing, and also enable learning activities to be conducted anytime and anywhere, which cannot be accomplished through the conventional methods (Bennett, Bishop, Dalgarno, Waycott & Kennedy, 2012; Chiu & Hsiao, 2010; Petrakou, 2010).

Inadequacy of 2-D applications

Despite of having well-known capabilities that are highly beneficial for teaching and learning, those online 2-dimensional (2-D) applications are still lacking in certain ways. This issue had been raised by many researchers and can be segregated into several categories. In term of communication, it has been said that multi-user 2-D applications were depending too much on the use of text as a medium of communication (Omale, Hung, Luetkehans & Cooke-Plagwitz, 2009). Furthermore, learning activities that take place in a virtual learning environment (VLE) generated by those 2-D applications mean that face-to-face communication became limited or no longer available for students and educators (Chiu & Hsiao, 2010). Thus, without the use of body languages, face expressions and even voice tones as a mean to convey message among each other, Sutcliffe and Alyares (2012) have referred this as a lack of non-verbal communication. Other than communication, interactivity in 2-D applications is also an issue that has been

---

E-mail address: p-afandy@utm.my

brought up. Surely it is undeniable that 2-D applications are all interactive compared to face-to-face learning, yet it is still not good enough to support certain type of learning, especially collaborative learning. As mentioned by Bronack, Riedl and Tashner (2006), learning activities are limited in this kind of environment. Hence, it is not surprising when learning activities by the use of 2-D application are considered by the students as boring and do not stimulate their experience (Sutcliffe & Alyares, 2012) and also could lead them to experience dissatisfaction with their learning (Bouhnik & Marcus, 2006; Wu, Tennyson & Hsia, 2010).

Being aware about all the weaknesses that have been mentioned before, educators nowadays have been shifting towards the use of new application with the form of 3-dimensional (3-D), or 3-D Multi-User Virtual Environment (3-D MUVE) to be precise, for teaching and learning (Duncan, Miller & Jiang, 2012; Hew & Cheung, 2010). In the next section of this paper, we will discuss further about the unique features of 3-D MUVEs which are valuable for teaching and learning activities, the type of 3-D MUVEs currently being used by the educators around the world, and follow up by our justification of the Open Wonderland as an appropriate 3-D MUVE to be used for teaching and learning.

Three-Dimensional Multi-User Virtual Environment

Background

Based on the history of its development, 3-D MUVEs or also known as virtual world, said to be rooted from virtual environments of role-playing games, for instance, a multi-player online games (MMOGs) (Duncan *et al*., 2012). Nevertheless, the major difference which differentiated a 3-D MUVE from a MMOG is that most of the 3-D MUVEs were developed without any specific objectives of storylines. It is an environment that grant users freedoms to completely control the environment (Warburton, 2009). In other word, the user himself or herself can determine the objective or storyline for the virtual world. Just as the online multi-user 2-D applications, 3-D MUVEs can also be accessed by numerous users at the same time (Gamage, Tretiakov & Crump, 2011). However, thing that made 3-D MUVEs unique is the sort of application that came with the ability to generate a virtual environment which consist of height, width and depth (McKerlish & Anderson, 2007), which is completely different from the VLE created by any 2-D applications. Besides, 3-D MUVEs also comprise of some unique features which can be utilized in teaching and learning that are rarely found in other 2-D applications, which will be discussed further in the next section. Hence this has attracted educators from around the globe to construct online learning activities in 3-D MUVEs. As a result, it popularity as a medium for teaching and learning, as stated by Duncan *et al*. (2012) has increased significantly in the past few years. This scenario has been mentioned as well in the Horizon Report of 2008, Australia-New Zealand Edition by the New Media Consortium (Johnson, Levine & Smith, 2008). The recent improvement of technologies' capabilities have also became one of the ignition for this scenario to occur (Choi & Baek, 2011).

Features of 3-D MUVE and its impact on learning

As stated in the previous section, there are several features of 3-D MUVEs which can be beneficial for teaching and learning. From the previous literatures, we have extracted some of the features that we assume as noteworthy. The features are as stated below.
- Offer a realistic and immersive virtual environment (Ibáñez, García, Galán, Maroto, Morillo & Kloos, 2011)
- Provide a flexible and persistent environment (Girvan & Savage, 2010)
- Represent user with 3-D avatar as an online identity (Peterson, 2005)
- Support verbal and non-verbal communication (Andreas, Tsiatsos, Terzidou & Pomportsis, 2010)
- Allow user to create and manipulate the world and virtual objects, and also let them adjust the camera to view the world from different perspectives (Dalgarno & Lee, 2010)

Thus, in a learning session that is conducted in 3-D MUVE, students generally learn by means of exploring the virtual world in order to obtain information, creating and manipulating virtual object based on the task and also interact with each other through their avatar (Gamage *et al*., 2011). According to de Freitas, Rebolledo-Mendez, Liarokapis, Magoulas and Poulovassilis (2010), this type of learning bestow students with an immersive experiences. By having that sort of features, the usage of 3-D MUVEs has given some positive impact on learning as stated in previous researches. For instance, the usage of 3-D MUVEs helps created an enjoyable virtual learning environment for students (Apostolos, Andreas & Thrasyvoulos, 2010). It is likely due to the game-like environment

of this technology. Moreover, 3-D MUVEs are also able to create an environment which encouraging one of the most important elements in online learning, that is sense of presence (Chen, Warden, Tai, Chen & Chao, 2011). It seems that some of the factors which affecting the sense of presence are the utilization of avatars as users' online identity, the options to communicate by using not just text but other medias as well, and the level of abstraction of the virtual world. As a result, the application of 3-D MUVEs in online learning has been reported to increase students' engagement (Bouta, Retalis & Paraskeva, 2012), satisfaction (Jestice & Kahai, 2010), interactions and motivation as well (Beltrán Sierra, Gutiérrez & Garzón-Castro, 2012).

Open Wonderland

Types of 3-D MUVE

There are at least two categories of 3-D MUVE, as stated by Apostolos *et al.* (2010). Those categories are proprietary 3-D MUVE and open source 3-D MUVE. The first category, the proprietary 3-D MUVE, is an application where the user must pay in order to access some features in that particular virtual world. Second Life, Active World and There are some of the 3-D MUVEs which fall into this category. Whereas the next category has been labelled as open source 3-D MUVE. Unlike the other category, the open source 3D-MUVEs can be used by any user for free and give them full control of the environment as well. Examples of open source 3-D MUVE are Open Wonderland and Croquet. Bear in mind that there is no category that is superior to another, because each of them have its own advantages and disadvantages. However, among both categories, there is one 3-D MUVE which has been considered as a mature 3-D MUVE for teaching and learning, namely Second Life (Warburton, 2009). It's popularity among educators as an online teaching and learning platform has been stated by Girvan and Savage (2010), where most of recent literatures are focusing on the utilization of Second Life.

Why choose Open Wonderland?

"If Second Life is an excellent 3-D MUVE, why do we need to shift to Open Wonderland?". That is perhaps a question which will arise from several educators and researchers. Yes, we also acknowledged the fact that Second Life is the most powerful 3-D MUVE around, where it can bring a lot of benefits for teaching and learning processes. Nevertheless, there are certain things about Second Life as written in previous literature which we believe are quite problematic for certain communities, especially for us and our university, also for our country as well. In our future research, these things have became factors that lead us not to use Second Life. We will discuss about these factors together with reasons of why Open Wonderland is the best 3-D MUVE for our research and perhaps for other researchers with a similar background as well.

The first factor is about the budget. As stated by Apostolos *et al.* (2010), a proprietary 3-D MUVEs like Second Life requires the user, who want to fully access the world, to pay for certain amount of cash to the developer. The fee is pretty expensive (Sutcliffe & Alrayes, 2012), particularly for research team with low budget like ourselves. Fortunately, there is a free version of Second Life offered by Linden Labs, the developer of this 3-D MUVE. However, it only allows users to explore certain places and use some basic functions and controls (Tsiatsos & Konstantinidis, 2009). Moreover, there are also some issues of privacy regarding of the free version of Second Life. As reported by Petrakou (2010), she spotted an outsider who suddenly appeared during the lecture that was conducted in the virtual world. Luckily for her that the students did not really get distracted by the appearance of the outsider. As for that case, we believe that privacy is an important thing in order to conduct teaching and learning in virtual world, especially for an open virtual life like Second Life which can be accessed by many people around the world that are not related to our research. However, only money can buy privacy in this commercial virtual world. To put this into a simple word, we need a private virtual world with many unrestricted functions and can be used for free. Does this kind of virtual world really exists? Yes it does. The name of that virtual world is Open Wonderland, which is formerly known as Project Wonderland (Joshi & Gardner, 2012).

Unlike Second Life, Open Wonderland is a Java-based open source 3-D MUVE (Ibáñez *et al.*, 2011). In other word, it can be used by any people for free. It was originally developed by Sun Microsytems before it became a fully independent and open source virtual world (Kaplan & Yalenkovish, 2011). This nature of Open Wonderland has made us believe that it is the best 3-D MUVE for our research. However, we did not simply select this virtual world just because it is free. There are other criterions of Open Wonderland that we took into consideration. Firstly, is about the privacy and control. As we stated before, we need privacy in order to conduct learning activities of our

research and the full control of our world. Open Wonderland is a 3-D MUVE which provide a privacy for the user without any charges applied and it allows user to completely control the virtual world (Chen *et al*., 2011). In other word, the user who is also the admin is the master of the world. He or she can control who is legal to access the virtual world, so that means no outsider is allowed. Plus, the admin also can control properties of some elements in the virtual world. For example, the admin is able to make some object visible to one group of students where the rest cannot see it (Arroyo, Kloos, Espiga, Calle, Rodríguez & Hernández-Leo, 2010). Furthermore, the extensible nature of the Open Wonderland provides the admin with opportunities to modify and extend it functionalities, especially for someone who is an expert with Java technology (dos Santos, Guetl, Bailey & Harward, 2010). As for the other user, mainly the students, they can freely control their avatar and use any tools available that are not restricted to them. Thus, we can assume that Open Wonderland is not just a free to use 3-D MUVE, it also a flexible and private virtual world.

Second criteria of a Open Wonderland that we paid attention to is its characteristic as a learning tool. According to Dalgarno and Lee (2010), there are 2 categories of characteristic of a 3-D VLE, which are representational fidelity and learner interaction. Each of those categories comprises of several characteristics. After we made a comparison between those characteristics and characteristic of Open Wonderland, we found that both characteristic mostly match with each other. First of all, to be able to display a realistic environment is one of the characteristic of 3-D VLE, and Open Wonderland has this characteristic as well. As in the research conducted by Ibáñez *et al*. (2011), they have successfully build a environment which is similar to the real town for language learning. However we believe that realistic here does not means that it should look exactly like the real things, as long as it can make each user feels immerse with the environment should be fine. Then the next characteristic of 3-D VLE which matched with Open Wonderland is the use of avatar as representation of every users. Open Wonderland provides an option for the users to use custom avatar or create their own avatar (Chen *et al*., 2011). Although it is quite limited compared to what the users can do to their avatar in Second Life, Open Wonderland is still allows them to modify many aspects of their avatar, such as hair colour, clothes, shoes and many more. We assumed this is good enough to provide students with sense of presence in the virtual world. Speaking of sense of presence, audio is one of elements that can increase that sense (Dinh, Walker, Song, Kobayashi & Hodges, 1999) and spatial audio is also included in the list of characteristics for 3-D VLE. Therefore by using Open Wonderland which also wield the spatial audio characteristic (Kaplan & Yalenkovish, 2011), not only we can let students communicate using their voice and put some sound effects in our virtual world for them, but we also can simultaneously stimulate their sense of presence.

Furthermore, the availability of avatar and spatial audio in Open Wonderland indirectly suggested that this 3-D MUVE has met another characteristic of 3-D VLE as listed by Dalgarno and Lee (2010), which is support the verbal and non-verbal communication. For example, Open Wonderland allows the users to make use of the chat box and voice over function in order to communicate with each other verbally, and also let them communicate using the non-verbal methods for example by exploiting the gestures provided for the avatar. The next characteristic on the list is known as embodied actions, such as view control, navigation and object manipulation. From our viewpoint, this one is quite important to considered if we intend to conduct learning activities in a 3-D MUVE. If the 3-D MUVE does not support those actions, there is a high probability that the learning process will be hindered. As for Open Wonderland, we found that this 3-D MUVE supports all those actions such as it let the users change the viewing angle in order to view the world from different perspective. Moreover, Open Wonderland also let the users control their avatar to explore the virtual world and allow them to create and manipulate an object and also interact with other objects (Arroyo *et al*., 2010). In fact, there are other characteristics of 3-D VLE which match with Open Wonderland that we have not discussed in this article, because we feel that what have been discussed here are sufficient enough to inform our readers about the capabilities of this 3-D MUVE.

Apart from that, the recent capability of our nation ICT particularly in our university is not as great as what they have in every modern country. This has became one of the factors that preventing us from using Second Life. Based on our observation, the internet speed of our faculty, which is crucial for running a 3-D MUVE, is not good enough to run Second Life smoothly. There is a solution to tackle this problem, which is by subscribing to any local internet provider for faster internet connection. However, this solution also means more money need to be spent. Thus, that is why we plan to use Open Wonderland in our research. With this 3-D MUVE, we can create a small virtual environment with less objects in it. We also can control the number of users who have access to our virtual world and make sure that the numbers are not too big. Therefore, our virtual world can be accessed smoothly by our students even with the standard internet speed of our faculty.

Last but not least, the next factors is about sensitive issues. Article written by Chen *et al*. (2011) has made us to take this matter seriously into our consideration. Most of the residents in Malaysia are Muslims, and we found that

some culture presented in Second Life are not suitable for our culture, especially to the students. For example, some of the avatars in Second Life are too sexy to watch. By using Open Wonderland, we can prevent this issue because the avatar only provided with normal or formal clothes for men and women, and its customization is also limited. Another sensitive issue that probably will arise while using Second Life, especially the free version of it is the interference, disturbances or harassments from other users to our students. In Second Life, they will meet lots of people from around the world with different backgrounds. If we look at the positive side, this provides an opportunity for them to know each other. However bear in mind that not all people is Second Life is good people. Some of them might be a bully, a rascal or someone who always swears and talks with inappropriate words. So we do not want our students to get involved with such people. Thus by utilizing Open Wonderland, we can restrict the access to our world. Only students of our own have the permission to enter the world. In other word, we can create a safe and secure environment for the students.

Conclusion

In conclusion, we can say that Open Wonderland is indeed a potential 3-D MUVE for teaching and learning. Because of that, we think it is better for us not to use Second Life and use Open Wonderland instead to conduct our learning sessions in our future research, although Second Life is the popular 3-D MUVE for teaching and learning that has been recognized by many educators. It is not because of Open Wonderland is better than Second Life, and we also did not mean to condemn Second Life as well, but it is due to the factors that have been discussed before. From our point of views, it is not a big problems to make use of Open Wonderland because from the previous literatures and also from our observations, most of the features provided by Second Life are also provided by Open Wonderland, but they are still quite different. Moreover in some circumstances, Open Wonderland can become the most suitable 3-D MUVE to conduct teaching and learning activities, just like our case. Hence, we recommend that any researchers who intend to do research in this field of study, but at the same time face the same problems like we do, just choose Open Wonderland as a 3-D MUVE for your research. Although it is still not mature enough as a tool for education, but Open Wonderland is a very promising 3-D MUVE.

Participatory Development Communication for Natural Resources Management in Ratchaburi Province, Thailand

Cherdpong Kheerajit[a][109], Alexander G. Flor[b]

[a]Department of Agricultural Extension and Communication,Faculty of Agriculture at Kamphaeng Saen,
Kasetsart University Kamphaeng Saen Campus, Nakhon Pathom, 73140, Thailand
[b] Information and Communication Studies, University of the Philippines Open University, Laguna, Philippines

Abstract

The participatory development communication is a key process of bringing stakeholders together to cooperate towards addressing the problem of dissolution of the environment and natural resources. It let them work together towards a sustainable social change away from individual behaviour change. It is a set of techniques to make people change their knowledge, attitudes, and practices that allow people to voluntarily engage in the activities related to natural resource management. In the case of natural resources management, multiple stakeholders are involved in administration and implementation. The model of this study assumes that all levels of participatory development communication will relate knowledge, attitude and practice of stakeholder's concerning natural resources management.

Ratchaburi province is a major agricultural area in Thailand. The area is prone to severe natural disasters in the past few years such as drought, inundation, hurricane and conflagration due to climate change. The government of Thailand allocates an increasing budget for natural resources management in the area, but this does not solve the problem alone. The government needs an effective strategy in mitigating the problems. The participatory development communication in community based natural resources management can help the government in formulating effective strategies to alleviate future disasters. This means that the community where the disasters occur helps in solving and mitigating the problems caused by natural disasters and natural resources degradation respectively.

The study centers the following variables; the levels of participatory development communication which is   (1) information sharing, (2) consultation, (3) collaboration, and (4) empowerment and knowledge, attitude and practice. The research assumes that the levels of participatory development communication affect the knowledge, attitude and practice of stakeholders. Which means higher the level of participatory development communication corresponds to higher knowledge, attitude and practice measure on natural resources management. Considering the relationship between these variables and the need to address the growing problem on natural resources management, it is important that the government using participatory development communication explore the different ways in conserving nature and lessen its expenses on unprepared disasters. The result assumes that levels of participatory development communication are correlated to stakeholder's knowledge, attitude and practice measure. There is a relationship between stakeholder's knowledge, attitude and practice towards natural resources management and participatory development communication practice. Particularly it puts into assumption that: (1) participatory development communication is directly correlated to knowledge, attitude and practice, which means that as participatory development communication level increases, knowledge, attitude and practice among stakeholders also increases, and (2) participatory development communication levels are inversely correlated to knowledge, attitude and practice, thus, as participatory development communication increases, knowledge, attitude and practice decreases or vice versa.

Looking at the situation of Ratchaburi province, the increasing budget on natural resources management can be lessen if there is proper communication and participation between stakeholders and the government. Thus, study will give a new government approach towards natural resources management and increasing knowledge, attitude and practice of stakeholders.

Keywords: participatory development communication; community based natural resources management

INTRODUCTION

Development communication plays a major role in information distribution in developing countries and other parts of the world. Communication does not to inform but also influences the behavior of the receiver of information. Effective development communication should motivate people to participate in planned activities. Participatory development communication means moving from a focus of informing and persuading people to changing their behaviour or attitudes and focus on facilitating exchanges between different stakeholders to address a common problem. Participatory development communication has been used in several development projects such as land and water conservation or natural resources management and poverty alleviation. Of the two, natural resources management is one of the major problems in Thailand. Thus, participatory development communication in natural resources management is an essential component of the participatory research and development process suggests shifting away from informing stakeholders in order to improve their knowledge, attitudes, and practice. It integrates communication, research, and action in an integrated framework, and involves researchers, extension workers, community members, and other stakeholders in the different phases of the development process.

OBJECTIVES OF THIS RESEARCH

The research aims to 1) identify the status and problems of natural resources management in Ratchaburi Province; 2) analyze the relationship between of participatory development communication levels and knowledge, attitude and practice on community based natural resources management**.**

REVIEW OF RELATED LITERATURE

Participatory Development Communication

There are many arguments about the meaning of participation. Participatory communication is under rural development as a shift from the dominant paradigm of top-down to self-development wherein villagers and urban poor are the primary stakeholder. Self-reliance and building on local resources are also emphasized in the process. Participation is the exchange of information from both parties the people and organization. In this process, the people or grassroots identifies the problem and the solutions to those problems. The people are given the opportunity in the decision-making. In interactive participation stakeholders take part in the analysis, which result in action plans and formation of new institutions of existing ones. Stakeholders get the chance to have practices and take control over local decisions. The last type of participation is self-mobilization. It is characterized by being independent of external institutions. This process allows the development of external contracts for resources which gives technical advice and construct how resources are used. Accordingly, Aycrigg (1998) divided level of participatory communication to four levels using the following: 1) Information Sharing, one way communication basically, people are included by informing them about what is being done; 2) Consultation, primarily one way communication with a stronger emphasis on feedback. Stakeholders provide their input but do not have a significant say in the decision making process; 3) Collaboration, two way communication supporting open interaction in decision making-input in decision making is balanced; and 4) Empowerment, transfer of control over decisions and resources. Two way communications ensures shared decision making.

In a development communication research, the one idea about the approach to undertaking a preliminary situation assessment in participatory communication programs for natural resource management is the participatory rural communication appraisal. It helps change agents in the following way in getting information needed in developing effective communication programs, materials and methods in natural resources management to ensure suitability to the stakeholders. Listening and understanding stakeholders better so they can plan together. Promoting involvement of stakeholders in decision-making that affects their livelihood; and planning communication programs for new development efforts.

Participatory Development Communication in Natural Resources Management

The communication is a key process of bringing stakeholders together to cooperate towards addressing the problem of dissolution of the environment and natural resources. Thus, participatory communication is a tool for stakeholders. It let them work together towards a sustainable social change away from individual behaviour change. Participatory development empowers local communities to discuss and address natural resource management and engage stakeholders in building an improved policy environment. The terminology has been used in the past by a number of scholars to stress the participatory approach of communication in contrast with its more traditional diffusion approach. Others refer to similar approaches as participatory communication for development, participatory communication or communication for social change. Though used frequently, participatory communication should first be defined in this study. Participatory communication in natural resource management is not just a set of techniques to make people change their knowledge, attitudes, and practices but the people should voluntarily engage in activities in natural resource management as part of a process of gaining critical understanding of why they are doing so. If people understand why and voluntarily change their practices and activities, such changes are likely to be more long lasting. In social change, people work together in agreement to make some changes happen at the community or societal level. Natural

resource management research needs to be conducted in a multidisciplinary and interdisciplinary way and should be participatory and community based. In the actuality, the primary concerns of the local communities and to have an effective management of the natural resource base, community participation is a basic requirement. Participation should be community-wide, since it is the responsibility of the entire community to undertake strong efforts towards natural resource protection. Given the data above, approach to development communication research should not be linear. The increasing interconnectedness today assumes that communication is visible in every aspect of our daily lives. Participation is innate but proper research participation is yet to be perfected**.** Participatory development communication is a way of enabling people to increase community involvement, to have a unified decision over something that is shared by the community. Thus, determining the levels of participatory development communication is important in doing participatory research, to determine the gap between knowledge, attitude and practice.

RESEARCH METHODOLOGY

This research follows a qualitative method. Data gathering involves reviews of secondary data and available information about the research site, and personal inquiries analyzed using thematic analysis.

RESULTS AND CONCLUSION

1. The status and problems of natural resources management in Ratchaburi Province

The result shows that farming practices evolved through time, which is generally brought about by the dynamic needs of the population and the threats to production effectiveness. Thailand's agriculture sector has developed mechanisms to fight its major threats. Though efforts have been done, natural resources management still faces problems. Ratchaburi province is a major agricultural area in Thailand. Majority of its land area is forested and cultivated. The area is prone to severe natural disasters in the past few years such as drought, inundation, hurricane and conflagration due to climate change. The government of Thailand allocates an increasing budget for natural resources management in the area. In 2007, an amount of 529, 028 USD was allocated mainly for the effects of severe drought. The following year, 301, 956 USD was allocated for inundation. The next two years (2009-2010) drought, but in 2011, severe inundation hit Ratchaburi province. The government allocated 1,700,310 USD restoration and management for that incident (Land Development Department of Thailand, 2009).

Increase budget allocation cannot solve the crisis alone. The government needs an effective strategy in mitigating the problems. The participatory development communication in community based natural resources management can help the government in formulating effective strategies to alleviate future disasters. This means that the community where the disasters occur helps in solving and mitigating the problems caused by natural disasters and natural resources degradation respectively. The community as well as the local government should work together to determine ways to protect the degraded and sensitive ecosystem. Natural resource management will require the participation of the local government units, non-government organizations, and institutions. It will serve as a stimulus in the technology adoption and policy support implementation.

Sustainable Development Foundation in Thailand (2003) studied issues and problems in natural resource management in Thailand. The result of studied can be summed as follows:

1. There is a fragmentation in the management of the government units and a monopolization of natural resources through centralized laws and policy. Responsibility in natural resource management is granted primarily to one specific government department creating issues of efficiency in governmental operations

2. The concept on natural resource management is piecemeal rather than holistic. Natural resources are viewed as trade commodities and only serve as production inputs

3. Natural resource management principles remain fragmented and continue to emphasize the use of natural resources for economic development

4. Different organic laws do not correspond with the constitution and the actual circumstances on the ground level due to a lack of participation from the people who are affected by such laws. Additionally, there is a lack of transparency, resulting in an overlapping of interest and benefits

5. Community's rights and people participation in natural resource management have not been recognized and accepted

2. Analyze the relationship between of participatory development communication levels and knowledge, attitude and practice on community based natural resources management

Participation in development and communication is often presented as a normative principal. Maximum participation carries an assumed status of maximum benefit. Development communication involves planned change in knowledge, attitude and practice, which influence not just an individual but other part of the system as well. Any new practice such as participation is also part of a system. What is needed in organizational behaviour is gradual enrichment of participation to the entire socio-technical systems to make agencies more responsive to people and their goals. System theory considers the interrelationships among subsystems as well as interactions between the systems and their supra-systems. A system is considered an organized unitary whole composed of two or more interdependent parts or components and delineate by identifiable boundaries from other systems. The systems theory provides a means of understanding in the interrelationships of organizations and its operations.

In the case of natural resources management, multiple stakeholders are involved in administration and implementation. The model of this study assumes that all levels of participatory development communication will relate knowledge, attitude and practice of stakeholder's concerning natural resource management. Which means higher the level of participatory development communication corresponds to higher knowledge, attitude and practice measure on natural resources management. Considering the relationship between these variables and the need to address the growing problem on natural resources management, it is important that the government using participatory development communication explore the different ways in conserving nature and lessen its expenses on unprepared disasters.

The conceptualized model of the study further suggests that levels of participatory development communication are correlated to stakeholder's knowledge, attitude and practice measure. The study then hypothesizes that there is a significant relationship between stakeholder's knowledge, attitude and practice towards natural resources management and participatory development communication practice. Particularly it puts into assumption that: (1) participatory development communication is directly correlated to knowledge, attitude and practice, which means that as participatory development communication level increases, knowledge, attitude and practice among stakeholders also increases, and (2) participatory development communication levels are inversely correlated to knowledge, attitude and practice, thus, as participatory development communication increases, knowledge, attitude and practice decreases or vice versa.

Figure 1. Framework showing stakeholder's Participatory Development Communication levels correlated knowledge, attitude and practice

Looking at the situation of Ratchaburi province, the increasing budget on natural resources management can be lessen if there is proper communication and participation between stakeholders and the government. Thus, study will give the government a new approach in dealing with natural resources management and increasing knowledge, attitude and practice of stakeholders.

Personalized learning and learning style among upper secondary school students

Noor Azida Sahabudin[a] Mohamad Bilal Ali[b,110]

[ab]Faculty of Education, Universiti Teknologi Malaysia, 81310, Johor, Malaysia

Abstract

In the learning process, learning materials is one of the main factors to be considered by the instructor because it can contribute to the acceptance of students of knowledge presented. Learning material can consist of various forms and formats depending on whether teaching methods using technology or conventional. Learning materials format is related to the learning styles as students will inclined to a learning material based on their learning styles. Because of individual has a different learning style, then the needs of learning materials are also different. Hence a study was conducted to study the format of learning materials that match students' learning styles based on Kolb's learning style model. A total of 39 students were involved as respondents in this study. To determine students' learning styles, instruments LSI (Learning Style Inventory) were used. Whereas, to determine the formats of learning materials, interviews have been conducted on the students according to their learning style. Although Kolb learning styles are divided into four groups, however, this study showed that students' learning materials format is divided into two groups only.

Keywords: personalized learning; learning style, learning materials format

Introduction

In this decade, a variety of issues regarding personalized learning has attracted many researchers especially from two different fields i.e. computer science and education, Tseng, Chu, Hwang & Tsai (2008). Personalized learning is the learning process conducted in accordance with the diversity of students' personal characteristics, Leung & Li, (2007). For example, from various personal features, there is a group of students who have same personal characteristics which are easy to remember things or information based on what they hears. Therefore, teachers need to provide the student, a set of learning materials that involving audio.

There are various methods that have been used by previous researchers in categorizing students either in learning styles, thinking styles, cognitive styles and many more. Categorizing students according to groups with certain features are important to help teachers and educational researchers to better understand the characteristics of the students, Tseng *et al.* (2008). When students are categorized according to the similar characteristic, researchers can investigate in more detail about the students.

Personalized learning

Personalized environment is becoming increasingly important in many areas such as e-commerce, e-tourism and cultural heritage, digital libraries, e-learning and many more, Carmagnola & Cena (2009). In education, personalized environment more synonymous with technology-based learning compared to conventional learning. Often found researchers focuses personalized learning environment with e-learning and social media such as blogs, facebook, twitter etc, McLoughlin & Lee, (2010).

In general, personalized learning is flexible learning that allows students to interact with the learning material that suits with their needs, Green *et al.* (2011). Personalized learning was introduced because of increased awareness among researchers about the diversity of students from various aspects such as learning styles, attitudes, interests, behavior, thinking skills, ability to learn, and so on.

Advantages of personalized learning is able to optimize students' learning process as well as help students acquire knowledge more efficiently and effectively, Mohamad (2009). In fact, according to Clarke (2003), when we provide students with personalized learning environment, they will be more active in learning, using their knowledge that they know and strive to discover more information. There are some implicit ideas behind personalized learning:

- Introduced by the tendency of individuals so that each individual student involved in the learning process.
- Teachers get to know the strengths, weaknesses and interests of each student.
- If practiced consistently, students will become independent and can manage their own learning.
- Compared to normal learning methods, personalized learning makes students able to set goals and measure the success of their own learning.

(DiMartino, 2001)

Personalized learning environments can be provided by any differences in tendencies towards the students such as cognitive style, thinking style, learning style and many more. In this study, the differences that are selected are according to students' learning styles. The chosen model of learning style is Kolb's learning style model.

Learning style

Each individual usually has their own learning style. Studies show that individuals will learn the different methods and have their own preferences and ways to receive and process information, Kumar, Kumar & Smart, (2004). Most of the learning style has been developed to enable students to be classified as a specific group. There are various models of learning styles have been introduced by researchers such as Honey & Mumford, Grasha-Reichermann, Felder & Silverman, Myers-Briggs, Kolbs and many more. Based on several considerations, the researcher chose Kolb learning style model in this study.

Kolb's learning style model is divided into four classifications of learning styles as follows:
- *Diverger* (learn with view)
- *Assimilator* (learn with listen)
- *Converger* (learn with processing the text)
- *Accommodator* (learn by doing)

Background of Problems

Each individual different from each other in terms of learning goals, prior knowledge, learning styles, thinking skills and cognitive style, Papanikolaou, Mabbott, Bull, Grigoriadou (2006); Tseng et. al (2008); Graf, Liu, Kinshuk, Chen, Yang (2009). Because of this difference, teachers and educational researchers should figure out how to ensure individual preferences and needs of each student can be fulfilled. In the classroom teaching, only experienced teachers can differentiate and adapt teaching and learning methods according to students' needs, Zajac (2009). However, not all teachers able to do so, and this condition requires highly careful observation by the teacher for each student.

Teacher can use any inventory or instruments to measure student learning styles according to some theories. When knowing the specific learning styles of students, teachers will be able to recognize, understand and meet the needs of all their students more effectively. For example, knowing the learning styles of a group of students, it was found that there were some students who tended to learning materials in graphic forms. This will help teachers to prepare learning material in graphic form for the students.

However, this is difficult to do if the process of learning occurs in the traditional manner (face to face) in the classroom. This assertion is supported by Graf, *et al.* (2009) which states that it is difficult to fulfill the needs of all students in the face-to-face sessions in the classroom especially for the class that has the high number of students. In fact, it is more relevant to use technology facilities to fulfill the needs of the students because it is more flexible and low cost Mohamad, (2009). There are advantages if student's learning styles are consider and they are given learning materials that suits to the learning style. According to Peter, Bacon & Dastbaz (2010), if teachers give students appropriate learning materials with their tendencies; this will increase the overall potential students in their learning.

In general, this study intends to find out format of learning materials that are appropriate to students according to their learning style. The format of learning materials will be developed in electronic form in order to facilitate

researchers and thus save costs. Although this kind of research was conducted by Yang and Wu (2009), but these studies remain carried out due to curriculum and educational background that differs between the two studies.

Research Objective

Objective of this study are:
(1) Identify the learning styles according to Kolb's learning style model.
(2) Determine the format of learning materials based on Kolb's learning style model.

Research Methodology

Research design

This study is a mix method because it involves quantitative and qualitative data. The student's learning styles are identifying by using an instrument. The data obtained in quantitative form as it involves the number of students and learning styles only. After knowing student's learning style, interview was conducted and the data obtained in the interview involves qualitative data.

A total of 39 students were selected from a secondary school in Temerloh, Pahang. This student is Form 4 students from two different courses which are Accounting and Pure Science. This study utilizes an instrument of LSI and a set of semi-structure interview questions.

Sampel of study

A total of 39 students were involved in this study as respondents and they consist of Form 4 students from two different classes, 4A (Accounting students) and 4B (Pure Science students) in a secondary school. Accounting students are about 22 people and Pure Science students are about 17 people.

Instrument of study and data analysis

In this study, researchers used instruments LSI (Learning Style Inventory) developed by David Kolb. This instrument contains 12 items and uses a nominal scale of measurement. Apart of LSI instrument, this study also use interview questions that provided in semi-structure. There numbers of question for the interview session are 16 questions.

Quantitative data for the student learning styles were analyzed descriptively. The qualitative data of the interview were recorded using a tape recorder and then transcribe by the researchers before translated it into quantitative data.

Result

Analysis demography data

Table 1 displays basic information about the students who participated in this study. Based on the data in Table 1, it found that the majority of students are female (64.10%), while male only 35.90% with majority of the respondents are Malays (66.67%).

Table 1. Demography Data

Respondent Information		Frequency	Percentage
Sex	Male	14	35.90
	Female	25	64.10
Race	Malay	26	66.67
	Chinese	10	25.64
	Indian	2	5.13
	Orthers	1	2.56
Course	Accaunting	22	56.41
	Pure Science	17	43.59

*N = 39

Learning style analysis based on Kolb's Learning Style

According to Kolb's learning style, the students are divided into four type of learning styles which are converger, diverger, assimilator and accommodator. Table 2 displays the frequency and percentage of students according to the learning style. The findings shows majority of students are group from accommodator learning style (43.59%).

Table 2. Number of the students according to the learning style

Learning Style	Frequency	Percentage
Converger	6	15.38
Diverger	7	17.95
Assimilator	9	23.08
Accommodator	17	43.59

*N = 39

Analysis based on the learning material format Kolb's learning style

After identifying each student's learning style, they were interviewed in groups according to their learning style. The interview was conducted in the form of semi-structured. The purpose of this interview carried out is to determine format of learning materials corresponding to students' learning styles. Interview questions were designed based on the findings of the research conducted by Yang and Wu (2009) - refer Table 3. Based on their study, the formats of learning materials have been divided into four types: text, graphics, video and XML covering all four categories of Kolb are learning styles.

Table 3. Yang and Wu (2009) findings

Learning Style	Format of learning material
Converger	Text (word, power point, excel)
Diverger	Graphics (image, chart, symbol)
Assimilator	Video (audio, animation)
Accommodator	XML (Web, SCORM, LOM)

A total of 16 questions were asked to all students in the interviews. Among the questions that have been put forward in the interview are:

"Between novels and comics, which one do you prefer?"

This question was asked to find out whether students' like text or graphics.

Other questions posed are as follows:

"In the History assignments, you should get a lot of information. What kind of method do you prefer between find reference books at the library or looking for material at the internet?"

This question was asked to know students' interests in learning material format either in text or XML.

At the end of the interview session, all students are shown with four types of learning material formats which were texts, graphics, video and web. They were asked to choose only one format of the learning material that most preferred. Although students give options to choose learning material format that shown to them, the researchers also analyzed their answers during the interview session to confirm the selected learning materials are not influenced by other factors.

Results of this study, based on the interview that was conducted, it was different from the findings done by Yang and Wu (2009). For students from converger group, a total of 5 of 6 students (83%) who prefer learning material in the form of text. Same as converger group, the students from diverger also prefer learning material in the form of text, it is about 6 out of 7 people (86%). Out of 9 students from assimilator group, 7 students (78%) prefer learning material in the form of video. While for the accommodator group, 12 out of 17 students, (71%) prefer video as their learning material format.

In conclusion, the data obtained from this study showed, students from group converger and diverger select text as their option, while assimilator and accommodator students choose learning materials in video form.

Table 4. Preferred formats of learning materials according to learning styles

	Learning material format	Text	Graphics	Video	XML	Number of students
Learning style						
Converger		5	-	-	1	6
Diverger		6	-	-	1	7
Assimilator		-	1	7	1	9
Accommodator		1	3	12	1	17

*N = 39

Discussion and Conclusion

From the results obtained, it turns out to be different from the findings of the research conducted by Yang & Wu (2009). There are several factors that influence the findings of this study compared to the study done by Yang & Wu (2009). Among these are:

- Educational background of students is different because Yang & Wu (2009) conducted a study in Taiwan, while the study is carried out in Malaysia.
- Methods of data collection. Yang dan Wu (2009) uses the attributes-ant algorithm while this study using interviews method.

Table 5. The differences result between Yang and Wu (2009) with this study

Learning Style	Yang and Wu (2009)	This study
Converger	Text	Text
Diverger	Graphics	Text
Assimilator	Video	Video
Accommodator	XML	Video

Based on Yang and Wu (2009) findings, there is a skepticism about the format of learning materials in the form of XML. This is because in the opinion of the researchers, XML can include all three other (text, graphics and video) formats of learning materials. Because of those concerns, this study was conducted to ensure that there are significant differences between the three learning materials formats.

From the findings of this study, only two types of learning format that filled student's inclinations which are video and text. When compared against the study done by Yang and Wu (2009), students from the accommodator was originally inclined to learning materials in the form of XML has changed to learning materials in the form of video. This may be due to the format in the form of XML itself. According to Salminen and Tompa (2011), XML is not a component of the learning material itself, but instead is a learning platform that contains various learning components such as web, graphic, metadata, text and video.

Limitation and Future Study

The limitations of this study were identified and one of it is the norm of students in Malaysia, especially the students at the school level that are still lack vulnerable with computer based learning environment. This makes them not comfortable when asked questions related to learning that involves the use of computer. Even so, researchers strive to ask them in the interview session not to reveal the question is about computer-aided learning. Instead, the questions posed were made to look like natural talk about their daily lives. For example, to find out whether the students like the video or not, the question asked is: "In your free time, do you like to watch television or play computer games?". Expected with form a natural question will make the students more honest to answer all questions in an interview session.

The suggestion for the further research is a complete learning system with several formats of learning materials should be provided directly to the students. Students will not be interviewed. In contrast, observation will be conducted to determine the formats of learning materials most preferred by each individual student according to their learning style. This situation will occur more naturally without any interruption or influence by external factors.

13th International Educational Technology Conference

Plastik sanatlar öğretiminde internet ve bilgisayar destekli elektronik ekipmanların öğrenme düzeylerindeki değişimi

Öğrt. Gör. Fuat AYIK, Arş. Gör. Naci EDİ[111]

Ağrı İbrahim Çeçen Üniversitesi / Eğitim Fakültesi / Güzel Sanatlar Eğitimi Bölümü

Özet

Bilim ve teknolojinin gelişimine paralel olarak bilgi çağının üretim, eğitim ve iletişin aracı olan bilgisayar, internet ve buna bağlı elektronik donanımları günlük yaşamımıza girmesiyle birlikte her alanda olduğu gibi sanat ve sanat eğitimi alanında da önemli bir yere sahip olmuştur. Daha önce zorlu şartlarda sanat eserlerinin renkli baskılarını yâda röprodüksiyonlarını görüp bunlar üzerinde sanatçıları tanıma, sanat eseri hakkında bilgi edinme, eleştirip değerlendirme durumunda kalan öğretmen ve öğrenciler bugün bilgisayar ve internet sayesinde daha kolay sanatçıları ve sanat eserlerini sanal ortamda görebilme, sanatçılarla konuşabilme imkânına kavuşmuşlardır. Bunun yanında hızlı ve güncel bir şekilde kütüphanelere, müzelere, sanat galerilerine ve sanatçı stüdyolarına girebilme, inceleyebilme ve sanal ortamda gezebilme olanaklarına sahip olmuşlardır. Bu durum öğrenci ve öğretmenlerin güncel sanat gelişimlerini yakından takip edilebilme ve uygulama şansını elde edebilmişlerdir. Araştırmamızın amacı da bu alanda geri kalmış bölgelerde internet ve bilgisayar destekli donanımların çok kültürlü sanat alanındaki gelişimini ortaya koyabilmesidir. Araştırma Ağrı İlinde yapılmıştır.

Anahtar Kelimeler: Sanat, müze, galeri, çok kültürlü sanat.

The change of internet and computer aided electronic equipments in plastic arts education on learning levels

Abstract

Parallel to the improvement of science and technology, computer and internet which are devices for production, education and entertainment of information age and their electronic equipmenthave been included in our everyday lives and acquired an important place in the field of art and art education like in other fields. Teachers and students who had to observe color printing or reproductions of artworks under tough conditions and acknowledge artists on them, acquire knowledge about artwork, criticize and evaluate them now have the opportunity to see artworks in virtual environment easily and have conversations with artists due to computer and internet today. Apart from this, they had the opportunity to enter, observe and visit libraries, museums, art galleries and artists' studios in virtual environment in a fast and current way. In this way, students and teachers could follow and apply current

artistic developments closely. The aim of our study is to put forward the effect of internet and computer aided equipment on development of field of multi-cultural art in backward regions.

Keywords: Art, museum, gallery, multi-cultural arts**.**

Giriş:

Gelişmekte olan Türkiye Cumhuriyeti Devleti, geçmişte olduğu gibi günümüzde de bilimde olduğu gibi sanat ve sanat eğitimi alanında da Avrupa'da uygulanan çağdaş yöntem ve teknikleri alarak bunları kendi bünyesinde uyarlamada başarılı politikalar uygulayan ülke olmuştur. Bu sebeple 1877'de İtalyan Corrado Ricci ile başlayan çocuk resimleri tarihi Georg Kerschenteiner, Franz Çizek, Viktor Lowenfeld, Rouma Jean Piaget, John Bannister Goodenough'un 1944 yıllarında sanat eğitimi alanındaki özgürlükçü yaklaşımı ışığında "alan ve çocuk odaklı" sanat eğitimi yaklaşımlarını 1998'li yıllara kadar sanat eğitiminde belirleyici olmuştur (KIRIŞOĞLU, Olcay Tekin. 1996). Ayrıca D. Person, R. Arnheim, E. Eisner, H. Gardner, G. Clark D. Feldman ve E. Zimmerman'ın sanat eğitim çalışmaları 1998 yılından sonra ülkemiz okullarında uygulamaya başlayan "disiplin odaklı" sanat eğitimi anlayışımızın düşünsel temellerine kaynaklık etmektedir.

Plastik sanatlar resim ve heykel alanında; bilim ve teknolojinin gelişiminde paralellik sağlaması, bilgi çağının kaçınılmaz gereksinimlerindendir. Bu bağlamda bilgisayar, donanımları ve internetin günlük yaşamımıza girmesiyle birlikte her alanda olduğu gibi sanat ve sanat eğitimi alanında da önceden tahmin edilemeyen görsel yenilikler ortaya çıkmıştır. Daha önceleri sanat eserlerinin renkli baskılarını ya da röprodüksiyonlarını görüp bunlar üzerinden sanatçıları tanıma, sanat eseri hakkında bilgi edinme, eleştirip değerlendirme durumunda kalan öğretmen ve öğrenciler, bugün bilgisayar ve internet sayesinde sanatçılar ve eserlerini sanal ortamda görebilme, sanatçılarla konuşabilme olanaklarına sahip olmuşlardır. Yine sanat eğitiminde önemli bir yere sahip olan müzeler, sanat galerileri, sanatçı stüdyoları gün ışığına çıkmıştır. Sanat dünyasına ait tüm etkinlikler dijital ortamlarda gününde izleyebilme önemli bilgi-belge ve dokümanları elde etme imkânları ortaya çıkmıştır. Bilgisayar ve internet sayesinde, ortaya çıkan bu fırsatlar sanat eğitimi veren kurumlar arasında fiziksel farklılıkların ortadan kalkmasına neden olmuştur. Kurumlar arasındaki nitelik farkı bu sayede en aza inmiştir. Sanat eğitimi alanında yapılan tasarımlar, ödevler, projeler, ders etkinliklerine bağlı kimi yöntem ve teknikler bilgisayar ve bilişim teknolojileri ile yapılır hale gelmiştir. Dijital fotoğraf ve kamera makineleriyle kaydedilen görüntüler siyah-beyaz veya renkli baskılar anında yapılır hale gelmiştir. Daha öncesinde karanlık odalarda uzun süren uğraşılar sonucu yapılan siyah-beyaz veya renkli baskılar artık tarihe karışmıştır. El işçiliği yerini fikir işçiliğine bırakmaya başlamıştır. Buna bağlı olarak bilgisayar ve bilgisayara bağlı donanımlarla yapılan sanatsal çalışmalar ve ürün oluşturmada süreç kısalmış olup, sanatçıya artı zaman sağlandığı görülmektedir.

XX. yüzyılın sonları ve XXI. Yüzyılın başlarında YÖK/Dünya Bankası Milli Eğitimi Geliştirme Projesi Öğretmen Eğitimini Yeniden Yapılandırma programı ile eğitimi çağdaşlaştırma çabaları için önemli adımlar atılmıştır. Bu duruma yönelik hazırlanan Eğitim Fakültesi Öğretmen Yetiştirme Lisans Programları içinde yer alan Güzel Sanatlar Eğitimi Bölümü Resim- İş Öğretmenliği Lisans Programı "Disiplinler Arası Sanat Öğretimi"ne

yönelik değiştirilip yeniden düzenlenmiştir. Bu eğitim; Sanat Tarihi, Estetik, Eleştiri, Uygulama gibi dört disiplin alanında temel bilgi ve becerileri kapsamaktadır. Böyle bir sanat eğitimi anlayışı ile öğretmen adaylarının; genel sanat anlayışlarının geliştirilmesi, sanatın doğasının tartışılması ve sanat eğitimi doğrultusundaki yanlış anlaşılmaların düzeltilmesi, görsel algı, sanatın dili ve araştırıcı sanat eleştirisi süreçleri; uygulamalı çalışma bilgisinin geliştirilmesi, estetik bilgi edinme yöntemleri, belli başlı sanat kuramları ve biçimler hakkında "derin yaklaşım" sergilenmesi amaçlanmıştır (KIRIŞOĞLU, Olcay Tekin. 1996).

Geçmişe yönelik sadece uygulamaya dayalı sanat eğitimi anlayışı böylece eleştiriye uğramıştır. Bu yüzden günümüz sanat eğitiminde kimi teknikler, amaçlar, içerikler hızla değişmek zorunda kalmıştır. Sanat eğitimi veren kurumlarda klasik atölye düzeni ile birlikte içinde bilgisayar ve internetin yanı sıra tarayıcılar, dijital kameralar, yazıcılar, geniş çalışma masaları, projeksiyon cihazları, çeşitli kaydediciler, istendiğinde karanlık hale gelen perdeli sınıf ve atölye özel öğretim alanları oluşturulmuştur (ÖZSOY, Vedat. Ankara, 2002). Tüm bu gelişmeler karşısında öğretmen adaylarının bir yandan konu alanındaki dersleri öğrenmeleri, diğer yandan öğretmenlik formasyonu dersleri ile öğretmenlik mesleğine ve anlayışına hazırlanmaları, bilgi teknolojilerini yakından tanımaları ve kullanmaları günümüzde daha önemli hale geldi. Nitekim YÖK/Dünya Banası Milli Eğitimi Geliştirme Projesi kapsamında öğretmen yeterliliklerinden bazıları şöyle tanımlanmıştır.

1. Elektronik araçlar ve bilgisayar yazılımları gibi bilişim teknolojilerinden yararlanma. ,
2. Öğretme- Öğrenme araç ve gereçlerini uygun ve etkili kullanma.
3. Dersi çeşitli öğretme – öğrenme etkinliklerinden yararlanacak şekilde planlama.
4. Gerekli oldukça alanında bilgileri daha üst düzeylere çıkartma (YÖK, Dünya Bankası,1997)

YÖK ve Dünya Bankasının bu projesinin amacı içerisinde uygulanan Ağrı İbrahim Çeçen Üniversitesi Eğitim Fakültesi Güzel Sanatlar Eğitimi Bölümü Resim-İş öğretmenliğinde okuyan öğretmen adaylarının Disiplinler Arası Sanat öğretimine yönelik konu alan dersleri ile öğretmenlik formasyonu kazandıran dersleri etkili kılmada bilgisayar, internet ve bunlara bağlı elektronik araç ve gereçlerin kullanımıyla ilgili olarak öğretme - öğrenme düzeyleri değerlendirilmiştir.

Örneklem

YÖK ve Dünya Bankasının proje kapsamında Ağrı İbrahim Çeçen Üniversitesi Eğitim Fakültesi Güzel Sanatlar Eğitimi Bölümü Resim-İş Öğretmenliği Anabilim Dalı lisans öğrencilerinin ders etkinliklerinde bilgisayar ve internetin yanı sıra yazıcı, dv video, dijital fotoğraf makinesi ve projeksiyon cihazı gibi elektronik araç ve gereçlerin kullanımı ile ilgilidir. Resim-İş öğretmenliği lisans programında yer alan uygulama ve teorik derslerin yanı sıra öğretmenlik formasyonu kazandırmaya yönelik derslerin tasarım, ödev, proje, mikro öğretim uygulamaları ile bunlara yönelik süreç dosyası oluşturma, sergileme, kişisel arşiv oluşturma gibi öğretme-öğrenme etkinliklerinde elektronik araç ve gereçlerinden yararlanma amaçları tespit edilmektedir.

Öğretmen adaylarının konu alanındaki dersleri öğrenip kendilerini geliştirmede ve öğretmenlik formasyonu dersleri ile Disiplinler Arası Sanat Öğretimine yönelik öğretmenlik formasyonu kazanabilmede bu araçları

kullanmanın önemli olduğu bilincinin yerleştirilmesi için öğrencilere rehberlik edilecek, bu araçların kullanımındaki eksiklikler belirlenecektir.

Araştırmanın Kapsamı İşleniş Planı

Bu çalışmanın kapsamı Ağrı İbrahim Çeçen Üniversitesi Eğitim Fakültesi Güzel Sanatlar Eğitimi Bölümü Resim-İş Öğretmenliğinde lisans eğitimi gören öğrenciler için bilgisayar, internet ve bunlara bağlı elektronik donanımların yer aldığı, kapsamlı Özel Öğretim Sınıfı (laboratuar) kurmak ve Disiplinler Arası Sanat Öğretimi konu alanı ve öğretmenlik formasyonu derslerine yönelik bu araçların kullanımıyla ilgili çalışmalar ve değerlendirmeler yapmaktır. Bu nedenle daha önce alt yapısı hazırlanmış olan ve içinde on adet internete bağlı bilgisayar, birer adet slayt makinesi, tepegöz, episkop, tv gibi ekipmanlar bulunan Özel Öğretim Sınıfına ek olarak, yazıcı dijital fotoğraf makinesi, veri tarayıcısı (scanner), dijital kamera ve projeksiyon cihazı alınacaktır.

Öğrencilerin disiplinler arası sanat öğretimini öğrenme-öğretme sürecinde yazarak, düşünerek, çizerek, boyayarak, araştırarak öğretme ve öğrenme sürecinin bitmeyeceği bilinciyle öğrendiklerini sorgulayan bireyler olarak yetişmeleri için kendilerine rehberlik edilecektir. Ayrıca özel öğretim sınıfında (laboratuarında) eğitsel etkinliklerin tümünü izlemeye ve değerlendirmeye yönelik veri saklama (arşiv) oluşturulacaktır.

Konunun Güncel Ve Evrensel Boyutunda Ulaştığı Teknolojik Nokta

Bilgi çağının baş döndürücü bir döneminde yaşamaktayız. Toplumların plan yapan, karar veren ve sürekli önüne gelen verileri yorumlayan, üstüne bilgi inşa edebilen, sosyal, teknik, sanatsal sorunları düşünen bireylere ihtiyaç vardır. Toplum olarak çağı yaşama ve yaşatmak zorunluluğundayız. Bunun için öğretmenlerin kendilerini çağın gereklerine göre donanımlı yetişmeleri ve yeni nesillere bilginin nasıl öğretileceğini öğrenmeleri gerekmektedir. Böyle bir yaklaşımda öğrenci ve öğretmenlerin eğitsel etkinliklerin yürütülmesinde ve geliştirilmesinde iş birliğine dayalı bir ilişkiye girmelerine ihtiyaç vardır. İş birliğine dayalı, öğrenci merkezli, teknolojik araç ve gereçlerin kullanıldığı, çağdaş eğitim, yöntem ve tekniklerin uygulandığı eğitim süreci ile programdaki beklenen hedeflere ulaşmak mümkün olacaktır. Bu zamana kadar imkânsızlıklar içinde de olsa elektronik araç ve gereçlerle yapmış olduğumuz mikro öğretim uygulamalarında, grafik tasarımlarında, ödev ve projelerde öğrencilerin öğrenme-öğretme, ürün vermede isteklendirme ve başarı düzeyi beklentilerin çok üzerinde olmuştur. Öğretmen adayları, bu proje kapsamında, eksikliklerini giderecek ilerisinde asıl görev alanları olan ilköğretim ve liselerde Resim-İş öğretimi alanında mevcut sorunları çözebilecek ve Disiplinler Arası Sanat Öğretimi'ni verebilecek öğretmenlik yeterliliğine sahip olabileceklerdir.

Sonuç ve Öneriler

Bu çalışma ile birlikte internet, bilgisayar, projeksiyon cihazı ve diğer elektronik ekipmanların kullanılabildiği, klasik atölyelerde olduğu gibi geniş çalışma masaların yer aldığı, duvarlarında tablo, levha, afiş kavram haritalarının bulunduğu atölyelerin etkin kullanılması sağlanmıştır.

Mikro öğretim uygulamaları, uygulamalı anasanat ve yardımcı (seçmeli) sanat atölye derslerinde yapılan çalışmaları sergileme, süreç dosyası oluşturma gibi etkinliklerin dijital ortama kayıtları yapılmıştır. Öğrenme ve öğretme etkinliklerinde dijital araç ve gereçlerin kullanılması, bu süreç içinde çağdaş öğretim yöntem ve tekniklerin uygulanması, öğretmen adaylarının sanatsal biçim dili oluşturması ve görsel sanat kültürü kazanmaları yönünde önemli katkılar sağlamıştır. Bu sayede öğrencilerin eğitsel etkinliklere yönelik motivasyonlarının artığı gözlemlenmiştir.

Sanat tarihi, estetik, eleştiri ve uygulamalı çalışmalara yönelik ödev, proje, levha, afiş, kavram haritaları sanat eleştirisi, çalışma kâğıtları hazırlama, anasanat ve yardımcı (seçmeli) sanat atölye çalışmalarının tasarım sürecinde internetin yanı sıra; word, paint, photoshop, sketchup, dynamic auto, painter gibi bilgisayar programlarını etkin olarak kullandırılmıştır. Bu araç ve gereçler kullanılarak yapılan çalışmalarda ürün verme süreci kısalmış, ürünlerin yapımında işçilik-ustalık gibi el becerileri yerini fikir işçiliği ve tasarım düşüncesine bırakmıştır. Bilgisayarla yapılması mümkün olan kimi uygulama çalışmalarını öğrencilerin istekli yapmadıkları tespit edilmiştir. Örneğin; tezyinat tasarımlarında form artırımına yönelik birim motif tekrarlarına ya da renk çemberi ve tangram çalışmaları, bilgisayar ortamında yapılması zorunlu hale gelmiştir.

Edmund Feldman'ın geliştirmiş olduğu betimleme, çözümleme, yorumlama ve yargılamaya yönelik öznel yönden sanat eleştirisi ile Louis Lankford'un sistemleştirmiş olduğu yansıtmacı, dışavurumcu, işlevsel ve biçimci sanat kuramları bağlamında yerli ve yabancı ressamların başyapıtları atölye ortamlarında yansıtılarak, bunlar renk, şekil ve uzam yönünden benzer ve farklı yönleri eleştirilerek tartışılmıştır. Renkli dijital baskıların görüntüleri çalışma kâğıdına aktarılması sayesinde, özellikle eğitimde önemsediğimiz yansıtmacı ve dışa vurumcu sanatla ilgili kavramlar sorgulayıcı, araştırıcı, öğrenci merkezli bir yöntemle eleştirilip değerlendirilmiştir. Bu durum öğrencilerin sanat eğitiminde kültürel okur-yazarlık kazandırmada etkili olduğu ve öğrenme düzeyini istendik düzeyde geliştirdiği tespit edilmiştir.

Proje kapsamında gördüğümüz başka bir veri ise okul öncesi öğretmenliği, sınıf öğretmenliği, resim-İş öğretmenliği anabilim dallarında okuyan öğrencilerin önemsediği en önemli derslerden birisi, çocuğun sanatsal gelişimi dersi olduğudur. Bunun nedeni ise; bu derste yapılmış olan çocuk resmi analizleri ve "bir adam çiz" testi uygulamaları ile geçen yüzyılda sanat ve bilim çevrelerinde çocuk resimlerinin ilgi odağı haline geldiğine yönelik örneklerin ortaya konulmuş olmasıdır. Örneğin; Pablo Picasso, Joan Miro Ferra, Paul Klee, Marc Chagall, Raoul Dafy, Jean Dubuffet gibi ressamların çocuk resminden ilham aldıklarına yönelik örneklemlerin perdeye aktarılıp çocuk resimlerinde görülen karakteristik özellikleri ile kıyaslanması ve çocuksu kavramının anlaşılır hale getirilmesi öğretmen adaylarının çocuk resmine ve eğitimine ilgilerini artırmıştır.

Disiplinler arası sanat öğretimi bağlamında, Louis Lankford tarafından sistemleştirilen yansıtmacı, dışavurumcu, işlevsel (araçsal) ve biçimci sanat kuramlarının öğretiminde, öğrencilerin internet sayesinde sanatçıların biçem dilini görme, algılama ve ayrımsama yapabilme; bunlardaki teknik, estetik bağlantıları değerlendirebilmeleri, eski dönemlerdeki öğretim yöntemleriyle kıyaslanamayacak düzeyde öğrencilere sanat alanında kısa sürede kültürel okur-yazarlık kazandırmıştır. Yine bu kapsamda, eğitim ve öğretim sürecinde optimum

düzeyde sınıf ve atölye yönetim becerisi gösterilip çalışmalar öğretim sürecinde gözlem fişleriyle somut olarak takip edildi. Öğrencilerin yapmış olduğu ödev, proje ve uygulamalar not ile derecelendirilmesi sonucu üstün ve mükemmel başarı düzeyi tespit edildi. Bu başarı düzeyini test etmek için Resim-İş, Okul Öncesi, Sınıf Öğretmenliği bölümlerinin II. ve IV. sınıflarında öğrenim gören 140 öğretmen adayına, on sorunun yer aldığı bir anket çalışması uygulandı. Ankete katılanlara, ankette yer alan sorulara evet, hayır ve kısmen seçeneklerinden birisinin işaretlemeleri istenildi. Anket sonuçlarına göre öğrenme ve öğretme düzeyine yönelik %90 oranında evet cevabı alındı. Bilgisayar ve internet imkânlarının olmadığı dönemlerde ki başarı % 50 oranındayken internet, bilgisayar ve ekipmanlarını kullanımından sonra başarı düzeyinin % 40 oranında arttığı tespit edilmiştir. Bu anket sonuçları 2012-2013 eğitim ve öğretim döneminde ankete katılan öğrencilerin notla derecelendirme puanlarıyla paralellik göstermiştir.

Plus Minus of ICT Usage in Higher Education Students

Yudi Perbawaningsih[112]

Atma Jaya Yogyakarta University
Yogyakarta - Indonesia
yudi_wl2002@mail.uajy.ac.id

Abstract

Information and Communication Technology (ICT) was created in hopes to help people communicate more efficiently and effectively, including the production, dissemination and understanding information. The effectiveness of ICT in education is demonstrated by the achievement of communication objectives, while efficiency is showed by saving cost, time and effort. In use in the educational process, theoretically, ICT would bring positive benefits. For all education participants, both teachers and students, ICT helps to provide a huge and various knowledge as well as up to date and easily accessible in a relatively rapid and in some cases even is free of charge. ICT also help academic community to fulfill one of the obligations of education is to distribute/ communicate science to the public for prosperity. ICT helps distribute knowledge very quickly, with an unlimited geographical coverage, and in some cases it is also free of charge. However, what is the use of ICT in higher education always brings positive benefits? This article describes the use of ICT does not always bring positive benefits or utilized. It was discovered in the institution of higher education in Indonesia, that there is a minus value of the use of ICT. This is due to several reasons but the important one is mental attitude among the leaders of educational institutions, which are associated with organizational policy and student's mental attitudes related to the use of ICT. The result is a low quality of science, the relation between teacher and student is bad, and of course the quality of graduates is low.

Keywords: ICT usage, ICT literacy; attitude; effectiveness; efficiency

Background

Modernization is characterized by the inclusion of technology in human life. It begins with the belief that technology always brings positive benefits to human being. Technology gives such good promises of freedom and happiness, that in fact, both of these are intrinsic values of *humanity*. Therefore, the technology has always been associated with humanity. In social life right now, this belief eventually evolved into the dependence of human to the technology. Its consequence is the establishment of human dependence on technology. It results people behavior are not freewill but rather controlled by technology. This dependence does not correspond precisely with the ultimate goal of freedom that technology created. Furthermore, because there is no freedom, it is difficult to create happiness. Furthermore, in this era the technology has high power. It is equal to or even exceeded the power held by political leaders in the political structure (Feenberg, 2000:131-147). It determines the social and cultural changes, including the social values. So then, technology brings both plus and minus effects on humanity and human life. There is a dialectics of technology.

This article describes the dialectical usefulness of Information Communication Technolgy (ICT) – one kind of technology- in the educational process, particularly in the learning process in higher education institutions in Indonesia, using the case of the University of Atma Jaya Yogyakarta. Dialectics has become very interesting to discuss because Indonesia is still included in the developing countries, which have not been fully or completely recognize and adopt this technology. Traditional values in education are still owned by some of the education community. Some of the traditional values are somewhat inhibiting ICT adoption and innovation. Even the middle class of this country has begun to know and use ICT, the very fast process and accelerated modernization makes an efficiency and effectiveness of ICT usage could not be achieved and in turn the goals of education could not also

E-mail address: yudi_wl2002@mail.uajy.ac.id

fulfilled. The assumption of this article is the effective use of ICT in education will be achieved if only certain conditions fulfilled, both at the level of the academic community (actor) and education institution (system-structure), including the policy (rule). If these conditions are not met, then the use of ICT has led to the inefficiency and ineffectiveness, including the emergence of *ICT dependency* that leads to the emergence of dehumanization of education.

ICT Usage in Higher Education Institution

There is nothing new about the benefits of ICT in education, especially in higher education. Most of the discussions state that the potential benefits of ICT-based teaching and learning strategies, based on the following two propositions: (1) ICT offers economical efficiency for the organization of education and the academic community, (2) ICT is able to generalize students, enabling the institution to accommodate individual differences such as goal learning, teaching style, comfort learning for both students or university anytime and anywhere (Massy and Zemsky, 1995, Pavlik 1996). In Indonesia, one variable for education quality assessment is the usage of ICT, especially of Information Technology (IT). Ministry of Information and Communications and Ministry of National Education of the Republic of Indonesia formulate 7 strategic roles of IT usage, namely (1) as a repository of knowledge, (2) a learning tool, (3) educational facilities, (4) the standard of competence, (5) supporting educational administration, (6) management tool, and (7) education infrastructure (Indrajit and Djokopranoto, 2006:375-388). Seven strategic roles of IT can be summarized in two major; (1) the functions of management/ administration (back office functions) and (2) learning function (front office functions) (Indrajit and Djokopranoto, 2006:343). Based on the Regulation of Education 2003 Article 1, paragraph 15, the Government encourages education institusion to use ICT to conduct a distance education *(e-learning)*. It shows the technology is recognized to have tremendous positive benefits for the effectiveness of education. It encourages higher education are competing to adopt ICT, even it becomes the important key to create good image and win the "market". Not only do adoption, improving IT and ICT using skill are also part of the curriculum that is perceived very marketable. In fact, it is not only in science-related fields but also in other scientific fields, such as social sciences. Some fields of study even are conducted rebranding by adding the word "industry" or "technology" is certainly associated with the use of ICT, eg 'Biotechnology'- in the past its name is the "faculty of biology", 'industrial sociology' – in the past its name just "sociology". Not only label study program or field of study but also on subjects such as online journalism, e - public relations, and online marketing and advertising. Rebranding and restructuring of the curriculum is believed to be able to build the image and education quality, including encouraging "market" becomes more passionate.

Bates and Wulff, as quoted by Siahaan (2004) mentions some of the advantages of learning by using Internet-based ICT shown in the following: (1) increase the level of interaction between student and teacher or instructor (enhance interactivity); (2) can be done anywhere and anytime. The nature of internet technology that does not require synchronicity allow it; (3) very capable of reaching a broad and global audience, and (4) easy and fast in updating learning materials and storing data or documents. Pavlik (1996) in his study mentions education by utilizing IT in education is more effective and beneficial than the use of conventional instruction technology, in terms of: (1) 30% savings of time, (2) 30% - 40% cost savings, and (3) improving student achievement.

But on the other hand, some papers also mention that the use of ICT will promote the effectiveness of education and learning along supported by a number of conditions, namely: (1) positive attitude of people in ICT, which is indicated by the large number of users and Internet-based ICT services provider, (2) price of ICT devices are relatively cheap and can be purchased by the general public, (3) the ability of the technology to process data quickly and large storage capacity, and (4) the extent of access or communication network / internet (Siahaan, 2004). Rankin and McCracken (Siahaan, 2004) also wrote that the effectiveness of the use of ICT in learning is determined by the ability of lecturers to explain the technological skills that must be possessed by students, and facilities and equipment needed in the ICT learning. On the other hand, students also must meet the requirements such as (1) have a high motivation to learn independently, (2) enjoy reading and like freedom, and (3) still having motivation to pass the grade eventhough fail in a conventional lecture. Perbawaningsih (2005:312) states to be able to conduct ICT-based learning and to achieve the learning effectiveness, we need (1) ICT tools, such as hardware, software and dataware with standardized operational capabilities; (2) human resources that have a positive attitude to technology and high ICT literacy; (3) institution has positive attitude and conducive organizational climate.

How do the conditions in Indonesia? What are the factors that determine the effectiveness of the use of ICT in education and learning? From the aspect of ICT tools and technology applications for education, the government of Indonesia already has positive commitment. This is demonstrated by the providing of ICT *backbond* of Higher

Education. The project is prepared to build the ICT infrastructure of all universities in Indonesia (Riandi, 2010). From a technical aspect, Indonesia is well advanced. It is shown by the following infrastructure developments (Purnomo, 2009):

1. 1999-2000: Network Internet (Jarnet)
2. 2000-2001: Network Information School (JIS)
3. 2002-2003: City *Wide Area Network* (WAN cities)
4. 2004-2005: *Information and Communication Technology Center* (ICT Center)
5. 2006-2007: *Indonesia Higher Education Network* (Inherent)
6. 2007-skrg: National Education Network (Jardiknas)
7. 2008-skrg: *Southeast Asian Education Network* (SEA EduNet)

Along with the development of the ICT infrastructure of the many educational institutions begin to develop *e-Learning*. At the level of higher education, some universities have develop their own *e-learning platform,* including UGM (http://elisa.ugm.ac.id/), Unissula Semarang (http://www.unissula.ac.id/sinau /), AMIKOM jogja (http:// *e-Learning.* amikom.ac.id /), and others. Several other PT *MOODLE platform,* including: ITB (http://kuliah.itb.ac.id/), UNPAR (http:// *e-Learning.*unpar.ac.id /), Gunadarma (http:// *e - Learning.* gunadarma.ac.id /), ITS (http://share.its.ac.id/), UB (http://inherent.brawijaya.ac.id/vlm/), Unitomo (http:/ / *e-Learning.*unitomo.ac.id), IST AKPRIND (http:// *e-Learning.* akprind.ac.id /), and other (Sutanta, 2009). But on the other hand, Public Sector Director, Microsoft Indonesia Teja Kusmana assess the Indonesia is still lack of Information and Communication Technology (ICT). One of the major reasons is the limited government budget for the ICT sector. "The cost of government budgeted for the ICT sector is quite limited because they have to share with other sectors is a priority, such as education and health," said Teja in PAD 28 Bar, Bistro and Coffee Corner, SCBD, South Jakarta (retrieved from Okezone, 11/13/2012). However, when referring to the quote above Sutanta, despite the government's budget for ICT is not much, the ICT budget allocation for education is quite large. That is, the commitment of the government and the private sector to promote the use of ICT is quite strong. But what do about the conditions in Indonesia on aspects of human resources or users of ICT? Are they have sufficiently mental and skill?

ICT Literacy and the Influencing Factors

The degree of ICT literacy is indicated by knowledge, attitude and behavior toward the information and technology. Lowest degree is shown by having low knowledge about ICT, seeing ICT is unimportant thing, and not using ICT at all for daily life activities, whereas high degree of ICT literacy is characterized by high knowledge, positive attitude and ICT usage for all daily life activities. In this degree, people are called have information culture and become a part of information society. Based on these indicators, the degree of ICT literacy of Indonesian people is low. This group is precisely the generation now holding the power that determines the future (Indrajit and Djokopranoto, 2006:318) and thus, the adoption of ICT innovation in this nation lags behind other countries. In 1998 a study showed that the level of ICT usage among college lecturer in Yogyakarta, Indonesia is quite high. However, the older generation of teachers, the level of ICT usage is lower, even if they have a positive attitude. It is caused by the inability to operate this technology. It is often called the technology illiterate. In the group of lecturers, ICT is more widely used for word processing. Only a minority of lecturers interact Internet-based communications such as an electronic mail*,* create a blog, transactions via online (Perbawaningsih, 1998). In 2012, Sungiardi, Indonesia computer expert claimed that only 10% of the total population of Indonesia who have truly technological literacy. Even in Indonesia there are about 80 million Internet users, but it is limited to the use of social networking Facebool and Twitter (www.tempo.co , retrieved on March 8, 2013). This meant that there were 23.9 million people of Indonesia who have a high level of ICT literacy, and most of them are having high educational background. Other references show that there is 63 million Indonesian people use internet or 24.23% from the total of population. It means that Indonesia is the country with the eighth largest in the world internet users. While the use of twitter Indonesia is in fifth position in the world. The Internet usage is 3 hours a day per person (Intisari, April 2013). However, there are only 23.9 million people of Indonesia who have a high level of ICT literacy, and most of them are of high educational background. Indrajit and Djokopranoto (2006:325) stated that most of the researches in Indonesia showed that the main issue of the various aspects of the digital divide focuses on the quality of human resources. In other words, the level of individual competence or skill in using ICT in everyday life is still low. Thus, the accumulation of these individuals forms a digital blind society or blind of technology.

In recent years, studies have shown that *ICT literacy* in high school and college is quite high (Sutanta 2009, Wahyono and Pujiriyanto 2010). This is due to the amount of the institution's commitment to the two cases above to take advantage of Internet-based ICT for education and learning. The adoption of innovation by the organization is then followed by the adoption of innovation at the individual level. On the other hand, the study also noted that the characteristics and individual attributes play an important role. Wahyono and Pujirianto's research (2010) states that a high socioeconomic class and achievement associated with ICT Literacy are also high.This study did not differ from the results of research Perbawaningsih (1998) which states that a positive attitude and a high level of ICT utilization is determined by several factors such as the degree of familiarity on ICT, the degree of ICT information seeking and the types of needs. If you refer to this study, it becomes difficult to rank ICT literacy. In the group that did not require a lot of applications of ICT in support of the work, the degree of ICT literacy is likely to be low. However, this low degree should not be understood as digital technology illiterate or blind.

Perbawaningsih (2013) update the results of research in 1998 on the level of attitudes and level of use of ICT on higher education students. This research takes the case of students of Communication Studies University of Atma Jaya Yogyakarta. This research found that ICT literacy students are high. Almost all students have computers in their homes, with a fairly high technology and newest specifications. Most of them said that their computers are connected to the Internet. It can be said that the students have a good access to seek data and information. In another aspect indicated that half of the students use and able to operate multiple applications, such as word processing, data/statistical processing, photoshop, movie maker, including social media applications. Level of use and the ability to use ICT is even beyond the expectations of faculty. However, the level and type of application usage are apparently different in different types of needs and demands related to the completion of tasks or study. They also considered that the use of ICT is quite help complete these tasks more easily and quickly. They also feel the considerable benefits of ICT, namely ease of obtaining data or information related to the science assignments or scientific papers or for a presentation in class.

The same study shows ICT literacy of lecturers in the high category despite the tendency of ICT literacy is lower than the students. Lecturers who ask their students to use ICT to accomplish tasks typically have the ability to use ICT. In learning process, lecturers or instructures are also using ICT. Use of the Internet in the classroom is frequently used to download learning materials. It encourages student interest in the course, including to the teachers. Also common, lecturers are using social media to interact and discuss the learning materials to the students. However, the use of ICT by teachers in the course is not related to final grades students on the course.

Referring to these studies it can be concluded that the level of skills and the use of ICT in education (teachers and students) are quite high. It is influenced by several factors, namely (1) individual characteristics, (2) support of organizational commitment, including the demands of the faculty, and (3) the availability of facilities either individually or institutionally. However, this finding might not be used to generalize the ICT literacy of students and lecturers in Indonesia, especially universities in rural areas. It is caused by the economic/ financial viability of each university is different and varied. The universities that exist in these areas tend to have difficult access to education networks (Internet-based) as well as the technical ability of the *hardware, software* and *dataware,* the small number of ICT instructors, and low levels of commitment to the needs of the organization or the adoption of ICT. It is strengtened by the fact that teachers in rural areas in Indonesia rarely used ICT for distance learning (Kompas, May 28, 2012).

Minus Factors of ICT Usage

When one of the factors supporting ICT literacy is not met then the effectiveness of education tend to decline or even become ineffective. Malfunctions of ICT is also one thing that happens, especially when the mental attitude of the user and not appropriate with the nature or purpose of ICT adoption. One form of facility malfunction of "copy and paste" is plagiarism. The ease and speed of getting data - or even paper - pushing students to simply download, without mentioning the source citations that paper or paper is just a collection of quotations obtained from *browsing* the internet. Implications of Internet-based ICT utilization is an abundance of knowledge. This will result in a very high ambiguity for education community. A certain students would likely avoid exposure to information due to the ambiguity caused cognitive discomfort. This situation is certainly not conducive to the achievement of learning objectives. In this case, the lecturers still have an important role as a facilitator to select and sort, and if necessary to reduce the information and frame or reframe the interpretation of the information. However, for other certain students the efforts can be interpreted as an attempt to limit the freedom of students to construct their own knowledge. On the other hand, ICT also provides convenience and speed of data analysis. On other case, as a consequence of the convenience offered by ICT is a presentation in class activities,

such as using a pointer system. This presentation system encourages students to understand the material, but generally, not on detail, partially and superficially. Similarly, when teachers use this system to deliver the material in class, students are more focused on the look of the presentation rather than an explanation or a more *comprehensive* description of the teachers. At the final evaluation, students tend to rely on the material in the presentation rather than reading thoroughly. Teaching using multi-media presentations, such as playing an audio-visual program, either directly downloaded from the Internet or using a video or DVD player, it does draw attention, but it does not help students to better understand the material as a whole. This is caused by the simplification process description / narrative material into the form of a film which also reduces the detail of the material.

On the other hand, the use of statistical software applications such as *Software porgram for Social Statistics (SPSS)* also encourages students to get instant results but do not understand the data processing. They tend to be a reliable technician but not a thinker/scientist who understand in depth the reasons theoretical/ academic behind any works created by ICT. On the other hand, ICT offers the convenience of Internet-based communication without the constraints of time and place, with a very cost efficiency, but it brought the situation to the relation between students and teachers has only rely on the sense of sight and hearing to obtain symbolic data. Potential differences in interpretation or misperception in conversation is very possible because of the losing data because of the function of the senses of taste, touch and smell can not be enabled. The relationship of teachers and students look like a relationship between robots or between machines because of the lack of emotion and affective factors that are easier to present when there is direct physical interaction. Furthermore, the purpose of the relation between students and teachers tend to be pragmatic, so that values personal such as togetherness that usually characterizes education in Indonesia it becomes difficult to achieve. The learning process that aims to build character and affection, and moral integrity are difficult to realize. In the aspect of reducing the burden due to be replaced by ICT teachers are not always responded positively. Reduction political role also means authority and power reduction. The reduction of the role of the teacher can also be interpreted as a financial reduction. There are many teachers were still comfortable in his position as "boss" for the students, and the presence of ICT actually be a threat. Cost efficiency is a mainstay of the use of ICT is also the potential will not be achieved when technological innovation adoption is not followed by the optimalization of function. As described earlier, the use of ICT with all the facilities offered - this certainly is comparable to the price offered- just more for word processing and communicating via social media.

It can be concluded that the ICT values such as faster, cheaper and better lead to education community emphasize on the achieving pragmatic goals rather than understand the idealism or critical values. ICT capability to produce and reproduce a huge number of the academic papers bring consequences on the process of industrialization that sometimes if it is not careful will bring the education community ignore their idealism. The values brought by technology that is efficient, if achieved, will encourage the abandonment of quality of a process. Orientation of students in learning is no longer a desire to deepen their knowledge and develop the science, but rather on the high grades and finish more quickly. Similarly, higher education also tend to ignore the ideals and compete to produce scholars as much and as quickly as possible. However, in some cases, the efficiency of the use of ICT can not be achieved. Not to mention when ICT literacy and then get stuck on the concept of reliance on ICT for all learning activities, educational and even everyday life. This dependency causes people to lose their independence when ICT is suddenly not working. This is a minus factor of the use of ICT, when: (1) all supporting factors are not met, and (2) when the adoption of ICT ignores or does not consider the characteristics or values that were developed in education and educational organizations. This condition occurs in Indonesia.

Conclusion

The use of ICT in learning in Indonesian higher education can improve the effectiveness and efficiency of learning and education. This is caused by the following factors: (1) ICT literacy in Indonesia in particular students in urban area or cities is already high enough. Not only does ICT literacy, but also the ease of access to ICT. This is shown by most of the students have ICT devices in their homes, and colleges were also providing the facility with excellent and adequate technical skills, (2) commitment to higher education, including policy-makers to make optimal use of ICT in learning and education; and (3) support the government by providing an electronic network that allows the implementation of distance learning as well as education and information science at the higher education. This suggests that the human factor (actor), the policy at the level of organization (system) and commitment of the Indonesian government (supra-system) is quite positive in the process of adoption of ICT innovation in higher education whereas in the same time, they -students- have negative attitude toward ICT. Abuse (malfunctions) ICT resulting in a failure to achieve the educational goals, that is creating qualified human resources, or human who master the science and technology to create nation welfare and prosperity .***

Potential of Twitter in Post-reading Activities Among Community College Students in Malaysia

Ida Soraya Hamidon, Norlidah Alias[113], Saedah Siraj, K. Kokila, Mariani Mohammed, T. Vanita Thanabalan[a]

University of Malaya, Lembah Pantai, 50603 Kuala Lumpur, Malaysia
[a]English Language Teaching Center,Nilai, Negri Sembilan,Malaysia

Abstract

Since its introduction in 2006, many studies have been made on the use of Twitter as learning tool especially in language classrooms. These studies, however, tend to look at the use of Twitter as language learning tool in the school, college or universities and rarely in the community college environment. Although it is one of the higher education institutions in Malaysia, community colleges do have vast differences with other institutions in terms of students' educational background and learning motivation, lecture duration and semester, mission and vision and lecturer expertise. Thus, this paper describes a survey study using a Fuzzy Delphi method to investigate the potentials of using Twitter for post-reading activities among Malaysian community college students. The main focus of this study was to get experts' consensus on the future of Twitter and its usage in language learning in the future for community college students. Experts consisted of experienced community college English lecturers and curriculum developers and academic specialists from the Community College Department, Ministry of Higher Education. Findings indicated that low level of Twitter usage among lecturers and students make Twitter as a learning tool rather vague in the future. This article discusses the reasons behind the moderate level of Twitter usage and the direction for future research in implementing Twitter in the language learning classroom.

Keywords: Twitter; post-reading; community college; Fuzzy Delphi.

Introduction

The use of Twitter for educational purposes has been of interest to many researchers and they have produced many studies showing positive correlation between Twitter and various aspects of education (Borau, Ullrich, Feng & Shen, 2009; Junco, Heibergert & Loken., 2010; Veletsianos, 2011). However, most of these studies are focusing more on the current state of technology and education and giving less focus to its future potential. There are even fewer studies that relate educational function of Twitter and how it can benefit community college students in developing their reading skills.

Due to the nature of the course and the emphasis on skills and training, English is given less attention by the community college students and it leads to poor proficiency especially reading skills. While one of the objectives of the community college is to create a knowledgeable community (*k-community),* reading fluently in the target language will definitely help to achieve the objective mentioned above. Thus, Twitter is seen as the most suitable learning tool for community college students to use the target language effectively, effortlessly even outside their classroom. Our main concern, however, is how long can Twitter potentially serve as a language learning tool? With the increased awareness and uses for other microblogging services such as Tumblr, Pownce and Jaiku and recently Edmodo (Holotescu & Grosseck, 2009), is the use of Twitter as the language learning tool for community college students still relevant for the next 10 years?

We begin by looking at a few studies showing the benefit of Twitter in education. Since its launch in July 2006, many studies have been conducted to understand the functionality of Twitter and its benefit to educators (Stevens, 2008) but there are few yet growing numbers of studies to investigate the relationship of Twitter and language learning situations (Lomicka & Lord, 2011). Several studies also show that not only students can benefit from educational usage of Twitter; scholars can also participate and use their social network for professional purposes. Veletsianos's finding indicated seven themes of scholars' Twitter practices and activities and one of the themes is "*expanding learning opportunities beyond the confines of the classroom*" (2011). Compared to Facebook, another popular social networking site which is more popular and commonly used by college students, Twitter primary functions as microblogging platform and ongoing public dialogue has attracted educators to use it as part of their college courses (Antenos-Conforti, 2009, Ebner et al., 2010; Grosseck & Holotescu, 2009; Junco et al., 2011; Schroeder et al., 2010; Smith & Caruso, 2010). This is reinforced with the findings from Junco et al., (2011) research where a group of students who use Twitter showed higher semester GPA than a group who did not; while a study conducted by Kirschner and Karpinski (2010) showed that Facebook users having lower GPA. Dunlap and Lowenthal (2009a, 2009b) stated that Twitter also has instructional benefits which are "*enhancing social presence, maintaining relationship, supporting learning, writing concisely and for an audience, addressing issue in a timely fashion, and connecting classmates and instructor*". With all the findings from the few studies above we can conclude that even though many studies have been done on the topic, still not much research exists on the potential of Twitter in the future. This research is significant because previous work has shown that positive attitudes are usually shown toward new technologies (Beauvois, 1998; Chen et al., 2004; Ducate & Lomicka, 2009; Ushida, 2005). We need to see the potential of Twitter in education and language learning as the novelty wears off and its survival with the emergence of new educational microblogging sites such as Edmodo.

Apart from these studies focusing on current technologies and the education scenario, most of the literature is usually directed to Twitter and its benefit to the communicative and cultural competence of the language (Borau et al., 2009). It would be interesting if there are many studies that show correlation between Twitter and how it can develop reading skills in a second language. Existing studies on community colleges also tend to investigate the current issues such as the most appropriate teaching method to teach certain courses and the effectiveness of the programs offered in providing and preparing student for employment (Hassan, 2011; Madar et al., 2009). Since community colleges in Malaysia are relatively new compared to other countries and doing research is not necessary for its educators, it is considered an urgency to build a body of knowledge that can help improve the quality of this institution in the future.

By looking and examining potentials of Twitter in education; and how it can develop reading skills among community college students, educators can adapt and apply Twitter into their lesson if this paper can prove that Twitter does have potential in developing reading skills. Policy makers and curriculum developers in the Community College Department in the Ministry of Higher Education can encourage educators to use Twitter not only for their lessons, but among educators in all 80 branches of community colleges in Malaysia. This can help educators to share ideas, request assistance and offer suggestions and to connect and network among educators in similar or different fields of teaching. Administrators can plan and provide internet connection, computers or any technological equipment and staff to facilitate the implementation of Twitter in language courses at all community colleges.

1.1 Twitter in Education

In line with an effort to foster and produce more autonomous learners, computer-assisted language learning (CALL) is seen as the best way to help achieve this aim. Blogs, for example have been used widely in classrooms to provide diversity in language learning, depending on pedagogical purposes (Lee, 2011). Lee stated that by writing blogs, learners can decide what, how much and when they want to publish their work (2010). Students can also develop their "*ability to plan, understand and regulate their own language learning*" (Baggetun & Wasson, 2006; Ward, 2004, as cited in Lee, 2011). Microblogging however, is a service that allows users to post their thoughts, share pictures, videos or links but with limited characters and smaller file size. Oulasvirta et al. (2009, as cited in Veletsianos, 2011) defined microblog as a service that allows users to write updates by using either mobile devices or personal computers and publishing them on the Web. A few microblogging tools falling under the category of Web 2.0 such as Jaiku, MySay, Hictu, Edmodo exist but the most popular of these tools is Twitter. With the increasing number of smartphone users from all levels of society, from toddlers to senior citizens, it is not surprising if Twitter is seen as a new medium that can help provide diversity in language learning. What set Twitter apart from

other microblogging tools or weblog is its features as part microblogging tool – part social networking tool that can enable users to access freely on the Web (Stevens, 2008 as cited in Bicen & Cavus, 2012). McFedries (2007) as well as Holotescu and Grosseck (2011) stated that microblog is different from weblog because of its social network structure feature. In short, Twitter is more interactive, allows user to be more creative with words (due to limited characters in a post), gives instant feedback, can be accessed easily and helps users to connect with people all around the world. It is not surprising that Twitter made its way into education and language learning, given that the number of tweets per week average around a billion (Smith, 2011). When an increasing number of language teachers and educators started implementing, assimilating and using Twitter as part of their teaching and learning, many studies have been done on the correlation of Twitter in language learning and education in many different aspects.

Research done by Lomicka and Lord (2011) proved that Twitter can help language learners form a collaborative community where they can learn, share and reflect. The sample consisting of thirteen students enrolled in an intermediate French course in a south eastern university in the United States and twelve native French speakers enrolled in an intermediate-high English conversation course in France shows that Twitter allows learners in both languages to develop a sense of community. They also learn a new language in a fun and interactive way.

A study conducted by Borau et al. (2009) to analyze the usefulness of microblogging (Twitter) in second language learning shows that Twitter can help second language learners to train in communicative and cultural competence. This is because the traditional language teaching method rarely gives the learner the chance to produce the target language actively and as a tool of communication. Junco et al. (2010, 2012) in his researches focused more on Twitter and student engagement. His research proved that Twitter, if using in educationally relevant ways, had a positive effect on student engagement, as well as having positive effects on students' grades. Junco et al. also proved that to improve student collaboration, engagement and success, faculty has to be actively participating and integrate Twitter into the course.

Few researchers have tried to look Twitter and its benefit to the educators. Veletsianos (2011) indicated that higher education scholars participate and use twitter for seven reasons. First, to share information, resources, and media related to their profession. Second, they use Twitter to share information about their classroom and students, followed by to request assistance and offer suggestions to others. Other reasons are to engage in social commentary, engage in digital identity and impression management and seek to network and make connections with others. Finally, higher education scholars use Twitter to highlight their participation in online networks other than Twitter such as YouTube and Facebook.

Bicen and Cavus (2012) summarized Twitter as a "*part social networking – part microblogging tool, freely accessible on the Web*". In their research on Twitter usage habits of undergraduate students, they have found that the majority of students spent their time using Twitter to share quotes, photos, videos, music, news, IT news and magazine news while educational material were least frequently shared by students. This gives a new insight of Twitter use in a classroom and the move to produce autonomous learners. This is because educators might wonder whether students' participation when Twitter in being used in the course is voluntary or because it is graded. This doubtful thought is being supported by a research done by Haytko and Parker (2012) where their research confirmed that students actually do not see any social networking sites; be it a Twitter or Facebook, as appropriate tools to be used in the university setting. Many students might create a new Twitter account for educational purposes if Twitter is part of their course requirement.

Elavsky, Mislan, and Elavsky (2011) in their study tried to see the effectiveness of Twitter in a different perspective; which is to explore the outcomes of Twitter usage in large-lecture hall. This is referring to the general courses where the students come with diverse backgrounds, perspectives and knowledge sets. The outcomes shows that Twitter usage in large-lecture hall is generally positive and can help improve students' impressions, participation and enthusiasm.

1.2 Reading Stages

There are four language skills that are considered important in order for a learner to acquire a second language. Those skills are reading, writing, speaking and listening. Reading, however, is seen as the most important skill for a

student to master (Carrell, 1998; Eskey, 1973, as cited in Mohd. Zin & Rafik-Galea, 2010). Teaching reading involves three stages; pre-reading, while reading and post-reading; each has its characteristics and benefits.

Post- reading stage is the last stage in teaching reading. The main purpose is to ensure learner's comprehension and retention of the information of the text that they have already read. It is also to develop and clarify learners' interpretation of the text and help them remember what they have created in their mind individually about the text. Post reading is done in many ways in a language classroom. Some are follow-up by teachers, discussion among learners or doing a graphic organizer and guided reading and discussion. All these strategies can help learners develop their reading skills as well as giving them the needed time to practice in the target language. It is also helpful if the reading material is authentic and written by a native speaker. Guo's (2012) study shows a strong relationship between extensive reading and vocabulary development. This means second language learners can learn better and faster if they have a certain amount of exposure to the target language and not only learning confined in the four walls of the classroom. This leads us to how Twitter can help second language learner learn the target language better.

Usually, a language teacher has limited teaching time in a classroom and can only rely on the students' response as how they understand something they read earlier. Anxiety also hinder students from perform well in the reading classroom thus affecting their reading performance (Mohd. Zin & Rafik-Galea, 2010). Since post-reading is an important stage to ensure learners' understanding of the topic learnt and a way to check their reading skills, due to students' anxiety and limited teaching duration, many teachers choose to ignore this stage. Some teachers gave comprehension activities to achieve the objectives, but it is difficult for them to determine whether the answers are individually written or copied from each other.

By using Twitter where response is quick, communication is interactive and individuality can be seen by individual tweet, teachers can determine and see indirectly which one of their students already developed reading skills, understand the text studied in the classroom and develop their own meaning and perception of the text. There are of course, certain things that teacher should be cautious when using Twitter to help learners develop their reading skills. Teachers should encourage participation from all learners. For example, participation should be graded. Teacher can also fully-use Twitter applications such as hastag, retweet and favorite to make interaction about a reading text more interactive. This is parallel to Bromley's study that develops the idea of the future of reading and writing. In his study, he proposed that pens, pencils and paper will soon be artifacts of the past, electronic reading and writing will be pervasive, collaborative and social events and lastly, speech will replace most writing.

Research Design

Community College is one of the four higher learning institutions for school leavers in Malaysia. The others are public universities, private universities and polytechnics. Contrary to popular beliefs, community college is not for school leavers who do not have outstanding academic achievement, but rather the main objective of community college is to create the lifelong learning environment in Malaysian society. To date, there are 80 branches of community colleges all around Malaysia; these are usually located in rural areas. The major difference between community colleges and all other higher learning institutions is its flexible study mode. Students can opt to study continuously for 20 months until they get the certificate (*Sijil Kolej Komuniti* or *SKK*) or study by module for about three to six months to get *Sijil Modular Kebangsaan*. The difference between the two certificates is that students who opt to do the latter can always complete a module for 3-6 months, continue or look for a job and continue a module again until they finished all 60 credits to get the *SKK*. They are also offered short courses which take less than month, sometimes a day to complete. As for entry requirement, no outstanding academic achievement or any academic certificate is necessary for acceptance.

Thus, given the variety of the duration of the courses and students' background and learning motivation, teaching English is considered as a real challenge in community colleges. English lecturers found it difficult to maintain interest, relationship, and enthusiasm because of several factors such as students' perception toward the language itself, student motivation, constantly changing students and timetable and the emphasis given on the technical subjects.

Methodology

The aim of this study is to examine the possibility of using Twitter for post-reading activities to community college students in order to develop their reading skills. In other words, the purpose of this paper is to study the potentials of using Twitter for post-reading activities among community college students. Studying the potentials of Twitter in the future of language learning involves subjective value judgement and great debate; therefore this study employed the Fuzzy Delphi Method (FDM). FDM is a great method to use when a study needs an effective tool to gather data generated from opinion where these opinions are always imprecise and uncertain. By using FDM, subjective data can be transformed into quasi-objective quantitative data and can facilitate decision making of controversial issues (Tang & Wu, 2010). It is a combination of traditional Delphi Method and the fuzzy set theory. Chang et al. (2000, as cited in Tang & Wu, 2010) explains that FDM can "*processes fuzziness in relation to forecast item and the information contents of respondents*". It also allows researchers to elucidate individual attributes of participants because fuzzy forecasts are utilized and preserved. It is not only a mean generated mechanically but an agreeable score based on the "acceptable value ranges" given by respondents.

This first stage of this study is to conduct interviews with several experts regarding teaching reading, Twitter and community colleges. Experts consist of active Twitter users, language experts from government schools and community colleges, curriculum developers from the Department of Community Colleges and Education and Information Technology experts. The rationale for selecting the experts was based on the assumption that they are experts who understand and active Twitter users themselves, experienced in language teaching, understand the potentials and barriers in the community college curriculum and have deep understanding of how to make Twitter or any electronic devices work in community colleges. The second stage of this study involved distributing questionnaires to 25 English lecturers at community college that have sound knowledge about their subject and have basic knowledge of Twitter. Some of them have a Twitter account, know the function but rarely used it while the others are considered as regular users (5-6 tweets a week). Questionnaires are either emailed, posted or conducted face-to-face.

Results

The main purpose of the interviews was to gather experts' opinions on how Twitter can be potentially used in post-reading activities in English lessons at community colleges. It is also to determine lecturers' attributes that can help achieve this motion and what are the state of facilities and technology needed for this to happen. Six main determinants were identified from the literature as well as experts' answers. The determinants are the future of Twitter, the future of Twitter in the language learning classroom for community college students, the current facilities in the community college, the current technology used in the community college, English lecturers' comprehension and attitude toward reading theory and English lecturers' comprehension, attitude and expectation towards Twitter. Only 30 out of 47 variables of six determinants achieved the experts' consensus. Measures percentage below 75% were crossed out. The final variables were then arranged according to percentage as shown in Table 1.

Table 1: Final variables from Fuzzy Delphi technique arranged according to percentage

No.	Item	Minimum Value	Maxsimum Value	Most Reasonable Value	Score	Ranking
The Final Ranking System						
1	**The Future of Twitter**					
1.4	Twitter will be more accessible with the increased use of smartphones.	9.20	17.20	13.20	13.20	1
1.1	Twitter will remain as the most popular social networking site for the next 20 years.	8.20	16.00	12.00	12.07	2
2	**The Future of Twitter in the Language Learning Classroom for Community College Students.**					
2.1	Twitter will be the most popular social networking site among community college students.	7.20	14.80	10.90	10.97	1
3	**The Current Facilities in the Community College**					
3.5	Community college should upgrade its internet and computer facilities regularly.	10.40	14.40	18.40	14.40	1
3.3	All community colleges are equipped with the internet connection.	9.40	13.40	16.50	13.10	2
3.2	All computer equipment is maintained regularly and in good condition.	8.10	16.00	12.00	12.03	3
4	**The Current Technology Used in the Community College**					
4.4	All community college staff and lecturers like to implement the latest technology in their work.	9.20	17.00	13.00	13.07	1
4.5	All community college staff, lecturers and students are open to the introduction and use of technology for learning purposes.	9.10	17.00	13.00	13.03	2
4.3	All community college staff and lecturers do not have problem using technology for work purposes.	9.00	16.80	12.80	12.87	3

4.2	Technology is used extensively in all community college lectures.	8.80	16.80	12.80	12.80	4

5.3	All English Lecturers apply post-reading activities in their lessons.	8.50	15.50	12.40	12.13	8
6	**English Instructors' Comprehension, Attitude and Expectation towards Twitter.**					

6.3	All English Lecturers should have Twitter account and connect with their colleagues.	8.50	16.20	12.20	12.30	1

Discussion

According to the arranged results, summarized in Table 1 in the Twitter and Language Learning determinant, Twitter will be more accessible with the increased users of smartphones. The experts agreed 100% about the usage of Twitter among community college students using smartphones. Nowadays, at this time almost all teens use smartphones in their daily lives. This is a trend for teenagers. They are willing to buy inexpensive smartphones. So, Twitter usage will be easy with smartphones. Moreover, the government had given a 200 ringgit rebate for teens who want to buy a smart phone (beritasemasa.com., Sept 29). The second highest ranking is Twitter will remain as the most popular social networking site for the next 20 years. The experts agreed 95% about this matter because twitter is easily handled by students with smartphones and unlike Facebook where we need a laptop to access it. The other two items have not reached consensus among experts. The items are there will be no social networking sites that can replace Twitter for the next 20 years and Twitter will remain popular because it is easy to set up a Twitter account and use all its features. We predict that most probably, Twitter will be considered outdated like Friendster nowadays. Most of the experts did not master in Twitter features.

Conclusion

Given the nature of Twitter and the current practices in community colleges, it is fair to say that there is still a long way for Twitter to be potentially used in not only post-reading activities but for all academic activities in Malaysian Community Colleges. While almost all English lecturers at the community college are armed with the language knowledge, skills and experience, many still not sure and certain how Twitter can be best used in facilitating language lessons. Not many of them are fans of Twitter, thus making it difficult for Twitter to get its way into the language classrooms. Current technology and facilities are also one of the issues for Twitter to be taken seriously as a language learning tool. Since community college students mostly are part-timers and live in rural areas, the number of students who can afford a smartphone and the mobile plan is also questionable. The point of using Twitter is students can learn anywhere even if they are not in the community college area, but while the internet connection at the college is what we can categorize as mediocre, the objectives are hard to achieve if students can only have access if they are within the community college grounds.

Twitter has always been overshadowed by Facebook and it is only a matter of time for a new social networking site to replace Facebook in a few years' time. If by promoting Twitter today to be used in community college results in lukewarm results, it is better for curriculum developers to look for and try a better, newer social networking site to be developed as part of the requirement of the English course. This way, lecturers and students can learn and explore a new technology together. As such, a final recommendation is to suggest for English lecturers at community colleges to embrace the current and new social networking site and try to look for the best way to use it in the classroom since it is easier than changing the modular study mode.

Given the exploratory nature of this study, the main challenge is to find English experts in community colleges who are active users of Twitter. Further study is required to see the acceptance of new technology among English lecturers and community college students to determine how best to integrate any latest technology or Web 2.0 tools in a language lesson.

Potential of Video Games in Learning Bahasa Melayu Vocabulary Among International University Students in Malaysia: A Meta Analysis of Selected Journals

Fuziah Rosman, Norlidah Alias[114], Saedah Siraj, Husaina Banu Kenayathulla,

Abd. Razak Zakaria, Ghazali Darusalam

Faculty of Education, University of Malaya, 50603 Kuala Lumpur

Abstract

This study uses a meta analysis to analyze several current articles published by selected journals by focusing on studies related to the potential of video games in Bahasa Melayu vocabulary learning by international students. Among the aricles are those in journals such as *Computers and Education*, *Computers in Human Behavior*, *Education Technology Research Development*, *Procedia Social and Behavioral Sciences*, *Australian Journal of Language and Literacy*, *Computer Assisted Language Learning*, *Educational Technology & Society*, and *Scandinavian Journal of Educational Research* published between 2003 and 2011. For this study, only 15 articles were focused on out of 33 articles in journals published between 2003 until 2011. Nevertheless, only 9 articles were identified using the key words video games and language learning. In terms of methodology, most of the articles were literature reviews followed by case studies and experimental studies. Some articles combined quantitative and qualitative approaches. Findings from all the articles reviewed show that video games have potential as effective teaching aids and are capable of motivating students in language learning.

Keywords: Video games, Vocabulary, Language learning, Meta Analysis

1. Introduction

Commercial video games have long been in the market since they were first introduced in 1958 such that today they represent various types or genres (Kudler, 2007). Each genre of video game has its story line or narrative in various levels and characteristics. Part of the traditional video game contains genres such as '*first-person shooter*', '*role-playing*', '*action*', '*adventure*', '*sports*', and racing as well as strategy.

If seen from reality and research carried out in the west, many agree that video games have educational value and the potential for use as effective and enjoyable teaching aids as stated by Papastergiou (2009) and Moreno (2008). Discussion related to the potential of video game in education was done by Prensky (2001, in Papastergiou, 2009); the conclusion was that electronic video games have attracted the interest of academics who see the potential of video games as giving motivation to teenagers if the games are integrated with learning activities as stated by Prensky who had introduced electronic games as "digital game-based learning".

Studies by researchers in curriculum and instructural technology have found that computer and video games are among the most popular in designing video games suitable for learning needs (Squire, 2003). The views of other researchers such as Jenkins dan Klopfer (2003) on video games is that one way to enhance motivation and quality in learning is through use of video games as a learning tool (Moreno, 2008). Video games represent an enjoyable and attractive element and this advantage should be absorbed in learning.

Papastergiou (2009) stated that several researchers agreed that the learning climate with video will be more enjoyable and effective compared with the traditional learning environment. Oblinger (2004) as cited by Papastergiou (2009) stated that video games have potential in changing the learning environment to one that is better based on several reasons; a) such games are multi-sensory, active, offer novel experiences, and problem based learning; b) give and increase experience and existing knowledge; c) provide fast feedback for hypothesis testing and learning based on action research; d) give opportunity to students to undertake self-assessment through scores; and e) enhance the social interaction environment between players or students.

Gamers can learn how to interact among themselves through their environment such as forming player groups online or "game-related information and resources" (Papastergiou, 2009). Several studies that have evaluated the use of video games in various academic disciplines such as mathematics, science, language, geography, and computer science have shown positive effect on student motivation and effective learning for achieving curriculum objectives (Papastergiou, 2009).

Furthermore, Tuzun (2008) stated that the future scenario for trends in video game technology in geography education is the application of 'MUVEs.' Researchers also have combined 'three-dimensional (3D) environments' in designing computer video games in geography learning. Virvou, Katsionis dan Manos (2005) in Tuzun (2008), for example, have created the computer video game VR-ENGAGE for teaching geography subject to grade four students.

Besides that,the effectiveness in designing educational video games must be achieved by balancing the educational value with enjoyment in learning. According to Moreno (2008) this is because the teaching and learning process (T&L) requires effective teaching techniques to achieve learning objectives.

Three types of initiatives were suggested by Moreno to achieve effectiveness are: 1) multimedia approach is very much related to content presentation; 2) using existing video games in the market for learning; and 3) existing video games that have been developed must be balanced between education and enjoyment or pleasure in learning.

Hence, the learning of Bahasa Melayu now must change in the application of the latest technology so that it is aligned with developments in video game technology that has been integrated with various academic disciplines. With the use of this teaching aid, language learning can be implemented more effectively besides increasing student motivation.

2. Background on Bahasa Melayu subject for International Students

Rusdi Abdullah (2001) stated that the flood of foreign students who some here for further studies in public (IPTA) and private (IPTS) tertiary institutions in Malaysia is more pronounced. Consequently, the Education Act Amended 1995 clearly states that Bahasa Melayu is compulsory to be taught to all foreign students undergoing studies in IPTS. The above teaching is aimed at exposing students to the basics of Malay language such as phonology and spelling system, basic vocabulary, casual conversation, sociolinguistic aspects, reading and understanding simple examples and writing. According to Rusdi also, adult foreign language students have exceeded the critical period in the language learning process especially in mastery of sound (phonology) but they have advantages in other language aspects. Their knowledge of their mother tongue can help facilitate the learning process such as analysis of morphology aspects, syntax, and semantics of the language.

Awang Sariyan (2006) viewed that the Bahasa Melayu teaching program for international students is to fulfill the needs arising from the role of bahasa Melayuas a language that is studied in various centers of learning all over the world. BahasaMelayu has its own position in the development of major world languages until there is a need for its teaching to foreign language learners although not as widely as the teaching of English.

Based on the experience of the International Islamic University Malaysia (IIUM), the BahasaMelayu course for foreign students is compulsory for all foreign students at the university. According to Siti Baidura Kasiran and Nurul Jamilah Rosly (2011) in the context of Malay language learning, many foreign students taking first degree courses at IIUM learn BM as a third language. These students not only have to learn BM, they must pass it as a requirement for graduation. The Bahasa Melayu course for foreign students was made compulsory for all foreign students at IIUM as decided by the Senate Meeting in April 1991.

This course was split into two levels, Bahasa Melayu I for Foreign students (LM 1010) and Bahasa Melayu II Course for Foreign Students (LM 1011). The credit hours for this course is 50 minutes for every meeting/class and classes are held twice a week (Siti Baidura Kasiran & Nurul Jamilah Rosly, 2011).

Fai'zah Abd.Manan, Mohamad Amin Embi and Zamri Mahamod (2010) stated that the National Accreditation Council (LAN) or now called Malaysian Qualification Agency (MQA) has created the National Language Syllabus specially for foreign students. Among the aims and objectives of teaching bahasa Melayu to foreign students in IPT di Malaysia are to enable them to master the basic skills in Malay language. Among the aims and objectives are:

i. Know the speech system, rumi spelling system, vocabulary and grammar of Malay language;

ii. Able to listen to and understand conversations in various daily situations;

iii. Able to speak and understand simple reading materials and;

iv. Able to express ideas and feelings in verbal and written form.

3.   Statement of the Problem

Fai'zah Abdul Manan et al. (2010) noted that most foreign researchers of BM in Malaysia who follow the BM course in tertiary institutions found such courses to be facing problems, weak, and fail to impart the requisite BM skills in the stipulated period. The present group of researchers quote the statement (Asmah, 2003; Fai'zah et al., 2009; Marzalina, 2005) that in many higher education institutions the method of teaching BM to foreign students still uses conventional teacher-centered approaches. According to Awang Sariyan (2006) in Fai'zah Abdul Manan et al. (2010) such approaches are deemed successful and can be determined as effective approaches after categorization by level and grouping according to the aims and needs of the foreign students who are learning BM.

Several researchers in Malaysia and the west concur that BM is a difficult language to master as a foreign language if the student learning it is not interested and lacking in confidence, has no need or motivation for the BM being learned (Jyh Wee Sew, 2005; Metzger, 2009; Pogadev, 2005,in Fai'zah Abdul Manan et al., 2010).

Based on the above problem situation, the BahasaMelayu subject for international students is very much in need of teaching aids that are effective in overcoming the disadvantages in the use of conventional approaches in teaching and learning. Similarly with the problem of bahasa Melayu that is said to be difficult to master resulting in students lacking in confidence, not wanting and not being motivated; all these might be overcome using video games as effective teaching aids capable of enhancing student motivation.

In Malaysia, many video games of various genres are in the market for commercial use and such games are the trend for teenagers and children today. In fact, the development of video game has crept into bahasaMelayu learning especially for foreign students. The potential of video game in the curriculum has been studied at length by researchers and curriculum experts in the west who have long developed video games in education (e.g., Gee, 2003; Moreno, 2008; Papastergiou, 2009; Prensky, 2001; Squire, 2003).

Behind the debate on the issue of video game playing lacking potential in education as stated by Van Eck (2006, as cited by Moreno, 2008) who touched on the cost of developing video games, the difficulties in integrating video games into the curriculum; and Michael dan Chen (2006) who touched on the need to evaluate the quality of video games in the learning process; Moreno (2008) suggested several alternatives or new approaches in focusing on a design for video games. Many video games of various genres in the industry have been identified as suitable for education. Existing commercially available video games also have potential for adaptation for use in learning; for example, the video game known as '*SimCity'* dan '*Civilization Sagas'*.

In the context of language learning, studies on video games have been done by many researchers(e.g., Laleh & Nasrin, 2011; Muhammet Demirbilek, Ebru Yilmaz & Suzan Tamer, 2010; Piirainen-Marsh& Tainio,

2009; Ranalli, 2008; Walsh,C, 2010;Yildiz Turgut & Pelin Irgin, 2009) and these have touched on the types of video games such as *The Sims*, *Massively Multiplayer Online Role Playing Games* (MMORPGs) and effectiveness of video games in language learning especially in English as a Second Language or English as a Foreign Language. Most research studies by the researchers mentioned were in the form of literature reviews and discussions. Studies have to be carried on with design of video game or developing video game prototype suited to language learning other than *The Sims*, MMORPGs and online video games.

Nevertheless, in Malaysia there exists a study byKamisah Osman and Nurul Aini Bakar (2011) on the implementation and limitations of computer video games in Malaysia from the perspective of Chemistry subject, showing that curriculum design in video games is still new and in the research stage in Malaysia.

Video game in language learning was done on Arabic subject by Muhammad Sabri Sahrir and Nor Aziah Alias (2011). Their findings show that online video games succeeded in enhancing achievement, motivation and positive attitudes of students toward Arabic language learning. However, the video games developed were still limited; students hoped that these video games will continue to be used as teaching aids in Arabic language learning.

Because studies on video game playing in language learning were done mostly on English and Arabic, and because the approach for teaching BM to foreign students is stillconventional in nature, we feel that this study is necessary to investigate the potential of video games in the aspect of BM vocabulary learning among international students. Hence, this study anticipates video games will become effective learning aids capable of enhancing the motivation in learning of Bahasa Melayu among international students.

4.   Objectives

In general, this study is aimed at investigating the potential of video games in Bahasa Melayu vocabulary learning for foreign students. Shih, Feng, and Tsai (2008) stated that meat analysis is the best way to identify articles veruy much related to the field of study.

This study is implemented to answer the following research questions:

1.   What is the percentage of research papers related to the chosen topic?

2.   What were the titles of selected articles related to the potential of video games in learning Bahasa Melayu vocabulary for international students?

3.   What methods were used in the selected articles related to the topic of research?

4.   What is the comparison in research findings obtained from the articles?

5.   Methodology

This study uses meta analysis to evaluate past research articles. Besides qualitative analysis, this study uses descriptive statistics to analyze data. According toLipsey dan Wilson (2001) meta analysis is a systematic technique for describing, analyzing, making conclusions on quantitative studies for some topic or question.

This study analyzes several current articles published with focus on studies related to the potential of video game in the Malay language (BM) curriculum for intgernational students. Among the articles obtained were those from the journals*Computers and Education(CE)*, *Computers in Human Behavior(CBH)*, *Education Technology Research Development(ETRD)*, *Procedia Social and Behavioral Sciences(PSBS)*, *Australian Journal of Language and Literacy(AJLL)*, *Computer Assisted Language Learning(CALL)*, *Educational Technology & Society(ETS)*, dan *Scandinavian Journal of Educational Research(SJER)*. Among the reasons for choosing these journals were: the articles in the journals were categorized under the jurnal articles of the Institute for Scientific Information(ISI) and development article and the articles were related to the theme title namely video game technology and curriculum or language learning. Meanwhile, only 15 articles were chosen from 33 articles published in the journals from 2003 until 2011 to be focused on in this study. However, only 9 articles were obtained using the key words video game in language learning.

6.   Findings of the Study

7.1. Analisis of articles

The research shows a total of 15 aricles out of 33 published in eight journals between 2003 and 2011 were related to the potential of video game in vocabulary learning of Malay language for foreign students. Data were analyzed according to year of journal publication as shown in Table 1.

Table 1

Percentage of 15 Published Articles According to Selected Journals in the Meta Analysis (2003- 2011)

	2003	2007	2008	2009	2010	2011	Total(%)
CE	1(6.7)			1(6.7)			2(13.3)
CHB			1(6.7)				1(6.7)
ETRD		1(6.7)				1(6.7)	2(13.3)
PSBS				1(6.7)	2(13.3)	1(6.7)	4(26.7)
AJLL					2(13.3)		2(13.3)
CALL			1(6.7)		1(6.7)		2(13.3)
ETS						1(6.7)	1(6.7)
SJER					1(6.7)		1(6.7)
Total	1(6.7)	1(6.7)	2(13.3)	2(13.3)	6(40)	3(20)	15(100)

*Note.***CE**– *Computers and Education,* **CHB** – *Computers in Human Behavior,* **ETRD**- *Education Technology Research Development,* **PSBS** - *Procedia Social and Behavioral Sciences,* **AJLL**- *Australian Journal of Language and Literacy,* **CALL** - *Computer Assisted Language Learning,* **ETS** - *Educational Technology and Society,* **SJER** - *Scandinavian Journal of Educational Research*

Based on Table 1, the journals CE, ETRD, AJLL and CALL each recorded 13.3 percent, while CHB, ETS and SJER recorded 6.7 percent, followed by PSBS at 26.7 percent. From 2003 until 2011, the year 2010 recorded the highest percentage for articles in the selected journals, as much as 40 percent. Among all the eight journals selected, PSBS recorded the highest percentage of published article son the topic, namely 26.7 percent.

7.2 Titles of selected articles related to potential of video games in learning of Bahasa Melayu vocabulary for

international students at Malaysian higher learning institutions

Subsequently, the title of the article was analyzed according to category. Studies were analyzed according to themes for categories in the articles reviewed. Among the categories derived from articles are:

7.3 Designing video games in education

Several views of researchers regarding video games with video educational value and enjoyable were stated by Aldrich (2004) in Moreno (2008); Aldrichstated that feedback receievd from students on video games was positive; students said the games enhanced their motivation. For example, 'The monkey wrench conspiracy'was of the type'first-person shooter'that used computer as a teaching aid. The same with 'Virtual Leader'that focused on teaching a complex subject such as the role of a leader. Video games in the form of'action' such as 'Slow Pace', 'Reflection', 'Study of Environment', 'Problem-solving make point' and 'Click adventure games' are relevant from the pedagogical perspective.

Moreno et al.(2008) suggested that design of video game should balance the pedagogical needs with the enjoyment factor that is difficult tto understand; the second aspect is an issue more in the high profile entertainment industry. According to Moreno (2008) in general design of games can support pedagogical approaches with several characteristics: adaptation to real time, suited to learner needs, evaluation and grading in play as well as integration with online learning.

Brett dan Jon (2011) said design of educational video game can enhance motivation of students especially grade 9 students in English subject. Ricardo Rosas et al.(2003) observed that design of video game showed positive effect on student motivation through use of video game as an experimental tool in the experimental group for the subjects of mathematics, reading, and English language comprehension and spelling.

7.4 An Interactive Learning environment

Video games are one of the channels of interactivity through the virtual world. A new learning environment has been shaped through video games online or through the internet. Ahmer Iqbal, Marja Kankaanranta and Pekka Neittaanmaki (2010) opined that the virtual world is able to enhancethe need for interaction through social networks and heighten the experience of video game play.

Apperley (2010) suggested that cyber text shapes complex interactionor an action allowed in video games. According to Apperley, video games allow students to shape a wider social context. Besides that, application of virtual 3D through 3DVWs is able to expose students to interactive and collaborative learning environments (Ibanez et al., 2011).

7.5 Video Games Enhance student motivation

Dickey (2007) noted thatMassively multiplayer online role-playing games (MMORPGs) are able to enhance students' intrinsic motivation. Dickey is supported by Peterson(2010) who found that MMORPGs showed enhancement of motivation and enjoyable learning in students through videogame-based interaction.

Papastergiou (2009) stated that video games based on physical and health education subject have the potential to motivate students to adopt a healthy and active lifestyle. Laleh Aghlara and NasrinHadidiTamjid (2011) meanwhile found that students from their experimental group who learned language using video games were more motivated as compared to the control group taught using conventional methods.

7.6 Video games in language learning

Based on findings of the study, aspect of video games in language learning proved that video game plying has the potential to be an effective learning aid. Walsh (2010) noted that experiential learning shows that students as players practised systematic literacypractices through video game play in learning English curriculum. YildizandPelin (2009) endorsed the effectiveness of video game playing in teaching based on online video technology based environment especially in learning vocabulary skills).

The use of video game as instructional support tool can also give positive effect on the way computer games are used in learning, the characteristics of play, appliances and class software infrastructure as well as the perception and attitude of teachers and students toward computer video games (Muhammet Demirbilek, Ebru Yilmaz & Suzan Tamer, 2010).Ranalli (2008) stated that computer simulation games such as *The Sims*have potential for use in language learning programs especially in learning English as a Second Language (ESL) for students with varied backgrounds. Students are actively involved in collaborative video game activities in language subjects having flexible resources and students can undertake self learning in operating and experiencing playing of the video game (Piirainen-Marsh & Tainio, 2009).

7.7 Methods used in selected articles

Data analysis of 15 articles found that all used one out of 5 methods consisting of literature review, case study, interview, experiment and mixed method.

Based on Table 2 there were 5 articles using literature review methodology, representing 33.3 percent of articles selected in the study; case study and experiment were represented by three articles or 20 percent respectively. Only two articles used the interview and mixed methods, representing 13.3 percent respectively.

Table 2: Methodology Used in 15 articles

No.	Methodology	Percentage (%)
1.	Literature review	33.3
2.	Case study	20
3.	Interview	13.3
4.	Experiment	20
5.	Mixed method	13.3

7.8 Comparison of Research Study Findings

Based onTable 1, analysis showed the percentage of research findings obtained from the 15 articles. The findings obtained found that there were 8 types of potential video games discussed by the researchers in the articles. From the analysis, motivation recorded the highest percentage (40%), followed by interactions in social networks and experience of the students (13.3 % respectively), followed by otehr potentials such as pedagogy and enjoyment, effectiveness of online video games, positive instructional support tool, potential for use of computer simulation in teaching & learning (T&L) and interactive and collaborative – all of which charted the lowest percentage of 6.7 percent.

Table 3

Comparison Between Findings on Video Game Potential in Articles Selected

No.	Potential of video game	Percentage(%)
1	Motivation	40
2	Pedagogy and Enjoyment	6.7

7.   Implications and Recommendations

Hence,there were 15 articles out of 33 articles selected in this study. While 9 articles were obtained using key words video game and language learning. Meta analysis study is appropriate for evaluating the strengths and weaknesses for every article studies. This meta analysis represents a collection of all articles related to the topic and can be categorized as thematic whether according to method, title, sample and study findings in an effective way. Hal ini demikian, perbandingan dapat dilakukan dan kesimpulan bagi setiap kajian turut dilaksanakan dengan sistematik. Although meta analysis is only descriptive in nature without using field studies and real data, its effectiveness lies in evaluating and providing beneficial critique and encouraging other researchers to adopt an action plan to fill existing gaps in the literature with continuous research.

8.   Conclusion

According to Shih, Feng dan Tsai (2008), a meta analysis not only helps the researcher identify the title of the study, methods and latest trends but also to know the influence and factors in the matters being investigated. The

findings were collected in thematic form and were then summarizedto see the overall direct effect of the article studied. Apart from qualitative analysis, this study also uses descriptive atatistics to analyze data. Based on the findings, of eight selected journals, the journal*Procedia Social and Behavioral Sciences* (PSBS) recorded the highest percentage of 26.7 from the aspect of research paper analysis. From the viewpoint of method most preferred, 5 out of 15 articlesused the method of literature reviewwhich recorded the highest percentage (33.3 percent).Comparative analysis showed that articles on motivation recorded the highest percentage or 40 percent. The overall finding from the articles was thatvideo games have potential as effective teaching aids capable of enhancing student motivation in language learning.

Hence, this studyJusteru, kajian helps researchers in identifying the limitations and gaps between previous research and the researcher's study. The researcher agrees with Yildiz and Pelin (2009) who stated that video game shows the effectiveness in language instruction based on the environment of online video game technology especially in learning language in vocabulary skills).The researchers also agree with the statement of Brett and Jon (2011) suggested that design of educational video games is able to enhance motivation in students especially in Grade 9 studenmts of English subject. Similarly Ricardo Rosas et al.(2003) staterd that the design of video game has a positive effect on student motivation through the use of video game as an experimental tool for the experimental group in in mathematics subject, reading, understanding and spelling (English).Hence, this meta analysis encourages researchers to study what previous researchers have not studies before and help the researchers to obtain further information and subsequently carry out research on the potential of video games in learning Bahasa Melayu vocabulary among international students.

Pre - Implementation Study of Blended Learning in an Engineering Undergraduate Programme: Taylor's University Lakeside Campus

S.Sivakumar[a] [115], S.Namasivayam[a], M.T.Al-Atabi[a] and S.Ramesh[b]

[a]*School of Engineering, Taylor's University Sdn. Bhd., 47500, Selangor, Malaysia*
[b]*Department of Mechanical Engineering, Advanced Manufacturing and Material Processing (AMMP) Centre, University of Malaya, 50603 Kuala Lumpur, Malaysia*

Abstract

This paper provides a framework on the implementation of blended learning (BL) for engineering undergraduate programmes. A survey comprising questionnaires, interviews and practical observations were administered targeting members of the faculty from three various engineering disciplines within the School of Engineering (SoE). Raw data was generated to establish the status quo of BL tools that are most preferred among faculty members using radar charts. A framework using the Plan, Do, Check and Action (PDCA) cycle used to monitor the progress of BL in engineering undergraduate programmes is developed.

Keywords: Blended Learning; Radar Chart; PDCA; Undergraduate Programme.

Introduction

The rules are changing drastically and there is an increased pressure on institutions of higher learning to evolve, adapt or desist (Swail, 2002). In 2003, the American Society for Training and Development identified Blended Learning (BL) as one of the top trends to emerge in the knowledge delivery industry (Rooney, 2003). Transformation of learning environments in higher education settings for an increasingly electronic world is critical (Williams, 2002). In agreement with Hicks, Reid and George (2001), there are demands for Universities to provide for a larger and more diverse cross section of the population, to cater for emerging patterns on educational involvement which facilitate lifelong learning and to include technology-based practices in the curriculum. The above literature all seem to focus on a need for a transformation in the learning environment. Before dwelling further into the measures needed for transformation, learning as a whole should first be understood. Learning may be defined as the acquisition of new mental schemata, knowledge, abilities, skills, etc, which can be used to solve problems potentially more successfully, furthering decision making on the basis of experience which elevates "doing" as a basis for achieving an effective understanding of knowledge (Pazos, Azpiazu, Silva & Rodriguez-Paton, 2002). The definition of BL on the other hand still remains a point of ambiguity. The main differences between BL and other terms such as distributed learning, e-learning, open and flexible learning and hybrid courses still remains unresolved. Some definitions of BL are so broad that it would be difficult to find any learning system that was not "blended" (Massie, Ross & Gage, 2004). While there exists a wide variety of definitions available for BL, if examined closely, these definitions are just variations of a few common themes. The three most common found definitions as described by Graham, Allen and Ure (2003) are:

- BL = Combining instructional modalities / delivery media (Bersin *et al.*, 2003; Orey, 2002a, 2002b; Singh & Reed, 2001; Thomson, 2002).
- BL = Combining instructional methods (Driscoll, 2002; House, 2002; Rossett, 2002)
- BL= Combining online and face to face (F2F) instruction (Reay, 2001; Rooney, 2003; Sands, 2002; Ward & LaBranche, 2003; Young, 2002).

The first two definitions suffer from the problem that BL is so broadly defined that it may be seen as encompassing almost all learning systems. The third definition however, is a more accurate reflection of the author's

---

E-mail address: Sivakumar.Sivanesan@taylors.edu.my

view on BL and shall be regarded as the foundation of this paper. The third definition reflects upon the combination of two separate models *i.e* F2F traditional learning systems and distributed learning systems with an emphasis on the central role of computer based technologies. Six reasons have been identified by Osguthorpe and Graham (2003) as to why an academic institution of higher learning should chose to design and eventually adopt a BL system, which are as follows: (1) Pedagogical Richness, (2) Access to Knowledge, (3) Social Interactions, (4) Personal Agency, (5) Cost Effectiveness and (6) Ease of Revision. However a more recent study by Graham, Allen and Ure (2003) showed that from the six reasons stated previously, academic institutions of higher learning that operate in a more laissez-faire environment tend to overwhelmingly chose BL systems mainly for three reasons which are (1) Improved Pedagogy, (2) Increased Access or Flexibility and (3) Increased Cost Effectiveness.

2. Rationale

Improved pedagogy with regards to an increase in the level of active learning strategies, peer to peer learning strategies and learner centered strategies have been cited by Hartman, Dziuban and Moskal (1999), Morgan (2002), and Smelser (2002). These authors have also provided an insight into how computer-mediated environments improve the level of authenticity when compared to the traditional classroom experience. For example, Collis (2003) shared a model for how BL can be used to integrate formal classroom learning with the much more anticipated informal workplace learning. Morgan (2002) and Smelser (2002) also suggested how by mixing live F2F elements with virtual reality, a more comprehensive collaborative learning and problem solving environment may be obtained.

Increased Access / Flexibility seem to be an important factor in many programs where learning experience is gained at a distance from instructors and / or students (Reynolds & Greiner, 2002). This according to the authors was due to the fact that many learners want the convenience offered by a distributed learning environment. Dziuban (1999) stated that almost 80% of Universities in the U.S.A. have seen an expansion of reduced seat time courses allowing for increased flexibility while retaining small amounts of traditional F2F contact. This proves to show that increased learning flexibility within a more distributed learning environment, a key feature of BL systems seem to be gaining popularity among a more computer mediated environment dependent students.

Cost Effectiveness which is an important consideration for the more laissez-faire Universities is also realized within a properly crafted BL system. This is because BL systems are capable of providing a large opportunity for reaching a large, globally dispersed audience in a short period of time with consistent, semi-personal content delivery as suggested by Kozma (1991). Dziuban (1999) also cited that some Universities have predicted cost savings due to cost reduction in physical infrastructure and improved scheduling efficiencies.

3. Methodology

3.1 Learning Content Management System (LCMS)

Taking into consideration the financial limits, as well as legislative rules imposed by other governing bodies of accreditation such as Engineering Accreditation Council (EAC) and Malaysian Qualification Agency (MQA) a baseline target was set as a tool to introduce and subsequently increase the awareness on the need for change, in order to adopt a BL system throughout the University. The target set was that 30% of the 50% of all modules for an engineering undergraduate programme conducted by the school should incorporate a BL approach. This means that a minimum total of 30% of the student's learning time should be spent in a BL environment in at least 50% of the total modules offered by SoE.

In SoE of Taylor's University Lakeside Campus (TULS), BL was embraced with a pragmatic approach. Taylors Integrated Moodle e-Learning System (TIMES) which is the LCMS system used in TULS is a Moodle based platform. It is a dedicated computer system used to organize and manage e-learning. This system offers a wide variety of tools that support and facilitate the publication of the service content, either in a text or graphic form or as ready-made documents or usable applications. TIMES also make it possible to manage groups of users as well as resources that were created for them. One of the most distinct features of TIMES is that the system offers tools which enable monitoring of the learning process. It is also worth noting that one of the world's largest and oldest online Universities, Open University in Great Britain, has also chosen Moodle as its LCMS platform. Research by Dobrzanski, Honysz and Brytan, (2006) and Dobrzanski & Broz, (2008a; 2008b), shows that a Moodle based platform is also preferred in Poland.

3.2 Integrated Teaching and Life-Long Learning Center (InTelleCT)

BL design within TULS is seen as a problem solving exercise from the perspective of the learning experience rather than the perspective of the tools. Shuell (1986) observed that the teacher's fundamental task is to get students to engage in learning activities that are likely to result in them achieving certain learning outcomes. Thus, to fully realize the potential of BL, the adoption of BL is motivated by a recognized need for more effective learning experiences that will lead to achievement of desirable learning outcomes. In order to facilitate the adaptation process among staff of the University, InTelleCT was developed with the aim of ensuring the provision of relevant, innovative and excellent teaching and learning experiences within the University. InTelleCT fuses the three-fold functions of three departments dedicated to cultivating a total learning experience through excellent teaching, academic student support and an innovative and technology-driven learning environment. Within InTelleCT, three divisions were established which are Teaching and Educational Development (TED), Learning and Academic Skills (LASC) and e-Learning Academy (eLA). Among the three divisions established, the eLA division was formed with the specific mandate to drive and support the implementation of BL at TULS.

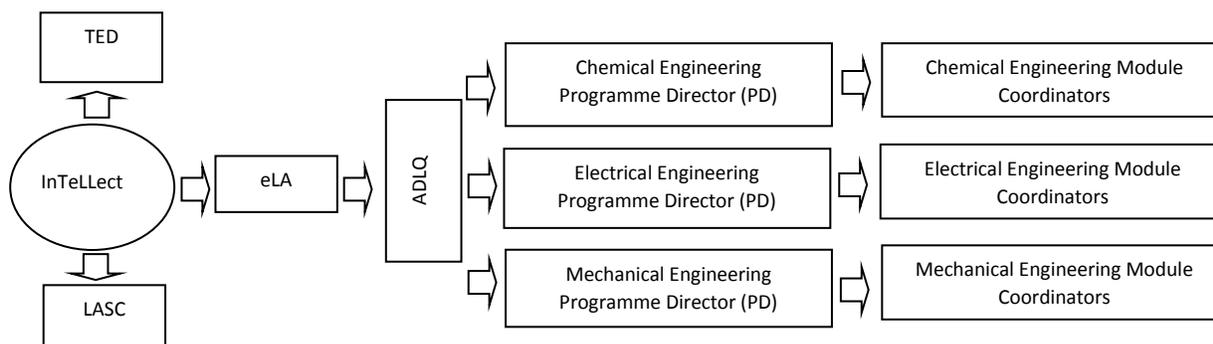
The Associate Dean of Learning and Quality (ADLQ) is appointed within SoE to coordinate BL activities between eLA and SoE as shown in Fig. 1. ADLQ also ensures that a smooth transaction of learning environment from the traditional F2F learning environment to a BL environment is achieved. A screen shot of the survey conducted to gage the BL hours incorporated in each module within SoE is as shown in Fig. 2.


Fig. 1. The Role of the Associate Dean of Learning and Quality (ADLQ)
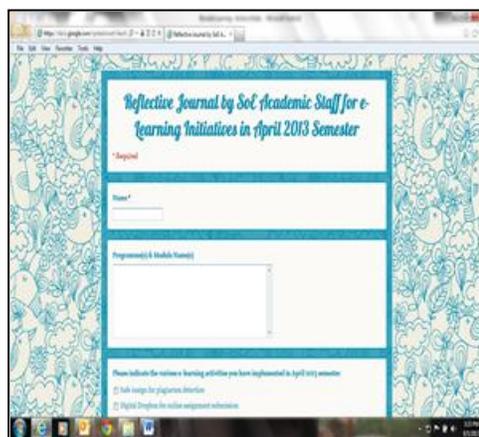

Fig 2. Screen shot of Survey to Gage BL hours in each module for staff in SoE.

4. Results and Discussion

4.1 Radar Chart for BL Tools and Hours.

As most if not all tutors had no experience in teaching within a BL framework, discussion sessions between the ADLQ and practitioners of e-learning and specialists in e-methodology, together with staff from eLA were held. This coupled with practical observations, student feedback and also valuable inputs from experienced staff members led to the creation of five BL tools that may be used as a preliminary tool in advocating BL environments in classrooms. Similar investigations conducted in University of Pretoria, University of Technology, Sydney and University of West Florida employed the use of a radar chart for results illustration (Sharafuddin & Allani, 2010). In addition, The American Society of Quality states that "Radar charts, which are extensively used in the field of institutional development, are commonly used to measure quality." Therefore, it is the belief of the author that the innovative use of a radar chart for educational assessment fits the purpose as well. The results are explained in Fig. 3, which is useful in interpreting the most favourable tool among staff of SoE.

Small magnitudes, (1) represent tools which are less favourable while large magnitudes, (5) represent more favourable tools. This chart suggests an image of a tiny island within an ocean, which amplifies the cautious steps that need to be taken by the ADLQ and eLA staff in educating the academicians within SoE on the usages of the various tools in order to achieve a BL environment that is a hybrid between F2F and online learning so instruction occurs both in the classroom and the online component becomes a natural extension of traditional classroom learning.

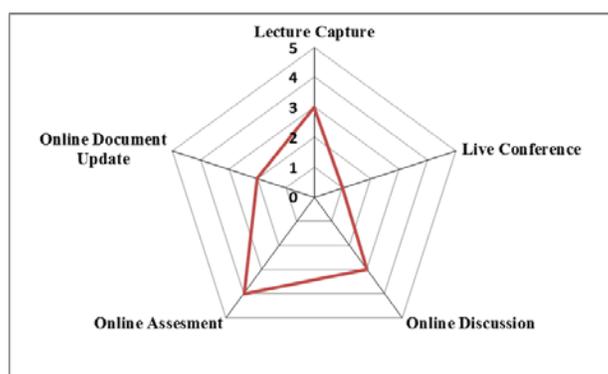
The findings from the above chart can be explained as follows:


Fig. 3. Radar Chart for BL Tools in SoE

Lecture capture system is seen by most staff as a tool for improvement. Such a system will also enable the enhancement in the learning quality of the students since students may review the captured lecture anytime, anywhere thus moving away from the traditional mortar-brick system opening the doors to a more flexible learning environment. However some staff believes that the lecture capture system has their disadvantage which is disclarity among students since their doubts cannot be addressed spontaneously. Others expressed concern due to the uncomfortable feeling that is felt being brought about by the thought that the lecture is monitored throughout the session and freedom to deliver in one's own pace is compromised. However it should be noted here that in the studies reviewed by Heterick and Twigg (2003), the authors suggested that in large student number classes, recorded (captured) lectures is a useful tool to replace the traditional one or two lectures each week allowing the module coordinators with more time to give to individual students and to enhance the quality of the course through sustained development and innovation as well as teaching development. Mixed responses on the effectiveness of this BL tool created an average of 3 out of 5 within SoE. Due to this, it was concluded that 1 lecture hour which is captured shall be equal to 20 minutes of BL time.

Live Conference tool involves the presentation of a video or any other audio formatted lecture through the use of Internet. The staffs have identified this tool as one which is capable of promoting higher levels of interaction in a teacher-student environment. However students stressed that due to the band width limitations, the video or audio quality may be compromised or even totally disrupted thus disabling the students to participate in a high level interaction environment that was perceived. This is the rationale behind the average score of 1 that was assigned to this tool. The total time contributed by activities using this tool was computed on a 1 to 1 ratio, which implies that the total activity time equals to the BL time.

Online Discussion consists of the use of Facebook, MSN Messenger, Blackberry Messenger, Whats App, Moodle forums and others alike. Such a method has gained support from the staff and students as it has been recognized to be highly interactive, yielding an average score of 3. It also encourages participation from all students and at times student with a rather quiet nature may also be motivated to write. However more than often, due to the highly interactive environment that most of the time is minimally guided by the module coordinators, students tend to repeat the same point by "liking" comments thus not having to go through a deep thinking process since the answers are already visible through the forum. With regards to the number of hours contributed to BL, if postings are to be within the lecture period then the activity would be accounted for on a 1 to 1 ratio. However, if delayed postings are allowed, the module coordinator needs to estimate the duration of the activity and assign that duration on a 1 to 1 ratio with regards to the contribution towards BL hours.

Online Assessments emerge as the top most favourable tool with an average score of 4. The online assessments include quizzes, structured questions and essay based questions. This tool based on empirical observations from staff and students promotes instant feedback to the students so that immediate remedial action can be accounted for. Assessments can also be conducted on a more frequent manner through the use of Multiple Choice Questions (MCQ) thus allowing students to obtain more feedback with regards to their understanding about the subject matter. For activities using this tool, the time taken to complete the assignment would then be regarded as BL hours.

Online Document Update also promotes an interactive environment, however the major difference here is that group participation and the ability of the module coordinator to gain a better insight on the individual contribution to the total group work is made possible. However academic dishonesty which occurs when a different student writes on behalf of his group member cannot be detected thus bringing the score assigned to this tool to 1. The contribution towards BL hours for this activity is 50% of the total activity time.

4.2 Implementation Framework

While preparing and realizing the project, great attention was paid to ensure high quality of teaching and learning is sustained within the classroom. Following the concepts underlying Total Quality Management (TQM), a Plan-DO-Check-Action cycle was developed to continuously monitor the progress of the implementation of BL environments within the classroom. PDCA cycles were developed by W.E. Deming in Bell Laboratories, U.S.A in the 1930's. The main concept behind the PDCA cycle is to divide the project into four steps. In TULC, each module was to be blended based on the number of credits that is offered by the module. For an example a module with 3 credit hours would require 120 notional hours, thus a total of 30% of these hours should be spent in a BL environment. Below, as seen in Fig. 4, a framework governing the initial implementation of BL within TULC is provided based on a PDCA cycle.

In the PLANNING section, the syllabus is written by the module coordinator and its compliance to the programme's requirements are discussed among the module coordinator, programme director and senior staff of SoE to ensure its alignment with the proposed learning outcomes, assessment methods and other legislative requirements. Once the syllabus is finalized, the syllabus content is now divided into smaller sub topics that would address each learning outcome directly. Sub topics are then further segmented into teaching hours. Each teaching session is for a period of two hours. Within this two hours segmented portions of the sub topic is addressed. For each segment a certain percentage of BL is introduced based on the depth and the learning outcomes. The tool that is to be used to cater for this BL activity is to be decided by the module coordinator after discussing with the ADLQ and other senior members of SoE within the same discipline.

The DO section involves the preparation of electronic material that would seem most useful in enhancing the student's learning experience as well as the teacher's teaching experience. Module coordinators would then conduct the session which would be observed by senior staff of SoE which is assigned by the ADLQ. Upon completing the session students are assessed on the understanding of the subject matter. This assessment is best done through a discussion forum which is created in TIMES. However module coordinators are not requested to adhere to the use of TIMES as a sole platform to obtain this feedback.

In the CHECK section, the module coordinator now obtains the student feedback together with the class observer feedback. An action plan is discussed with the ADLQ to address the gaps that were discovered. Based on the gap analysis corrective actions catering for improvement are planned. This action will then result in a more enhanced delivery method.

In the ACTION section, scope of activities involves the execution of the enhanced delivery method that was formulated earlier. Student feedback is obtained once again and thus the quality improvement cycle forms a closed

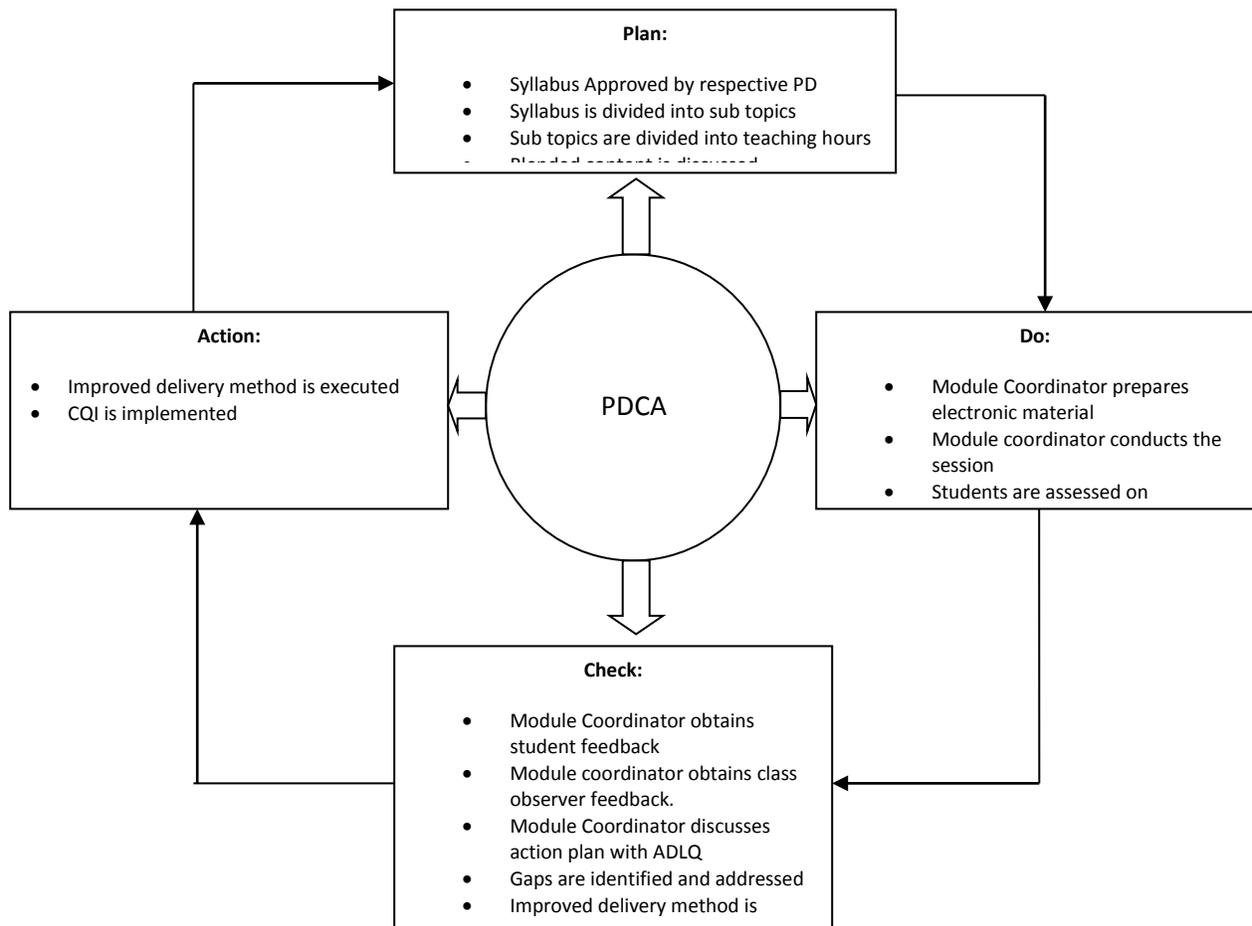
loop where the principles of continual quality improvement can now be employed in the pursuit for an excellent BL environment.


Fig. 4 PDCA Cycle for the implementation of BL within a Module.

5. Conclusion

A framework based on a survey consisting of questionnaires has been administered in SoE. The results seem to show that the staffs of SoE are keen on adopting a BL environment into their classrooms. However the relatively small island depicted by the radar chart in Fig. 2 proves to show that not all staff seems to be well informed with the use of these tools to enhance the BL environment in the classroom. It is hoped that once an initial pilot run is administered in SoE, the feedback from the staff would enable higher levels of collaborative BL design between the eLA team and the T&L coordinators which would then churn out brand new ideas on the improvisation of BL within the classrooms of SoE. The guidance provided on the quantification of BL hours based on the BL activity which is still in the conceptual stage needs to be experimented first by module coordinators. The feedback obtained from these tests would craft a better quantification system thus forming a closed loop for continual improvement in quality.

Abstract

E-learning is the computer and network-enabled transfer of skills and knowledge. E-learning applications and processes include Web-based learning, computer-based learning, virtual education opportunities and digital collaboration. Unpad is one of the largest universities in Indonesia with the number of students reached almost 40 thousand's. It is a potential and challenges for the implementation of an ideal education (effective and efficient) to produce graduates with the desired competencies. Ongoing education should not always use conventional way, even technology support must always updated.

The expectations from e-learning are Lecturers and students can communicate without restriction, Unpad have already prepared for e-learning. No less just 200 courses are online, this process needs a structured and integrated plan which is supported by policy leaders. The fact, the online learning desire was born of personal volition but it was not enough. Such things happen with the class video conferencing between FISIP Unpad and SKKU Korea. Technically the learning process went very well, but in fact very weak support in anyways even the quality of the results of students who participate in the program became doubtful.

The paper contribution is to evaluate the distance learning programs especially in Unpad, where the idea is learn from the various research and compare with the existing condition. Hoping there is a synergy knowledge and idea regarding the implementation of distance learning in order to approach the ideal conditions expected in many aspects.

Keywords: e-learning, Fisip Unpad, SKKU Korea.

INTRODUCTION

Development in science and technology is a sure thing keep going. It is sometimes linear, but often pervasive and difficult to control. As well as in education area, should be able to use technology in teaching and learning, considering education is the core to create a quality human.
Unpad in this case the Faculty of Social and Political Sciences (FISIP-Unpad) in collaboration with Sungkyunkwan University (SKKU-Korea) has been almost a year carry out cooperation in the field of distance learning (electronic learning). Both of teachers from Korea - Unpad turns the process of teaching to student learning through electronic media as well as video conferencing.

Whether realize or not, there are many types of electronic learning materials have been defined which is used in the learning process. The following types of learning materials are :

- Technical parts
- Learning units/ Material contents
- Learning entities

Where Technical parts Consist of:

1. Text
2. Picture
3. Animation
4. Video-clip

E-mail address: iradagoasri@yahoo.com; mdenjatm@yahoo.com

5. Sound
6. Etc…

The three learning material is an absolute prerequisite for the success of a learning process, where it should be supported by technical knowledge related to the teaching (next 6 point above). Without it we can be sure the learning process less than the maximum. The process of teaching and learning is expected to adopt the concept of student-centered model (see table 1 below). Where interactive occur on both sides between students and teachers. This concept is theoretically appealing, but the challenge is whether the implementation of the teaching (as a pioneer) is able to bring students in the interactive process? Or even passive.

40. Table 1. Teacher-Centered Versus Student-Centered Models (Sergio Bermejo, 2005)

Teacher-Centered Model		Student-Centered Model	
Teachers	Students	Teachers	Students
Are the performers	Are the spectators	Are the trainers	Are the active players
Transfer knowledge	Repeat this knowledge in exams	Both from a society for discovering and creating knowledge	
Are active	Are passive	Both are active	
Are focused on grading		Are focused on understanding	
Learning environment		Learning environment	
Individual and competitive		Cooperative or collaborative	

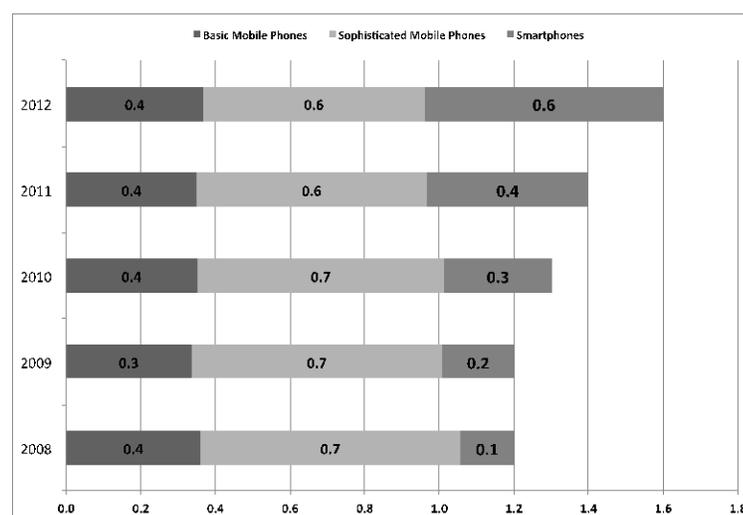
Terms of student-centered learning, one of which is the use of the mobile device for interacting. It is confirmed by the study on sales for smartphones rise significantly (see figure 1).


Fig. 1. Number of mobile phones sold (in thousands of millions) per-year worldwide (P. M. Santos, 2009)

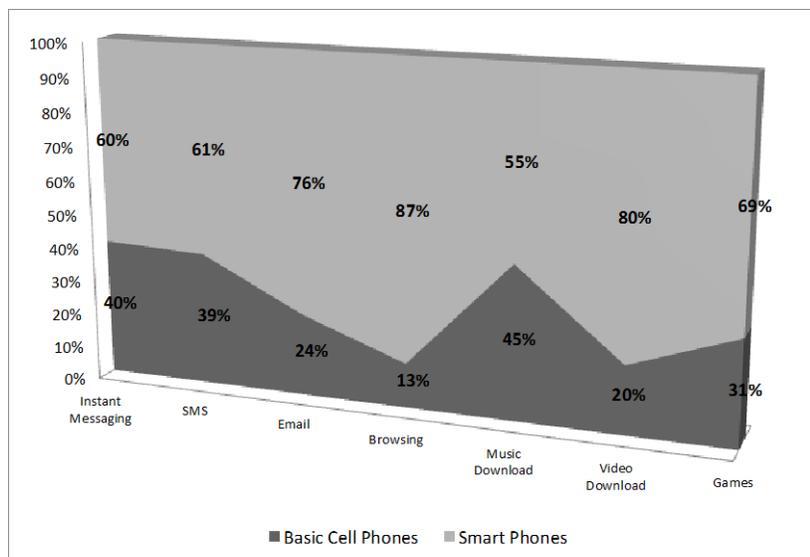
Along with the interest for smartphone as well as the support of the ease of access to information, this is an opportunity for the success of electronic learning program where the content can be easily embedded in a digital server to be accessed by students in support of the learning process, so that the process is much more effective.
It is increasingly recognized by the vendor or applications provider and information services to immerse learning content for easy access to learning anytime anywhere with various kinds of content and packaged in such a way to attract interest of students to learn. The electronic content is currently developed with various templates (P. M. Santos, 2009). If we can utilize all the content is in the process of teaching and learning activities it will be very helpful.


Fig. 2. Advanced functionalities used in basic phones and smart phones 2009 (P. M. Santos, 2009)

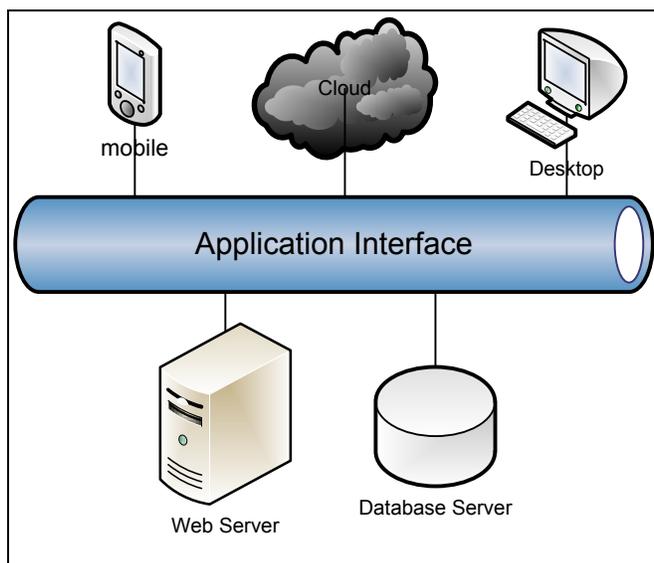
The content of the most widely circulated is the presentation type. Just a few presenters tend to create an interactive presentation such as games, video and other digital content. Though it is quite effective in improving the effectiveness and efficiency of the electronic learning process.


Fig. 3. Client-server architecture of the framework

For example, the implementation of a wide range of connected devices integrated in a single server (see figure 3). This shall be done if we are to seriously applying the model of e-learning quality. Framework in figure 3 ensures easy access and content management of electronic materials and their relation to a wide range of devices including smartphones.

ANALYSIS FINDING

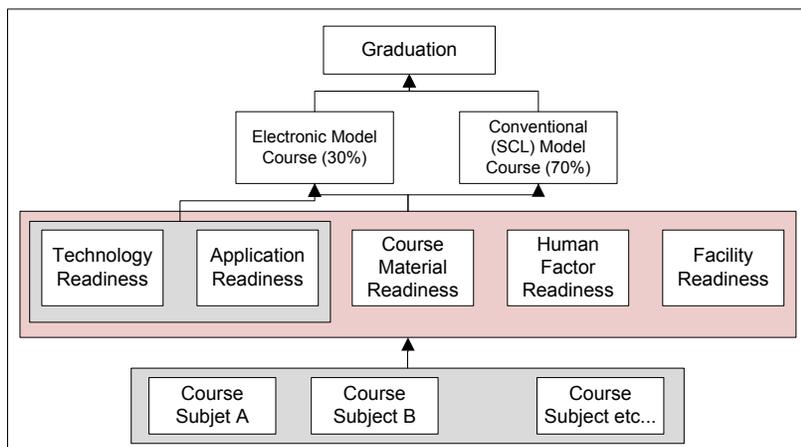
There is a tool for evaluating the effectiveness of e-learning programs in small and medium sized enterprises (SMEs). The model and tool for the evaluation of the effectiveness of e-Learning programs in SMEs has been designed to provide an easy-to-use instrument to carry out a retrospective evaluation of an e-learning program. This retrospective analysis should enable enterprises to detect weaknesses and strengths of their learning program with regard to its organizational, pedagogic and technological implications (Graham Attwell (ed.), 2006). Fisip not implemented a good system in preparing the electronic learning process, the happened next is the organization still highly dependent on the incidental and several individuals involved.


Fig. 4. The professional Course System Structure

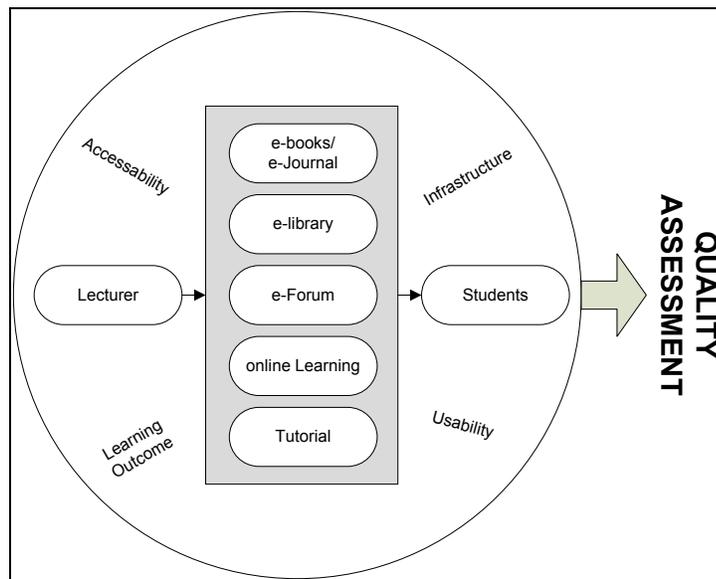
Figure 4 shows the application of electronic learning system seriously. This is very necessary based on explanation above that the teachers must also adopt information technology knowledge in the teaching-learning process. For the present framework we used, it tends to use no appropriate framework. The framework is not designed carefully to the needs of electronic learning seriously.


Figure 5. The Framework of e-Learning

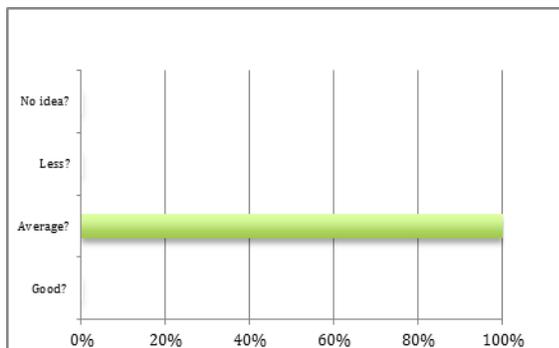
Figure 5 shows how to get serious to implement this framework in e-learning activities. We then tried to do a survey of the 10 participants of e-learning class on master degree program who regularly attend with FISIP Unpad and SKKU Korea. We try to analyze the important things that should come during the implementation of the learning process.


Figure 1. Computer skills of the students

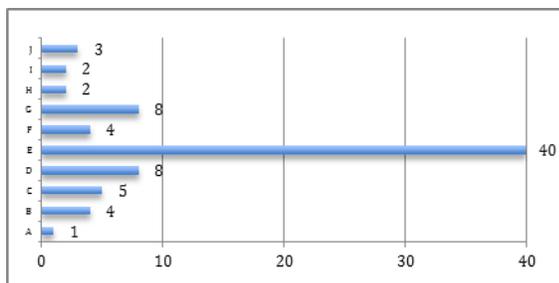
First, we tried to ask about the capabilities of computers who follow the teaching and learning activities. Results demonstrate their ability level is on average which means basic computer skills and office application skills are likely under their control.


Figure 2. Hours a week the students to access the internet facility on campus.

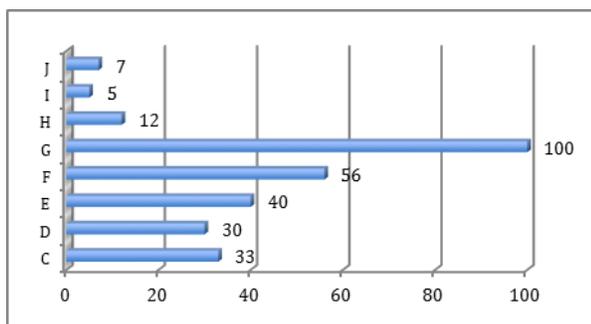
Next we will look how many hours a week do students access the Internet in the campus area? Apparently the average student access the internet 7-8 hours a week. Only one student is very high internet access on campus with the numbers 40 hours a week.


Figure 3. Hours a week (frequency) of accessing the internet at home

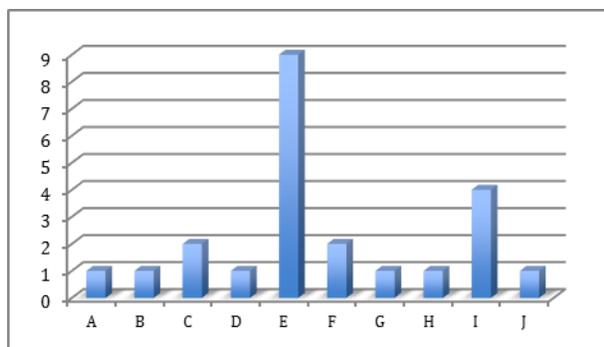
Next question, how often the students accessing the internet at home. An average of 35-36 hours a week answering internet access at home.


Figure 4. How often (times a week) the students access the e-books/ e-journal?

But it is must to be concern that the hours they access the internet at home or on campus, the number of accessing e-books / e-journal per-student 2-3 times a week. Based on interviews we obtained information that they are only occasional access to e-books / e-journal only where they have an assignments. It seems that access electronic journal / e-books have not become a habit for students.

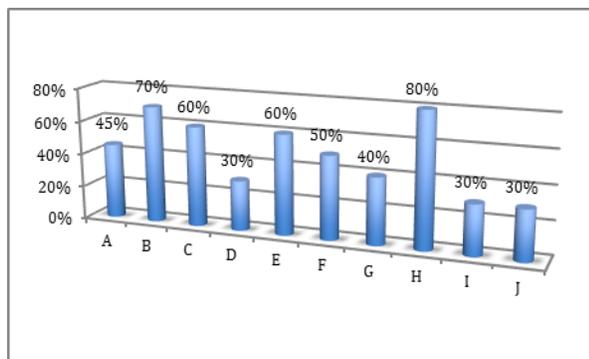
This become homework where the students should begin actively looking for an updated literature. This can be obtained through scientific publications published by many researchers in the scientific journals on the internet. Although the figure is less high-access journals, but students experienced the benefits of electronic learning process and they still want the electronic learning process continued eventhough several challenges must still be resolved. But nevertheless, there is no doubt that e-learning technology has a positive impact also has a negative impact.


Figure 5. How effective the online learning for students (in percentage)

The positive impact are :

- Easy updating and management of teaching materials until the distribution process
- More flexible in terms of discussion, interactive until the time management, grade, etc.
- Easier to control because the function is two-way and transparent
- To Push all parties to use Internet technology for academic purposes

The lack of e-Learning are :

- Lack of emotional contact between teachers and students.
- The relatively expensive infrastructure investments
- e-Learning need more effort in preparing learning materials.
- Not all subjects can be represented by this process, such as mathematics, physics, chemistry require further guidance

- There is no formal legal regulations related to support this process and sometimes, we cannot avoid the both impact.

Recommendation of The Study

It is quite difficult to implementing the ideal e-learning concept. Based on the existing conditions, we try to recommend a few things that feel important in improving the teaching and learning process. Here are the steps proposed:

- Defining the course material
- To evaluate the course material
- An evaluation of students, faculty, the teams involved and the infrastructure

The course material, it should be discussed with both parties in this case are a team of Fisip Unpad and SKKU Korea. Such as determines the course for the lectures, the point 1 tend to be easy to do. Its a little tricky is point 2, where the evaluation of the material must be executed before and after the lecturing process. This is required to ensure that the material presented is a suitable and students-even can easily understand and digest the material. Even more complicated is actually the third point, which cross-check using the tools of analysis required here, since there must be a statistical measurement of the relationship between the value of on-line courses with the teaching-learning process in which the entire process involves all components. This is necessary because the process running is quite effective and efficient or otherwise.
In the process of teaching and learning also consider two basic objectives:

- Students of different disciplines, so the material is able to be understood. It can not be avoided given the master program consists of various disciplines so that the proper selection of materials is required.
- Motivating teachers to produce high-quality materials through the selection and evaluation of instructional materials.

It is proposed that the e-materials are evaluated according to the following elements:

Technical Evaluation of implementation and compatibility

A variety of equipment and materials involved in the process of e-learning ranging from human resource tools and specifically identify the lecturing trip, so it will feel effective and efficient. It involves upgrading and installation issues hardware / software, bandwidth sufficiency, type / presentation materials and interopability.

Evaluation of Quality Production

Related to the evaluation of quality of production, not only about the technical superiority of equipment and materials, but also covers the quality of the text, graphics, grammar, speech, presentation style, layout, and so on. This should be considered carefully given the success not only related to the production of technical equipment and materials used alone, but there must be an innovation in the implementation.

Interface Device Evaluation

Planning user interface is an urgent task for the achievement of the quality and success of electronic content. The interface-specific e-learning must ensure that learners and educators get the same quality of the interface and understood by both parties. Therefore, the following factors should not missed to be evaluated. For example ease of display, the menu is basic, tracking facilities, navigation, ease of organization of material, service, support must be ensured to run smoothly.

Content and Instructor Evaluation

The quality of the trainer is the most important point in the process of e-learning. We realize that this is part of the most comprehensive and quality should be improved. Following evaluation focuses on learning content, ie, the relationship between learning objectives, content, methods, and participants. For example, description of the intended use of the learning materials, the definition of learning goals, learning objectives and the suitability of the content of the presentation, and so on is the most important thing to get an increase.

Conclusion

The quality of electronic learning material is become the importance thing, since the production of e-material is significantly increase. It is also true that the World Wide Web offers a huge mass of e-material in different ways, using different technologies and didactical approaches. Because of all the aforementioned, it is necessary to determine and implement criteria for the quality assessment of e-material, as well as to establish an appropriate system for transparent evaluation. The last and the most important thing is leadership support and commitment from various parties is one factor that can not be overlooked in the success of this activity.

Abstract

As engineering education shifts its focus from the traditional content and time-based method into the student-centred and outcome-based method, more detailed and rigorous assessments of student's learning outcomes are required. In outcome-based education (OBE), the focus is on what students are expected to know and be able to do by the time of graduation. Aside from many tasks including preparing teaching materials, examination papers, laboratory sheets, markings papers, doing research, and some administrative support tasks, lecturers are now required to do intensive OBE assessments and Continual Quality Improvement (CQI) planning and implementation for every module they handle.

This paper presents the details of a quantitative measurement of the learning outcomes (LO) and programme outcomes (PO) in the module level and up to the programme level to assess the student's PO attainments upon graduation. An End-of-Semester Assessment Tool (ESAT) was developed to assist the lecturers in this OBE assessments and CQI process. ESAT is a macro-enabled software package that automatically calculates the students' individual LO and PO attainments based on their respective module's assessments mark. A LO or a PO is said to be achieved if the student's total assessment mark is greater than or equal to a defined key performance indicator (KPI) related to that LO or PO. ESAT results from all modules are then stored in the students LO and PO database system to generate the cohort's, and the individual student's PO attainments. ESAT results in the programme level offers varied results that describes the student' overall PO performance. Periodic results can be generated for all students that can be used for student's CQI action.

Keywords: quantitative measurement; LO attainments; PO attainments; key performance indicator; outcome based education

1. Introduction

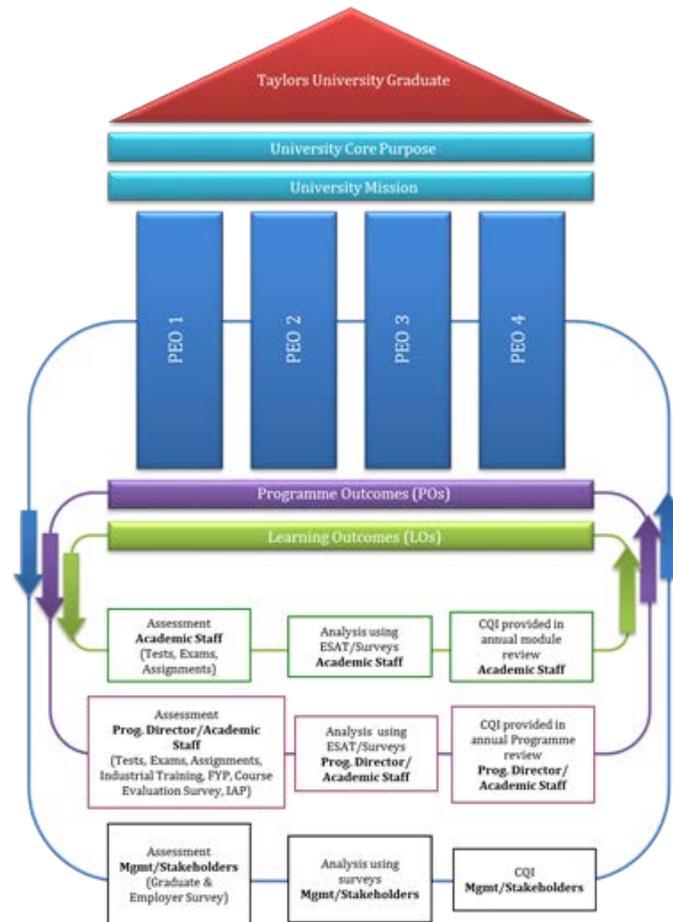
All universities in Malaysia offering engineering degree programmes are now mandated by the Engineering Accreditation Council (EAC) to implement OBE as a requirement for accreditation. Taylor's University in particular fully supports and implements OBE in its engineering programmes. Guided by EAC Manual (2012) and Taylor's University graduate capabilities (TGC), the School of Engineering crafted its own PEOs and POs to do OBE assessments and CQI implementation in its engineering programmes according to the OBE model shown in Figure 1 (Namsivayam, et.al., 2012).


Fig. 1 Taylor's University OBE Model

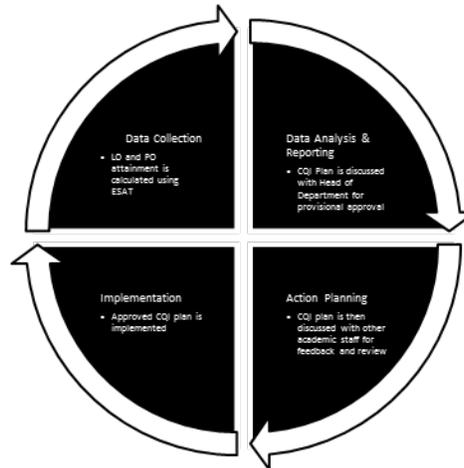
With reference to LO loop in Fig. 1, at the start of semester, the students are provided with an approved scheme of work (SOW) that guides them on how the module will be delivered throughout the semester. The SOW contains the weighted assessment components, LO-PO mapping, and assessments-LO mapping among others. Students marks collected from the assessments are then used to measure the students learning outcomes quantitatively through a macro-enabled End-of-Semester Assessment Tool (ESAT). ESAT generates the module LO and PO attainments based on the individual student's LO and PO attainments marks. These results will be used by lecturers to prepare the module review which evaluates the impact of CQI implementation from previous semester to the current semester and henceforth develop a CQI plan for implementation the next semester cycle. This complete CQI process in the module level is depicted in Fig. 2.


Fig. 2. Taylor's University CQI Process Flow

In the PO loop, all modules ESAT results will be collected and stored in the LO-PO database system that will be used to generate the individual students as well as the cohort's PO attainments upon leaving the programme. ESAT provides end of semester results summary to monitor learning outcomes and do a CQI action plan and its implementation. In the PEO loop, qualitative assessments are used to evaluate the graduates PEO attainments 3 to 5 years after graduation.

Authorities in OBE have not specifically defined OBE assessment standard which leads to various methods and techniques being used by many universities. In Malaysia particularly, Ismail, Zaharim, Abdullah, Nopiah, and Isa (2007) reported that in Universiti Kebangsaan Malaysia (UKM), an used grade point average (GPA) at the end of semester OBE assessments, while Sani, Noor, Senawi, Sulaiman & Rejab (2008) stated that Universiti Malaysia (UM) Pahang used an exit survey from final year students to assess the PO attainments of its mechanical engineering programme for CQI planning and implementation while the Mechanical Engineering program of University of Maryland-Baltimore Country uses both quantitative and qualitative method of assessing PO attainments (Spencer & Zhu, 2007). Although EAC manual (2012) suggests that PO mapping be given weighted emphasis, some universities used equal emphasis on PO mapping like the Faculty of Engineering and Built Environment of the National University of Malaya (UKM) and the Faculty of Electrical and Electronic Engineering of Universiti Tun Hussein Onn Malaysia (UTHM) among others (Sharir, et al. 2008, Shamsul et al., 2012).

As OBE is a continuous, and a tedious process, lecturers are faced by added burden of preparing documents to evaluate the students LO and PO attainments for each module. This is on top of a module analysis and CQI plan to be prepared and presented based on LO and PO results. Since lecturers are already tied-up with a lot of paper documentation for each module required by the accrediting agency, there is an urgent need to provide a OBE assessment tool to do quantitative measurements of LO and PO attainments. This paper will now present the details of LO and PO attainments from the module level up to the programme level using ESAT.

2. End-of-Semester Assessment Tool (ESAT)

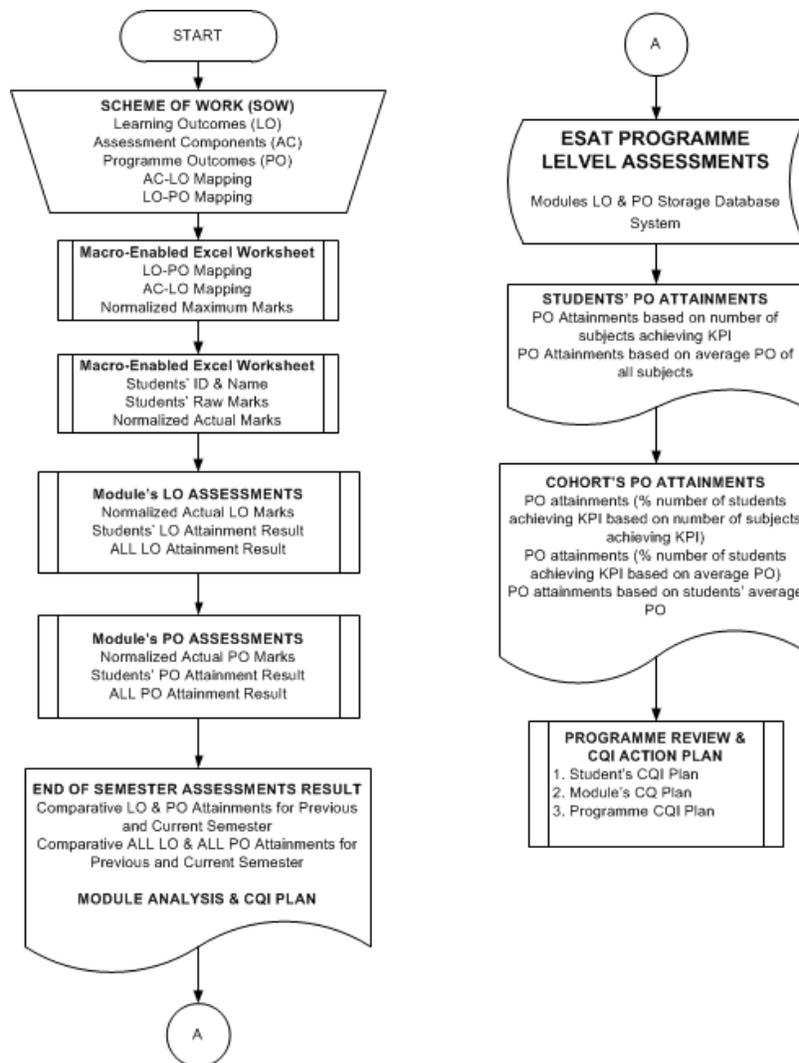
The ESAT developed by the author consists of macro-enabled worksheets that automatically calculate the module's LO and PO attainments at the end of semester. This improved model was implemented at the School of Engineering in all of its programmes. The implementation of ESAT is shown in Figure 3.


Fig. 3. ESAT Process Flow Chart

As indicated in Fig. 3, the Scheme of Work (SOW) was used in the LO and PO assessments. The SOW contains the details of assessment components (AC) and their respective mapping to each LO, and the LO-PO mapping among others. The information was used to generate the LO-PO mapping and the associated normalized LO and PO marks. The students' raw marks were used as input, which automatically generates the respective LO and PO assessment marks. ESAT outputs the comparative LO and PO attainments for the previous and current semester that serves as basis for CQI plan. ESAT results from all modules were then stored in the LO-PO database system to generate the student's PO attainments upon graduation. Details of the ESAT process flow are presented through screenshots shown in Fig. 4 to Fig. 10 using an ESAT file of Analogue Electronics that the author handled in the September 2012 semester.

Fig. 4. LO-PO Mapping

Fig. 5. Assessment Components (AC)-LO Mapping

Fig. 4 shows the LO-PO mapping from SOW where POs are mapped to one or more LOs and given equal emphasis while Fig. 5 shows the assessment components mapped to LOs. Lecturers are given flexibility to layout the mapping based on their preference where each assessment component can be mapped to one or more LOs and need not be based on 100 marks. These assessment marks are automatically normalized to 100 to generate the normalized LO and PO marks. A screenshot of normalized LO mark is shown in Fig. 6.

Fig. 6. Normalized LO Marks

After generating the normalize LO and PO marks, the lecturer is now ready to key-in the students' individual assessments mark based on Fig. 5 AC-LO mapping. A screenshot is shown in Fig. 7.

Fig. 7. Students' Raw Assessment Marks vs LO Normalized Marks

Fig. 7 shows the individual student's raw marks distributed to respective LOs with corresponding normalized LO marks. At this point, as marks are keyed in, the student LO and PO assessments marks are generated automatically using equations (1) to (4).

$$LO \text{ Assessment Mark} = \sum \frac{\text{Raw Mark}}{\text{Maximum Raw mark}} \, x \text{ Normalized LO Mark} \tag{1}$$

$$LO \text{ Attainment Mark} = \frac{\text{LO Assessment Mark}}{\text{Maximum LO Mark}} \, x \, 100\% \tag{2}$$

$$PO \text{ Assessment Mark} = \sum LO \text{ Shared Assessment Marks} \tag{3}$$

$$PO \text{ Attainment Mark} = \frac{\text{PO Assessment Mark}}{\text{Maximum PO Mark}} \, x \, 100\% \tag{4}$$

For example, for the student with ID of 0305308 in Fig. 7, LO1 and PO1 attainments are calculated as

$$LO1 \text{ Mark} = \frac{20}{20} x 2.5 + \frac{12}{20} x 2.5 + \frac{78}{100} x 5.0 + \frac{15}{15} x 10.5 = 18.4$$

$$LO1 \text{ Attainment Mark} = \frac{18.4}{20.50} x 100\% = 89.76\%$$

$$PO1 \text{ Assessment Mark} = \frac{18.4}{3} + \frac{15.8}{3} + \frac{8.8}{2} + \frac{8.9}{3} + \frac{7.7}{3} + \frac{9.8}{2} = 26.2$$

$$PO1 \text{ Attainment Mark} = \frac{26.2}{38.25} x 100\% = 68.5\%$$

At 60% KPI set for the programme, a LO or a PO is said to be attained if at least 60% of the students obtain 60% of their assessment mark related to that LO or PO. Hence, in this example, the calculated LO1 and PO1 are considered attained by the student. A screenshot summary of the module LO and PO assessments marks is shown in Fig. 8.

Fig. 8. Students' LO Assessment Marks

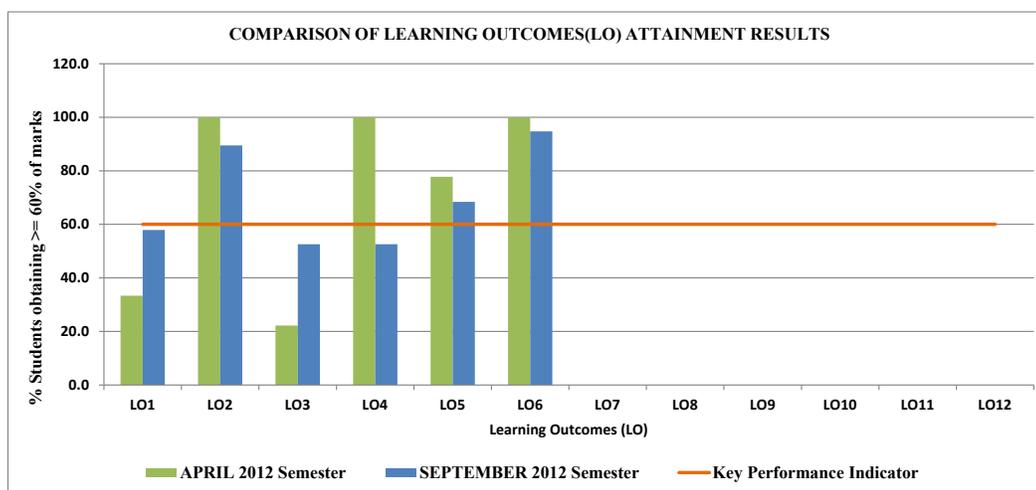
After generating these LO and PO attainments, a bar chat comparing the previous and present semester LO and PO attainments are generated for the module. Screenshots are presented in Fig. 9 and Fig. 10, respectively.


Fig. 9. End of Semester LO Attainment Results

It can be observed in Fig. 9 that there are LOs that improved and there are those that decreased considerably. Also, some LOs although improved did not reached the KPI. Analysis of these results will lead to CQI action plan that can be implemented in the next semester cycle.

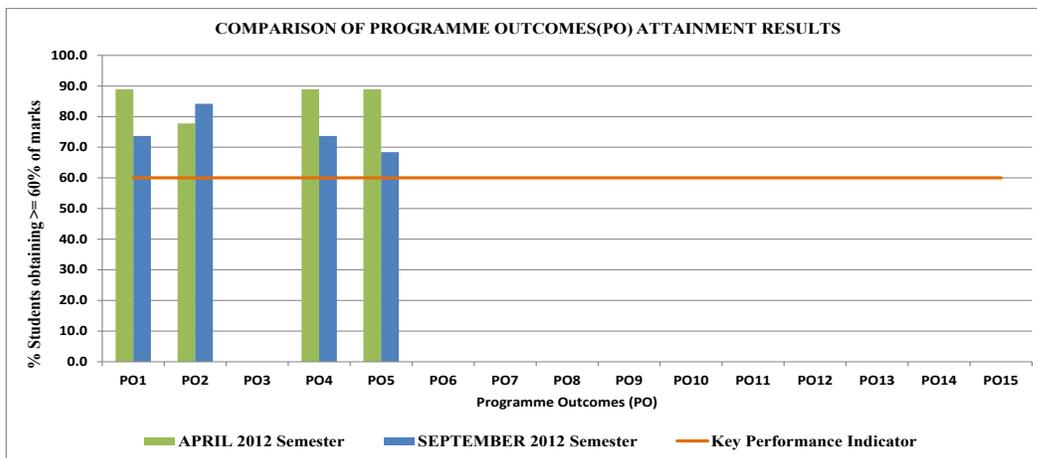
Similarly, Fig. 10 shows the comparative PO attainment results for the previous and the current semester. It can be observed that there are POs that improved and there are those that decreased from the previous semester to the current semester.


Fig. 10. End of Semester PO Attainment Results

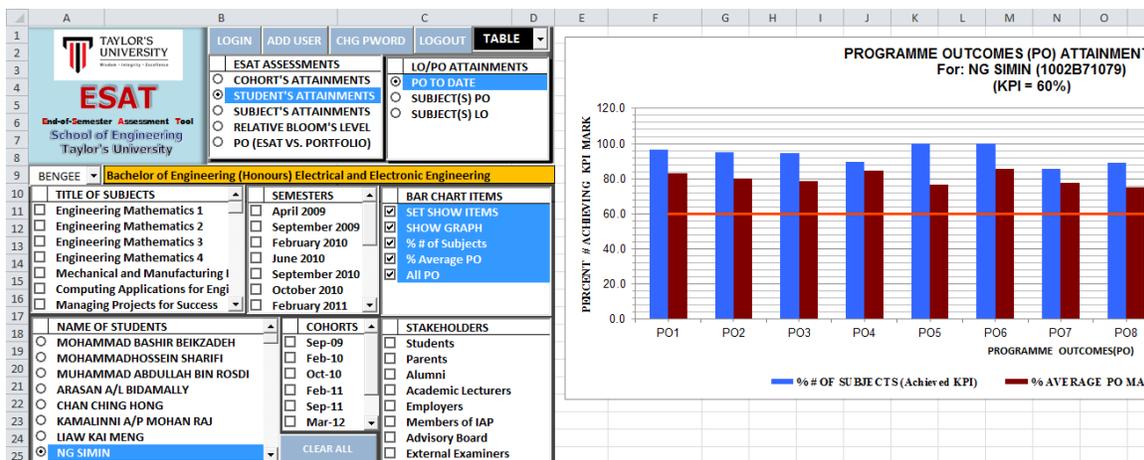
In the programme level, all ESAT files from semester 1 to semester 7 were collected and stored in the LO-PO database system. ESAT can generate the individual student as well as the cohort's PO attainments at any desired assessment period in just one click of a button. The screenshots for the student's PO attainments are presented in Fig. 11 and Fig. 12.


Fig. 11. ESAT's Programme Level PO Attainments Window

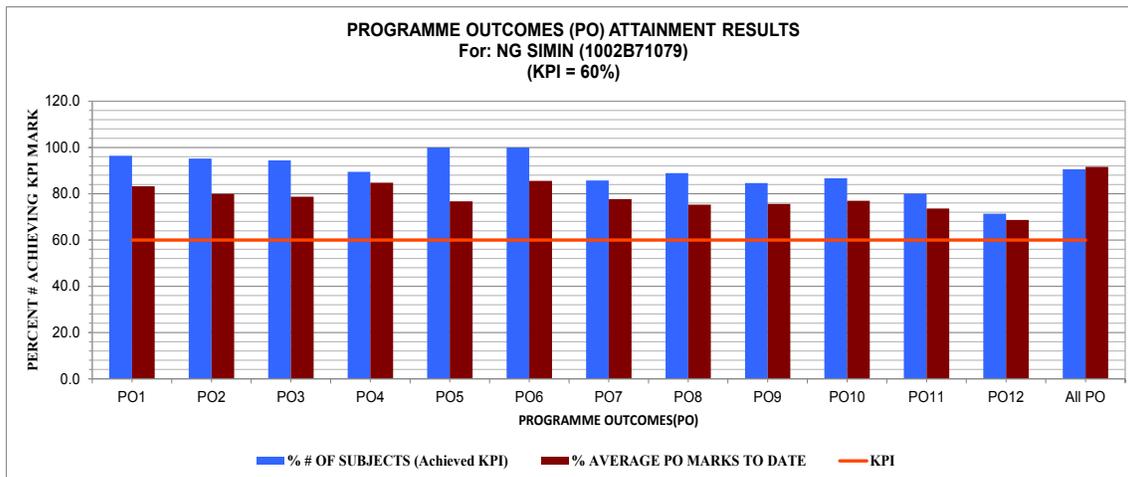
In Fig. 11, by just clicking the name of a student, a bar chart consisting of two types of student's PO attainment results can be generated. The first bar (in blue color) in Fig. 12 represents the PO attainments based on the number of subjects achieving KPI while the second bar (in red color) represents the PO attainments based on the average POs of all modules. Management can decide which output best describes the student's PO attainments.


Fig. 12. Student's PO Attainments To Date

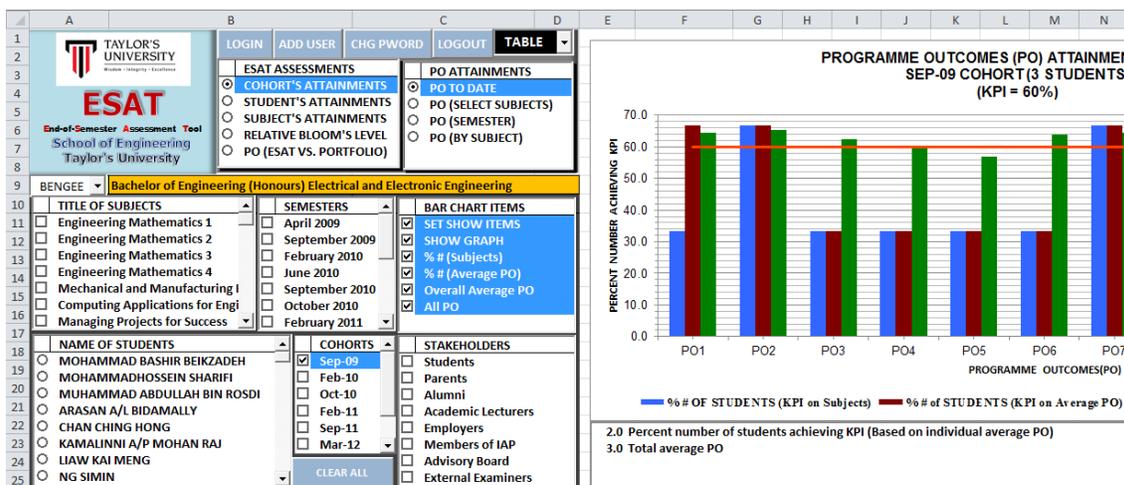
Similarly, the cohort's PO attainments can also be generated through the main window. Fig. 13 and Fig. 14 shows the screenshots for 2009 cohort's PO attainments result. Fig. 15 shows three types of PO attainments that can describe the cohort's performance. The first bar (in blue color) represents the percent number of students achieving KPI based on the number of subjects achieving KPI while the second bar (in red color) represents the number of students achieving KPI based on the individual average PO, and the third bar (in green color) represents the simple average of the students PO attainments.


Fig. 13. Student's PO Attainments To Date

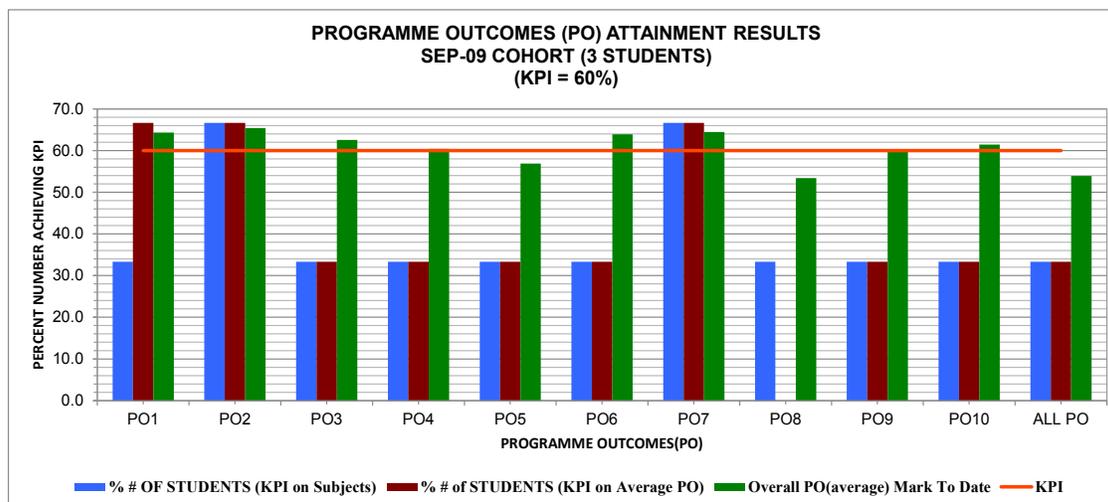
ESAT can also generate the LO and PO attainments of any module or group of modules offered in a semester for any student or cohort that could be used for analysis, monitoring and CQI action planning.


Fig. 14. 2009 Cohort's PO Attainments To Date

Conclusion

A comprehensive presentation of a quantitative measurement of PO attainments had been presented. The authors believe that with this blueprint in place, lecturers can perform module-level LO and PO assessments with ease, reliability, and efficiency. ESAT results can be an effective tool in improving the module delivery through regular assessments, monitoring, CQI action planning, and implementation thus ensuring better quality graduates equipped with desired capabilities ready face the complex challenges of their respective field of profession. ESAT PO attainments in the programme level can also be used to evaluate the lacks and insufficiencies in curriculum, facilities, and other programme policies towards enhancing the students learning experience.

Research and trends in the studies of WebQuest from 2005 to 2012: A content analysis of publications in selected journals

Norlidah Alias[118], SaedahSiraj, Mohd Nazri Abdul Rahman, Alijah Ujang,

Rashidah Begum Gelamdin, Aniza Mohd Said
Faculty of Education, University of Malaya, 50603 Kuala Lumpur, Malaysia

Abstract

This paper provides trends analysis and content analysis of studies in the field of WebQuest that were published in seven major journals: TOJET, Educational Technology & Society, Educational Technology Research & Development, Computers & Education, Learning and Instruction, Australasian Journal of Educational Technology and British Journal of Educational Technology. These articles were cross analyzed by published years. Content analysis was implemented for further analysis based on their research topics, issues category, research settings and samplings, research designs, research method and data analysis. It was found that WebQuest benefited students academically. The results of the analysis also provides insights for educators and researchers into research trends and patterns of WebQuest.

Keywords: WebQuest; Research Trend; Content Analysis

1. Introduction

The process of learning and improving students performance by using appropriate technological processes and resources have been the order of the day. In this regard, WebQuest application is a new phenomenon that motivates students in their learning processes (Dodge, 1995). It has been used by students as a web-based tool for collecting and evaluating information to increase their learning performance. According to Dudeney (2003), its application that requires student to perform certain tasks, analyse, evaluate and solve problems motivates students than outdated course books and other such teaching materials. WebQuest is a web-based activity which requires the students to be active learners and allows them to enhance their higher order thinking skills such as finding topic-related web sites, examining and selecting well-prepared and reliable Web sites (Halat, 2008). Regarding finding relevant resources, they must evaluate the sites so that all the unnecessary information will be eliminated and this will help them to develop their critical-thinking skills. WebQuest is a valuable tool for providing students with many interaction opportunities in realistic settings thus making for a more meaningful, experiental and very motivating learning experience. If the WebQuest is associated with students' professional needs, their implementation can be very successful and it helps to enhance students' skills both in academic and cooperative work (Laborda, 2009). As research documented that WebQuests is more effective in promoting student engagement, motivation, connecting to authentic contexts, critical thinking, creativity, literacy skills, improving problem solving skills, social interaction, scaffolding learning and collaborative learning (Abu-Elwan, 2007; Allan & Street, 2007; Abbitt & Ophus, 2008; Ikpeze & Boyd, 2007; Kanuka, Rourke & Laflamme, 2007; Lara & Reparaz, 2005; Lim & Hernandez, 2007; Segers & Verhoeven, 2009; Yasemin, Madran & Kalelioglu, 2010). That is why a majority of the teachers used WebQuest as a tool for teaching and learning; to achieve the learning outcomes (Yasemin, Madran,& Kalelioglu, 2010; Segers & Verhoeven, 2009; Cheng, Tzung, & Wei, 2011; Pear & Crone-Todd, 2001) and assisted in bridging the gap between theory and practice (Lim & Hernandez, 2007).

A WebQuest is one example of how teachers can integrate technology into classrooms, which is a growing area of interest as information technology creates new learning opportunities and becomes more accessible across the world (Krismiyati Latuperissa, 2012; Garry, 2001; Lin & Hsieh, 2001). Research has shown that integrating technology especially using internet in teaching and learning can have positive influences on students' motivation, inquiry-based learning, attitudes, achievement and peer interactions in the classrooms (Abu Bakar Nordin &

Norlidah Alias, 2013; Chandra & Lloyd, 2008; Dorothy Dewitt, Saedah Siraj & Norlidah Alias, 2013; Lim & Tay, 2003; Norlidah Alias & Saedah Siraj, 2012; Wang, Kinzie, Mcguire, & Pan, 2010).

In Malaysia the research done on WebQuest is still lagging far behind compared to other countries in the world. Research done in 2009 by Norazah Mohd Nordin & Ngau Chai Hong on the development and evaluation of WebQuest for Information and Communication Technology subject found that WebQuest could attract students to search more information using the web by using the link attached. It also serves as an easy way for e-learning.

So far, there have been numerous publications about WebQuests in the last few years; the majority have either fallen within the categories of conceptual, descriptive, design or other technical aspect of it (Sox & Rubinstein-Avila, 2006). Since then, there has been increasing research on WebQuest application on a wide range of topics. However, none has focused on content analysis of publications on WebQuests.

2. Research Objective

This review intends to concentrate on and learn about the research trends related to WebQuest covering the years 2005 to 2012. The articles were obtained from seven professional journals and abstract databases and published in the *Social Sciences Citation Index* (SSCI); which has comprehensive coverage of the world's most important and influential journals and research results.This paper only covers 7 journals that have been selected from ISI, namely the Educational Technology Research and Development (ETRD), Turkish Online Journal of Education and Technology (TOJET), The Educational Technology And Society Journal (ETS), The Learning and Instruction Journal (L&I), Australasian Journal of Educational Technology (AET), British Journal of Educational Technology (BET), as well as Computer & Education (C&E).

The present study looks into all the articles published in the *Education Technology Research & Development* (ETRD) comprising 233 articles, *Turkish Online Journal of Educational Technology* (TOJET) contained 398 articles, *Educational Technology and Society*(ETS) consisting of 493 articles, *Learning & Instruction* (L&I) contained 294 articles, *Australian Journal of Educational Technology* (AET) containing 51 articles, *British Journal of Educational Technology*(BET) containing 906 articles and *Computer & Education* (C&E) comprising 1240 articles. From the total of 3707 articles, only 10 articles were successfully extracted and identified to cover related WebQuest researchers. It showed up in the publication of journals namely, *Education Technology Research & Development* (ETRD)(2011) 59, *Australian Journal of Educational Technology* (AET)(2012),vol.28(2), *British Journal of Educational Technology*(BET)(2007) Vol.38(6) and (2011)Vol.42(5), *Learning & Instructional* (L&I)(2009)Vol.19, *Turkish Online Journal Educational Technology*(TOJET)(2011),vol.10(2),(2012) Vol.11(4), *Educational Technology and Society*(ETS)(2009)vol. 12(1) and (2010) vol. 13(3)and *Computer & Education* (CNE)(2011) vol.57

Accordingly, this review will provide content analysis of such journal articles by categorizing them based on the research topic, methodologies, design and WebQuest trends. Our analysis, therefore addresses the following research questions:
1. What are the research topics about WebQuest during the study period from these selected journals?
2. What are the research methodologies that have been used?
3. What are the research designs that have been applied?
4. What are the WebQuest trends in the selected journals?

The study undertaken is to extract the similarities and differences from the above classification including the findings found in those selected journal articles. It may shed some light on future research that will be conducted and provide guidance for researchers and a basis for discourse for policy makers.

3.Method

Content analysis is a research technique and tool for social science and media researchers. As a scientific method for an objective, systematic, and quantitative description of the manifest content of communication (Berelson, 1952). Furthermore it can be extended to describe the characteristics of content of a document, making an observation and provides an analysis. Krippendorff (1980) defined content analysis as a research technique for making replicable and valid inferences from data to their context. One of the most frequent uses of the content analysis is to study the changing trends in the theoretical content and methodological approaches by content analyzing the journal articles of the discipline (Loy, 1979).

Firstly, a content analysis of journal articles was conducted by formulating the research question and the objectives of the study. Secondly, 7 journals were selected which were published in the Social Science Citation Index (SSCI) pertaining toWebQuest research. Thirdly, a set of criteria were set for the analysis and development of

the content categories. Fourthly, data preparation for the necessary analysis was completed before final analysis and drafting of the report.

In order to examine the research trends in WebQuest research, the study make classification of research topic of each published article. Descriptions of those categories consist of (i) Research Trends (ii) Research topics (iii) Research Design and methodology; and (v) Data analysis and findings.

Webquest Research Trend

The utilization of information technology such as internet, digital program and gadget has increased in education. Recently the use of internet learning tools such as WebQuest, Facebook, Wiki, YouTube and Web-Based have been integrated into instructional learning in the classroom. Focusing on the topic of WebQuest in all the 7 selected journals and results of trend analysis from 2005-2012 shows that out of 3614 articles published, only 13 articles were related to WebQuest. This is only about 0.35% from the total number of journals analyzed as shown in Table 1.

Table 1: Number of research articles in WebQuest published in 7 selected Online journals.

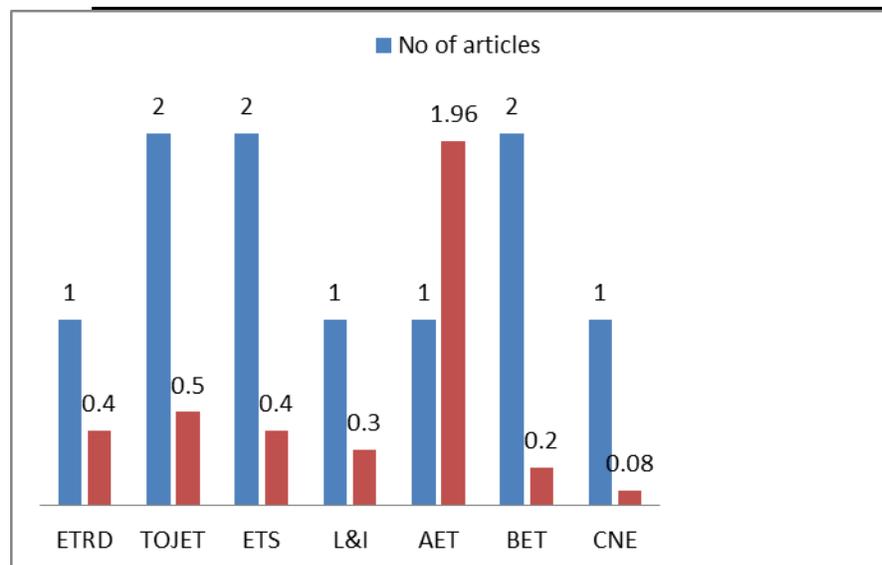
Year	No of Journal with WebQuest articles	Percentage (%)
2005-2006	0	0%
2007-2008	1	14.3%
2009-2010	3	42.9%
2011-2012	5	71.4%


Figure 1: Percentage and number of articles in selected journals

The study found that from the year 2005 until 2012; only 1 or 2 articles which were related to WebQuest were published in the seven selected journals. For example, in AET there is a research on self regulated WebQuest learning system for Chinese elementary schools. While in TOJET there were two articles that studied WebQuest was found in 2010 & 2012. ETS also had the same pattern which WebQuest related research articles found in 2009 and followed in 2010. The issues that were highlighted since 2009-2012 was reading comprehension performance

(2012), motivation of the preservice elementary school teachers (2011), oral communication in English (2009) and WebQuest- Web Macaresi for teaching and learning (2010).

Two articles from TOJET 2011 and 2012 clearly discussed advantages of using WebQuest. The post-test administered in those research found that WebQuest helps in improving students' reading comprehension performance and it shows that WebQuest use has the potential in promoting competency in reading comprehension. For this reason, teachers and students need to be trained in order to use WebQuest more effectively (2012). The pre service elementary school teachers who used designed WebQuest–based applications in teaching and learning mathematics shows that it had a great effects on their motivation (2011). Results of these studies imply that developing WebQuest-based activities in a college level methodology courses may have more positive effect on the attitudes of the pre-service elementary school teachers towards teaching and learning mathematics, rather than doing spreadsheet activities. If they try to design WebQuest activities as a group or individual project in their methodology courses, they might have the opportunity to practice their pedagogical and content knowledge in a different environment, which will give more benefit in developing their competency. Multimethodology in teaching and learning processes also promises a good sign to practice not only for teachers, but also the students. The distribution of WebQuest articles in selected journals is shown in Table 2.

Table 2: Distribution of WebQuest articles in selected journals

Journal	No of articles	WebQuest	Total of articles	Percentage %
ETRD	1		233	0.4%
TOJET	2		398	0.5%
ETS	2		493	0.4%
L&I	1		294	0.3%
AET	1		51	1.96%
BET	2		906	0.2%
CNE	1		1240	0.08%
	10		3614	100

One of the main purposes of this study was to categorize research topics in WebQuest and to help indentify research trends from 2005-2012 in the 7 selected journals. The selected articles which were reviewed were classified into three categories such as WebQuest as learning enviroment, WebQuest as a learning tool and WebQuest for self development. Our study found that 40 % of the articles focused on the learning enviroment. For example, research done by Allan and Street (2007) on the impact of a knowledge by pooling WebQuest in primary initial teacher training shows that WebQuest has the potential to promote high order learning within different disciplines in higher education. It also creates a new enviroment in learning. As a result, the study of the 10 articles on WebQuest research found that: (1) when WebQuest was used in real situations, students could acquire more knowledge and experiences, and (2) in the learning activity of the experiment, the students accomplished different learning tasks and expressed their own opinions and perspectives, which could foster their critical thinking skills. On the other hand, the students in outdoor situation could be positive to participate in learning activity. Based on these outcomes, WebQuest has the potential to develop as a pedagogical model for teaching and learning. In Table 3, the study summarizes the content analysis from the selected journals.

Table 3: Content analysis of WebQuest articles in selected journals.

Research Topic	Topic Category	Source : (author, year, journal, page no.)	Sample and research location	Research Design	Instrumentation
Learning in a sheltered Internet enviroment: The use of WebQuests	Enviromental Education	Segers & Verhoeven *Learning and Instruction* Vol 19 (2009) : 423-432	229 Grade Sixth (116 boys & 113 girls) , Elementary School in Netherlands	Quasi-Experimental Design and Statistical analyses to measure the effects of WebQuests.	CITO Test, Digit Span Test, Questionnaire (21 Items), Knowledge Test, Scoring Form,
WebQuests in special primary education: Learning in a web-based environment1099 801..	Differences in learning gain when performing a WebQuest with a well-defined versus an ill-defined assignment	Tijs Kleemans, Eliane Segers, Mienke Droop and Hanneke Wentink *British Journal of Educational Technology* Vol 42 No 5 2011 801–810	Twenty boys and twenty girls (mean age 11; 10), attending a special primary education school, performed two WebQuests.	Knowledge acquisitionwas assessed by means of a concept map (ie, associative knowledge) and a knowledge test, based on facts concerning the subject (ie, factual knowledge).	Concept map (associative knowledge) and a knowledge test,

The quest for deeper learning: an investigation into the impact of a knowledge-poolingWebQuest in primary initial teacher training	Explores the impact on learning in higher education of the integration of a knowledge-pooling stage into a WebQuest.	Jo Allan and Mark Street *British Journal of Educational Technology* Vol 38 No 6 2007 1102–1112	Questionnaires were completed anonymously by 87 of the 95 students participating in the sessions; 37 of these respondents were on the BEd course and 50 were on the PGCE. Two focus groups were formed: one consisting of eight BEd final-year students, and one consisting of six PGCE students. Twelve questions were used to guide the focus group sessions.	i. Explain the concept of WebQuests, consider recent literature regarding the effects and difficulties of this approach to learning. ii. Examine students' perceptions of the impact of this tool on high-order learning.	i. Level of learning achieved by respondents is analyzed using Biggs' Structure of the Observed Learning Outcomes (SOLO) taxonomy. ii. Three sets of data were collected for this study: (1) from a student questionnaire focusing on students' perceptions of the impact of the WebQuest session; (2) from focus groups; and (3) an analysis of 48 feedback sheets for PGCE assignments. The questionnaire was used in order to gain as broad a picture as possible of student perceptions of learning via WebQuest.
Implementing a self-regulated WebQuestlearning system for Chinese elementary schools	The rapid growth of Internet has resulted in the rise of WebQuest learning recently. Teachers encourage students to participate in the searching for knowledge on different topics. When using WebQuest, students' self-regulation is often the key to successful learning.	Hsien-Sheng Hsiao, Chung-Chieh Tsai, Chien-Yu Lin and Chih-Cheng Lin *Australasian Journal of Educational Technology* 2012, 28(2), 315-340	Participants in the study including 193 students in six classes, with average 12 years of an elementary school in Taipei County,Taiwan. The experimental group and the control group are composed of three classes respectively.	The current study investigates the correlation between students' selfregulated behavior and their achievement when using WebQuest learning through the self-regulated learning assisted functions and traditional WebQuest learning.	Used quasi-experiment to study the effect in WebQuest learning, and sequential analysis to calculate students' particular interaction patterns. Study was a five-week experiment, in which the independent variables were the WebQuest learning with as well as the WebQuest learning without self-regulated learning assisted functions, and self-regulated levels of the students, while the dependent variables were their learning effect.

The effect of two different cooperative approaches on students' learning and practices within the context of a WebQuest science investigation	Science Education	Zacharias C. Zacharia • Nikoletta A. Xenofontos • Constantinos C. Manoli *Education Tech Research Dev* (2011) 59:399–424	The participants were 38 seventh-graders (14 year-olds) from two classes (Nclass1 = 18 and Nclass2 = 20) of a public school (Gymnasium) in Nicosia, Cyprus	Qualitative	WebQuest Conceptual test Screen and video captured data Interviews
The study on integrating WebQuest with mobile learning for environmental education	Enviromental Education	Cheng-Sian Chang, Tzung-Shi Chen, Wei-Hsiang Hsu *Computers & Education 57* (2011) 1228–1239	One hundred and three sixth-grade students in a public school in Tainan, Taiwan, participated in this study, and their ages ranged from 11 to 12	Experimental design	Pre test Post test
The effect of using WebQuests on reading comprehension performance of Saudi EFL Students	Reading comprehension performance	Yousif A. Alshumaimeri & Meshail M. Almasri. Curriculum & Instructional department. College Of Education.King Saud University, Riyadh. *TOJET:* Oct 2012-Vol 11, Issue 4. pp. 259-306	1st year preparatory program with 83 level 3 male students in the science and engineering track in the preparatory Year (PY) in King Saud University. Saudi male EFL students	Quasi-experiment. pre-test and post-test quasi-experiment non equivalent control group research design. Experimental group-received the traditional teaching &WEBQUEST as supplementary activities and the control group received traditional teaching only. Performance in the post-test was compared for both groups in order to determine whether there were significant differences between the groups in relation to the treatment. They were enrolled in the intensive English program with 20 weekly contact hours for two semesters and summer.	Data collected were analyzed using SPSS and t-**test** was computed to investigate the differences between the pre-test and post-test. An analysis of covariance (ANCOVA) was conducted, partialling out the pre-test scores, in order to investigate the differences between the experiment and control group in the post-test.
The impacts of mathematical representation developed through WEBQUEST and spreadsheet	motivation of pre-service elementary school teachers	Halat E (Halat,Erdogan); Peker M (Peker, Murat). *TOJET:* April 2011- Vol 10, Issue 2, pp. 259 -	30 studens in experimental group and 40 students in control group. The study conducted in the spring semester	Quasi experiment. Questionnaires, Course interest survey (CIS) as pre and post test in the study.	Test scoring guide in the analysis of the CIS. The response scale range from 1-5. *t*-test statistical procedure with $\alpha = .05$ in the pre-test scores to

		267	2008 and it took place for 7 weeks. Each group had 4 hours of instruction in a week.	To investigate how students are motivated, or expected to be, by the particular setting.	determine any differences in terms of motivational level between exp. and control groups.
activities on the motivation of pre-service elementary school teachers.			70 pre-service elementary school teachers as a convenience sampling that enrolled in mathematics teaching course at a university located in central Turkey.	Included 34 statements that categorized into 4 part: i. attention ii.relevance iii. confidence iv. satisfaction	This t-test procedure showed means scores differences in term of level and motivational between the two groups favouring the control group. Then scores from the CIS were compared using one-way analysis of covariance (ANCOVA) with $\alpha = .05$, which is a variation of ANCOVA, to adjust for pretest differences that existed between control and exp groups
Using WebQuest for oral communication in English as a foreign language for Tourism Studies	Present a practical back ground for using WebQuest, mainly orally. Effect of WebQuest in the classroom communication in English	Laborda JG 2009. *Educational Technology & Society,* 12(1),258-270.		The framework presented 3 main aspects: i. as a contructivism learning approach ii. as a professional developement activity iii. as an oral development task.-	Provide a real example to facilitate the understanding of the theoretical concepts.
Development and Evaluation of an Interactive WebQuest Enviroment: " Web Macerasi"	Developmental design: i.analysis and design ii. developement iii. implementation iv. evaluation	Yasemin Gullbahar, R. Orcun Madran and Filiz Kalelioglu. *Educational Technology & Society*, 2010 13(3), 139 -150.	convenience sampling. 3 courses from 2 departments in the educational faculty of a private university. 92 pre-service teachers (59 women & 33 men). The second phase of the study was conducted in a sophomore course called Teaching Principle and Methods	Qualitative & quantative method were used for this research. Collecting data relating to WebQuest used. WebQuest application Questionnaire was used. 1st part- 9 item for demographic data. 2nd part= 22 items for general design of WebQuest 3RD part- 19 items steps of the WebQuest project. All the items in this questionnaire used a five-point Likert-type scale where 5 = strongly agree, 1 = strongly disagree	Quantitative part: **Q**uestionnaire (descriptive analysis method) 1- demographic data 2. general design of QW site. 3. Steps of the WebQuest project 4.workng as individually or group on WebQuest project. Qualitative part: (content analysis) interview

This paper analyzed the publication by the methodology involved in WebQuest research. The results shows that 60% of the articles used quasi-experiment as the research design. The research objectives were more to see the positive aspects of using WebQuest. The other methods used were Developmental Research and as a concept paper. For example in TOJET (April 2011- Vol 10, Issue 2), a study on the impacts of mathematical representation developed through WebQuest and spreadsheet activities on the motivation of pre-service elementary school teachers used quasi experiment which involved 30 students in the experimental group and 40 students in the control group. While, the study done by Zacharias, Nikoletta, and Constantinos (2011) used a qualitative approach to study the effect of two different cooperative learning approaches, namely, the Jigsaw Cooperative Approach (JCA) and the Traditional Cooperative Approach (TCA), on students' learning and practices/actions within the context of a WebQuest science investigation. Various aspect of the learning processes including performance, comprehension, understanding, creativity and motivation were highlighted. The study described the implementation of a WebQuest in science in which 38 seventh-graders were involved as participants to study about the ecology, architecture, energy and insulation of CO_2-friendly houses. The result revealed that by applying the Wilcoxon test procedure, the JCA and TCA conditions improved the students' understanding of concepts related to the ecology, architecture, energy and insulation of CO_2-friendly houses. However, there were no differences between the two approaches, in terms of enhancing students' understanding of concepts related to CO_2-friendly houses using the Mann-Whitney procedure. The study described 6 categories of working mode that the students followed within the context of a WebQuest science investigation. The study also identified 4 categories of problems the students face within the context of a WebQuest science investigation (i.e., the problem with regard to the actions/practices (working mode) to follow, the WebQuest material, the web-based platform tools and student interaction within a group).

In comparison, the articles in C&E which studied WebQuest used an experimental design as the approach. An experimental group comprising 103 sixth-grade students participating in the study were broken down into three groups namely: traditional instruction, traditional instruction with WebQuest and WebQuest instruction with outdoors. Their assignment was to learn more about resource recycling and classification with the objectives being to know about the use of natural resources which not only improves the quality of life but also destroys the natural landscape and brings about environmental pollution at the same time; to learn the concept of resource recovery so that they can form habits of resource recovery and classification; and to understand that the earth's resources are limited. The results of the study showed that using WebQuest in outdoor instruction influences students' learning performance positively.

As a result of this study, the research methodologies had been used in all the articles appeared in the seven selected journals were descriptive research studies conducted involving WebQuest. The focus was on informational research with regard to the concept or the use of WebQuest in education.

Conclusion

The present study examines the WebQuest research trends between 2005-2012 from seven selected journals. In this decade, the WebQuest research trend has involved the quasi experimental study on how WebQuest can be used as a tool in teaching and learning, enhancing student potential and creating a positive learning enviroment. The analysis shows that all research had relied on a descriptive methods and critical analysis. It puts less concern on the importance of interpretative methodology that can be applied. Both types of research could emphasize and attempt to understand such phenomenon (WebQuest application) in order to deal with the issues of ability, reliability and effectiveness of such technology in terms of creating a better student and teacher as well. From the research also, it shows that we do not have any evidence that the studies were able to deal with those issues. Finally, this study suggests that research in the future should expand the data sources for more deliberate analysis. Future research is also encouraged to conduct similar studies; but with more current information and research data from various sources.

Abstract

This paper provides research trends and content analysis of studies in the field of Twitter that were published in seven major journals: **The Turkish Online Journal of Educational Technology (TOJET), Educational Technology & Society (ET&S), Educational Technology Research & Development (ETR&D), Computers & Education (C&E), Learning and Instruction (L&I), Australasian Journal of Educational Technology (AJET) and British Journal of Educational Technology (BJET).** These articles were cross analyzed by published years. Content analysis was implemented for further analysis based on their research topics, issues category, research settings and samplings, research designs, research method and data analysis. The results of the analysis also provide insights for educators and researchers into research trends and issues of Twitter.

41. *Keywords:* Twitter; Trends; Content Analysis

1. Introduction

Twitter was founded in 2006 by Jack Dorsey (@Jack), Evan Williams (@Ev) and Biz Stone (@Biz), programmers at the San Francisco podcasting company Odeo Inc. (Picard, 2011). The increasing number of educators, who use Twitter as part of their teaching and learning process, does create a niche area for researchers to study its use in education. In parallel to this increasing interest of the use of Twitter in education is the increasing number of studies conducted and published regarding Twitter use in education that have covered a wide range of topics; such as language learning, students' engagement and grades, students' collaboration and success, students' perception toward teachers or instructors and also higher education scholars' participation on Twitter (Johnson, 2011; Junco, Elavsky & Heiberger, 2013; Junco, Heiberger & Loken, 2011; Lomicka & Lord, 2012; Veletsianos, 2012). With the overwhelming numbers of published articles about Twitter usage in education, there is indeed a need to review the research trends and issues about the topic in order to help future researchers in related fields to design and framed their research interest.

e-mail address. drnorlidah@um.edu.my

Although previous studies have shown that there were always enthusiasm for new technology, over time this perception may change as the 'novelty wears off' (Lomicka & Lord, 2012). With more than 175 million tweets per day (Infographics Labs, 2012) from 200 million active users (Bennet, 1993) six years after its introduction, the future of Twitter seems promising yet nothing can be said for sure. Moreover, by analyzing the current trends and issues in the studies of Twitter, this study will help generalizing the findings from the related researches and enable educators to decide whether Twitter usage will benefit them or otherwise. It is crucial, therefore to examine research trends and issues concerning Twitter in education based on the published articles related to the topic at this point.

As such, this paper intends to provide insights into the research trends and issues in the studies of Twitter through content analysis of selected journals from 2007 to 2012, covering seven major journals: TOJET, ET&S, ETR&D, C&E, L&I, AJET and BJET**.** The research questions that need to be answered by this paper are:

1. What are the research topics and research setting and sampling related to Twitter that were published in these selected journals from 2007 – 2012?
2. What are the main issues category and source of article related to Twitter that were published in these selected journals from 2007 – 2012?
3. What types of research design, research method and data analysis have been applied in article research of Twitter that were published in these selected journals from 2007 – 2012?

2.   Review on Studies of Twitter

The prevalent use of Twitter has increased in education; thus learning is no longer restricted to the four walls of classroom. By trying to move away from the traditional pen and paper classroom, Twitter as a new form of communication – a Web 2.0 micro blogging tool, appears to be blending harmoniously well with modern thinking and current educational practice as it ensures that learners will have more opportunities to be independent in their study and research (Crook, 2008).

Although it is always considered the world's second most popular social media platform after Facebook, Bruns (2012) listed a few characteristics of Twitter that makes it no less appealing than Facebook, such as (1) 140-characters updates that are designed for brief messaging, (2) flat and simple network structures, (3) public and visible to all messages from users or private and visible only to approved 'followers' and few other mechanisms such as #hashtag and @replies.

The benefit of Twitter in education does not only apply to students but to educators as well. The earlier studies that were published when Twitter started being used in the classroom mainly focusing on students' online practices (Ito, Baumer, Bittanti, boyd, Cody, Herr-Stephenson, Horse, Lange, Mahendran, Martinez, Pascoe, Perkel, Robinson, Sims & Lisa, 2009). It was then followed by few studies that attempt to examine the relationship of social networks and students' achievement and outcomes (Kirschner &Karpinski, 2010; Junco et al., 2011). Hew (2011) in his studies also tried to find students' attitudes towards online social networks.

After the first wave of studies about Twitter in education in general; which is mainly to see the relationship about Twitter and students, researchers then started focusing on Twitter usage and benefit in specific subject. The top of the list is the language learning. Borau, Ullrich, Feng and Shen (2009) in their research were focusing on using Twitter to train communicative and cultural competence. Lomicka and Lord (2012) proved that Twitter usage among language learner can be used to develop sense of community and social presence. The importance of Twitter to enhance social presence was again studied by Dunlap and Lowenthal (2009). There are also researchers who used Twitter in their studies to be compared with Facebook (Junco, 2012; Ranieri, Manca, & Fini, 2012).

It has been six years since Twitter being established on July 2006. With 500 million registered users and 340 million tweets daily and being nicknamed as "SMS of the internet", there is still a big room for future researchers to study the effect, benefit, advantage, usage or looking into the current trend and predict the future of Twitter in every aspects of life. This phenomena called for a need to conduct a generalization for previous studies as the basis for future studies related to Twitter.

3.   Methodology

This studies use methodology content analisis to analyse trend and issue about twitter. Why content analysis? Stemler (2001) confirmed that content analysis indeed is a powerful method to examining trends and patterns in documents. It is also a useful technique to discover and describe the focus of individual, group, institutional or social attention (Weber, 1990). By conducting a content analysis from the seven selected journals in the timeframe of 2007 to 2012, this study will look out for issues and trend that underlies the studies of Twitter currently.

Besides that, this study cross-examines papers related to Twitter; published in seven selected journals from 2007 to 2012. The selected journals were **TOJET, ET&S, ETR&D, C&E, L&I, AJET** and **BJET**. These journals were chosen based on its impact factor as released by Thomson Scientific 2011 Journal Citation Reports and Institute of Scientific Information (ISI) Journal Citation Reports. There was 4319 document items have been published by these journals from 2007-2012. However, only papers that were identified as 'article' were chosen and analysed.

Six databases were chosen for the cross-examine purpose. The different databases were chosen due to the availability of certain journals and accessibility of the abstract and full text for the selected articles. The databases were; **EBSCOhost, ProQuest Education Journals, Science Direct, Springer Link, Web of Science** and **Wiley Online Library**. One search engine was also used for the purpose above. The search engine used was Google Scholar.

First procedure in conducting this research is setting three items to search for the related articles in all databases above. They are; (1) Selected Journal Name for Journal Name, Publication Title or Journal/Book Title column, (2) Twitter for Topic or Title column and (3) 2007-2012 for Time span, Year or Coverage column. This step is important to ensure standardization in order to search the related articles in spite of the different interface between all databases.

There were 110 articles have been identified from the first procedure. Next procedure consists of further comprehensive review which needs the researchers to examine 110 articles carefully to determine the articles which is related to Twitter. Finally, a total of five articles were selected for the analysis.

Trend Analysis

Trend analysis of an article can show the periodic discussion taking place in a knowledge discipline (Erford, Miller, Duncan, & Erford, 2010). In the analysis of trend and frequency, justification for selection of articles is found in the TOJET, ETS, C&E, ETR&D, AJET and BJET only.

Content Analysis

Based on content analysis or the process of summarizing and reporting of written data (Cohen et al., in Cowan, 2011), the research topics in the articles selected for analysis were categorized according to key words in the given abstracts, issues discussed as well as research scope. Throughout the data analysis carried out, each category identified was further clarified using thematic analysis. At the end of the analysis, the categories and sub-categories of the articles are as follows:

1. Research topics

2. Issues category

3. Research settings and samplings

4. Research designs

5. Research Method

6. Data Analysis

4. **Findings**

Frequency and trend analysis

Based on frequency analysis, there were four articles listed in the shortlist related to the topic of Twitter. Three of these were found in BJET, ETS and C&E for the period 2007 until 2012. Following frequency analysis, there were two shortlisted articles related to Twitter in the BJET, one article ach in Journal of ETR&D and C&E for the period 2007 until 2012. Analysis of number of articles is given in Table 1.

Table 1
*Number of Articles Related to Twitter According **Yearly Phases***

No	Journal	Frequency	References
1	**BJET**	2	Shesen Guo, Ganzhou Zhang, & Run Zhai, 2011; Fei Gao, TianLuo, Ke Zhang, 2012.
2	**C&E**	1	Martin Ebner, Conrad Lienhardt, Matthias Rohs, & Iris Meyer, 2010
3	**ET&S**	1	Rita Kop, 2012

Content Analysis of Current Articles on Studies Related to Twitter

For the latest trend related to twitter, this chapter also considers issues in the published articles in the BJET, ET&S and C&E for the years from 2007 until 2012 only. Given the limitation of the date of publication four articles related to twitter were found. The selected articles were type of research based articles.

Research based articles are content analyzed based on several constructs such as title, research topic, issues category, research setting and sampling, research design, research method and data analysis. Table 2 show the results of content analysis of four selected articles related to Twitter categorized according to two categories namely research based articles and non research based articles.

Table 2. Content analysis and current focus on studies of Twitter.

Article Title	Source	Research Topic	Issues Category	Research Sample and Setting	Research Design	Research Method	Data Analysis
Use of Twitter for formative evaluation: Reflections on trainer and trainees' experience.	Liwen Chen; Tung-Liang Chen. **BJET**. March 2012, Vol. 43, Issue 2, E49-E52	Twitter benefit, barriers and method.	Perceptions of trainer and trainees on using the Web 2.0 application.	39 colleges, university and a private university student in Taipei.	Case study	Interview, observation, participation	Thematic analysis
Integrating readability index into Twitter search engine.	Sheshen Guo, Ganzhou Zhang & Run Zhai. **BJET** September 2011, Vol. 42, Issue 5, E103-E105	Application Program	Challenges to enhance capability by using Twitter	Twitter search engine	Descriptive research	Exploratory project	Thematic analysis
Micro blogs in higher education: A chance to facilitate informal and process-oriented learning?	Martin Ebner, Conrad Lienhardt, Matthias Rohs & Iris Meyer. **C&E** August 2010, Vol. 55, Issue 1, 92-100	Twitter for process-oriented learning, higher education	Chances to facilitate informal and process-oriented learning	Students of University of Applied Science of Upper Austria	Case Study	Observation	Thematic analysis
The unexpected connection: Serendipity in human mediation in networked learning	Rita Kop. **ET&S**. April 2012. Vol. 15, Issue 2, 2-11	Recommender, RSS, Twitter, Serendipity, Networked learning	Challenges and opportunities for learning towards Twitter.	recommenders, RSS and micro-bloggers	Qualitative research	Literature Review	Content analysis

5. Discussion and Findings

In this section, the authors summarized and discussed the major findings as follows:

Only four articles were found to focus on researches pertaining to Twitter. A published article focused on the benefits, barriers and methods in Twitter. Another article studied the application program. The third article looked at the use of Twitter for process-oriented learning and higher education. The final article studied recommender, RSS, Twitter, Serendipity and networked learning.

The main issues category that were discussed in these selected journal was user's perceptions on using of Twitter. Second and fourth article are concern on the issues of challenges which is to enhance capability by using Twitter and opportunities for learning towards Twitter. Third articles discuss about chances to facilitate informal and process-oriented learning. The source of article related to Twitter were Liwen Chen and Tung-Liang Chen, (2011), in BJET, 43(5), E49-E52; Shesen Guo, Ganzhou Zhang and Run Zhai, (2011), in BJET, 42(5), E103-E105; Martin Ebner, Conrad Lienhardt, Matthias Rohs & Iris Meyer 2010, in **C&E** Vol. 55, Issue 1, 92-100; Rita Kop (2012) (Special Issue Articles) ET&C, 15 (2), 2–11.

From these four articles, 39 students from institutions of higher learning in Taipei became samples. Research sample for the second article was the Twitter search engine. Students of University Of Applied Science Of Upper Austria became research samples for the third article while research samples for the fourth article were recommender, RSS and micro blogging.

Altogether, there were eight research methods used in the articles on Twitter, among them interview, observation, participation, exploratory project, and literature review. In design analysis, two articles featured different designs, namely descriptive research and qualitative research. Meanwhile, the other two articles featured case study design.

In data analysis, it can be concluded that three articles involved thematic analysis. Only one was in the content analysis category.

6.   Conclusion and Implications

In general, the results from the analysis done on articles pertaining to Twitter published by BJET, C&E and ET&C revealed that the use of Twitter is still new in the arena of teaching and learning as it was first introduced in 2006. However, it was proven through the articles that Twitter can be the trending networking medium and learning method. These articles based on research should be highlighted and displayed in various locations to support and expand this alternative educational tool as an innovation in the world of education.

Abstract

The National Long-term Education Reform and Development Plan (2010-2020) has pointed out that national education modernization and informatization has entered a new period of increasing development and improving educational quality. During this period, a different task and special requirements about education informatization has emerged, which has signaled the promotion of digital schools' construction and acceleration of the process of education informatization. By analyzing current characteristics and existing problems of China's digital schools' construction, this study offers suggestions that must be given more attention in future construction.

Keywords: Education informatization; digital school; elementary education; regional informatization

1.Instruction

The concept "digital school" was first coined by Professor Kenneth Green of American Claremont College, who sponsored and hosted a large-scale scientific research project, the Campus Computing project. However, concepts such as "digital city", "digital school" and so on had not been accepted internationally until the influence of former U.S. vice-president AL GORE's lecture "The Digital Earth: Understanding our planet in the 21st Century", which was given at the California Science Center on January 31, 1998.

Throughout the progress of elementary education informationization in the U.S., England, Australia and New Zealand, a common feature of global elementary education informatization construction has been to make schools become the main body and to promote further development of education informatization (Huang Ronghuai 2009). It can be concluded from these strategic reports of national educational development and from official investigations and studies that digital school construction in middle and primary schools focus primarily on the following aspects: informatization leadership, application of advanced technology, application of online evaluation, promotion of digital learning and teaching, support of effective teaching and learning, participation of community and family, learning outside school and the problem of campus safety (Wang Yunwu 2010). These experiences have provided China with abundant enlightenment. That is, while constructing our digital schools, we need not only pay attention to those vital aspects but also practically develop and creatively act according to our national condition and the actual situation and features of each school.

In China, the earliest appearance of academic journals devoted to digital schools dates back to the working report "Constructing High Engineering Education Model with the Harmonious Development of Knowledge, Ability and Quality, Trying Hard to Improve the Educational Quality and Managerial Level", published by Hu Guogen, president of Guizhou Industrial University in June 1999. This report mentioned "strengthening the constructing force of the digital school, establishing modernized teaching methods system and teaching management system". In April 2002, Huang Xuanzhe, the leader of the Information Centre of Shanghai Fuxin Senior Middle School, embarked on a systematic discussion of the digital school. Huang suggested that building digital schools is a current question and would provide teachers and students an entirely different digital working, studying and living environment. He also stressed that primary and middle schools must significantly differ from universities in the construction and functional design of digital schools (2002).

With increasing discussion of digital schools, many primary and middle schools have begun construction. For example, in Jiangsu, Zhejiang, Guangdong, Shanghai, and Beijing, some schools and areas with superior consciousness began building digital schools. After a long period of exploration and continuous improvement,

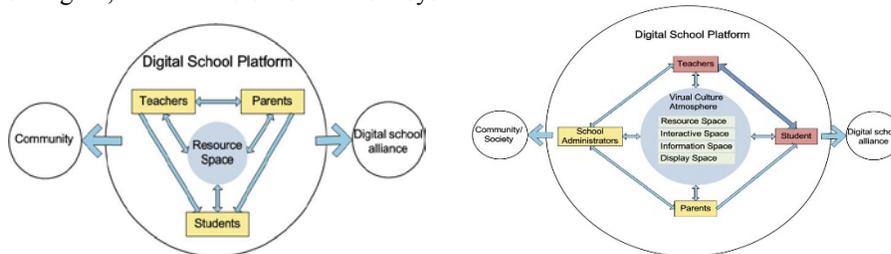
E-mail address: dongy@bnu.edu.cn

thoughts about construction are becoming clearer. Each school has gradually developed its own features, unique building ideologies, programs and promotional strategies. Based on analysis and conclusions about the characteristics, problems, and future development tendencies of our country's primary and middle schools, this study aims to supply an overview and revelations on the national digital schools of primary and middle schools for researchers and practitioners who are interested in this area.

2. Features of the current construction of digital schools

Prof. Huang Ronghuai, who leads the construction of digital schools in the Beijing region of China, has analyzed how the ideal digital school should effectively support teaching and learning, a rich school culture, truly broaden temporal and spatial latitudes, be based on service-oriented consciousness, rely on advanced communication network technology, and build a teaching and learning educational environment with easy business, shared resources and flexible artificial intelligence.

Based on this ideal, we can draw a new educational system structure model under the support of the digital school as indicated in follow figure, which differs from the old system.


42. Fig. 1. (a)The old educational system structure model; (b)The new.

The new education system possesses the following characteristics. I. Openness. An important function of the digital school is realizing information transmission and communication across the boundaries of campus and technology by means of new and varied technology. This type of exchange involves the sharing and interchanging of information and resources not only in schools but also among schools and between schools and society. Each school attempts to fuzzify the individual boundary and create open and shared digital space in the large educational area. II. Interactivity. Cooperation is a core aspect of contemporary educational management of the school, as is multi-level interaction among teachers, students who promote their mutual cooperation, and, consequently, activated educational development. III. Development. The school respects the individual needs of the development of teachers, students and parents, and the digital school has provided relevant services for all levels of personnel that will satisfy each other's demands and realize the wisdom shared by mutual interaction and cooperation.

Currently, China's primary and middle schools have initiated digital school construction, and we will extract features of this construction from various practical construction cases.

2.1 Paying more attention to the practical requirements, improving function design, and incorporating campus culture and developing features

Many have stressed the practical demands coming from all levels of schools during digital school construction, and this foundation function design must be improved.

Chen Shengri, the headmaster of the information center at Qibao Middle School in Shanghai, compared different departments' requirements to tree branches. He considers that if the education environment likes vast soil, education informationization could be treated as one of the tens of millions of species of plants that scatter in the soil like stars or spread like forests, and as they grow, their roots make the soil more solid; at the same time, their growth cannot do without the soil. The branches and leaves of the plants, which represent the multifold demands, must also live in the soil (the present situation of the development of education and schools), but the soil wants to know their varied needs (Chen Shengri 2010). In this respect, different schools have not only commonalities with digital school construction but also have functional requirements for its own development. Therefore, how to analyze all levels of their own needs and the process generated by the possible interaction among all levels is of great importance.

Beijing Chaoyang Experimental Primary School (for their entire design scheme) investigated the actual demands of all types of users before construction, finding as many questions in real utilization as possible. Based on former jobs, designers should increase, decrease or integrate some functional modules when it comes to digital school planning, which has proven extremely effective in the latter usage stage (Chen Lihua and Li ying 2010). Another successful case is Nanshan Experimental School in Shenzhen, Guangdong province, whose digital school construction was based on the demands of five roles, including the school itself, parents, students, teachers and curriculum. This school produced the guiding ideology that digital culture leads the development of the connotation of the school and conducts construction on four aspects, including digital resources, digital platforms, technology applications and mobile learning exploration.

While improving functional design, campus culture and developing features become increasingly prominent. With this guiding ideology, digital school construction in Beijing area has made significant achievements, building a group of experimental digital schools with their own characteristics. For example, Beijing No. 94 Middle School has developed human software similar to a genuine errors-recorded notebook and ecological school-based curriculum; Fuxue-Hutong Primary School filled its digital school with Fu-Xue special culture (Ma Dingyi, Hu Songlin and Ma Yong 2011); Qiyi Primary School stressed effective evaluation in digital school construction; and Fengshi's attached primary school built a "digital class."

2.2 Consistent with the people-oriented principle and service-oriented construction ideology and focusing on users' feedback and experience

The ultimate purpose of digital school construction is to serve all kinds of users throughout the school, but those users are sometimes very critical, stating many work needs and not personal but mutual needs. Consequently, we must observe the people-oriented principle, that is, that the application of technology should return to the nature of education and humans, and must think about how to increase the effect and decrease the burden from the perspective of physical and psychological development, allowing the user to be completely free in the technical experience rather than act passively.

In the traditional technical environment, for example, each function system, which may be developed in different periods, has been put into use once achieved. Consequently, many systems are independent from others. Therefore, when teachers try to log into different function modules, they must go through identity verification many times, a repeated operation that is inconvenient and may waste time so is not necessary. To prevent such unpleasant things from happening, some schools have adopted a software technology called a wisdom application developed by K12 Inc. in Beijing, which constructs a set of communication mechanisms that complies with international standards by applying middleware technology, with enterprise instant communication software as the carrier. This mechanism may realize unified identity authentication, single-point login, application gateways and personalized information-pushing communication mechanism, connecting isolated information islands among the software, and man-machine information gaps; thus, users can smoothly deal with all types of application system processing. This technology has, indeed, produced sound effects.

The people-oriented principle is also able to focus on all levels of users' experience and feedback when they surf in digital schools. Users can learn that technology has brought some satisfaction to work and self-development. Accordingly, the leading organization of Beijing digital schools added the "user-happiness" index to the latest proposed digital school construction evaluation specification. The headmaster of Nanshan Experimental School in Shenzhen put forward this idea of benevolent education (Li Xianqi 2011), which guides digital school construction, attaching importance to the development of all children's behavior through information technology. It realizes personalized, student-oriented education and does not result in teachers having extra schoolwork burdens but rather improves their professional happiness.

The basic ideology of digital school construction is service-oriented and stresses that construction should provide service to the overall development of schools, not only in constructing, operating and maintaining the digital school itself but also in promoting the idea to serve teachers and students in daily teaching applications and professional development. In addition, it improves the practicability of digital schools through home-campus interactive network construction and development.

2.3 Using various methods and actively promoting the application of digital schools

With the development of China's education informatization construction, campus networks have gradually turned to the application of information technology in practical education from information infrastructure construction. Correspondingly, the problem people care about is no longer what equipment should be installed but instead what resources must be purchased, how can resources be managed uniformly, how can the system platform support teaching and learning, and how can we improve school informatization leadership and teachers' and students' information literacy. To promote the application of digital schools, each school has taken different approaches, such as strengthening teachers' ICT applications by providing training, improving teaching efficiency using scientific studies, and so on.

Guangzhou Dongfeng Road Primary School in Guangdong province set a goal of integrating new technology into daily teaching and learning activities and making technology application universal to realize universal usage and normal technology application, with the percentage of the curriculum, roles and processes covered totaling 100%. In addition, they invited education technology experts and scholars to guide the staff training, to help promote effective technology applications and to aid teachers and students in controlling technology easily, flexibly and creatively. These trainings and applications change the usual condition of just one or two typical application stages; for example, only in the public class would the integration of information technology with curriculum be put into practice. The digital school of Shanghai Qibao Middle School contains much practical application software development, such as achievement analysis software, elective course management software, teaching and scientific research achievement management software, art evaluation management software and a questionnaire survey subsystem (Chen Shengri 2011). All software actively works with the teachers' teaching and management, and teachers consider that the informatization works easily.

Zibo Beimengli Primary School in Shandong province concluded from an exploration experience of digital school construction that "subject is the first step". It applied for many national research projects during the "eleventh five-year plan" period, including "study on online teaching design and model in primary schools", "research on blended learning based on interactive white blackboard" and "research on primary school students reading and writing in advance under the information technology environment". Teachers and students actively participate in national primary and middle school information technology innovation and practice, with scientific research leading teaching research. This strategy not only promotes the application and development of digital schools but also has gained

many achievements. Teachers and students say that participation in scientific research has improved their information literacy. The application of information technology in education is from spontaneous to conscious, and from step-process toward standardization. After taking these subjects, teachers have learned a significant amount from many experts and have learned more in terms of educational theory.

3. Three factors that restrict digital school construction

Although China's digital school construction has moved to a certain stage, several factors continue to influence its process and are the imperative problems faced by primary and middle schools.

3.1 Personnel factors

Without informationization leadership or teachers and students with good information literacy, we cannot construct digital schools, let alone develop them. Informationization leadership plays a key role in digital school construction. Leaders must take charge in the overall planning of digital school construction, and it would be impossible for those who are lacking knowledge of informationization and current educational theories to work out an appropriate e-campus plan. The information literacy of teachers and students is also a critical reason to promote digital school construction, which largely determines the extent of the real practical applications of digital schools. Without qualified information literacy, no one knows when and how to use digital schools, which are actually "castles in the air".

One personnel factor is the technical team of primary and middle schools, which is different from universities with many technical experts, a professional staff and sufficient support when building digital schools. Advanced information technology (e.g., cloud services, mobile computing, the internet of thing technology, electronic schoolbag) has appeared. Although there is no strict request to use this technology in digital schools, it is a trend for future education. People have designed a blueprint for the prospective education informationization, which has not yet been built, so we hope technical and theoretical assistance will accelerate digital school construction. Some experienced areas can learn from one other by holding academic conferences, discussions and site visits. Experienced areas must help those who are lacking to break through temporal and spatial limits by sharing digital resources and creating an educational situation in digital schools.

As for primary and middle schools, there are so few people who are skilled in the latest computer technologies that if some schools desire a powerful professional team to achieve construction, they must always turn to technical individuals who are not part of their own staff. At present, most primary and middle schools take such strategies as "schools cooperating to develop with companies", "buying some resources, and then cooperating with or assigning to the companies", and some schools even "assign the task to capable companies". On the contrary, the phenomenon of schools independently developing rarely occurs in primary and middle schools. Hence, primary and middle schools must try their best to do enough research and improve functional design. Only if those former tasks were better accomplished would the latter work progress more smoothly. Consequently, while working together with other companies, the alternation of practical needs would have no influence on developing speed. Assuredly, in practice, changes in schools will also cause actual demands to change to some degree immediately.

3.2 Technical factors

Because of the long-term nature of digital school construction and the participation of different technologies, we must use all types of technical programs while dealing with data among various platforms, owing to their integrating standards that are different from one other. Recently, the data-planning problem has become a common issue raised by certain provinces and cities. Our local digital school construction holds the mutual goal to make true sharing of decent educational resources and managing of resources intensively and uniformly. Nevertheless, because different areas and schools cooperate with different companies and different companies follow different data standards, different data standards make different information systems unable to read or write each other's data and share resources, which ultimately gives rise to isolated information islands. Each school does things in its own way, resulting in repeated resources. This situation is critical.

Thus, we require a unified data standard as soon as possible to let each school have a criterion to comply with in digital school construction. Beijing city has been the leading example. First, it created the data interoperability specification. Second, it sent it to all experimental schools, and every school then self-defined and modified

according to this data standard. Under this uniform background, all schools may actually undertake personalized construction without restriction.

3.3 Evaluation factors

Evaluation plays an important role in digital school construction. Through evaluation of each school, we may know of the defects of construction and deficiencies of applications and then make corresponding improvements.

Yet, it is not easy to evaluate digital school construction for several reasons. First, each region has its own characteristics, so evaluation must be regionally distinctive. Particularly in different areas of China, there exist wide gaps in economic development. Therefore, each region differentiates from others in both investment and ideologies. Second, digital school construction has classified stages so the evaluation must be categorized. Third, practical evaluation must be mutative, as the actual process of constructions shifts. Fourth, schools in the same area have their own software and hardware features respectively, and similarly, evaluation should be performed at different levels. Fifth, significant attention must be paid to the characteristics and creation of digital school construction; therefore, evaluation must have some extended differentiation. Sixth, evaluation plays a guiding and leading role in digital school construction and, thus, should be particularly forward-looking.

Some areas have already formulated their own assessment solutions in terms of regional construction. Taking the example of Yangzhou city in Jiangsu province, its regional digital school evaluation rules contain four primary indexes: informational infrastructure level, teaching application level, management application level and guarantee measure level. In addition, Changing district of Shanghai has proposed an evaluation standard for application of digital schools, including six primary indexes: organization and management, network and facilities, teaching and resources, teaching staff and training, social service and communication and school-based features. Another example is Yinzhou district in Ninbo city of Zhejiang province. This region has set the standards for evaluating typical digital schools through six primary indexes: organization and leadership, hardware and equipment, educational resources, school managements, effect of usage and additional score.

Evaluation of digital school construction is constantly changing; consequently, it is necessary to take charge of evaluation and to constantly observe, think, explore and improve focal points in current construction. Only in this way may people promote "construction" with "evaluation" and lead "construction" with "evaluation" and ensure that digital school construction can be successfully completed.

4. Future development of digital school construction

Digital school construction aims towards, with school as the principal part, the constant promotion of building and developing the informationization of elementary education, connections between inside and outside the campus, interworkings among schools, and integration of technology and education. To promote full development, digital school builders can also locate some critical breakthroughs in the conclusion below.

4.1 Mining key technology for the "hotspots" in digital school construction

In the digital school environment, we can call those spaces that are often visited by teachers and students "campus hotspots" (e.g., intelligent classrooms, virtual communities, online libraries and virtual laboratories). Prof. Zhang Jiping summed up the features of the future ideal intelligence classroom, which is a prospecting blueprint of a prospective classroom, as "everywhere network, seamless access, flexible tables and chairs combined, changeable form, multi-channel display, convenient cooperative learning, classroom record, easy self-study, integration of virtual reality , resource expansion, intelligent controlling, people-based". The Intelligence Classroom is such an intelligence-enhanced classroom, which is characteristic of natural human-computer interaction, that it could freely control and operate all sorts of visual, acoustic and electrical equipment, teachers and students could be seamlessly engaged in teaching and learning activities and accustomed to many types of learning methods (e.g., distance education). In this classroom, learners study in a comfortable physical and psychological environment, multiform class activities are available, acquisition of high-quality multimedia educational material becomes more rapid, interpersonal interaction becomes stronger, class management is unified, teaching becomes artful and flexible, and learning is individual with interactive cooperation. Anyone can, without limit, transcend temporal and spatial blockages, arriving anywhere, talking to anyone, finding any learning resource and interacting with anyone in anyway. In a word, the application of information technology in the classroom satisfies all kinds of people's

educational demands, and the intelligence classroom brews an ideal and personalized educational form that can best match the individual's wishes.

It is beneficial to the construction of "hotspots" to know how to apply advanced technology, such as the ubiquitous internet of things technology, cloud computing technology and so on. The wireless terminals of internet of things technology not only allow for personnel positioning but also allow for parameter positioning for all sorts of "things", providing technical help for educational management, security management, health monitoring and class teaching. Take wireless interactive terminal technology, for example; it can make up the class interaction system with which teachers can real-time know the learning condition of and feedback from all students and then adjust the teaching progress. Regarding extracurricular teaching, internet of things technology supports independent inquiry learning, sets a certain teaching situation and performs mobile learning, and all of these benefits help cultivate the bold science-exploring spirits of students. Even though internet of things technology remains to be explored, scholars believe that it will realize the "wisdom campus (the intelligence campus based on the advance technology)" in the near future.

4.2 Regionally establishing digital school construction evaluation standards based on different regions

Standards are the foundation of campus innovation, and campus innovation allows for the development of standards. Yet, there is not only one unified standard or one complete standard system that includes implementation rules and management rules. It is critical to establish a platform that would allow teachers and students to apply and sufficiently develop with a multi-level and multidimensional usage based on the standard.

China has vast areas but a serious unequal distribution of economic development, and as a result, nearly all regions differ from one other in digital school construction. To promote the development of digital school construction, it is indispensable to develop evaluation strategies. However, it is not feasible to establish an absolutely unified evaluation standard. Therefore, some scholars have suggested establishing regional digital school evaluation standards, which not only promote digital school construction but also accelerate the interaction of various digital schools in a region. At present, regions such as Jiangsu, Zhejiang and Beijing that began digital school construction early have already formulated digital school standards. They are of some referenced worth but must be further refined.

Associate Prof. Li Yishun, who conducted a comprehensive analysis of the key points and evaluation work of developed countries' digital school construction, such as the U.S., England, Australia and New Zealand, refers to the 2010 American educational technology planning (named "Transforming American Education Learning powered by Technology") and education informationization evaluation and advanced a three-layer digital school evaluation theory. First is the construction level, which involves mastering the overall condition of the digital school construction of every school, evaluating the results of digital school construction with great investments and, if the intended targets are achieved, checking implementation. Second is the application level and involves judging if the construction of all kinds of software and hardware facilities have been put into practice to evaluate the reasonable degree of the former design and planning, the promotion of the core business, highlighting school-based features and innovation. Third is the benefit level and involves assessing the result of digital school construction and application and researching users' satisfaction to evaluate if the applied technology is available and if digital school construction would raise the comprehensive strength of the school and promote sustainable development in the future.

The establishment of evaluation standards is simple for areas or schools to evaluate the condition of their digital school construction while also supplying standards and advice about the schools that are constructing and designing digital schools.

4.3 To continue promoting the teaching application of digital schools and, at the same time, to drive comprehensive application

The ultimate goal of digital school construction is teaching application. Therefore, schools must try their best to make the digital school play a vital role in this aspect. They must also discover deficiencies in applications and solve these problems. In the 21st century, it is essential to cultivate students' four capacities: creativity and innovation spirit, critical thinking, problem-solving ability and communicating and cooperating ability (Joathan Anderson 2010). Fortunately, the digital school can provide the most convenient conditions for these similar objectives. Digital schools have gained some positive results in supporting the application of subject teaching, and each school must take other means to drive additional application.

Facing the current problems, Prof. Huang Ronghuai has established five "winning" rules of digital school construction that are inspiring our schools to promote the comprehensive application of digital schools. (1) Take advantage of situation. For example, simplify the complicated procedures for freshmen and let students feel more comfortable than previously through informationization. The application of an "all-in-one-card " system brings about the integration and management of sharing data. (2) Use a horizontal marketing strategy. The department of business takes charge, optimizes the work of the school office and educational administration, raises the service level, and wins "trust". (3) Look into conflicts and master the condition of demands. Take the special events of the school development, grasp the particular opportunities, arouse leaders' attention and "stimulate" coordination among departments. (4) Create time and space. Strive for time, solve significant problems and avoid the "short board" effect in digital school development. (5) Innovate constantly. Technology, business and service all require innovation, and win the value recognition of teachers and students through service (Huang Ronghuai 2011).

In spite of the active utilization of all sorts of platforms with various functions provided by digital schools, schools must also integrate other technology and equipment with applications. Currently, the alternation of resources and terminals is more influential in the educational aspect. Among them, Adobe, Inc. is one of the most outstanding examples. This company rapidly assists teachers in creating teaching resources by use of their e-learning suit (including Acrobat, Photoshop and Flash), and these teaching resources bring about a strong interactive learning environment with a multimedia experience, thereby giving the students multiple experiences, including visual, acoustic and sensual. Multiform teaching resources can also be combined as just one "resource pack", and this form allows students to watch and operate without any restriction over platforms, make independent study convenient, and help teachers modify on their own more easily to satisfy personalized practical needs. These rich-media technologies must be assuredly potential in the education application, as it can create a sort of rich-media teaching experience, full of self-modification, individualized custom-made rules and ample interaction and a teaching context like real life, which backs the transfer of knowledge and enhances problem-solving abilities. This fertile visual and acoustic experience not only contributes to stimulating learning interests but also helps teachers teach more effectively.

Lastly, teachers and students are increasingly attracted to tablet computer technology, which stresses the users' experience. This technology supports mobile learning as well. With the assistance of such mobile, light and portable computers, it is possible for informal and individualized learning to occur and also for teachers to build a mobile-learning environment for students in the real-life context. Mobile learning is highly suitable for independent study outside class. Once opening the computer, learners can begin to study at any time and in any place. Take teachers from Xishan branch campus of the high school affiliated with Renmin University of China, for instance; after experience with this equipment, they began attempting to explore real-life mobile learning based on tablet computer technology. They say that while students are discussing in class or doing independent inquiry learning, teachers can approach students and answer questions more closely. For example, in a mathematics class, teachers can also demonstrate the entire process of graphic alternation with the computer to help students better understand certain geometric principles. When this demonstration is over, the process of graphic alternation can be saved and promptly sent to the student. This behavior perfectly describes how teachers apply technology to support actual teaching and treat it differently with different students.

4.4 Building a community of digital school development and deeply promoting further communication and technical sharing

In the next ten years, the digital school construction, especially that of primary and middle schools, is an inevitable trend in the development of education informationization, an effective scientific method that helps to facilitate the integration of education and technology.

The first digital school communication conference was held in April 2011 in Beijing. This conference indicated that national digital school construction is currently underway, and many areas and schools are seriously promoting this work. However, we also have found that development is quite uneven, based on participants' opinions. For example, Shenzhen, Shanghai and Beijing have accumulated significant experience, while Shandong and northwest areas still have many problems.

Hence, we consider it necessary to establish some communities as early as possible and then regularly organize conferences on digital school construction and conduct multilayered discussions. We believe these efforts will promote digital school construction. Also, experts in this field will gather all over the country, discussing and exchanging mutual viewpoints on national educational informationization, such as the relationship of technology and

education, advanced direction of the development of national elementary educational informationization, construction and development of digital schools and so on.

5.Summary

Digital school construction aims to support learning and innovative teaching, resulting in improvement of resource integration and service, which enhances the efficiency of the educational innovation of the entire school. Yet, people have been conscious that this work cannot be achieved overnight but must be performed systematically. Whether you can seize and make good use of the opportunity to construct digital schools depends on the work of changing teachers' and students' informationization knowledge, improving opportunity awareness, strengthening reformation and taking reforms as breakthroughs. Trying our best to effectively promote digital school construction and firmly enhance our schools' strength, our dream of development of elementary educational informationization may come true!

Abstract

There is a shift in school improvement paradigm over the years due to the advancement of technology. School improvement efforts are more focused on capacity building, improved teaching and learning processes, high level student learning outcomes, and creating a community of learning amidst a digitized learning environment. This has transformed the roles and responsibilities of principals to make ICT as an enabler for effective teaching and learning. In this context, this case study is attempted to explore the best practices employed by a principal in an urban secondary in Kuala Lumpur. The findings indicated the importance of principal's leadership qualities, attributes and his belief in the use of information communications technology to guide ICT utilization in school.

Keywords: School improvement; Technology Leadership; Transformational Leadership; Instructional Leadership

Introduction

Current school improvement efforts are influenced by technology advancement. Information and communication technology (ICT) has compelled teachers to use innovative pedagogies to improve learning. Aligning to changing pedagogies and learning with ICT, reforms in curriculum, assessment, governance and financing (Levin, 1998 in Hopkins, 2001) were evident in education systems in countries like Australia (Schiller, 2003), Hong Kong (Yuen, Law & Wong, 2003), Britain, Canada, Ireland, Japan, New Zealand, Singapore (Ministry of Education, 2003) and Malaysia (Ministry of Education Malaysia, 1996).

For school improvement, principals are expected to improve student achievement (Hopkins, 2001; Leithwood, Day, Sammons, Hopkins & Harris, 2006; Crum & Sherman, 2008). However, due to centralized policies (Hopkins, 2001), efforts to enhance teacher's capabilities may be hindered. Meanwhile, concrete links between school leadership and school improvement ICT could yet be established in educational and leadership studies in Canada, United States of America, United Kingdom, and Australia (Barth, 1990; Gray, Hopkins, Reynolds, Wilcox, Farrel & Jesson, 1999; Harris, Day, Hopkins, Hargreaves, Hadfield & Chapman, 2003; Leithwood, Day, Sammons, Hopkins & Harris, 2006; Ross & Gray, 2006; Crum & Sherman, 2008).

The Ministry of Education, Malaysia upholds ICT as an enabler to propel education to greater heights (Ministry of Education, Malaysia, 2006). However, the challenge lies in the principal's autonomy to implement change due to the hierarchical organisational structures and centralised school management. Moreover, research on ICT utilization and leadership in the local context is scarce. Most studies on school leadership focus on effective schools and developmental models (Rahimah Ahmad, Zulkifli Abdul Manaf & Shahril Marzuki, 1999; Shahril Marzuki & Mohd Faisal A. Ghani, 2007). A recent study on factors affecting leadership and ICT utilization in Malaysia indicated there is no significant relationship between ICT competence and transformational leadership in implementing ICT (Mojgan Afshari, Kamariah Abu Bakar, Wong & Saedah Siraj, 2012). Hence, case study to explore the best practices employed by principal to guide ICT utilization in school is required.

School Improvement, Leadership and ICT Implementation

Technology has transformed how pupils learn, how teachers teach and influences how school principals envision opportunities for ICT utilization for teaching and learning (Ministry of Education Malaysia, 2010). To facilitate effective ICT adoption, school processes need to be redesigned (Law, Wong and Yuen, 2003). Learning is curriculum-driven and technology supports learning (Ministry of Education Malaysia, 1997). Hence, teachers should innovate their teaching practices and adopt constructivist and learner centred approaches to make learning fun and engaging (DeWitt, 2010).

ICT in education programmes were more focused when it was established that ICT enhances the quality of education (Tong & Trinidad, 2005 in Mojgan Afshari, Kamariah Abu Bakar, Wong & Saedah Siraj, 2012). ICT-competent principals were found to be more successful in implementing ICT programs (Hughes & Zachariah in Ho, 2006). To facilitate creation of digital citizens, school administrators are needed to be visionary leaders, competent instructional designers and excellent professional practitioners, as highlighted in the National Education Technology Standards (International Society for Technology in Education ISTE, 2009). Therefore, it is essential for school principals to be knowledgable and to develop relationships to sustain the culture of ICT utilization (Fullan, 2001; Mojgan Afshari, Kamariah Abu Bakar, Wong & Saedah Siraj, 2012).

Leadership is a social process involving complex relationship-webs with multiple and evolving influences, with the intent to influence followers to move in a desired direction (Ho, 2006). School principals were recommended to regenerate school systems by resetting directions, redeveloping its people, redesigning their organizations, and managing their instructional programmes for organizational transformation (Leithwood, Day, Sammons, Hopkins & Harris, 2006). Building teachers' capacity, encouraging innovative pedagogies and creating communities of learning are focus areas to consider (Barth, 1990; Gray, Hopkins, Reynolds, Wilcox, Farrel & Jesson, 1999; Hopkins, 2001). The transformational entities should include facilitating instruction, developing personnel, facilitating leadership, delegating and empowering teams, recognizing the ultimate accountability, establishing communication and rapport, and managing change (Crum & Sherman, 2008), as well as developing staff competencies and providing accessibility to the teaching and learning content (Glickman, Gordon & Ross-Gordon, 2010). Teachers, senior management, governors and parents contributing as the 'community of learners' is of importance because these groups energize their learning as well as of others. In advocating the importance of school capacity in school transformation, a new dimension of technical resources refers to the quality of the curriculum, instructional material, assessment instruments, effective use of technology for the work place was identified (Newman, King & Young, 2000).

School principals are instructional leaders in leading curricular instruction in school (Leithwood, Louis & Anderson, 2004). However, school principals as change facilitators were found to be successful in initiating and implementing school change with ICT (Schiller, 2003). A recent research has indicated transformational leadership as the significant leadership type to influence and promote ICT utilization in schools (Yee, 2000 in Mojgan Afshari, Kamariah Abu Bakar, Wong & Saedah Siraj, 2012). Transformational leadership explained as idealized influence, inspirational motivation, intellectual stimulation and individualized consideration occurs when one or more persons engage with others in manners that leaders and followers raise one another to higher levels of motivation and morality (Geijsel, et al. 2003). Creating collegial norms is the principle behind this principal-teacher collaboration (Davies, 2005; West-Burnham in Bush, 2005). The key to building these interpersonal relationships depends on how effective school principals encourage and empower teachers to share the role of 'change agentry' in the change process (Senge, 2005). These initiatives could result in raised confidence levels and renewed expectations among the education community. However, successes of such initiatives are highly dependent on the school culture and the quality of interpersonal relationships (Barth, 1990).

Meanwhile, a research in 800 schools in USA indicated that technology leadership is necessary for effective ICT utilization in schools (Anderson & Dexter, 2005). In technology leadership, pupil engagement in authentic learning experiences, supported by the use of appropriate technology; sharing a vision of defined technology's place in education; effective professional development; equity of access by providing ICT access to pupils regardless of the skill or interest of their teacher; and ubiquitous network where digital technologies are available whenever and wherever needed were areas which need to be addressed (Flanagen &Jacobsen, 2003). Similar entities of vision,

access and support were reflected in Riedl's technology leadership model (Ho, 2006). Ultimately, school principals takes on different leadership roles to ensure ICT is utilized for teaching and learning. They are the instructional leaders, transformational leaders and technology leaders.

The Study

In this exploratory case study, an inductive approach is used to investigate leadership practices and ICT utilization by a school principal of an urban secondary in Kuala Lumpur. The best practices employed for school improvement amidst a budding and developing digital school environment in Malaysia was observed. This study attempts to explain the connection between ICT utilization from the following perspective.

a. What is the belief of the school principal regarding ICT in education?

b. What are the leadership practices adopted by the school principal?

c. What are the attributes shown by the school principal?

Methodology

Research Design

This case study explores the emergent leadership themes in relation to ICT utilization. Relationships between people, and findings based on views and actual accounts of how the school principal influences the use of ICT by stakeholders especially teachers, student, parents and the community are determined by the grounded theory approach. This systematic analytical procedure was selected because it could explain phenomenon and context which are not clearly evident where multiple sources of evidences are used (Yin, 1994) besides facilitating meaningful analysis of data by linking particular facts and areas without biasness (Lincoln & Guba, 1995).

Sampling

A school was selected based on its impressive track record on successful ICT utilization and its establishment as the centre of academic excellence. The school principal was awarded the ICT Excellent Leadership Award in 2008 due to his accomplishments in leading ICT for teaching and learning. The school found to excel in co-curricular activities, English language and ICT niche areas was also conferred the cluster school of excellence in 2008 by the Ministry of Education, Malaysia.

Data Collection

Open-ended interviews were conducted to determine leadership practices and ICT utilization in the school. Probing questions were used to explore emerging themes in depth by permitting free and unlimited responses (Lincoln & Guba, 1985). Consent for participation and the use of research data was obtained prior to research. The interview was audio-recorded and transcribed. Subsequent interviews were conducted until sufficient data was found for corroboration. Information was also collated from reviews of the school mission and vision statements, the school's charter, event logs, the school annual magazines et cetera and school's websites.

Data Analysis

In analysis, the transcript was categorized according to leadership themes and mapped to establish emerging links between school leadership practices and ICT utilization. In data presentation and analysis, these findings were supported with literature and quotes from the sample.

Findings & Discussion

The emerging themes in relation to transformational leadership, instructional leadership and technology leadership were found to contribute to successful ICT utilization in school. Four improvement initiatives linking leadership practices and ICT utilization identified were realigning school practices, building teacher capacity, building community support, and building a culture of technology utilization.

Findings are explained in two segments: (1) the school principal's beliefs in ICT utilization and (2) how the school principal's leadership practices and leadership attributes influences the initiatives attempted for ICT utilization in school. The leadership attributes are used to explain the leadership practices

School Principal's Belief and ICT Utilization

Successful school improvement initiatives are highly dependent on the beliefs of the school principals due to factors of passion, ownership, skills and knowledge (Fullan, 2000). In context of this case study, the school principal's firm beliefs on the importance of ICT for school transformation were indicated below.

"..As I have pointed out earlier, the school has long since established in academic excellence but to maintain and further improve teachers and students in this aspect, I choose to use ICT to areas of learning, teaching and administration…."

"IT is not for show. No doubt people will be impressed with the technology infrastructure but that's not how it is supposed to be. Technology is to be translated into efficiency and productivity… it is about teachers being able to access resources for teaching and learning and others for administrative purposes…"

The following teachers' responses were elicited to support the school principal's belief in ICT.

"…the principal is IT-savvy and he sees opportunities in using IT in school… He practices IT and as you can see we have a technology rich environment…That's why the school is moving towards IT…"
…He is different… still insist on teaching a few IT classes which is very rare these days…"

Leadership Practices, Leadership Attributes and ICT Utilization

The school principal demonstrated the transformational, instructional and technology leadership attributes as well as a strategic leader in resetting priorities, organizational goals and planning for developing school capacity.

Realigning School Practice

The respondent was found to be an interventionist, a strategist (Hopkins, 2001) and change facilitator (Barth, 1990; Caldwell in Bush, 2005; Yukl, 2002). The purposeful school leader in the sample who viewed changes with urgency and energy expedited the change (Harris, 2000**).** His initiatives included resetting goals, environmental scanning, needs analysis, priority setting, planning, budgeting and motivating stakeholders.

"…I set targets and make sure the vision of the school to achieve world class education by 2010 is achieved…..I have to scrutinise the school vision and mission and to redefine what is world class education in a very tangible way before setting certain targets for the school…I did an environmental scan to look into gaps and areas for improvement…I get the teachers to do a SWOT analysis of strengths, weaknesses, opportunities and threats other than my own personal scanning... is about turning weaknesses into strengths…"

The school principal empowered teachers to direct management and exercise control over curricular related tasks. The importance of teamwork and ownership, an attribute of transformational leadership (Leithwood, Jantzi & Steinbach, 1999; Bush, 2005) were noted.

"...Teachers are appointed to different committees and they came up with strategic plans, lesson plans and teaching and learning resources... This strategic plan is a point of reference when we finally get down to getting things done...This plan is dynamic and expandable from time to time as we encounter different situations... "...I have compiled the school strategic plans and uploaded to the school website the school's Drupple, a Content Management System (CMS) application which I have set up last year so my teachers can access all sorts of materials and resources for instance the strategic plan online via intranet to see what other teachers are doing

"...Ownership among teachers is very important, so what best to do is get them involved in planning and setting targets. I make sure my teachers have ownership of their plans and I practices both top-down and down-up managing... in achieving targets..."

Building Teacher Capacity

Building teacher capacity by developing competencies and establishing professional learning communities (Newman *et. al.,* 2000; Harris, 2000) was identified. Engaging teachers in continuous professional development is very important as it allows teachers to self-sustain and to experiment and construct new knowledge. As an instructional leader, the school leader provided opportunities for teachers to enhance their teaching and learning skills, resulting in more learning possibilities to support student's learning (Mortimore, 1998; Fullan, 2000).

"... I piloted an internationally acclaimed ICT Certification for my teachers... they went for the ICT courses and were certified... teachers gain knowledge and hands-on skills in using applications... and this is a way to encourage teachers to continuously learn...My teachers are all ICT literate... they have to proof that they are using higher level applications like Flash and Professional Adobe Illustrator to develop teaching and learning resources and lesson plans..."

"...we are going to set up an LCD projector at main school office to salute long serving and excellent teachers. It is a way for the school to recognise and give appreciation for their hard work...this is the least the school can do to show that we care and appreciate their services and to celebrate their achievements...it is to be unveiled as a surprise for the teachers and a gift during the upcoming Teacher Day in May..."

Building Community Support

Creating and facilitating networks that leverage on good practices were found to enhance relationships between the school and the community (Day, 2005). The school principal has succeeded in negotiating and forming networks and strategic alliances with the community for instance with the State Education Department, the school alumni, parents, agencies and private sectors to support the ICT initiatives. Contribution of expertise for professional development, monetary resources, school infrastructure and ICT equipment were recorded.

"...I usually have coffee ...with the old boys to get them to "buy in" to new ideas...don't have much problem garnering support in fact I have more demand to supply. They are very supportive in developing the school... the new building adjoining the old wing is fully sponsored by the Old Boys Alumni...The computers in the two (2) computer laboratories are funded by the alumni..."

"...company X tested and piloted an internationally acclaimed ICT Certification...after the one year tenure Company X awarded the school with the set of online software and since then teachers have continuously learn ..."

Building A Culture of Technology Utilization

The continuous efforts to build a culture of technology utilization is influenced by the school principal's beliefs on ICT as an effective tool and how it can be used to further enhance learning and teaching. In this aspect, the school principal portrayed the attributes of a technology leader who constantly builds student's and teacher's

capacity in using ICT, and the leader of resource management by providing equal access to ICT (Flanagan & Jacobsen, 2003) and leading technical resources (Newman *et. al,* 2000; Fullan, 2000).

"...One of the standards of cluster school is single schooling session...this year we implemented the one schooling session...With this new time, we can slot IT classes into the actual schooling timetable which is once a week for all classes...

"... we are provided with projectors and screens to facilitate teaching in the classroom... we also set up a central repository centre where all courseware are loaded up on to the CMS server where students use the content online for self-pace, self-directed and self-access learning.."

The school principal's efforts to provide equal access to equipment and resources were reflected below.

"...Content Management System (CMS) application which I have set up last year...so my teachers can access all sorts of materials and resources for instance the strategic plan online via intranet..."

"...computer club generates about RM80,000.00 per year...funds are used to pay for utilities and facilitate other IT based activities in school...two (2) IT coordinators come in twice a week to assist in managing ICT... their salary is paid by using the computer club funds..."

"...We were funded RM500,000.00 by the government ...By using this fund, we bought PCs and laptops. At this moment, the teacher computer ratio is 1:1, either PCs or laptops...for existing ICT infrastructure, what I did was to upgrade their equipment with more random accessed memory (RAM)... All classrooms are equipped with mounted Liquid Crystal Display (LCD) Projectors and screens...I'm looking into setting a panel whereby teachers can easily link up their equipment to the projectors ...The whole school is wired and linked up with the Schoolnet, we used the streamyx line where we pay the service providers by using funds from the Computer Club..."

A summary of the improvement initiatives, leadership styles and attributes in ICT utilization in school is tabulated in Table 1.

Table 1: Summary of Leadership Styles and Attributes in ICT Utilization in School

	ICT Utilization in School: Leadership Styles and Attributes				
	Initiatives	**Leadership Types**	**Leadership Attributes**	**Concepts**	**Descriptors**
1.	Realigning School Practices	Transformational leadership Instructional leadership	Strategist Change Facilitator Interventionist Motivator	Shared Vision Goal Setting Teamwork Interpersonal Relationship Collegiality	Setting achievable targets Aligning teachers to school vision and mission Accessing and scanning the environment for opportunities Selective in defining areas for improvement Creating strategic and tactical plans for ICT utilization Involving teachers as managers and leaders in different committee
2.	Building teacher capacity	Instructional leadership Transformational leadership	Skilled Directors in Curriculum Skilled Human Resource Directors Master in Building Managers Negotiators	Innovative Pedagogies Sustained and retained expertise	Developing and enhancing teacher knowledge, skills and expertise Appreciation and recognition Rewards and promotion
3. Recommendations & Conclusions

In relation to leadership literature and research, this case study has consolidated the importance of the school leader, his leadership styles, attributes and beliefs as the key for successful ICT utilization in school. However, a clear distinction of a single leadership practice is not evident as the school principal was continuously adapting to instructional, transformational and technology leadership at different instances.

The school principal's beliefs were also found to influence school initiatives. In implementation, the school principal has had a worldview of how ICT provide teachers opportunities for innovating pedagogies and developing new learning experiences. Secondly, the school leader strongly believed that ICT was the solution for improving students' learning. Building strong community support is another salient point for success, and being effective negotiators with effective communication skills to bring ideas across is an advantage.

Therefore, the following recommendations are suggested for leadership practices and ICT utilization schools.

- Initiatives are school-based and teacher initiated

- Communicate goals and change efforts to the entire school community.

- Committed to teacher development and professional growth by providing professional learning opportunities

- Develop leadership and temporary systems where groups of teachers act as catalysts for change within the school

- Promote collaborative problem-solving and open communication

- Incorporate a collaborative and participative approach within the school

- Focuses on professional interchange, collaboration and networking where professional communities are established through their work in schools – establishing communities of learning

- Develop improvement and monitoring strategies

However, this case study is specific to one school only, and further research is required to determine if these principles could apply to other cases.

In conclusion, effective school improvement initiatives involve the whole school working in collaboration to motivate and inspire the community in lieu of changes in practices and belief systems. School principals are considered as change agents, ICT leaders and ICT champions to encourage and acculturate ICT utilization in school.

Faced with this challenge, it is recommended that school principals explore the possibilities of being transformational leaders, as well as instructional and technology leaders.

School management by values according to teachers' opinions

Associate Professor Dr. İ.Bakır ARABACI [122]

Fırat Üniversity Educational Faculty 23119 Elazığ/Turkey

Abstract

Today,management by values has increased in value instead of management by regulations and norms.Internalized values of administrators and teachers at schools influence the improvement of organizational behaviours effectively.This research aims to determine the perceptions of teachers at primary schools about 'management by values' and if there is differentiation in successs according this perception or not.In research, survey methods are used.Research's sample is formed by 261 teachers working at schools in Elazığ. Schools' successes were determined according to results in SBS.In result,participants adapt management by values in high levels.

Key words: Primary schools,Values, Management by values,Teachers'opinions.

Introduction

According to pozitivist paradigma in management science in past, thougths of organizations and management as a cosmic and reality, it was supposed that various patterns developed in this field can be applied to all organizations. But,at the end of the last quarter of 20. century, observed in other fields ,in organization and management theories a paradigma transformation became a current issue and serious criticisms started about programmes aiming the training of education administrators. (Mulkeen, Cambron, McCabe, Anderson, 1994; Şişman ve Turan, 2002).

At the beginning of mid 1970s,a trust worthy transformation in organization and management science started. In all fields, multiplying theroists started a struggle against the pozitivist paradigma.Post-Pozitivizm and Post-Rationalism claim that reality, knowledge and truths are social speculations. So we reach different results in topics appearing as indisputable. Because each of us fing different meanings of the same things according to subjective perception. Therefore, the same thing can be interpreted differently. (Tierney ve Rhoads,1993,322; Şimşek, 1994). Existing education management and leadership theories ignore the importance of values and culture at scholl. But, culture gives the meaning of life. Culture is an intellectual skeleton combining belief, values and actions. Last studies emphasize that the importance of values in school administrators' effectiveness (Bates, 2001a) and make a point of values in education organizations.(Strike, 1993). School administrators' values are the sources of intends. In many studies, despite the emphasis on instrumental actions and technic contentment, it appeared that values intending administrators and their culturel sources are valued.(Bates, 2001a, Yılmaz, 2006).

According to Greenfield(1994) ,the field of educational management, since it entered the dominance of pozitivist paradigma, human values, emotions and subjectivity have be ignored intentionally or not. Greenfield (1994) brings out that researches in educational management fields need to head topics forming human behaviours such as language, culture and social contect to understand the social realities.(Cited by Turan, 1998;Turan ve Şişman, 2000; Şişman ve Turan, 2004b;Yılmaz,2006).

Values of people influence behaviours in all stages intentionally or not. Social structures effected by human behaviours also can be effected by values. Human behaviours concern not only himself but also the society. It is important that education system which aims to shape human behaviors should be programmed as value-centered.

 The basic assumption of management by values is the point of view seeing human as a presence behaving according to values rather than reasonal. Management by values is an approach integrating the employees around the values and providing value-focused behaviours. According to this approach the most important factor of collective spirit is the shared values. In the organizations of values management there is an emotional relationship between employees and the organization. If the degree of internalization is strong, the emotional relationship becomes stronger. The strength of emotional relationship increase the ethnic responsibility of employees. (Çelik,2002:84). At the same time ,the researches in physchology and education fields show that people generally reflect the values they find important to their work environment (İmamoğlu/Aygün,1999; Baloğlu ve Balgalmış, 2005).

Purpose of Research

The aim of research is to determine the opinions of primary school teachers about school management topic and testing if there is a differentiation or not in the opinions of teachers' according to success.

2. Method of Research

The research is in survey pattern and it is carried out as a descriptive study. The study universe of research is formed by the schools in the center of Elazığ in 2008-2009 school year. Sample is formed by 261 teachers in 18 primary schools chosen randomly.

Data Collection and Data Analyze

As data collection instrument 'Management measure according to values' was used, developed by Yılmaz.(2006). To determine the measure's validity and reliability opinions of two academicians took into

consideration, so content and expression aspects were arrenged. To determine the validity and reliability a survey conducted 80 chosen teachers in city center of Elazığ raof datas to factor analyze (KMO) ve Cronbach Alpha co-efficient was calculated. KMO= .93, Barlett's Test= 2844,6 as a result of this test, the datas were suitable to factor analyze. In factor analyze it was understood that sections gathered in mono section and mono factor explains %47 of loads of sections. For example, in the result of reliability analyze Cronbach Alpha co-efficient was found as= .97.This result shows that the measure is reliable. There are 25 sections in measure. Schools' successes were evaluated according to SBS. While interpreting the aritmetic avarage in Likert survey, the results were 1.00-1.80 totally disagree, 1.81-2.60 disagree, 2.61-3.40 uncertain, 3.41-4.20 agree and 4.21-5.00 totally agree accepted.

3. Findings and Comments

Participants gave opinions about school management as 'Agree' or 'Totally agree' (X= 3.83- 4.42). So it was concluded that teachers accepted high level value management. This situation is suitable for cuntries such as Turkey devoted to values.

In 2007-2008 school year sample schools' successes in OKS 100/3= 33 according to equal co efficient; it was determined as 0-33= 3, 34-66= 2, 67-100=1. Related information is shown in Table 1.

Table 1. 2007-2008 school year , sample schools' OKS success.

	School Name	Participant Students	Successfull Students	Success Rates %	Success Sequence
1	Özel Mustafa Sabuncu Primary School	53	51	96	1
2	Özel Harput Primary School	34	29	85	1
3	Özel Bilgem Primary School	18	15	83	1
4	Kıbrıs Şehitlerı Primary School	28	21	75	1
5	Mezre Primary School	247	140	57	2
6	50.Yıl Primary School	14	8	57	2
7	Hilalkent Primary School	41	23	56	2
8	Koç Primary School	79	40	51	2
9	Fevzi Çakmak Primary School	13	6	46	2
10	Mehmet Ve İfakat Gülaçtı Primary School	7	3	43	2
11	İstiklal Primary School	39	15	38	2
12	İbn-İ Sina Primary School	18	6	33	3
13	Yavuz Sultan Selim Primary School	3	1	33	3
14	Ziya Gökalp Primary School	25	8	32	3
15	ŞHT.Öğretmen Rüstem Şen Primary School	11	3	27	3
16	Vali Tevfik Gür Primary School	42	10	24	3
17	Kuyulu Primary School	8	1	13	3
18	Şht.Öğretmen Nadir Ozan Primary School	22	1	5	3

Taking into consideration of school success,teachers'opinions about the management by values are shown in the table.

Table 3. The means of the participants according to their school's success

Groups	Mean	Frekans	Standart Deviation
Group1	4,11	86	0,61
Group2	4,00	100	0,79
Group3	3,78	75	0,75
Total	3,97	261	0,73

According to success situations of participant schools,the answers to measure sections are varient as (X= 3,971; SS=0,73) and this comes the levels 'agreee and totally agreee' .Highest participation about the management by values belongs to high-level successfull school teachers. 1st Group= (X= 4.11; SS=0,61).

A single-option variance was done to see probable difference in the opinions of participants according to school success. In result of analyze,despite no difference in 16. Section,there was a difference in 9. Section.

Table 4. A single-option variance determining the difference between school success and participants' opinions.

No	Items	X	F	p	Difference
5	All sorts of studies are cared to be copmleted successfully.	4,08	10,38	.00	1 ve 2- 3
6	Scientific principles are seen as a guide.	3,83	6,46	,00	1 ve 2- 3
7	Hard workers are appreciated in community.	3,66	3,51	,03	1 ve 2- 3
10	Private time should be sacrificed for school in necessary situations.	4,00	17,56	,00	1. Grup ile 2 ve 3 arasında
12	Cooperation among colleagues should be cared.	3,96	3,47	,03	1 ve 2- 3
19	Taking responsibility in friends and work groups shouldn't be ignored.	4,06	4,06	5,38	,005
21	Sources are tried to be used effectively and productively.	3,97	4,06	,41	1 ile 2 ve 3. grup
22	The necessity of harmony among colleagues are thought.	4,22	3,00	,42	1 ve 3
25	Works are done in pleasure.	4,03	4,32	,14	1 ve 2- 3

The different sections among employees are the sections about responsibility,coordination and cooperation related to study methods.The highest participant in management by values measure was in favor of first group and there were different opinions with other groups.

4. Conclusion and Discussion

Management by values perception, appropriate to human nature, has increased in value recently.In this research,done to determine the opinions of teachers about tht management by values,teachers adapted the education by values in high levels.At the same time we reached other researches done to similar results.(Yılmaz, 2006; Blanchard&O'Connor, 1998; (Powellandothers, 1984).Management by values is so significant about the acceptance of organizational purposes and affordance of organizational effectiveness. (Wiener, 1988).

In the research we concluded that the teachers of successfull schools' accepted the management by values more.That is to say,the management of successfull schools depends on values.The schools having strong organizational culture and values are more successfull and motivation of teachers are higher(Cheng, 1993; Stolp, 2002).So it shouldn't be forgotten that motivation, the base of organizational success is affected by beliefs and values.

Suggestions

- Management by values appliances in education organizations should be widespread.

- Trainings for teachers,students and tutors about the management by values topic should be arranged.

13th International Educational Technology Conference

Self-Directed Learning in asynchronous courses: Strategies for Effective Design and Development

Thuraya Khalifa AL Ghafri[123]

Ministry of Education Oman,Educational Program Designer, AL Buraimi P.O.Box862,Oman

Abstract

Designing asynchronous online courses should be done through the application of scientific strategies using different models of instruction to ensure the success and achievement of the educational goals. This paper will discuss the process of designing a computer based instruction for the Ministry of Education in Oman to teach the main strategies to design asynchronous online courses. The paper will explain the process used to design this project using the "Dick and Carey System Approach Model" and the Merrills' First Principles of Instruction to design the content of the Computer Based Instruction.

Key words: Front- end Analysis; Needs Analysis; CBI.

Introduction

   As we are living in the 21st century, technology is playing a vital role in speeding the education movement around the globe. The Ministry of Education in Oman (MOE) has a team called: "The E-content and E-Learning Team" which is responsible for designing and developing instructions for learning use besides providing the necessary training courses to enhance the use of technology in each region. Recently, this team began to offer online courses through the Educational Portal in the MOE. A front-end analysis process was conducted to ensure the need for an instruction; the analysis consisted of analysing the MOE online courses and questioning both the course designers and learners on the effectiveness of the MOE courses; the results revealed the course designers lack the knowledge of designing online courses and learners are still not satisfied after all. The front-end analysis ensured that there was a need to design an instruction to teach the strategies of designing online courses. The purpose of this project is to design and develop a computer based learning instruction for MOE team members on the strategies of designing effective self-directed online courses. The paper will describe the design, development, and evaluation stages of this computer based instruction and then present the results. This paper will discuss the project case study and define the Instructional Design Approach which will be applied in the design and development of the Computer Based Instruction (CBI). The learners of this CBI are specifically members of the e-content and e-learning teams of the Ministry of Education in Oman (MOE), and generally any educators who design self-directed online courses whether in K-12 schools or any other educational academics can get benefit from this CBI.

Project Case Study

   The Ministry of Education Oman (MOE), Sultanate of Oman, has established the educational portal to create a communication platform between all personnel working in the Ministry; teachers, students, parents, faculties, etc. Within the different directorates of the Ministry of Education in the different regions; e-learning and e-content teams have been formed. In the last two years, those teams had started to teach asynchronous online courses through the Educational Portal Forums. Those online courses are open to anybody in the Ministry, teachers and faculty, to sign up and then complete them in their convenient time. The courses are completely online and learners have to achieve

---

123 Corresponding author.
E-mail address: thorayaalghafri@gmail.com

them without the instructor. Those courses have been mentored by the General Directorate of Information Technology in the Ministry of Education Oman.

Front-End Analysis:

Environmental Analysis

The MOE has visions and missions in online education and there is a potential support to provide variety of online courses to e-learning and e-content members. The MOE has provided the team members with the needed technology to accomplish its vision. As a result, each member has the needed software and hardware and also the capabilities to use them. The MOE provides positive social support to learn all what is needed to design online courses. More results on the environmental analysis are included in Appendix D.1.

Learner Analysis

Each e-content and e-learning team in each region consists of members who used to be teachers, of different subjects, but skilful in integrating technology into teaching. They have been selected according to their skills in computer and their ability to be innovative to teach using technology. When those teams have been first established in every region, members have been trained and exposed to variety of workshops to prepare them for the new job. Thus, all team members are aware of the future goals and the responsibility of the e-learning and e-content teams. Many of the team members have taken online courses before but none of them have taken courses on the strategies of designing online courses. At this point, the teams of the different regions have posted a variety of asynchronous courses within the last two years. Besides, the teams are continuing to create courses as there is still a need for those courses to spread the importance of integrating technology into teaching. More results on the learner analysis are included in Appendix D.2.

Needs Analysis

Performance Problem

From my navigations within the asynchronous courses which mainly have been created by members in e-content and e-learning teams, they lack the principles of the self-directed online courses; such as not supported with clear syllabus neither clear directions on how to accomplish each task. Online surveys were submitted to almost 200 members of the e-learning and e-content members (See appendices A, B, C). The results of a scale question (1-5 scale) on any previous training/workshop experience on learning how to design online courses is as following: 80% have previous training experience on designing online courses, 10% have no previous experience on designing online courses, and 10% have limited experience based on readings. Moreover, the survey included a question to ensure whether the learners were able to access formal training resources to learn how to design online courses, the results are: only 10% have attended workshops but 10% have used Google only as a main source. Besides, 10% have more than one resource to learn the strategies to design online courses. Also, 50% of members pointed out that they are in need for a CBI to teach them the strategies of designing online courses, however; only 10% did not need to learn the strategies on designing online courses. On a different online survey which was given to teachers who have taken the MOE online courses, the results clarified that the MOE online courses need some modification in delivering the content. In a scale question about the satisfaction of those learners: 10% were satisfied with the MOE online courses, 10% were unsatisfied, and 75% were fairly satisfied with the MOE online courses. Also, 70% of learners were not able to complete the MOE asynchronous courses without the instructor, 20% not sure, and 10% who did explain the difficulty to complete those courses without an instructor. Based on the previous question of the survey, 50% of learners agreed that the MOE online courses did not include any guidance on how to complete the course. Moreover, 100% of learners agreed that the MOE online courses should be improved regarding the content and guidance provided to complete each course. In additional comments provided by the learners: they think that the MOE online courses should be clearer and should provide details on how to accomplish the course objectives.

Proposed Solution

   Given the problems listed above and the need for those asynchronous courses, providing an instruction on the strategies of designing online courses will increase the teams' abilities to design effective asynchronous courses. The instruction will teach learners the strategies and principles of designing online courses especially the self-directed online courses. This instruction will be designed and developed as a self-instruction which will teach learners how to design their own self-directed online courses. The Instructional System design that will be used to develop this project is: "Dick and Carey System Approach Model." Using this model, this project will go through the following steps: Analysis, Design, Development, Implementation, and Evaluation. This instruction will be developed in the form of a Computer Based Instruction (CBI) using "Adobe Captivate" and will include a pre-test and post-test besides the developed content. The content of this project will be taught using An Instructional Design Approach, First Principles of Instruction Approach, to ensure mastering the learning objectives.

The Delivery System using the Computer Based Instruction (CBI)
   The Computer Based Instruction (CBI) will be the delivery system for the designed instruction. The CBI is a term used to indicate that the designed material is software and able to be used in any computer whether the CBI is stored in CD/DVDs, in a personal website, or any other server. The CBI of this project will be designed using Adobe Captivate and it will be a self-directed instruction; the instructor is not involved in the learning process. Within this CBI; the learning materials will be provided to learners besides the pre-test, post-test, and short exercises.

Instructional Design Model (Dick and Carey Model)

Design

   - The optimal goal of the CBI is: to apply the best strategies when designing an asynchronous course. The CBI also includes other six sub-goals:
     - Identify synchronous from asynchronous courses
     - List the main strategies of designing an asynchronous course
     - Demonstrate designing a course syllabus
     - Demonstrate designing a course guidance
     - Demonstrate designing a course schedule
     - Demonstrate designing a course content

   The design stage consists of two stages: designing a task analysis (See Appendix D.3) and performance objectives and assessment (See Appendix D.4).

Instructional Design Approach

To teach the content of the CBI, an Instructional Design Approach will be applied: "First Principles of Instruction Approach" which is one of the instructional design approaches to design and develop instructions (Merrill, M. D. 2009. First Principles of Instruction, 2009, p.42). The criteria for selecting this approach when developing the CBI are: the context, the learners, and the environment. The goal of this approach is to enhance the skills of understanding the content. This approach could be applied to teach adults and provides motivational techniques for learning the content. Besides, this approach could be applied in a variety of environments and the CBI is one of them. Since this CBI is a self-directed instruction in which learners are not receiving any guidance from the instructor, this approach provides techniques to ensure the effectiveness and efficiency of mastering the learning objectives such as the application phase. Appeal is also another priority for learning the content of this CBI in which this approach supports appeal more than effectiveness and efficiency. This approach consists of four phase cycles (Figure 1): activation, demonstration, application, and integration. The principle of each phase includes (Merrill, M. D. (2009). First Principles of Instruction, 2009, p.42):

Figure 1: The Four-Phase Cycle of Instruction

Development

Storyboard

The storyboard of the CBI includes a detailed description of each slide in the CBI; what will be the content of each slide, the narration/ audio of each slide, media used and any additional notes. Based on the content of the storyboard, the designer will develop the CBI. Appendix D.5 includes the Storyboard of this CBI.

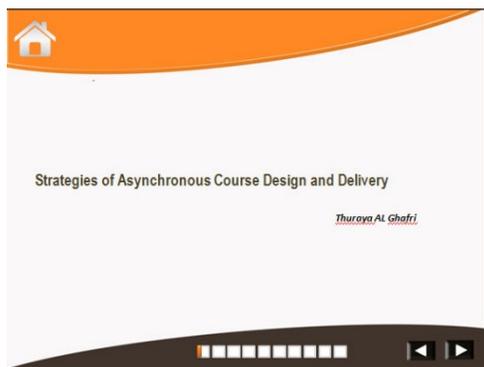
Designing and Conducting Formative Evaluation

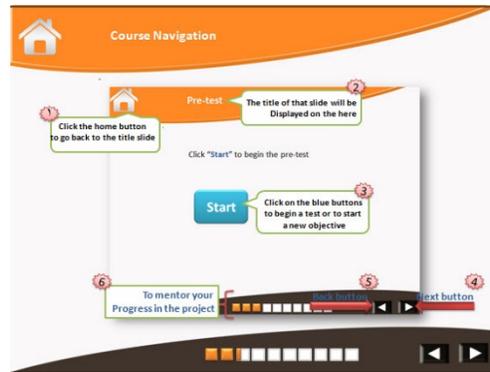
As part of the Dick and Carey Model; a formative evaluation was conducted after the first draft of the developed CBI. The purpose of this evaluation was to improve the module after it has been developed and to get feedback on the currency and accuracy of the content. The formative evaluation consisted of two parts; the one on one evaluation and the small group evaluation. The learners were able to access the CBI through the following URL: www.thurayaalghafri.com/Moodle

The CBI is uploaded within the course: CBI MOE

The following are sample screen shots from the developed CBI:

Figure.2: Screen shot samples from the CBI

The introductory slide   **Pre-test Slide**


Navigation Screen


The One on One Evaluation

The purpose of the One on One Evaluation is to identify and remove the most obvious errors, to obtain initial performance indications, and to get reactions on the content by learners. There are three main criteria that this evaluation will be gathering from learners:
1- Clarity: of the content, objectives and the learning materials presented in the module.
2- Impact: the learners impact on the module, their attitudes, and their achievements of the learning objectives.
3- Feasibility: of the time and resources provided in the module.

Participants

The participants of this evaluation consisted of four learners from different knowledge background; one is IT teacher and three English language teachers. They are all females and members of the e-learning and e-content teams in the MOE. The four of them have work experience in the Ministry of education between 4 to 8 years. The learners did the evaluation one at a time. Learners received the CBI URL, www.thurayaalghafri.com/Moodle, which includes both surveys and the developed CBI.

The Small Group Evaluation

The second evaluation stage was the small group evaluation. In this evaluation, a group of users tested the CBI without any guidance from the designer. The purpose of this evaluation was to: determine the effectiveness of the changes made after the one on one evaluation, and to identify any remaining learning problems. The criteria that this evaluation did focus on are: the learners' performance scores on the pre-test and post-test, their attitude about the instruction, and the feasibility of the instruction.

Participants

The participants of this evaluation consisted of three female learners from different knowledge background; two English teachers and one used to be a math teacher but have good skills in technology. Two of them have 5 years of work experience and the third one has 8 years of work experience. Each learner did the evaluation separately and in a different location from other learners because each one lives in a different region and it was difficult to have all of them do the evaluation at the same time and place. The internet was the only source to access the developed CBI. The designer shared a drop box with learners besides uploading the CBI in a private server. The designer was able to talk to one of the learners to discuss the CBI in general and get an impression about the CBI besides the written surveys.

Results

One on one evaluation

The attitude questionnaire, appendix D.8, consists of three parts: the scale part and the comments and others. In the scale part of the questionnaire, the survey samples rated their motivation to use the instruction in a scale of 5 in the CBI objectives in the following areas: attention, relevancy, confident, and satisfaction. The reason for evaluating the CBI based on these areas is that they can measure the effectiveness of the CBI from different sides; the design, the content, the presentation of the content, etc. Based on analysing the first part of this questionnaire, see Appendix D.9, the results were as following; the lowest average was 1.8 on these parts of the project: sample video of a course guidance, and the exercise on a course syllabus. On the other hand, the highest average was on the objective: "demonstrate designing course guidance" as the average was 3.7 and 3.5 on these goals: "what are the main parts of course guidance 3.7", and "course guidance objective 3.5.

The results on the "comments" part which asked learners to add the strengths and weaknesses on parts of the project. The most important comments on the strengths of this CBI were: the CBI was inspiring and easy to use, as well as it has nice screen interface design. On the contrary, the main weaknesses of the CBI were as following: it has lots of texts, it was long, it was little bit boring, and also there should be more diversity of slides. Moreover, the results of the second survey, See Appendix D.7, were average between good to very good, and a few times it was "excellent". There was one questionnaire which added a comment "needs more clarification in the clarity of the content.

To add more, both tests were included in the CBI in the form of an online URL, using Google Docs applications. This is because most of the questions in both tests are subjective and difficult to score the students' results whether correct or wrong. From analysing answers of both tests, all students answered the multiple choice questions correct. However, in the other questions the students' answers in the post test were better than the pre-test. In the pre-test the students did not have an idea of what is a syllabus or what is the course guidance. In the post test, the students' answers were more accurate and based on the CBI content.

One on One evaluation, Changes:

After conducting the one on one evaluation, the designer made several changes and additions to the CBI such as: including more videos, images to increase the learners' motivation and adding the introductory video which demonstrates the main objectives within the CBI. Besides, the designer added a summary video which summarizes the main content of the CBI.
Also, the designer changed the post-test and the pre-test and included them within the CBI instead of including them in Google Docs.
Continue designing the rest of the objectives; "Identify synchronous from asynchronous courses", "List the main strategies of designing an asynchronous course" and "Demonstrate designing course content".

Small group evaluation

The attitude questionnaire, appendix D.8, consists of three parts: the scale part, the comments, and others. In the scale part of the questionnaire, the survey samples rated their motivation to use the instruction in a scale of 5 in the CBI objectives in the following areas: attention, relevancy, confidence, and satisfaction. Based on analysing the first part of this questionnaire, see appendix D.10, the results were as following; the lowest average was 1 in the objective "Demonstrate designing course guidance" and specifically in the exercise part. To add more, the following objectives also scored low average of 1.2: learners' satisfaction on the new skills, clarity of the CBI vocabulary, learners' confidence to demonstrate designing a course schedule, and the exercise part in the objective "demonstrate designing course guidance". On the other hand, the highest average was 2.2 on the following parts of the CBI: "face to face vs. online", "sample of a course syllabus", and on the relevancy of demonstrating designing a course schedule and course syllabus.

The results of the other survey, appendix D, were as following: most answers vary between good and very good while there were blanks in some questions of the survey. The most interesting answer was that the CBI "sentence structure" was complex. Also, the length of the CBI was another interesting result; two of the learners find the CBI

is long and it took them almost an hour to complete it. Moreover, the main weakness in the instruction is that it needs more audio to guide learners within the CBI. Besides, in the exercises and also in both tests, filling the gap questions was very challenging and difficult.

The score results of both the pre-test and post-test is explained in Appendix D.11. In general the post test scores are higher than the pre-test scores for each learner.

Small group evaluation, Changes:

- After the small group evaluation, the designer is planning to make the following changes to the CBI:

- Add more explanations on some of the objectives as some learners indicated that the "sentence structure" is complex.
- Add audio into some of the slides such as: before the pre-test and post-test slides to explain the tests and provide information on the question type.
- Change the font size and color in some of the slides to make the visual media more interesting and appealing.
- Modify the typo mistakes in some of the slides.

Evaluation Results:

Based on the one on one evaluation results, there are some required changes in the CBI. The first one is to re-edit the sample video of course guidance as well as the exercise of a course syllabus. Moreover, based on the attitude questionnaire results, the required changes are mainly in the diversity of slides and also to reduce the text in some of the slides to make the CBI more interesting. According to the tests results, the multiple choice questions might be too easy and they could be modified especially in the post-test. After all, most changes are technical changes and related to the course design and few of the changes are on the clarity of the content or the tests.

According to the small group evaluation results, the CBI still needs modifications in the buttons, audio, and images. Also, more audio guidance on how to proceed or where to click should be added in some of the CBI objectives. There are other modifications should include the language complexity such as adding glossary for difficult vocabulary. To add more, the results of tests clarify that there is a progress in the students' learning, however; the learners' comments shows that they faced difficulty in filling the gap questions. Thus, "fill in the gaps" questions could be converted to a multiple choice question.

Conclusion

In conclusion, this paper discussed the stages that a developed CBI went through: a front-end analysis stage, and then the design, development and evaluation stage of the computer based instruction to teach the strategies of designing self-directed online courses for the e-content and e-learning team members in the MOE. The paper reviewed the front-end analysis process to ensure the need for the computer based instruction. The front-end analysis included surveying both the learners and designers of the current MOE online courses. The results of the need analysis proved that the designers lack the knowledge of designing online courses. Moreover, the paper included the environmental analysis, the learner analysis, and the reasons for developing the instruction as a computer based. The Dick and Carey Instructional System Model was used to conduct this paper. Merrill's First Principles of Instruction Approach used to design and develop the CBI. This paper included all details of each step used to design and develop the designed instruction. Both the "one on one evaluation" and the "small group evaluation" were used to assess the effectiveness of the CBI. At the end the paper was concluded by discussing the evaluation results and explaining the limitations of this paper. This paper will play a great influence on the e-content and e-learning teams' performance in Oman to help them design asynchronous online courses for the Ministry of Education. All the data gathered and analysed based on the environment and learners in Oman. Thus, based on the current language and knowledge skills the content of this CBI was developed. Despite the difficulties to achieve this project, language, distance and time difference between Oman and the US, the evaluation results guided the designer on the strengths and weaknesses of the CBI. Upon the formative evaluation results, there will be more modifications to this CBI till it

becomes ready for final implementation. When the final version of the CBI is ready, it will be used by the Ministry of Education in Oman. This CBI will be a great asset and an additional source for the e-content and e-learning teams in the MOE to help improve the teams' productivity of designing asynchronous online courses.

Shared Mental Model Among Graphic Designers, Multimedia Designers and Subject Matter Experts in Designing Multimedia-based Instructional Media

Rafiza Abdul Razak[124]

ªUniversity of Malaya, Faculty of Education,50603, "Kuala Lumpur",Malaysia

Abstract

The research identified and explored the shared mental model among the instructional multimedia design and development experts comprising of subject matter expert, graphic designer and multimedia designer. The knowledge shared by the team was categorized into three groups of multimedia design principles encompasses of basic principles, authoring principles and design principles. The research focused on soliciting knowledge of agreement on the principles.   Outcome of the research is essential in providing description of the cognitive skills needed to perform tasks in multimedia design and development proficiently.

Keywords: shared mental model, subject matter expert, graphic designer and multimedia designer

INTRODUCTION

To share can mean to have or use the same entity such as share the beliefs, but it can also mean to distribute. In the context of team cognition and shared mental models, sharing can imply either knowledge similarity or common knowledge that is held among team members for example, everyone knows the same thing or knowledge distribution in which knowledge is shared by apportioning it to team members according to expertise or role (Cooke et. al; 2001, Salas et. al; 1995). In this sense knowledge is complementary, not common with respect to the team. It has been suggested that realistically, team knowledge is not likely completely common or distributed, but rather overlapping with portions that are distributed or common (Cooke et al, 2000; Klimoski & Mohammed, 1994). Thus, this advocates the research which focuses on the shared knowledge among experts in multimedia design as the overlapping knowledge.

In order to explore the shared mental model, Cognitive Task Analysis (CTA) is applied throughout the research. Cognitive Task Analysis (CTA) is defined as the exploration of mental processes, a method to analyze and represent the knowledge and cognitive activities workers utilize to perform complex tasks in the work domain. It focuses primarily on how workers function in cognitively-demanding domains. It is most useful in developing training programs, developing means to assess performance, and developing criteria to select people for certain jobs. It also provides insights into creating effective decision support systems and other software systems (Clark et al, 2007).

A team Cognitive Task Analysis is a description of the cognitive skills needed to perform a task proficiently. It is helpful as it can describe the way the team is thinking as opposed to the steps it is following. Cognitive processes for teams consist of control of attention, shared situation awareness, shared mental models, application of strategies and heuristics to make decisions, solve problems and plan and metacognition (Cook et al, 2001).

2. REVIEW OF RELATED LITERATURE

Shared mental models imply that team members have the same understanding for the dynamics of key processes. These processes can include the roles and functions of each team members in accomplishing the task, the nature of the task, the use of equipment and so forth. In most settings a critical factor is the degree to which the team members have a shared mental model of their own roles and functions (Schraagen, Chipman & Shalin, 2000). The research focused on soliciting knowledge of agreement on strategies. The process requires asking each team member to

* Rafiza Abdul Razak. Tel.: +6012-6523893; fax: +603-79675139.
  E-mail address: rafiza@um.edu.my

analyze the situation and justify strategies taken. Besides that, the purpose is also to analyze team agreement (Schraagen, Chipman & Shalin, 2000). This is further discussed in the methodology section on the application of Delphi technique to analyze team agreement.

One common source of difficulty for teams is when the members are confused about who is supposed to do what. Confusion about roles and functions leads to wasted effort or a failure to carry out essential subtasks. Effective teams understand the functions, including the common routines. Hence shared mental models refer to the configuration of the team and the way it is supposed to perform routines (Hoffman & Militello, 2008).

Another issue that must be addressed is how the elicited information is represented. As is the case with CTA data at the individual level, there are several representational formats that might be useful as a means to describe knowledge elicited from a team CTA. For example, task action hierarchies, concept-maps, semantic nets, concept graphs, task network models or simple lists or Tables could be useful to employ communication or link analysis to describe the flow of information among team members, models of shared knowledge or analyses of knowledge overlap among team members. These latter techniques have not received much attention in the literature, but are crucial if a true picture of team-level knowledge stemming from a team CTA are to be useful. This includes an understanding of what each team members needs to know to function effectively, as well as an understanding of what information must be dynamically shared among members (Schraagen, Chipman & Shalin, 2000)

Research aimed at addressing this issue is clearly needed. Despite the gaps in research, a number of knowledge elicitation methods are available from research since such data are required so that team selection, training, task design and management systems can be optimized. This research highlights the flow of information among team members, models of shared knowledge or analyses of knowledge overlap among the design and development of multimedia courseware team subject matter expert, graphic designer and multimedia designer. Issues in the design and development of courseware are often neglected. These include understanding of what each team member needs to know to function effectively, as well as an understanding of what information must be dynamically shared among members.

3. RESEARCH DESIGN

A cognitive task analysis was conducted using twelve national multimedia design and development experts to construct the list of principles in designing multimedia-based instructional media. For the purpose of establishing content validity of the multimedia design principles, the number of experts is more than 10 due to its consistency with Dalkey's finding (as cited in Martino, 1972). The sample involved experts from various fields who are experienced and qualified in multimedia design process. A modified Delphi technique was used to facilitate experts' opinion to reach consensus on the principles in designing and developing multimedia-based instructional media. At the second phase, interview was done twice for each expert. The first interview was done simultaneously with gaining experts' consensus during the second round of the modified Delphi technique. The second interview was carried out after analyzing the final consensus among the experts, so that questions asked during the interview are based on the final consensus. Three experts representing each specialization was selected for the interview.

4. RESEARCH FINDINGS

4.1 Modified Delphi

Table 1 showed that all the three groups of experts obtained similar result with no consensus for all the principles under design phase. They obtained median score between 4 to 5 and interquartile range between 2.00 to 3.25. Moreover, all the three groups of experts shared the same view that they gained no consensus with regard to the application of the principles under validate phase. They obtained median score between 4 to 5 and interquartile range between 2.25 to 3.50. Apart from that, all them also obtained high consensus with high median score between 4 to 5 and low interquartile range between 0.00 to 0.75 for enhance and maintain phases.

Graphic designers and multimedia designers shared the same view with regard to authoring phase. Similarly they obtained high consensus for production phase of instructional design process with median score between 4 to 5 and interquartile range between 0.00 to 0.75. This indicated that both groups of experts involve in the production phase of instructional design process.

. The result shows that only subject matter experts considers the application of principles under analysis phase. The median score is between 4 to 5 and interquartile range is between 0.00 to 1.00. Graphic designers on the other hand, are the only group who involved in development phase. They obtained high consensus for all the principles in development phase of instructional design process with median score 4 and interquartile range 0.75.

Table 1 : Consensus among subject matter expert, graphic designer and multimedia designer in instructional design process

Consistency principles	5	0.75	5	0.00	5	0.00

4.2 Interview

Expert 01 explained that graphic designers design illustrations which is then passed to multimedia designers who will add movements and animations on the graphics. Multimedia designers and graphic designers work well together and this is advocated in analysis of findings from Delphi technique round 2. Graphic designers and multimedia designers shared the same view with regard to production phase of instructional design process. Both groups of experts involve in the production phase of instructional design process. Expert 01 further supported that:

multimedia designers and graphic designers can work together ..usually these two groups of experts easily understand each other..

Their specialization in developing content requires them to apply principles under cognitivism, behaviorism, constructivism, andragogy, instructional design theory and interactivity in designing multimedia. This is elaborated by expert 01 that:

subject matter expert developing content..instructional designer focusing on design aspect.

Thus, multimedia designers involve in the application of majority of the principles under authoring tools. Expert 01 elaborates that multimedia designers apply programming software in most of their tasks.

okay first, graphic designer will design illustration then his work will go to multimedia designers who will move and animate the graphics..use programming..usually these two task easily understand each other

However, subject matter experts do not involve in the application of the principles under software support tools. Graphic designers differ from multimedia designers and subject matter experts as they apply majority of the principles under audio visual. This is due to the principles are closely related to graphic and design specialization.

Expert 01 elaborates that graphic designers perform task based on their observation of characters, images and events around them. Their work is mostly based on experience rather than reading materials. Expert 01 explains:

the role of graphic designers is not just reading..he obtain information by digesting his surrounding .....meaning he needs to observe characters, images..reading or reference as such are not applicable and very limited for graphic designers ..

5. RESEARCH IMPLICATION

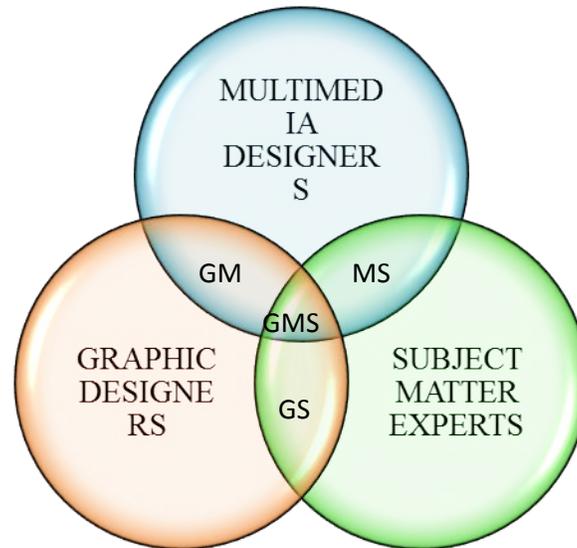
The shared knowledge among subject matter experts, graphic designers and multimedia designers is as explained in the shared mental model illustrated in figure 1 (Cooke et. al; 2001, Salas et. al; 1995). The research further categorized the multimedia designing task into two types of tasks: shared task and expertise-based task.


Figure 1: Shared Mental Model of subject matter experts, graphic designers and multimedia designers

5.1 Expertise-based Task

Jamaluddin et al. (2003) and Norazlin et al. (2007) agree that each team members in designing and developing multimedia-based instructional media work according to their area of expertise. This is further emphasized in the instructional design process which segregates the experts according to their expertise. The subject matter experts concentrate on the design phase where designing instruction is their expertise. Graphic designers are involved at the develop phase. Multimedia designers perform tasks in the author phase. Multimedia designers obtained high consensus for principles under authoring tools. Job specification of multimedia designers requires application of principles under authoring tools. Jamaludin et al. (2003) further support that the design group includes subject matter expert, instructional designer and script writer.

5.2 Shared Task

Graphic and multimedia designers (GM) are categorized under the same technical team (Jamalludin et al. ,2003; Alessi and Trollip, 2001).   Graphic Designer and multimedia designer similarly perceive all the principles under learning theory are not applicable to their specialization. Furthermore, they also agree that all the principles under instructional design theory as not important to be considered under their job specification. The Modified Delphi analysis shows that multimedia designers and graphic designers work together and share knowledge under the produce phase. Graphic designers and multimedia designers share the same view with regard to the production phase of the instructional design process. Both groups of experts involve in the production phase of the instructional design process. Furthermore, the principles under screen design essentially involved multimedia designers and graphic designers when designing multimedia.

The shared mental model involves all the three groups of experts. Specifically, they share similar view with regard to principles such as self-critique principles, conceptual principles, marketability principles, and consistency principles under content design principles. Design principles under instructional design process also involve all the three groups of experts. Thus, the shared knowledge provides understanding of what information must be dynamically shared among members which further solicited knowledge of agreement on principles of multimedia design and development for instructional purposes (Schraagen, Chipman & Shalin., 2000).

6. CONCLUSION

The research focused on the shared mental model among the experts in multimedia design and development such as subject matter experts, graphic designers and multimedia designers. A critical need exists for a solid understanding of the factors that influence team decision making and performance in order to identify interventions that can affect the decision making process and improve performance (Hall & Regian, 1996; Klinger et

al., 1993; Salas et al., 1995). Previous research (Keppell, 2000) addresses the gap in the field of instructional design and outlines a number of key principles to consider in interacting with subject matter experts. Hence, this research provides a platform for further investigation on expertise study for other area of expertise.

Abstract

Contemporary researches on the impact of globalization and the development of Information, Communication and Technology (ICT) towards the roles of principal had shown that school principals are experiencing dramatic changes in their work. The Malaysian Ministry of Education is planning to transform all schools into smart schools. Principals simply cannot avoid this. They have to be sophisticated users of management information system. They have to become proficient users of a variety of software, hardware, both Intra and Inter Networks, integrating technology into teaching and learning processes, attending professional development programs for enhancing their level of competencies in handling ICT equipment, and experiencing the impact of ICT on their work. Specifically, this paper will focus on the roles of principals in transforming their respective schools into smart schools.

INTRODUCTION

The information age poses a whole new set of challenges and questions to Malaysian schools. The quality of our nation's political, social and economic future will depend on the ability of our young generation to become functioning members of society who can understand how to access information (and determine its significance), handle data, draw independent rational conclusions and communicate findings. Students today need a higher level of academic, technical, communication and information-processing skills in order to function effectively in a society. The contemporary workplace requires that employees be adaptable team players with strong problem-solving and decision-making skills. Schools will have to accommodate a variety of learning styles, interests and life experiences if they are to educate today's students. Leading experts have suggested that an organization's ability to learn, and to keep improving the way it learns, may be the ultimate competitive advantage.

With our interest in the goals for students in Vision 2020, we are beginning to look at what it takes to educate our children for the world of the future and what skills that will need to acquire to become productive citizens. It is interesting to explore the wide range of skills in communication, critical thinking, and even problem solving that the world of work would ask educators to consider when planning curriculum, as well as the advanced technical skills associated with the information society we are going to become.

The mission basically is to develop a world class quality educational system which will realize the full potential of the individual and fulfil the aspiration of the Malaysian nation. This will only happen if education departs from the disinterested rote learning mode, and explores how information technology can be used to encourage active, creative, and independent learning. Malaysia needs to make the critical transition from an industrialised economy to being a leader in the Information Age. In order to make this vision a reality, Malaysians need to make a fundamental shifts towards a more technologically literate and thinking workforce, able to perform in a global work environment and use the tools and technology available in the Information Age. To make this shift, the education system under the guidance of the National Philosophy of Education, must undergo a radical transformation. The schooling culture must be transformed from one that is memory-based to one that is informed, thinking, creative and caring. One way to make this happen is through the use of leading-edge technology.

NEW PARADIGM IN INFORMATION TECHNOLOGY ENVIRONMENT

The challenges of the new millennium such as the rapid globalization, the tremendous impacts of information technology, the international transformation towards knowledge-driven economy, the strong demands for societal developments, and the international and regional competitions have driven numerous educational changes in the different parts of the world. The paradigm shift in learning inevitably requires corresponding paradigm shift in teaching and teachers' role. Teaching is considered a process to initiate, facilitate, and sustain students' self-learning, self-exploration and self-actualization; therefore, teachers should play a role as a facilitator or mentor who supports students' learning.

Teachers can maximise the opportunities to enhance effectiveness of their teaching from local and global networking and exposure through Internet, web-based teaching, video-conferencing, cross-cultural sharing, and different types of interactive and multi-media materials (Holmes, 1999; Ryan, Scott, Freeman, & Patel, 2000). With their help, students can learn from the world class materials, experts, peers, and teachers in different parts of the world such that teaching can become world-class teaching. Through participation in local and international development and research programs, teachers can achieve global and regional outlook and experiences beyond institutions. In other words, all schools should be transformed into smart schools.

ICT AS A TOOL AND AN ENABLER IN EDUCATION

According to 2013, Ministry of Education's websites, Malaysia has 7,745 primary schools and 2,340 secondary schools. Infrastructure development for schools includes the installation of ICT facilities to all schools in Malaysia. Planning for the 10,085 schools is carried out in phases as follows:

2001	2,400 schools
2002	2,000 schools
2003 onwards	the rest of the schools: 10,085 schools

It is against this background that Smart Schools have been made one of the flagship applications in the Multimedia Super Corridor (M.S.C.). The concept of Smart Schools is no longer a fashionable luxury but the only way forward. In 1999, there were about 635 schools undergoing the Computers-in-Education programme and 87 schools under the Smart Schools programme. Whereas the comprehensive computerisation programme is mainly aimed at bridging the digital divide, the smaller Computers-in-Education programme is dual-pronged, i.e. aiming at both ICT literacy and use of ICT as an enabler in teaching-learning. The smart schools programme is a total

solution targeted at improving not only teaching-learning but also school management and external relations and involves an even smaller number of schools (Rohani Abdul Hamid, 2002). Smart Schools are equipped with computers and appropriate software that offer tremendous scope and potential for self-paced and interactive learning. The Smart School will not be elitist in nature, but will be innovative, creative and stimulating, coupled with extensive usage of computers along the areas covered by the multimedia super corridor. Smart Schools are not only intended to produce knowledge workers who possess the requisite technological skills but also aim to inculcate critical thinking skills through intelligent learning consistent with the tenets of the National Education Philosophy. A Smart School is an educational establishment that adopts instructional processes and educational management practices that foster systemic changes that are intended to enable learners to surmount the challenges posed by the information technology era. The Smart Schools Pilot Project was implemented in 87 schools nation-wide. Beginning in 1998, the Teacher Education Division of the Ministry of Education, Malaysia was charged with the task of training teachers for the Smart Schools Programme. The effective training of teachers for these Smart Schools is a key factor impacting on the success of the Programme.

How successful is the Smart Schools Programme? During the 2010/2011 academic year, we had conducted a series of studies that investigated the effectiveness of training programmes intended to train Smart School teachers and evaluated their impact on student learning. The data for this study was collected through a questionnaire that was administered to 882 Smart School teachers. The questionnaire was also administered to 2689 students in 70 Smart Schools throughout Malaysia. The findings of the study show that Smart School teachers acquired a diverse range of knowledge and skills related to smart instruction. These teachers reported that they had succeeded in mastering various aspects of the concept of smart instruction, planning smart teaching, managing smart instruction and managing the smart classroom. Smart School learners had a positive view of, and were receptive to Smart School instruction. On the whole, smart school instruction has had a moderate to high impact on smart school learners. But, in implementing smart instruction in schools, only **23.9%** received the necessary support from their respective principals (Mohammed Sani Ibrahim, 2010).

Consistent finding was obtained from another study conducted earlier by Baharom Mohamad (2002) who had explored teachers' perception of instructional leaderships given by their respective Headteachers/Principals in computer literacy in their schools. A survey was conducted by using questionnaires administered among 380 randomly selected teachers in the State of Johor, Malaysia who had involved in the Computers-in-Education and Smart School Programmes. The major findings from this study indicated that only **24.0%** of the primary school teachers and **29.4%** of the secondary school teachers were satisfied with the support obtained from their school heads.

These two research projects had proved that Malaysian school principals were not able to integrate technology in the teaching and learning processes in their respective schools. If we don't improve this, then the Ministry of Education, Malaysia would definitely unable to transform all schools into Smart Schools by the year 2020. Appropriate steps should be taken immediately to overcome this situation by infusing technological culture among school principals first before trying to convert all schools to become Smart Schools.

MALAYSIA EDUCATION DEVELOPMENT BLUEPRINT 2013-2025

The Prime Minister of Malaysia had recently launched the Malaysia Education Blueprint 2013-2025. There are eleven shifts that had been suggested in order to achieve the national vision. Shift Number 7 is to leverage ICT to scale up quality learning across Malaysia. Why such shift is important? : The Ministry has spent more than RM6 billion on Information and Communication Technology(ICT) over the past decade in education initiatives such as Smart Schools—one of the most capital-intensive investments the system has undertaken. However, ICT usage in schools continues to lag expectations—both in terms of quantity and quality. For example, a 2010 Ministry study found that approximately 80% of teachers spend less than one hour a week using ICT, and only a third of students perceive their teachers to be using ICT regularly. Critically, the 2012 UNESCO review found that ICT usage has not gone much further than the use of word-processing applications as an instructional tool. ICT has tremendous potential to accelerate the learning of a wide range of knowledge and thinking skills. However, this potential has not yet been achieved. What success will look like: Across all 10,000 schools in Malaysia, ICT will enhance how teaching and learning happens. Students will be able to access a wider range of content that is more engaging and interactive. They will be able to learn some lessons at their own pace, and will have fewer limitations in what they choose to study through distance-learning programmes. Teachers and principals will have access to both national and international learning resources and communities to help them improve their practice. ICT will be a ubiquitous part of schooling life, with no urban-rural divide, and with all teachers and students equipped with the skills necessary to use this technology meaningfully.

THE ROLE OF PRINCIPALS IN DEVELOPING SMART SCHOOLS

What makes an administrator ready for the digital age? What kinds of leadership skills are necessary for both in-service and pre-service administrators to lead in today's ever-changing field of technology? In order to lead and collaborate affectively with other educators and policy-makers in the digital age, educational administrators need to take advantage of the wireless revolution and its impact upon the infrastructure of school districts. School leaders must recognize and use the "power of technology" to improve student productivity, while making "more efficient use of time, money, and staff (O'Neil and Perez, 2002; Schrum and Levin, 2009). Many studies have demonstrated that computers are still found in computer labs, with limited access for integrated instructional uses, and students use technology far more outside of school than within the school environment, where it is often still seen as an "addition" rather than a part of the curriculum" (Schrum and Levin, 2009, pp. 65-66). Educational administrators should inspire and lead development and implementation of shared vision for comprehensive integration of technology to promote excellence and support transformation throughout the organization, engage in an on-going process to develop, implement, and communicate technology-infused strategic plans aligned with a shared vision and advocate on local, state and national levels for policies, programs, and funding to support implementation of a technology-infused vision and strategic plan. The principal, technology coordinator, and superintendent are urged to collaborate with key stakeholders, such as teachers, students, program and curriculum directors, parents. Community members and governmental officials should be involved in strategic planning initiatives that enhance the most effective technology use in education.

Below are some ways that school principals can adopt in order to transform their schools to become smart schools:

Develop an ICT Culture

The principals and the senior management play important roles in building a professional culture of teaching which is responsive to changes (Hargreaves and Dawe, 1990). ICT is becoming an important facet of school culture. If a school is to move forward with its usage of ICT, such a subculture must be embedded in the structure of the school. The principal's role is vital in developing an ICT culture in school and he should ensure that financial support is available to maintain and update the equipment on a rolling programme.

Leadership

Even the most inspiring ICT co-ordinator is going to make little impact on a school without the support of the principal. Principals continue to be the powerful definers of the culture, ethos and organisation of their schools, and it through working with individuals, within the school system that they are able to build the momentum and involve others in the process of change. While there are different viewpoints on educational leadership, most schools have adopted an approach that involves some type of collaborative management. In this way, schools are able to maximise the skills, commitment and energy of their staff to create a `potent and catalytic mix for successful change and development'. It is important to have deadlines and clear targets, as well as the support required to achieve

them (Fullan, 1992). Principals wishing to embed a positive ICT culture in the school must make their intentions clear to all through the processes that take place on a daily basis

Principal as an administrator, one should ask:
- Does the principal give attention to the ICT usage in subject areas on a daily basis?
- What are the available financial resources for ICT and to what extent does the principal involved in seeking additional funding for this purpose?
- Does the principal serve as a role model in the usage of ICT?
- How does the principal support staff development in ICT?
- What are the principal's immediate needs in developing a partnership?
- What kinds of professional development can he provide for his staff?
- What are the legal, social, and ethical issues that he must be concerned with?
- Does the principal take into account a person's ICT capability when selecting and promoting staff?
- What kind of technology plan can he implement?

As a teacher, one can ask these similar, but more learner-centered, questions:
- How can I partner with others to help my students?
- What support can I have with using new technologies?
- How can I use technology to enhance my instructional strategies in class?
- What could I do to impede or improve the progress of my students' learning?
- What are the legal, social, and ethical issues that I must be concerned with?

Generating and Maintaining an ICT Policy

As ICT is something that every teacher will use, it is important to have a policy to hold together the ways in which ICT is involves in lessons throughout the school. It is vital that all teachers share the values envisaged within it and that they understand its implications. It follows that every teacher should have some involvement in the production and upkeep of the policy.

Here are some suggestions for designing an acceptable use of policy in your school:
- Keep it simple, one page if possible.
- Use student-friendly language, but be very clear about the policies.
- Provide reasons for having the Acceptable Use Policy (AUP).
- Install penalties for misuse.
- Have a place for all stakeholders to sign an agreement with the AUP requirements.

Compliance training conducted yearly for all staff members could minimize any possible negative impact upon the way in which the acceptable use policy is carried out in the school. Technology changes constantly on a yearly basis. It makes sense, therefore, to institute a training program that is updated frequently.

TARGET SETTING

Target setting is a key activity for improving schools and it involves school community. Target setting provides a focus from planning changes and for monitoring progress towards personal or institutional goals. Targets should fulfil five characteristics summarised by the SMART acronym: Specific, Measurable, Achievable, Realistic and Time-related. Everyone can participate in the formulation of targets as well as sharing the responsibility for carrying them out.

The School Development Plan

The development plan represents specific activities which school intends to carry out in order to implement its policy and achieve its targets. ICT will undoubtedly form a part of each school's development plan and will probably continue to do so as the technology improves and our knowledge of pupils' learning with computers grow. The purpose of the plan is to help school to improve its use of ICT through reflection on existing practice and the development of new ideas. Schools need to undergo the process of finding out *where they are now* and identifying *where they wish to be* after a set time interval.

ACHIEVING AND SUSTAINING ICT CAPABILITY

A policy with respect to ICT and the inclusion of ICT in the school development plan alone will not result in the desired change in teachers' perspective. Teachers' thinking is now challenged. A key element in successfully achieving and maintaining an ICT culture is the establishment of development cycle where policy and whole-school

planning are put into practice through integrated schemes of work. Here teachers recognise the importance of undergoing certain types of training, depending on their needs, and understand the importance of reflecting on the effectiveness of their ICT usage in lessons. The challenge for managers is to create conditions which will help individuals and teams to achieve their goals and the overall goals of the school.

The ICT co-ordinator plays a significant part in ensuring that the development process is maintained. Policies and schemes of work of every school should be reviewed annually and developed in response to new technologies, educational initiatives, inspection findings and internal evaluation. It was recognised that not only could policy changes lead to improvements in practice, but that often policy needed to be developed to reflect and disseminate successful practice that had been implemented and evaluated informally.

MONITORING PROGRESS

For any change programme, monitoring and evaluation are the most important elements. Improving both quantity and quality is a daunting task and needs to be thought of in terms of both short- and long-term goals.   For schools embarking on a review of their policy, the normal starting-point is the auditing of current teaching and learning activities involving ICT. It is important to identify a baseline for development through an audit process for ICT and to monitor progress towards the goals or targets set.

SMART SCHOOLS: AN ESSENTIAL VISION FOR THE FUTURE

In this section, we draw together the strands presented in the previous sub-topics and set out a vision of what it means for a school to be successful in developing ICT capability.

Developing ICT-capable pupils

We have to develop pupils to become ICT-capable pupils. There is a role for ICT-based homework in bridging school and home culture; pupils who do not have adequate resources at home should be given opportunities to use school resources outside normal school hours.

Developing ICT-capable teachers

If schools are to improve the development of pupils' ICT capability, it is through the work of teachers and other staff that support learning that it will be achieved. Teachers should be given the opportunities to attend in-service training for ICT. They should get support from experienced colleagues and a sustained programme of curriculum-based training and development is vital. The level of ICT capability of the individual teacher is important, and is likely to influence classroom usage. Technology cannot survive in schools without full integration in professional practice by all educators, and that must both include and be led by educational administrators (Garland, 2010). School principals, in particular, need to understand and facilitate collaborative models of professional development. The delivery of in-service programs for teachers should be interactive and on-going. The content should address the 21st-century educational mandates for competency-based instruction and connected learning (Garland, 2008). Administrators and teachers alike need to engage in career-long learning networks. Empowering teachers to make changes in their instructional practices is a powerful means to help them meet their students' needs. The results of a study by Bogler (2005) showed that teachers who perceived that they could make positive changes in their instructional methods were most likely to also improve their commitment to professional development. Continuous in-service training, possible only with the proper allocation of time and resources, is an important element in integrating technology at any school site. Many educators can also benefit from a networked learning community that links other professionals regionally and globally to the education platform.

Developing ICT-capable classrooms

The ICT-capable classroom is a combination of

- *Teachers* who are prepared to use technology as a model for pupils.
- *Pupils* who are disposed to use ICT and can judge when it is likely to be helpful in their work, rather than just using ICT for the sake of it;
- *Resources* which are easily available – either in the classroom or in a nearby resource area.

Teachers need to link the learning located in the computer room with the activities in the subject classroom. The availability of an internet link has the potential to transform the culture of most classrooms. It makes a massive range and capacity of information and activities available, facilitates direct communication with people and organisations that were previously remote and perhaps uninteresting, and allows pupils to have new audiences for their work (Pachler & Williams, 1999). In the ICT-capable classroom, pupils will learn by watching, discussing and evaluating ICT use by others, as well as by taking their opportunity for *hands-on experience.*

In particular, principals and technology coordinators must support classroom assistance and professional development for teachers in implementing new technology resources for the targeted learning needs of all students. Special needs students are not always well served by the technology available in most schools because most

software programs and Internet search sites are only in English and learning disabled students are also found to be academically excluded from information communication (McKenzie, 2007). In addition to these socio-economic, language, and special needs issues in the digital divide are factors of race and gender. Social issues in technology use by students and educators involve not only safety and privacy but also ethical and communication practices.

Developing ICT-capable subjects

The role of subject leader is vital in developing a team of teachers who use ICT in the classroom. Subject leaders should keep up-to-date with ideas about links between ICT concepts and subject concepts, and should incorporate ICT into staff development activities in their subjects. It is vital for subject leaders to work with ICT co-ordinators.

Developing capable ICT co-ordinators

The co-ordinator in an ICT-capable school will have a high level of understanding of the basic ICT concepts and good higher order skills. They must be able to work with colleagues who may have very different teaching styles. The co-ordinator may well be the ICT resource manager as well, but even if not he or she will help plan the development of a school intranet system which can support teaching, learning and curriculum management, and act as a gateway to the internet.

Developing ICT-capable management

As mentioned earlier, the role of senior management team is crucial. The school's vision and drive should be focused on teaching and learning, not merely the acquisition of more resources. The ICT-capable school will have systems in place, accepted and adopted by all staff, to ensure that the process of development is continuous. The ICT-capable principal should also support the development of teaching and learning by effective use of management information systems to inform curriculum planning, staff development and appraisal, and pupil support.

External support and services

The ICT-capable school will make use of a range of external services – commercial, academic and governmental. The personnel in District Education Department are seen as a valuable filter for general findings on good practice. Schools' inspections are a powerful force in stimulating change. The most successful schools should response positively to any weaknesses in ICT teaching identified by inspection reports.

Staff development programmes for ICT capability

Staff development must also be based on teaching and learning needs, In-service training programmes are needed to ensure that staff have the requisite skills to make personal use of ICT equipment and that they understand how it can be used to help pupils to learn. The programme must also match the ICT policy and be in line with the school development plan. After attending INSET programmes, new techniques must be adopted to implement the changes in teaching processes required to take advantage of ICT.

PRINCIPALS AND ICT

Currently, there is no research on the aspects of how school principals in Malaysia acquire the necessary knowledge and skills in handling ICT software and hardware. But in Australia, Gurr (2000) had conducted a study based upon interviews in 1999 with 21 Victorian government school principals concerning the impact of ICT on their work. In the interview, principals were asked to describe the impact that information communication technology had on their work as principals. The interview was unstructured with principals free to explore the areas that they felt most relevant. The responses to these questions were thematically analysed. The themes that arose were as follows:

(a) Use of technology: Software

Principals used a variety of software and related administrative packages provided by the Department of Education (DOE).

(b) Use of technology: Hardware

The most significant hardware mentioned was the use of DOE supplied laptops. All principals had a desktop or laptop computer at work and many had their own desktop computer at home. For some, having their own work place computer has been a dramatic change.

(c) Use of technology: Networks

Many principals mentioned how their schools were developing networks or responding to government initiatives in this area and how these were impacting on the teaching and learning processes.

(d) Teaching and Learning

Most principals seemed to be energised by the possibilities of IT to change teaching and learning. Principals believed that they had an important role in this process of change.

(e)   Working with Staff

Principals relied on staff to assist with technology. This may have meant working with a dedicated IT person or with teaching staff with particular expertise. Principals sometimes had to support IT staff to make sure that the technology was being used efficiently, or simply to encourage the work of the support staff.

(f)   Administration

Technology is changing the way school administration operates. The management information systems constructed by the Department of Education allow schools to collect, store and manipulate most of the data related to the running of a school. Principals described how these systems gave them ready access to critical information. To access this quickly and to manipulate the information, principals needed to be competent users of technology.

(g)   Department of Education: Help and Hindrance

The use of technology by the Department of Education was cited as both helping and hindering the work of principals.

(h)   Principal Professional Development in Technology

Principals acknowledged the need for professional development. Some principals mentioned that whilst they had a need for professional development, they found it difficult to find the time. A lot of development in skills appears to occur on-the-job simply through the use of technology. One of the principals had a parent who was providing weekly training sessions for the principal. Principals also rely on staff expertise to help them learn new software or to solve technical problems.

(i)   Personal Qualities

There appeared to be two broad categories of principals: Those who were confident in their technology skills and those who were insecure about using technology.

In their own professional development efforts, administrators themselves must learn the technology that best applies to the profession. In order to ensure effective practices in the infusion of technology across the disciplines, professional development opportunities do not have to occur within the boundaries of a particular school or district. There are numerous conferences, both online and on-gound, that provide training for administrators and teachers in emerging technologies. Principals, program coordinators, and technology coordinators can stay connected by participating in annual conventions and conferences in which digital age collaborations are celebrated. The educational leaders are thus urged to attend an online or local technology conference in order to better stimulate innovation at the school level.

CONCLUSION

This paper had explained why it is important for principals to acquire the knowledge and skills which will enable them to transform their schools into smart schools. Based on the findings of many researches in Malaysia, it was obvious that most principals are not prepared to do this. This paper had discussed the `how' and the `what' aspects in integrating technology in the teaching and learning processes as well as in the administration of the schools. All principals must transform the schools into smart schools by the year 2020. Principals now have to be sophisticated users of management information systems. They also must become proficient users of a variety of software including word processing, spread sheets, databases and email. They don't have to be network experts, but they have had to ensure that their school is developing appropriate networks. The nature of work in both teaching and learning and administration has changed, and whilst old practices can be done more efficiently, the technologies have allowed new practices to develop.

13th International Educational Technology Conference

Social Media as a Non-formal Learning Platform

Brian Lee[126]

SIM University, Singapore

Introduction

The world is seeing a paradigm shift in the way it considers education; where 50 years ago a university degree would be the ticket to a plethora of job opportunities, the corporate world has since moved from focusing on academic qualification and work experience in seeking out potential hires to actively seeking job candidates possessing specific character traits, emotional intelligence and social aptitude, or "soft skills" that are evaluated in equal if not higher importance to academic achievement. The view is further endorsed by global organisations such as the Organisation for Economic Co-operation and Development ("OECD") and the United Nations Educational, Scientific and Cultural Organisation ("UNESCO"), both of whom have extensively defined and endorsed lifelong learning – an overarching philosophy defined by the OECD as consisting of formal, non-formal and informal learning – as a key proponent for economic development (Tuijman, 1996) as well as social wellness (Delors, et al., 1996).

Traditional education systems already have formal learning down to a near-rigid science; in Singapore, which is ranked 11th of 48 as at 11 May 2012 in the Universitas 21 benchmark for higher education (Williams, de Rassenfosse, Jensen, & Marginson, 2012), at least 14 years of an average person's life will be spent in pursuit of a very well-structured formal education, beginning in kindergarten at four years of age to earning a diploma or a degree at a tertiary institution when the individual has entered his or her early 20s. Yet, soft skills development is hardly dependent on formal learning – such assets are attained through hands-on experience, relationship-building, and maturing of thought processes *out* of academia more so than in it. As noted by Fuller, et al. (2003, p 7), "… people learn in many different settings and that only some of this learning is classroom-based and/or accredited through qualifications, and that it can occur over the life course."

The point of graduation from formal education into working life is where informal and non-formal learning will take precedence in a person's further skills development. Drawing from a CapitalWorks employee survey (Cross, 2003), informal learning forms 87% of total contribution to job proficiency as weighed against formal learning methods such as job training and classes.

---

[126] Corresponding author.
E-mail address: brianlee@unisim.edu.sg

Tough (2002) also highlighted this by suggesting there is a "20/80 split" in learning, with approximately 20% of concerted learning endeavours being formal or non-formal and 80% being informal.

The authors found that digital technologies: [Play] a beneficial role in overcoming some of the barriers which may prevent adults from engaging in learning beyond formal settings. Not only can technologies such as the internet provide the information people need to inform them what opportunities are available, they can also offer learning opportunities which are more flexible, more convenient, and, for some learners, more engaging than other options available to them (Hague & Logan, 2009, p. 17)

Given the pervasiveness of the available technology and the tools that are commonly accessible, this proposal investigates how adult learners make use of digital media tools as a platform for non-formal learning. Digital media tools consist of tools as smart phone applications, social media such as blogs, Facebook and twitter and any other Web 2.0 based internet applications.

According to the glossy of terms in the European Centre for the Development of Vocational Training (Cedefop, 2001) formal, non-formal and informal learning are defined as:

- *Formal learning* consists of learning that occurs within an organised and structured context (formal education, in-company training), and that is designed as learning. It may lead to a formal recognition (diploma, certificate). Formal learning is intentional from the learner's perspective.

- *Non-formal learning* consists of learning embedded in planned activities that are not explicitly designated as learning, but which contain an important learning element. Non-formal learning is intentional from the learner's point of view.

Research Methods
The main study group was facilitated by a group of lecturers who set the ground rules and were in constant touch with the respondents for the main study. To gain a better understanding of the informal learning tools used in the study and to give the Delphi study findings some context, an in-depth interview was conducted.

Four facilitators of the six-week COM355e Multimedia Public Affairs Reporting at SIM University, which was conducted in January 2010, 2011, and 2012 were invited to participate in an in-depth interview in the form of an email questionnaire. These participants were so chosen because of their use of social media as learning tools during the course of the module, which augmented the central Blackboard Discussion Board.

The facilitators will be referred to as respondents, and the use of social media and other technologies as teaching tools will be referred to as non-formal learning tools in this report.

Key Findings

The respondents found that the Blackboard Discussion Board, stipulated by the university as part of the course and in consultation with UniSIM's educational technologists offered a convenient one-stop shop for students as the ability to constantly push relevant and current content in real-time. As one participant mentioned:

"Blog(ging) in teaching multimedia journalism provides a holistic platform for students to experience the range of media elements introduced in the course (video, photos, graphics, animations, audio, music, text) actively and intuitively. Video has great visualizing power to start discussions and engage students in learning about multimedia."

These non-formal teaching tools not only facilitated peer-interaction and peer-critique, but also functioned as a platform for submitting assignments, clarifying course assignments requirements, concepts, terms, etc and informal raising of any concerns related to courses.

The preparations needed to introduce these tools into the curriculum and to students were surmised in two steps: content curation, and student instruction. Before the course started, triggers for discussion were carefully selected, expectations articulated, and relevant materials curated. When the course commenced, students had to be provided with instructions which included setting up of their blog, housekeeping and administrative procedures, and the Discussion Board populated with engaging threads to stimulate student participation.

The level of engagement that was required by the students in using the tools drew varied responses which from the need to log in at least once daily, to logging in once every 2 – 3 days being deemed sufficient. Though the frequency of the logins needed varied, it was of unanimous consent that effort was needed by both tutors (to provide information to prompt activity) and students alike to overcome the challenge of self-directed learning – to acquire the mindset to explore and embrace new dimensions of learning that is on demand, informal and social.

The Facilitators

The respondents agreed amongst many points that facilitators had to make their presence felt by contributing regularly to the discussion boards not only to show that the boards are being 'monitored', but also to motivate students. It was however, wise to regulate the frequency and volume of online activities such as exercises, extra readings and notes as these could bog down the learning process instead cause disinterest amongst students. It was also suggested that facilitators should have a consistent manner of organising information on any non-formal learning tool so that students may not miss out pertinent information. A respondent surmised their key takeaway as the following:

"I need to re-imagine my role as a journalism and media educator. I need to innovate teaching approaches and adopt new platforms – to move from gatekeeping and transmitting of information to one of aggregating and curating content, challenging and verifying assumptions, and providing platforms for students to connect and collaborate as peer learners."

While students were interested in non-formal learning methods and appreciated the additional information and discussion points beyond the graded requirements that the tutors provided, some students displayed motivation to interact and engage with their peers only in view of being awarded mark – the platforms were viewed as simply as a tool for submitting their works.

In a post-course evaluation done by the students, 7 out of 10 students had agreed or strongly agreed that the non-learning platforms employed in the module had reinforced their understanding of the course materials, provided insights into their strengths and weaknesses, and sustained their learning interest through the multimedia tools used.

An interesting thought arose from this discussion in which an a respondent expressed that coupling the non-formal learning platform with a social component such as blogs and discussion forums could debunk the transmission myth that many students still have by forcing them to play an active role in exchanging and co-creating information.

Motivation, Opportunity, and Ability as Factors of Effectiveness in Learning

Whilst utilising non-formal learning tools was reported to have a positive impact in the motivation and learning amongst students, possible regressive effects of information overload (too much learning tips, links, and notes being posted on Blackboard), and inculcation of an inhibitive consciousness amongst students which may develop in fear of being criticised by their peers in an open environment were highlighted.

Self-motivation was reported as the basic factor needed for individual students to get on to the platform to be able to participate and learn when asked how motivation, opportunities, and abilities factored into effectiveness to learn from the non-formal learning platforms. Though motivation had to be coaxed by incentivising participation, opportunities and ability amongst the students were abundant, as many of them were digital natives or avid users of communication technologies who embraced non-formal learning platforms effectively. In fact, many students accessed materials online and participated in the activities during office hours, and demonstrated their abilities in ECA multimedia projects that served as a showcase of their ability to integrate ideas, practices and theory. A respondent opined that students were motivated to:

" think differently as a result of being able to exploit a new communicative environment where 'learning is more than being taught.' Because knowledge is distributed among many stakeholders and 'the answer' does not exist or is not known, students learn proactively and take responsibility for their learning. "

Students welcomed the break from textbooks and prescriptive learning to the flexibility that non-formal teaching tools offered - offering 'anytime, anywhere' access to knowledge that formal teaching platforms lack. Such an environment where knowledge is externalised (online, transcontinental, virtual) and shared, and where its production is a collaborative effort was reported to develop more engaged students.

The break away from formal learning shifted the emphasis to skills, where students are enabled to move away from memorising facts and rules to applying knowledge to complex real-world situations and see the relevance of the course beyond the curriculum and textbook.

Implications

Building an additional e-platform, e.g. a dedicated Facebook page for students' participation require much upfront effort from tutors and may not justify its need just for a short 6-week course, and may even dilute the effects and outcomes gained from the existing platforms. It was suggested that just one main complementary platform, e.g. Facebook, be selected to complement the Blackboard Discussion Board be incorporated as part of the upfront formal course development and structure, so that the implementation can be easily rolled out to all the tutors teaching the same course.

Student Centered Learning in Statistics: Analysis of Systematic Review

Hairulliza Mohamad Judi[a,127], Noraidah Sahari[a]

ᵃSchool of Information Technology, Faculty of Information Science and Technology, Universiti Kebangsaan Malaysia, 43600 UKM Malaysia

Abstract

This paper reports the initial results of research relatedto student-centered learning in statistics education. Student-centered learning (SCL) suggests students to engage actively as doers in education setting who are empowered to decide on what, when, where, and how to learn. Although SCL in statistics instruction research has rapidly increased, there is little study to evaluate and synthesize the results of relevant research in this area, specifically within the context of computer support education. The objective of this paper is to identify the direction of recent research in SCL usage in statistics teaching and learning. Four research questions were raised in this study: What are the important issues in student centered concept in statistics teaching and learning? What are the SCL methods in statistics course? Which methods are used in statistics education research? What type of computer supported material sources involved? This paper applies systematic review to summarize the research by performing synthesis on research resources. Results of the review were presented and discussed in the paper.

*Keywords:*Student-centered learning; Statistics; systematic review

Introduction

Traditionally, teaching and learning processes are conducted actively by instructors or teachers. This approach is now replaced by student-centered learning (SCL). SCL provides an environment where students play more active role in obtaining knowledge by accessing key materials and resources in the learning process. SCL suggests major changes in the central issue of teaching and learning.Lu et al. (2007) summarize the main transformation in education key factors quoted by Oblinger& Maruyama (1996) in terms of the role of instructor and student, and the notions of place and time. SCL suggest the instructor to play a role as a learning facilitator instead of a learning organizer. Meanwhile, students engage actively as doers in education setting who are empowered to decide on what, when, where, and how to learn.

Implementation of SCL in statistics education as in the case of other subjects require preparation include education program, course content, learning outcome and general experience with the subject. The general assumption of statistics education at university level typically highlight the difficulty of the course content, relevancy to future job specification and the attitude of nothing could change the initial perception of the course (Gonzalez et al, 2010).

Although SCL in statistics instruction research has rapidly increased, there is little study to evaluate and synthesize the results of relevant research in this area, specifically within the context of computer support education. The objective of this paper is to identify the direction of recent research in SCL usage in statisticsteaching and learning. Four research questions were raised in this study: What are the important issues in student centered concept in statistics teaching and learning? What are the methods used in SCL for statistics course? Which methods are used in statistics education research? What type of computer supported material sources involved?

2. Student-centered learning

SCL model suggests that students are flexible and empowered individual to access important sources of knowledge (Lu et al, 2007). These resources may include course instructor, course material, library and internet that provides most of the

---

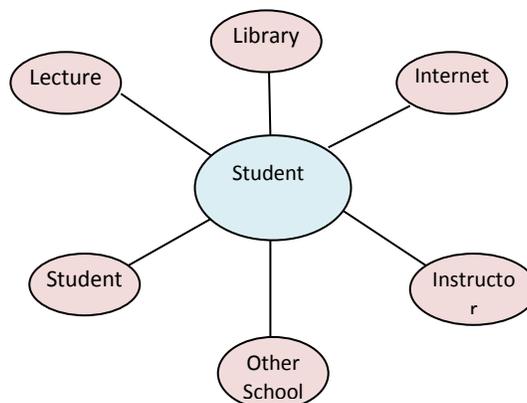
E-mail address: hmj@ftsm.ukm.my

materials, other students as peer in the learning process. With the availability of ICT, students have more flexible access to multiple resources including the library, the Internet, instructors, other students, lecture, and other school. Figure 1 presents this relationship.


43. Fig. 1. Student-centered learning (Oblinger and Maruyama, 1996)

SCL environment consists of a number of methods. Among the important methods are computer supported collaborative learning, collaborative learning, problem-based learning, active learning and cooperative learning. In computer supported collaborative learning (CSCL) environments, students collaborate together to solve a problem with the help of computer technology. CSCL trains students with important procedure by sharing their thoughts, exploring computer tool to construct solution and using skills in a knowledge building to solve the given problems (De Corte, Verschaffel, &Eynde, 2000).

Collaborative learningitself is a method that enables students to work together through the process of collaboration and brainstorming to retrieve vast amount of informationefficiently, in a meaningful way to create new ideas or to accomplish learning tasks (Lipponen, 2002). Problem-based learning (PBL) method suggests that students to be guided to work in small groups where they identify what they do and do not know, and what information they need to solve the problem at hand (Baturay and Bay, 2010). Therefore, students in PBL method take responsibility for and get involved in their learning, whereas instructors are responsible for organizing suitable content that represent real problem to be solved and to facilitate group processes and learning. In this method, students are required to apply and develop critical thinking and working in team.

Cooperative learning (CL) involves small groups for example two students who work together to maximize their own and each other's learning(Johnson & Johnson, 1998).Four types of team work are introduced in CL i.e. formal, informal, cooperative base groups, and academic controversy that provide one another with efficient and effective help and assistance. CL emphasizesgroup members to exchange information or materials, discuss the concepts and strategies being learned, decide how to solve problems, and provide for the necessary support and encouragement (Johnson & Johnson, 1996).In active learning environment, students were trained to think critically and reflectively helped them become self-directed learners(Justice et al., 2007). As a consequent, they were able to weigh evidence from a variety of sources, synthesize information, and communicate their ideas.

3. Method

The method for this study applies systematic review. Kitchenham and Charters (2007) define systematic review is a process for identifying, evaluating and interpreting research materials to answer a number of research questions. The purpose of systematic review is to summarize the research by performing synthesis on research resources. The review process is conducted in systematic procedure. It provides means or ways to conduct a literature reviewusing extensive and comprehensive strategies based on severaldefined stages (Norsarimah, 2008). The method could be categorized intothree major phases. In design phase, the major activities involve identification of the need of the

review, development ofthe review protocol and formulation of the research questions. The second phase deals with searching related research. The main activities in the second phase include identification of relevant literature by conducting acomprehensive and exhaustive search and selection of primary studies based oninclusive/exclusive criteria. In the final phasei.e. analysis and interpretation, these procedure are performed: data extraction together with the quality assessment, synthesis of evidence, and interpretation of results and report writing.

The design phase require the researchers to conduct in depth literature review to justify the need of the review. The rational is reported in introduction section. The formulation of research questions produces four useful guidelines to be used in the review:What are the important issues in student centered concept in statistics teaching and learning?What are the methods used in SCL for statistics course?What kind of test was used to evaluate SCL implementation in statistics course?What type of computer supported material sources involved?

The second phase deals with searching related research. The main activities in the second phase include identification of relevant literature by conducting acomprehensive and exhaustive search and selection of primary studies based oninclusive/exclusive criteria.

To examine relevant research in the second phase, the researchersidentify relevant literature. The researchers conduct database search on SCL in statistics instruction using prominent sources: Elsevier, Sage, ERIC and IEEE. These data bases were identified as a source of information domain because top ranking journals in education are widely covered and published, including the publication of conferences e.g. International Conference on Multimedia Computing and Systems (ICMCS), International Conference on Education Technology and Computer (ICETC), and International Conference on Information and Multimedia Technology (ICIMT). The review protocol applies two keywords i.e. "Student-Centered Learning" and "Statistics".

Theinclusive criteria are as listed: Research papers published between the years 2005 - 2011;Research paper that discusses the topic of SCL in statistics education. Meanwhile, the rejection of a research papers are those that meet this criteria: Research papers published other than English;Research papers outside the domain of SCL in statistics education. The analysis and interpretation is discussedin the next section.

Results and Discussions

The search protocol produces 67 research papers.Using the exclusive criteria, 20 papers were rejected leaving only 47 papers to be accepted for analysis. The percentage for valid paper is 70% from the initial 67 retrieved research papers.Table 1 summarizes the result. The entire result would be presented according to the intended research questions.

4. Table 1. Paper reviewed

Paper	Number
Total fulfill inclusive criteria	67
Total fulfill exclusive criteria	20
Total valid	47

Research question 1: Issues ofSCL in statisticseducation

A number of issues were identified from the research paper. Table 2 presents the distribution of issues. Each paper brings at least one issue:main issue and additional issue, if available. The important issues are techniques of teaching and learning, assessment of technique, computer supported learning: design and development, interaction, motivation and attitude, ability and aptitude.

Regarding techniques of teaching and learning in statistic SCL, many aspects were discussed. Sung and Hwang (2013) emphasise the need for proper teaching and learning design to ensure intended result could be achieved. Without proper designsuitable learning support, negative impacts of employing computer game in statistics instruction could occur.Tsai (2010) andSendag and Odabasi (2009) discuss the suitable environment for efficient teaching and learning to take place such as help by instructor are needed to seek information and solve problems in spoon feed environment. Ke (2013) and Schoor and Bannert (2011) were interested in the interaction in learning activities and motivation on knowledge acquisition during SCL session.

The second issue,assessment of techniqueemerge due to the need to conduct empirical study that support the usefulness of teaching and learning method, specifically within the context of teaching statistics This may include learning tool such as video podcasts (Kay and Kletskin, 2012; Lloyd and Robertson, 2012), computer system (González et al, 2010),integrated computer technology (Lowerison et al 2006) or teaching method (Harpe et al, 2012).

The design and development of computer support were considered important issue because the use of computer technology may motivate students in the learning experience of statistics (Lopez-Morteo and Lopez, 2007). Computer learning tool was designed to suit the selected learning method such as PBL scenario for Statistic course (Nurnadiah et al, 2009), or to be able to generate different statistical exercises and to provide immediate feedback to students' answers(González et al, 2010).Issues on interaction, motivation and attitude, and ability and aptitude were also receivedattention from researchers. For example, Lin (2010) evaluates the interaction among students in the collaborative problem posing and solving learning system and understands their intention to use.Lloyd and Robertson 2012 assess the effect of screencast tutorials on learning outcomes, including statistical knowledge, application, and interpretation.

Research question 2: SCL Method used in statistics education

There are ten identified methods used in the research paper, as in Table 3. Computer supported collaborative learning,collaborative learning and problem-based learning appear to be the most widely used SCL method. According to Lazakidou and Retalis (2010) computer supported collaborative learning (CSCL) allows students to jointly work out a solution to a problem, engage themselves to the knowledge building process using computer technology. Combinationof SCL methods werealso used in statistics teaching and learning (Cavanagh, 2011). This result implies that statistics instructors are required to be more flexible, to use combination of traditional teaching approach with other techniques in lecture and tutorial to make the session more interesting.

Research question 3: Method used in statistics education research

Table 4 presents the method of statistics education research. Experiment appears to be the most widely used approach in this topic (Sung and Hwang, 2013;Lazakidou and Retalis, 2013; Chiu and Hsiao, 2010; Tsai, 2010; Chang et al., 2012; Schoor and Bannert, 2011, Mercier and Frederikson, 2007; Jitendra et al., 2011; Harpe et al, 2012).Among the reason to use this method is due to statistical controlled design in the study to examine the impact of teaching style on learning (Giles et al, 2006).

The use of survey was also relevant, especially to assess students' attitude towards statistics (Hall and Buzwell, 2013) and to measure students' perception on the extent to which the lecture activities helped them to learn and understand the course content (Cavanagh, 2011). Case study was used to expand the methodology involved in the lesson study process as well as some practical ideas for its implementation (Davis and Blanchard, 2004; Roback et al, 2006).

Research question 4: Types of computer used in statistics education

Half of the papers were using computer technology in statistics instruction (refer Table 5). The computer technology used was categorized either as statistics learning tool/ multimedia, web-media system, e-workbook or game. These computer technology was used in statistics courses to improve the statistical abilities of students by continuously engaging these students to certain activities that could develop their understanding in long run without much intervention and supervision by instructor, who would be far from the student's sight (Jover et al, 2010).

Among the proposed statistics learning tools involve linear and non-linear multimedia courseware (Nurnadiah, 2009), Interactive Instructors of Recreational Mathematics (Lopez-Morteo and Lopez, 2007), and a randomized statistical exercises tool (González et al, 2010). Web-based system or tools such as problem-based video podcasts were used to teach the subject (Kay and Kletskin, 2012).Web-based classroom technology including podcasting, vodcasting, and screencasting, is on the rise in higher education (Lloyd and Robertson, 2012).

Conclusion

The initial results of research related to student-centered learning in statistics education. Systematic review was used to summarize SCL related research in statistics by performing synthesis on research resources. The results suggest a few emerging issues in SCL, identify the SCL methods in teaching statistics, discover research methods used by researcher in this domain and determine computer technology used in statistics SCL classroom. The finding from this paper may givessome direction of recent research in SCL usage in statistics teaching and learning.

Students' attitudes towards computer-assisted language learning

Mojgan Afshari[128], Simin Ghavifekr, Saedah Siraj & Duan Jing

Department of Educational Management, Planning and Policy, Faculty of Education, University of Malaya, 50603 Kuala Lumpur, Malaysia
mojganafshari@um.edu.my

Abstract

Faculty of languages and linguistics at university of Malaya in Malaysia has invested substantially to introduce students to computer-based language learning materials and to integrate technology into existing curriculum. The purpose of this study was to examine the attitudes of students towards use of computer-assisted language learning (CALL). Data was collected from 100 students using a survey questionnaire. Findings of this study indicated that students had moderate attitudes towards CALL. Moreover, study results indicated that perceived usefulness, perceived ease of use, and subjective norms were significant predictors of computer attitudes. Implications for student training and suggestion for further research were provided.

Keywords: Computer assisted language learning, computer attitude, perceived usefulness, perceived ease of use

1. Introduction

Many researchers believe that integrating information and communication technology in education supports pupils in their own constructive thinking and engages them in cognitive operations (Teo, 2006). Pemberton, Borrego and Cohen (2006) conducted a study on using interactive computer technology to enhance learning and found that the use of ICT creates a powerful learning environment and intrinsically motivate students to learn and participate in classroom activities. In line with this idea, Wright (2008) stated that academic learning accompanied by computer technology offers students much more confidence and interest in the process of exploring and learning knowledge. It would seem that computer technology is an important tool to support new ways of teaching and learning. It can be used to develop students' skills for cooperation, communication, problem solving and lifelong learning (Voogt, 2008).

Nowadays, computers have been recognized as a valuable instrument in teaching modern foreign languages in universities. Lee (2000) stated that using computer in second language instruction can improve practices for students through experiential learning, motivate students to learn more, enhance student achievement, increase authentic materials for study, encourage greater interaction between teachers and students and students and peers, emphasize individual needs, escape from a single source of information and, enlarge global understanding. It is clear that the field of English as a Second Language can be enhanced through the use of computer technology.

Teo (2006) found that students' attitudes towards computer have an influential role on their acceptance to use the computer as a learning tool and their future behaviours towards the computer such as using it for further study and vocational purposes. Similarly, Zhang (2011) stated that students' attitudes towards the computer-assisted language learning (CALL) can be considered as a key predictor in terms of successful application of computer to language learning. Moreover, Ajzen and Fishbein (1977) stated that ''attitudes toward targets will predict multiple-act criteria, provided that the attitudinal and behavioural entities involve the same target elements'' (p. 981). It would seem that awareness of students' attitudes toward computers can be ''a critical criterion in the evaluation of computer courses and in the development of computer-based curricula'' (Woodrow, 1991, p. 165). Therefore, computer attitudes should be considered as key constructs in predicting technology acceptance for future use.

Several models were developed to help in predicting technology acceptance. Among these models, the Technology Acceptance Model (TAM) is the most popular (McCoy, Galletta, & King, 2007). It is testable and has received substantial empirical support for being robust and parsimonious in predicting technology acceptance and adoption in various contexts and using a variety of technologies (Teo, 2009) (Fig.1). This study used this model to understand students' attitudes and the factors that influence these attitudes. The successful integration of computers in education is largely affected by students' attitudes and their willingness to embrace the technology (Pektas &

---

[128] Corresponding author.
E-mail address: mojganafshari@um.edu.my

Erkip, 2006). Studying students' attitudes can help us to answer some questions relating to acceptance and usage of technology in teaching and learning.

2. Literature review

Many researchers believed that computer technology is the ideal tool to enhance students' learning in English. Beatty (2003) defined computer-assisted language learning (CALL) as "any process in which a learner uses a computer and, as a result, improves his or her language" (p.7). Warschauer (1996) stated that computers help students to learn English in three ways: computer as tutor (offers tutoring to students), computer as stimulus (improves synthetic and analytic thinking of students), and computer as tool (e.g. grammar checking, word processing, collaborative writing, and Internet). It is clear that the computer should be integrated into teaching and learning process. Computer technologies can enhance interpersonal and communication skills and can provide opportunities for cooperative learning. Hence, using computers not only increase instructional effectiveness and efficiency, but also promote positive social interactions and enhance students' motivation for learning (Afshari et al., 2007).

According to Teo (2006), attitudes toward technology play a crucial role in the adoption of instructional technology and students' learning in the classroom. Attitude is also considered as one of the affective variables in the success of implementing technology in the second or foreign language learning process. In line with this idea, Ayres (2002) conducted a study on students' attitudes toward CALL and reported that 80% of the students believed that CALL is relevant to their needs, 77% of the students agreed that CALL gives useful information, and 66% of the students thought that more CALL should be used in their learning. Moreover, he added that attitude is one of important factors which promote or inhibit the successful implementation of any initiative. Hence, it is important to examine students' attitudes toward computer at different stages of development.

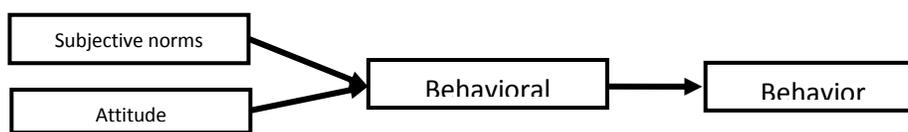
In addition, several attitude theories and models have confirmed the relationship between attitude and behaviour. In 1980, Ajzen and Fishbein introduced The Theory of Reasoned Action (TRA) and stated that behavioural intent of a person determine his performance of a particular behaviour and this behavioural intent is identified by two things, attitude and the subjective norms within which a person operates, i.e. the cultural norms of the organization. Marcinkiewicz and Regstad (1996) conducted a study on the influence of subjective norm on computer use and found that subjective norm is most predictive of computer use, alongside self-competence, perceived relevance and innovativeness. Moreover, Pan, Sivo and Brophy (2003) and Teo and his colleagues (2008) reported that there is a positive relationship between subjective norm and attitudes.


Figure1: Theory of Reasoned Action (TRA) (Ajzen & Fishbein, 1980).

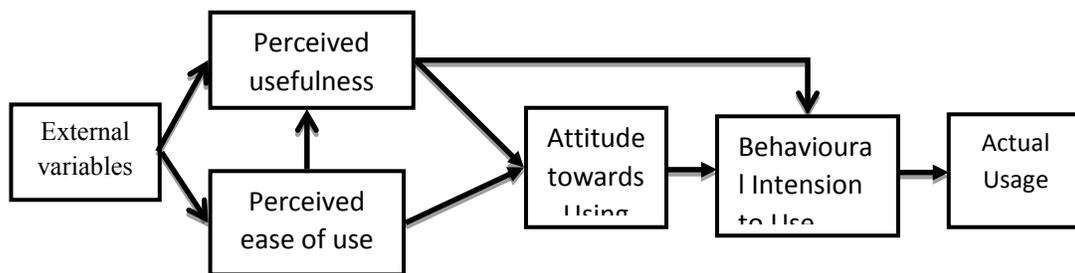
Davis et al. (1989) developed the Technology Acceptance Model (TAM), based on the Theory of Reasoned Action. TRA is general whereas TAM relates to technology; TAM takes this model and derives from it two variables which determine attitude (Gilbert & Kelly, 2005). These variables are perceived usefulness, and perceived ease of use. Perceived usefulness refer to the extent to which people believe a technology will help them to do a better job, and perceived ease of use shows the ease or lack of effort to actually use it (Davis, 1989). When people believe that computer is easy to use, nearly free of mental effort, and helpful to learning; then they may have a favorable attitude toward using computer to learn English. It can be predicted that such people may use computer technologies frequently and intensely. Moreover, Moon and Kim (2001) hypothesized that perceived ease of use related to perceived usefulness.


Figure2: Technology acceptance model (Davis 1989)

Although the TAM has been validated and has been examined its importance on the adoption of innovation since 1989, studies on its application in education is limited. Venkatesh (2000) suggested that "Future research should examine mandatory usage contexts to test the boundary conditions of the technology acceptance model" (p. 358). The purpose of this study is to use TAM model to examine students' attitudes towards computers. This study extends the TAM by including an additional user-related variable (subjective norm). The objective of this study was achieved by answering the following hypotheses:

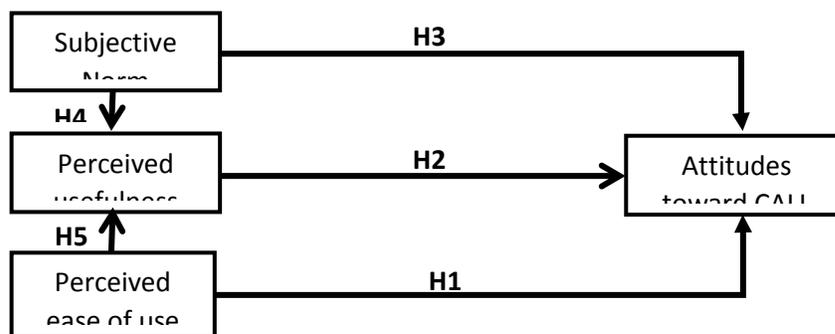
Hypothesis 1: There is a positive relationship between perceived ease of use of computers and students' attitudes toward CALL;
Hypothesis 2: There is a positive relationship between perceived usefulness of computers and students' attitudes toward CALL;
Hypothesis 3: There is a positive relationship between subjective norm and students' attitudes toward CALL;
Hypothesis 4: There is a positive relationship between Subjective Norm and perceived usefulness of computers;
Hypothesis 5: There is a positive relationship between a student's perceived ease of use of computers and her/ his perceived usefulness of computers.


Figure 3: proposed research model

3. Methodology

A structural equation modeling (SEM) approach was used in this study to develop a model that shows the relationships among four variables: subjective norm, perceived usefulness, perceived ease of use, and attitudes toward CALL. Also, a quantitative method was utilized to collect data from students at the Faculty of Languages and Linguistics in University of Malaya.

Participants were 100 students at the Faculty of Languages and Linguistics in University of Malaya. They were selected from undergraduate (42%) and postgraduate students (58%). Among the participants, 21% were male while 79% were female. In terms of age, 43% of respondents were within the 23-25 age range, 31% were within the 18-22 age range, 22% were within the 26-30 age range, and 4% were more than 30. Almost every student had access to a computer at home (99.9%) and majority of them (67%) had much competence in using computer. Approximately 80 % of the respondents used computers daily and 86% of students reported that they did not use computer-assisted language learning lab in faculty.

A survey questionnaire was administered to the participants who volunteered for this study. The instrument was composed of 22 statements on attitude, 7 statements on PU, 3 statements on PE, 2 statements on SN. Participants gave their opinions to each statement on a 5-point Likert scale, ranging from 1 (strongly disagree) to 5 (strongly agree). Participants from various field of study completed the survey questionnaire provided by the researchers. The purpose of the study and its potential usefulness explained clearly for participants. Those who wished to participate were assured about confidentiality of their responses. Further, the enumerators provided those participants with briefing on how to fill the questionnaire. The enumerators checked the questionnaire for completeness immediately upon return. On average, each participant took not more than 20 min to complete the questionnaire.

4. Data analysis

Test of the measurement model

To review the reliability and validity of the measures, a confirmatory factor analysis was carried out. The results of the measurement model have been shown in Table 1. All factor loadings are above 0.85 and range from 0.85 to 0.99. Together, the principal component analysis showed that these three factors in the proposed model explained 87% of the total variance. All standardised regression weights are above 0.85. The multiple square correlations (R^2) of all items ranged from 0.73 to 0.99, indicating that these items were explained by their predictors at a range from 73% to 99%. Also, Convergent validity of these instruments was calculated.

Convergent validity refers to a set of variables that presume to measure a construct (Kline, 2005). It can be tested using: average variance extracted (AVE) and factor loading. According to Hair et al. (2006), AVE and factor loading on a factor more than or equal 0.5 indicate a high convergent validity. The average variance extracted (AVE) ranged from 0.78 to 0.99 which were above the minimum level of 0.5 (Fornell & Larcker, 1981). Moreover, construct reliability was measured. As shown in Table 1, the construct reliabilities ranged from 0.77 to 0.99 which exceeded the minimum level of 0.7 (Chin, 1998). It would seem that the measures have adequate reliability and convergent validity.

Table 1. Results for the measurement model

Latent Variable	Manifest Variable	Factor Loading (>0.50)*	CR (t-Value)	SRW	R^2	AVE (≥0.5)	Construct Reliability (CR)
Subjective Norm	SN1	0.99	50.976 ***	0.99	0.98	0.99	0.99
	SN2	0.99		0.99	0.98		
Perceived usefulness	PU1	0.85	13.452 ***	0.85	0.73	0.78	0.97
	PU2	0.89	14.890 ***	0.88	0.78		
	PU3	0.87	14.40 ***	0.87	0.76		
	PU4	0.90	15.668 ***	0.89	0.80		
	PU5	0.91	16.111 ***	0.90	0.82		
	PU6	0.89	15.328 ***	0.89	0.79		
	PU7	0.89	15.302 ***	0.89	0.79		
	PU8	0.93		0.93	0.86		
Perceived ease of use	PEU1	0.91	14.980 ***	0.91	0.83	0.81	0.96
	PEU2	0.89	13.839 ***	0.88	0.78		
	PEU3	0.91	14.793 ***	0.90	0.82		
	PEU4	0.90		0.89	0.81		
Attitudes towards CALL	Affective	0.99		0.99	0.99	0.97	0.77
	Cognitive	0.98	48.994 ***	0.98	0.96		
	Behavioral	0.99	53.297 ***	0.98	0.97		

SRW: Standardized Regression Weight.

Average variance extracted= AVE= $(\Sigma\lambda 2)/n$
Construct reliability = CR= $(\Sigma\lambda) 2 / (\Sigma\lambda) 2 + (\Sigma\delta)$

Furthermore, this study assessed the discriminant validity. Discriminant validity is considered adequate when the variance shared between a construct and any other construct in the model is less than the variance that construct shares with its measures (Fornell et al. 1982). The variance shared by any two constructs is obtained by squaring the correlation between the two constructs. The variance shared between a construct and its measures corresponds to average variance extracted. Discriminant validity was assessed by comparing the average variance extracted for a given construct with the square of correlation between that construct and all other constructs. According to Table 2 in all cases, the AVE was greater than the square of correlation between the two factors which indicate that all variables meet the requirements of discriminant validity.

	Computer Attitude	Subjective Norm	Perceived Usefulness	Perceived Ease of Use
Computer Attitude	1	0.77	0.97	0.98
Subjective Norm	0.77	1	0.73	0.74
Perceived Usefulness	0.97	0.73	1	0.96
Perceived Ease of Use	0.98	0.74	0.96	1

Table 2: Square of correlation between constructs

A variety of indices such as the $\chi 2$ statistics, comparative fit index (CFI), Tucker-Lewis index (TLI), Goodness-of-Fit index (GFI), and root mean square error of approximation (RMSEA) can be used to obtain a comprehensive model fit (Hair et al., 2006). The level of acceptable fit and the fit indices for the proposed research model has been indicated in Table 3. Based on these criteria, we can conclude that the measurement has a good fit.

Table3: Fit indices for the measurement model

Model fit indices	Values	Recommended guidelines	References
$\chi 2$	449.57	Non-significant	Klem (2000), Kline (2005), McDonald and Ho (2002)
CFI	0.92	≥ 0.9	Klem (2000), McDonald and Ho (2002)
TLI	0.91	≥ 0.9	Klem (2000), McDonald and Ho (2002)
GFI	0.94	≥ 0.9	Klem (2000), McDonald and Ho (2002)
NFI	0.92	≥ 0.9	Klem (2000), McDonald and Ho (2002)
RMSEA	0.072	<0.08	McDonald and Ho (2002)

4.2 Test of the structural model

Several indices were examined to test the structural model. Findings indicated a good model fit ($\chi 2$= 425.23, P< 0.001, GFI=0.92, AGFI=0.94, CFI=0.91, NFI=0.916, TLI=0.925, and RMSEA=0.071). The results of the hypothesis test and path coefficients of the proposed research model have been shown in Figure 4. Findings indicated that all hypotheses were supported by the data. All the hypotheses were significant indicating PU significantly influenced students' attitudes toward CALL (b = 0.52, P < 0.05), supporting hypothesis H2. SN was found to be significant in influencing PU (b = 0.24, P< 0.05) and attitudes toward CALL (b = 0.18, P < 0.05), thus supporting hypotheses H4 and H3. PEU was significant in influencing PU (b = 0.34, P< 0.05) and CA (b=0.28, P < 0.05), thus supporting hypotheses H5 and H1.

Two endogenous variables were tested in the research model. Students' attitudes toward CALL were predicted by SU, PU, and PEU, resulting in an R2 of 0.67. This means that 67% of variance in the students' attitudes towards CALL was explained by SU, PU, and PEU. PU was significantly determined by SN and PEU. About 29% of variance in PU was explained by SN and PEU.

5. Discussion and conclusion

The purpose of this study was to identify students' attitudes towards CALL. The study found that students had moderate attitudes toward CALL (M=2.45). Moreover, this study identified the key determinants of attitudes towards CALL. Study results indicated that students' PU and PEU were key factors of their attitudes towards CALL.

Both variables (PU and PEU) had a direct and significant effect on students' attitudes towards CALL. Moreover, PU and PEU had a very strong correlation with attitudes towards CALL, indicating that as students' perceptions of computer attributes (PU and PEU) improve, their attitudes will be enhanced as well. The result of this section is consistent with prior theoretical arguments made by Davis (1989) and previous studies in which TAM examined (Teo et al., 2007; Masrom, 2007). Furthermore, findings of this study indicated that SN can be a determinant of students' attitudes towards CALL. SN had a direct and indirect effect on students' attitudes towards CALL.

According to Chang et al. (2012), training should be provided for learners to learn not only computer skills, but also a positive attitude. Training can encourage students to use computers with CALL applications as much as possible in their learning. Computer lab and language lab should be opened to students as many hours as possible. Furthermore, the university should encourage lecturers to integrate more computer technology into their teaching and curriculum design. Lecturers should believe that CALL–based ESL course can be more effective than traditional one. They should be familiar with CALL applications and software in order to give technical support to the students and provide the best way to integrate CALL into their ESL course design.

Abstract

This paper presents students' feedback on the design and development of a Website for Biology, namely e-AV Biology for senior high schools in Indonesia. The teaching media was developed with the main feature of video lessons and other features supporting the learning of Biology such as the Interactive Quiz and Discussion to support students' learning in Biology. Some video lessons described Renewable Energy on the field of Biotechnology Industrial, which is one of the topics that commonly difficult to visualize and explain. There is a need of aiding the explanation of Biodiesel sources, Biodiesel production process and Biodiesel usages by using audio visual. This study examined the design (Features and Interactivity, Video Content) and the Learning Impact of e-AV Biology Website. A total of 256 high school students participated in a larger study of a quasi-experiment in year 2011 with the intervention of two different ways of teaching, one with fully media instruction using e-AV Biology teaching method and another one the traditional manner of teaching. However, for the purpose of this paper, only the perception of the students participated in experiment group (n= 121, with 75 females, 46 males) were used, analyzed and reported. The last section of the paper presents the findings which indicated that majority students have positive response to overall feedback towards e-AV Biology teaching method, particularly the Features and Interactivity that provided in e-AV Biology Website.

Keywords: Feedback, e-AV Biology Website, Renewable Energy, Biodiesel, Learning Impact

Introduction

The teaching and learning Biology in Indonesia was done traditionally in the form of teacher-centred learning (Durbin, 2001). Teachers explain the subject according to the textbook, and then they write it on the whiteboard. After lecturing, teachers give some assignments to students. Meanwhile, students' activities in classroom are mostly the following: listen to teachers' explanation, take note, memorize the subject and also do assignments (Durbin, 2001). These are the scenario of Biology classes in Indonesia (Setiawan, 2008) resulted students who are generally passive and lack interest in Biology. This can be shown in the low enrolment of Biology major classes in upper levels (Puspita et al., 2008) as they do not find Biology an interesting subject (Setiawan, 2008).

The teaching aids such as audio visual materials or multimedia have been considered as an urgent necessity for the teacher to explain Biology subject in a more appealing way. A picture is worth a thousand words; multimedia appears to be more visual appealing supported by audio that explains the abstract concepts in a planned sequence based on instructional design principles. Teachers must have the ability to make the learning atmosphere more interesting while using the teaching aids for their classes. In this study, the teaching media platform, namely e-AV Biology Website, was developed with the main feature of video lessons in supporting the students' learning in Biology. e-AV Biology Website is one of the alternative aids to explain Biology in a visual appealing way supported by interactive features such as quizzes, and the control panel for the videos.

Objectives

The purpose of this paper is to report a part of the larger study. Focus of this paper is to gather feedback of e-AV Biology learning materials. There are two objectives here: 1) To examine the Design (Features and Interactivity, Video Contents) of e-AV Biology Website; 2) To examine the Learning Impact of e-AV Biology Website.
These objectives are in line with the research questions which in context of e-AV Biology: 1) What is the Improvement of the Design of e-AV Biology suggested by students? 2) What is the Learning Impact of e-AV Biology Website as perceived by students?

Difficulties in Studying Biology

Students' difficulties in learning Biology concepts have been investigated by many researchers. The survey outcomes from a study conducted by Lu, Cowie, and Jones (2008) indicated that 66% of the student respondents expressed that their Biology classes were taught monotonously. Just over half of the respondents (53%) wishes their teachers would include more interaction and active involvement in the lessons.

Moreover, the Biology teaching and learning process was often faced with abstract concepts and it was out of the students' daily experiences, particularly the process the production of Biofuel (Renewable Energy). Shelmet, Shields, and Huggins (2008) stated that many science classes have been conducted in 50-minutes content-driven lectures in traditionally classroom. Memorization of facts and algorithmic problem solving are often stressed, rather than conceptual understanding. Therefore, Biology needs to be taught dynamically, not as a static subject in textbooks (Tekkaya, Ozkan, and Sungur, 2001).

Finley, Yarroch, and Stewart (1982) reported that cellular respiration, photosynthesis, protein synthesis, mitosis and meiosis, were difficult and important topics for students to learn. Other topics which students find difficult to learn were respiration and photosynthesis (Anderson, Sheldon & Dubay, 1990), and concept of energy (Jennison & Reiss, 1991), all of these concepts were also supported by Tekkaya et al. (2001, p.145). Most of the participants of in the study conducted by Tekkaya et al. (2001, p.148) reported that "Biology is a course that presents overwhelm contents, most of which depend on memorization. Textbooks are boring and include excessive details; textbooks contain too much new and unnecessary information".

The study of Baggott and Wright (1996) on the use of interactive video in teaching cell division, among first-year undergraduate Biology education students, indicated that they find it more advantageous and more motivating in grasping the relevant phenomenon. Moreover, Prinou et al. (2003) stated that most of students reported that the moving image clarified or enhanced their understanding. It seems that through video, they understood that mitosis is a continuous rather than step-by-step process.

Renewable Energy

Due to global trend of the reduction of fuel resources, the human efforts are collectively looking into a renew source of energy, especially biofuel. Indonesian is rich of biofuel resources such as Jatropha oil, Coconut oil, Cassava and Crude Palm Oil. Biotechnology Industrial, especially Renewable Energy as a part of Biology is learned in the tenth grade of Senior High Schools, it is determined by the fifth Competency Standard of Indonesian Biology curriculum, which states that:

"The Students are able to explain about Biotechnology - the principles, roles and its implications for sciences, environment, technology and society". Energy resources and renewable energy is an important issue to be introduced to students; many side topics related energy such as energy consumption and preservation, generation of energy with consideration of environment protection are all related to this topic.

Multimedia Website for Learning

The educational content that build based on multimedia can be delivered through internet, so the teaching and learning process can be done via internet. According to Thierry and Deborah (2000, p.225), "The Internet is the major technological advancement reshaping not only our society but also that of universities worldwide. In the light of this, universities have to capitalize on the Internet for teaching, and one progressive development of this is the use of online delivery methods".

According to McAuliffe (2001), the online teaching and learning process could produce more relevant and consistent interaction than what is produced in the traditional undergraduate classrooms. A large traditional classroom does create communication barriers that make it more difficult for all students to participate in class discussions. The Internet is providing a practical way to remove learning barriers and encourage greater access to intellectual resources. The Internet has proved to be a powerful educational tool for Biology, because not only can it offer a large number of alternative images of the same phenomenon, but it can also provide a numerous of suggestions for the synthesis of relevant educational material (Prinou et al., 2003).

The Audio Visual is one of the popular multimedia components in education. Didactical video or Audio Visual is able to give a multisensory aspect to the learning experience to students than textual information. On the other hand, paper based pedagogical materials, such as books or articles, could allow students to think and analyses the content provided. Multimedia materials in this study presented in a Website can bring the two kinds of material together. Firstly, it allows the inclusion of Audio-Visual content into the array of educational materials. Secondly, it also allows the inclusion of textual information (Amatller & Simo, 2007). Multimedia material has another distinctive characteristic: it allows interaction. Students can interact with the information in different mode. The access to information could be done in multiple ways, different items could be connected according to students' interest and the practice and simulation of complex processes such as the processes of production biofuel is made possible. All the characteristics are not only the result of technological possibilities; they are also opportunities for constructivism based pedagogic materials (Amatller and Simo, 2007). Nowadays, Audio Visual Media is easily produced and published on the web and CD (Romero et al., 2008).

Methods of the Study

The teaching and learning process of Biology in Senior High Schools of Indonesia was tested using the e-AV Biology instructional design framework. Two Senior High Schools with 4 classes of students use e-AV Biology for their individual learning on Biology topics. They used it for 4 weeks, with first week as introduction to the website, 2nd week for Renewable Energy of Biodiesel Sources, 3rd week for Renewable Energy of Biodiesel Production and 4th week for Renewable Energy of Biodiesel Usages. In total 256 students completed their lessons and a post survey was conducted to seek feedback from them regarding audio visual learning on Biology. However, for the purpose of this paper, only the perception of the students participated in experiment group (n= 121, with 75 females, 46 males) were used, analyzed and reported. The instrument (post

survey) contains various dimensions of learning measures and also students' feedback on e-AV Biology. Those dimensions are: Video Contents, Features and Interactivity, and Learning Impact of e-AV Biology.

Description of e-AV Biology Website

A Website was used as the Multimedia technology. The website includes the interactive video about Biotechnology Industrial as a part of Biology subject. e-AV Biology had been developed with integrated and comprehensive video lessons, and other features supporting the student learning process. The use of animations, motion images, and videos was intended to render a scientific phenomenon and process to be easily comprehended by students.

There are some features to aid teaching and learning, available in e-AV Biology Website:

Home Page of e-AV Biology

This part aims to introduce students to the e-AV Biology Website. It starts with a description of how-to-use and register to become users of the e-AV Biology, followed by a short description of e-AV Biology menu and other e-AV Biology features.

Video Lessons

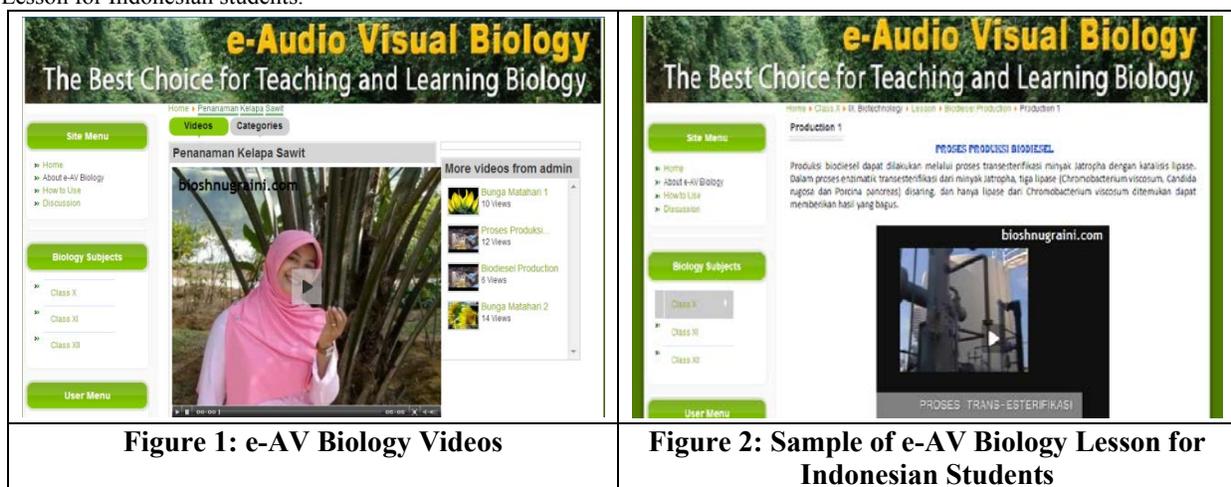
This part contains various videos concerning biofuel sources, biofuel production and biofuel usages (in Indonesian and English). Students were provided with contents in the form of audios, videos and animation that enables them to explore e-AV Biology Website on their own pace/individually. The integration of various media elements such as diagrams, audio, video and animation in this part adds more value to the website. Figure 1. shows e-AV Biology Videos, while Figure 2 shows sample of e-AV Biology Lesson for Indonesian students.


Figure 1: e-AV Biology Videos	Figure 2: Sample of e-AV Biology Lesson for Indonesian Students
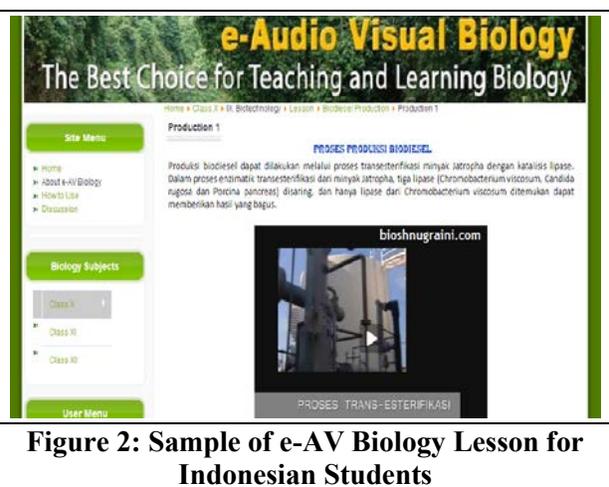


The video lessons also supported by articles and textual information related to Biology for the benefit of students to read about Renewable Energy such as Biodiesel Sources, Biodiesel Production and Biodiesel Usages. It provides materials for students in a more convenient way of access through text based information.

Findings and Discussions

This section present the survey results on e-AV Biology Website gathered the students' participants of experiment group, after they were using e-AV Biology Website for their learning individually.

Mostly descriptive findings are presented to highlight popular items and also to notice which items are less agreed or more agreed by students. A mean score of 4.5 with low standard deviation value indicates that the items are agreed and strongly agreed by students, and also many of them sharing the similar feedback on the scale of 5 or 4 (agreement). These items will be mentioned and discussed in the following sections. Likewise, for items with mean scores near to 3 indicated that the items are neither agreed nor disagreed by students (only one item in Table 3), it indicates indecisive opinion by students for those items or other words a mixture of opinion of agree and disagree by the group of students collectively. Majority of the items draw favorable agreement by most of the students, with mean scores value ranging from 3.22 to 4.78 and the standard deviations around 0.42.

a. Feedback of Video Contents in e-AV Biology Website

Table 1 shows the Students' Feedback of Video Contents in e-AV Biology Website. The table shows that majority the students have a positive response to Video Contents in e-AV Biology Website, with aggregate mean value = 4.35, and standard deviations around 0.53. The percentage of students' agreement and disagreement were represented by '%', while 'number of students' was represented by 'n'. 'Positive Respone/Agreement' indicated the students' *agree* and *strongly agree* with the statements, while 'Negative Response/Disagreement' indicated the students' *disagree* and *strongly disagree*.

Table 1: Video Contents Feedback

Items	Statements	Agreement (%) (n)	Undecided (%) (n)	Disagreement (%) (n)	Mean	Agregate Mean
q8	Video contents of **e-AV Biology** are useful to learn Biology	98% (119)	2% (2)	0% (0)	4.554	
q9	I am interested in using the video contents of Biology	77% (93)	20% (24)	3% (4)	4.207	
q10	Video contents of **e-AV Biology** are suitable for Biology courses	97% (117)	3% (4)	0% (0)	4.562	
q11	I am satisfied with the video contents for learning Biology	82% (99)	12% (15)	6% (7)	4.314	
q12	The Video contents are attractive	89% (107)	9% (11)	2% (3)	4.421	
q13	The Video contents can increase my ability to learn Biology	92% (112)	6% (7)	2% (2)	4.471	
q14	The Video contents can motivate me to learn Biology more	82% (100)	17% (20)	1% (1)	4.430	
q15	The sequence of video contents are easy to follow	87% (105)	11% (13)	2% (3)	4.595	4.35
q16	The Video contents allow me to clarify my misconception in Biology	77% (94)	21% (25)	2% (2)	4.331	
q17	The background music is attractive, the background music is appropriately used.	54% (65)	38% (46)	8% (10)	3.868	
q18	The background music is distracting	17% (20)	18% (22)	65% (79)	3.893	
q19	Video content can explain abstract concepts clearly	86% (104)	13% (16)	1% (1)	4.562	

Note : n = 121

Likert Scale 1: Strongly Disagree, 2: Disagree, 3: Undecided, 4: Agree, 5: Strongly Agree

Agreement = *agree* and *strongly agree;* Disagreement = *disagree* and *strongly disagree*

Students' feedback on Video Contents of e-AV Biology indicated that item q8, q10, q15, and q19 shows higher mean scores (mean ≥ 4.0) with low standard deviation scores (SD ≤ 0.8), which mean that the items have low variability of the feedback from students. Many of them agreed and strongly agreed that Video Contents of e-AV Biology were useful to learn Biology, it was suitable for Biology, the sequence of Video Contents were easy to follow, and Video Contents can explain abstract concepts clearly.

b. Feedback towards Features and Interactivity of e-AV Biology Website

Table 2 shows that majority the students have a positive response to the Features and Interactivity of e-AV Biology Website, with aggregate mean value = 4.55, and the standard deviations around 0.66.

Table 2: Features and Interactivity

Items	Statements	Agreement (%) (n)	Undecided (%) (n)	Disagree-ment (%) (n)	Mean	Agre-gate Mean
q20	There are many visual examples in **e-AV Biology** Website	90% (109)	8% (10)	2% (2)	4.603	4.55
q21	Feature of Interactivity helps me learn better	89% (108)	10% (12)	1% (1)	4.570	
q22	The features of audio and visual are helpful as I can easily get the visualisation and explanation of the studying material	93% (113)	5% (6)	2% (2)	4.554	
q23	**e-AV Biology** is helpful in my learning because it has interactivity feature where I can pause and play on my own paced	87% (106)	11% (13)	2% (2)	4.537	
q24	I can repeat **e-AV Biology** Videos as much as I want	84% (102)	10% (12)	6% (7)	4.397	
q25	**e-AV Biology** makes me easy to study and make discussion based on the assignment, hence, enrich my learning	89% (108)	10% (12)	1% (1)	4.653	

Note : n = 121

Likert Scale 1: Strongly Disagree, 2: Disagree, 3: Undecided, 4: Agree, 5: Strongly Agree

Agreement = *agree* and *strongly agree;* Disagreement = *disagree* and *strongly disagree*

Students' feedback on Features and Interactivity of e-AV Biology indicated that item q20, q21, q22, q23, and q25 shows higher mean scores (mean $\geq$ 4.0) with low standard deviation scores (SD $\leq$ 0.8), which mean that the items have low variability of the feedback from students. Many of them agreed and strongly agreed that e-AV Biology has many visual examples, Features and Interactivity in e-AV Biology help students learn better, they can easily get the visualization and explanation of the studying material, e-AV Biology was helpful in students' learning because it has interactivity feature, where students can pause and play on their own paced, and it make them easy to study and make discussion based on the assignment, hence, enrich their learning.

c. Feedback of the Learning Impact of e-AV Biology Website

Table 3. shows that majority of the students have a positive response to the Learning Impact of e-AV Biology Website, with aggregate mean value = 4.27, and the standard deviations around 0.42.

Students' feedback on the Learning Impact of e-AV Biology indicated that item q26, q28, q36, and q39 shows higher mean scores (mean $\geq$ 4.0) with low standard deviation scores (SD $\leq$ 0.8), which mean that the items have low variability of the feedback from students.

Many of them agreed and strongly agreed that they were motivated to learn Biology using e-AV Biology because the contents were able to attract students' attention. e-AV Biology has positive impact on students' learning of Biology. Students did not feel bored studying Biology with e-AV Biology. e-AV Biology has shortened students' learning time on a particular topic of Biology, and students' knowledge was improved by e-AV Biology.

Table 3: The Learning Impact

Items	Statements	Agreement (%) (n)	Undecided (%) (n)	Disagreement (%) (n)	Mean	Agre-gate Mean
q26	I am motivated to learn Biology using **e-AV Biology** because the contents are able to attract my attention	87% (105)	12% (15)	1% (1)	4.578	
q27	My motivation will be decrease after using **e-AV Biology** for several time	20% (24)	15% (18)	65%(79)	3.876	
q28	**e-AV Biology** has positive impact on my learning of Biology	98% (119)	2% (2)	0% (0)	4.777	
q29	I have interest to use **e-AV Biology** during the learning of Biology	84% (102)	14% (17)	2% (2)	4.488	
q30	**e-AV Biology** is efficient than the conventional teaching of Biology	73% (88)	26% (32)	1% (1)	4.223	

q31	Learning through **e-AV Biology** is effective than the conventional learning of Biology.	73% (88)	25% (31)	2% (2)	4.273	
q32	I wish **e-AV Biology** could be used in the teaching of Biology	86% (104)	9% (11)	5% (6)	4.446	
q33	I can learn Biology with **e-AV Biology** alone	69% (84)	25% (30)	6% (7)	4.231	
q34	I do not feel bored studying Biology with **e-AV Biology**	70% (85)	15% (18)	15% (18)	4.149	
q35	Biology textbook make me feel bored	48% (58)	24% (29)	28% (34)	3.223	
q36	**e-AV Biology** has shortened my learning time on a particular topic of Biology courses.	84% (102)	16% (19)	0% (0)	4.512	
q37	My interest towards Biology was increased by **e-AV Biology.**	75% (91)	23% (28)	2% (2)	4.380	
q38	**e-AV Biology** was effective in helping me learn the material.	92% (111)	8% (10)	0% (0)	4.008	
q39	My knowledge was improved by **e-AV Biology**.	90% (109)	10% (12)	0% (0)	4.653	

Note : n = 121

Likert Scale 1: Strongly Disagree, 2: Disagree, 3: Undecided, 4: Agree, 5: Strongly Agree

Agreement = *agree* and *strongly agree;* Disagreement = *disagree* and *strongly disagree*

Overall Feedback

Students had reported about Feedback of Video Contents in e-AV Biology Website, Feedback of Features and Interactivity and Feedback of The Learning Impact of e-AV Biology Website. The survey results indicated that majority the students have positive response (agree and strongly agree) for overall feedback of e-AV Biology Website. The data had been collected from results of the questionnaires as presented in Table 1 to Table 3.

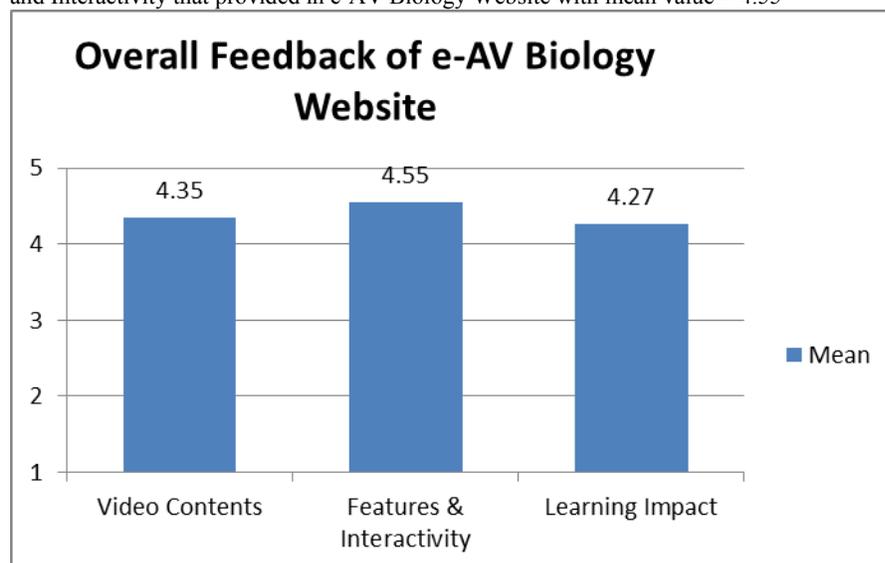
The findings of students' feedback towards e-AV Biology Website for learning Biology can be summarized as shown in Figure 3. The graph indicated that majority of students have positive responses towards e-AV Biology Website, particularly in the Features and Interactivity that provided in e-AV Biology Website with mean value = 4.55


Figure 3: Students' Feedback towards e-AV Biology Website

Conclusion

The study on Students' Feedback of Audio Visual teaching media through e-AV Biology was conducted due to the increasing challenge of teaching an abstract subject, and the importance of the topic of Biotechnology Industrial or Renewable Energy (Biodiesel Sources, Biodiesel Production and Biodiesel Usages). Audio and Visual media was incorporated as the key component in e-Learning website, based on Integrated Framework of e-AV Biology which have been designed and developed. Findings

indicated that majority the students have a positive response to the Video Contents in e-AV Biology, the Features and Interactivity, and also the Learning Impact of e-AV Biology Website for students' Biology learning.

Students' feedback on Video Contents of e-AV Biology indicated that many of students agreed and strongly agreed that Video Contents of e-AV Biology were useful to learn Biology, it was suitable for Biology, the sequence of Video Contents were easy to follow, and it was able to generate similar perception of students about abstract concepts.

Students' feedback on Features and Interactivity of e-AV Biology indicated that many of students agreed and strongly agreed that e-AV Biology has many visual examples, Features and Interactivity in e-AV Biology help students learn better, they can easily get the visualization and explanation of the studying material, e-AV Biology was helpful in students' learning because it has interactivity feature where students can pause and play on their own paced, and it make them easy to study and make discussion based on the assignment, hence, enrich their learning.

Students' feedback on the Learning Impact of e-AV Biology indicated that many of students agreed and strongly agreed that students were motivated to learn Biology using e-AV Biology because the contents were able to attract students' attention. e-AV Biology has positive impact on students' learning of Biology. Students did not feel bored studying Biology with e-AV Biology. e-AV Biology has shortened students' learning time on a particular topic of Biology, and students' knowledge was improved by e-AV Biology.

Limitations and Future Research

The limitation of this study is mainly due to: (1) a short time frame of conducting the study and the impact on knowledge gain has not shown much significance. (2) The research is only conducted in one of the major cities in Indonesia, (3) the research sample is limited to International Schools by the Indonesian Government.

The contribution of the study is to propose the e-Learning Website design and development for Indonesia Senior High Schools to address the problem faced in Biology education. e-AV Biology website will be further developed to include more videos related to different topics of Biology since generally students are able to accept it and perceived it as useful to improve their interest and attitude toward Biology.

Abstract

The study uses a survey analysis for 140 SMEs of manufacturing sector of Punjab in India to understand the level of MkIS by firms. Punjab has been ranked as one of the growing states of India. The study uses step-wise regression technique to find the important predictors of the MkIS model. The results depict that co-efficient of determination is 0.508 and adjusted co-efficient of determination is 0.490, these predictors explain 49% of the variation and Durbin-Watson index is 2.102, which is acceptable for the model. The main objective of the study is to validate the success of MkIS model for SMEs through a case study done for six firms of which 2 firms produce cutting tools from district Patiala, 2 firms producing sports goods from district Jalandhar and 2 firms producing bicycle components from district Ludhiana respectively.

Keywords: Marketing Information System (MkIS); SMEs, Punjab manufacturing; Important Predictors of MkIS.

1. Introduction

Marketing Information System (MkIS) is a set of procedures and methods designed to generate, analyze, disseminate, and store anticipated marketing decision information on a regular, continuous basis. An information system can be used operationally, managerially, and strategically for several aspects of marketing. MkIS also provides methods for interpreting the information it provides. With a proper MkIS in place, the complete organization can be tracked which can be used to analyse independent processes. This helps in establishing a broader perspective which helps to know which steps can be taken to facilitate improvement. MkIS is critical for planning. No organization can do planning without information. For planning, the first thing which is needed is the organizations capabilities, then the business environment and finally competitor analysis. In a proper MkIS, all these are present by default and are continuously updated. Thus MkIS is very important for planning and analysis. MkIS are mostly applied by large and dominant firms, but it is right time now for SMEs to focus on the MkIS and initiate steps to enhance information technology culture in SMEs of Punjab manufacturing. The present study has been taken against the above backdrop for MkIS of manufacturing SMEs of Punjab in India.

On the basis of literature the following five predictors have been identified as independent variables. These are:

1.1 Design characteristics of MkIS:
As per (Piercy and Evans, 1983), (Little, 1979) and (Milis, 2008) design characteristics deals with information. Design characteristics cover the following:
   a. Broad scope information. (DC1)
   b. Timely information. (DC2)
   c. Accurate information. (DC3)
   d. Current information. (DC4)
   e. Aggregated information. (DC5)

1.2 Capabilities of MkIS:
According to (Knuckles, 1987) and (Fleisher *et al.,* 2008), the broad capabilities of MkIS range from providing data to decision support system for sophisticated analysis of data. These capabilities are highlighted as:
   a. It simply provides data on which decisions are made. (CA1)

---

* Corresponding author. Tel.: +91 9988094554.
E-mail address: rahulhakhu@yahoo.com

b. It has the capability to undertake simple analysis of the data and from this provides information on which decisions are made. (CA2)

c. It provides sophisticated analysis of data, and therefore provides invaluable decision support information. (CA3)

d. It provides sophisticated analysis of data and has the ability to make recommendations, if so required, as an aid to decision making. (CA4)

1.3 Primary characteristics of MkIS:

According to (Bhagwat and Sharma, 2007) Primary characteristics of MkIS are considered as a major tool to help companies provide a competitive edge in the era of globalization. As per (Murray *et al.,* 2004) primary characteristic covers the basic tools for MkIS and highlighted as :

a. Windows 98 & Windows XP as Operating system. (PC1)

b. E-Mails & Search Engines as Internet (PC2)

c. Word, Excel & PowerPoint as Applications. (PC3)

d. Timely information of marketing needs. (PC4)

e. Stores marketing information. (PC5)

f. Processed information maintained in the data-base. (PC6)

1.4 Hindrance factors of MkIS:

For success of MkIS it is essential to identify the factors that can deter its progress. It is essential to deal with them properly, so that they cannot act as impediment. As per (Sisodia, 1992) tackling hindrance factors of MkIS is in fact very important. Infact, system implementation success factors is not just use of Technology. According to Thatcher and (Thatcher and Oliver, 2001) problems are the result of the interaction between characteristics of the people being asked to adopt the system and characteristics of the system itself. The hindrance factors covered are:

a. Not as an information processing system. (HF1)

b. Can solve all management problems. (HF2)

c. Lack of training. (HF3)

d. Adequate attention not given. (HF4)

e. Impersonal system. (HF5)

f. Does not give perfect information. (HF6)

g. Under estimating. (HF7)

1.5 MkIS sophistication:

As per (Van Nievelt, 1984) and (Martin, 2004) sophistication covers the marketing needs for meeting customer requirements and also for formulating of the strategic plan for effective marketing decision. The MkIS sophistication covered in the study are:

a. Strategic perspective.(SO1)

b. Meeting customer needs. (SO2)

c. Threat. (SO3)

d. Strategic planning. (SO4)

e. IT budget. (SO5)

f. Marketing decision. (SO6)

2. Research Methodology

The present study has been based on a survey analysis conducted in the state of Punjab, one of the growing states of Indian economy. Data has been collected through a self-structured questionnaire from 140 manufacturing industries which include 124 small and 16 medium enterprises respectively of Punjab from the following districts: Patiala for cutting tools (30 units), Jalandhar for sports goods (50 units) and Ludhiana for bicycle components (60 units). Reason for selecting these districts is due to the 82 per cent exports of total exports from these districts of Punjab and they have prominent range of product. Cutting tools from Patiala, sports goods from Jalandhar and bicycle components from Ludhiana compromises nearly 15 per cent of total exports from Punjab and provides 75 percent of the country's requirement.

The survey was tested for reliability and overall reliability score (Cronbach Alpha) of the questionnaire has been 0.902. Face and content validity have been done. The questionnaire had been validated by the peers and has a validation score 3.75 on a scale of five. Some questions were reframed. Table 1, describes the details of the reliability statistics. The data so gathered analysed using SPSS ver.19. The questionnaire has five sections viz. i) Primary characteristics (usage of computers), ii) Design characteristics/ Capabilities/ Marketing mix/ Sophistication

of MkIS, iii) Success factors of MkIS, iv) Hindrance factors of MkIS and v) Organizational performance. The reliability score of all the four sections ranged between 0.710 and 0. 829.

Table 1	Reliability Statistics		
Items		No of Items	Cronbach Alpha
Primary Characteristics(Usage of Computers)		11	.829
Design Characteristics/ Capabilities/Marketing Mix/ Sophistication of MkIS		19	.792
Success Factors of MkIS		07	.710
Hindrance Factors of MkIS		07	.807
Organizations Performance		06	.729
Overall		50	.902

2.1 Objectives of the study:
- To identify the predictors for the development of MkIS model for the selected manufacturing SMEs of Punjab.
- To develop a model for the MkIS in the selected SMEs of Punjab.
- To validate the survey based results and case study analysis.

2.2 Hypothesis related with the study are:
H1: Design Characteristics of MkIS are positively associated with success factors of MkIS Model.
H2: Capabilities of MkIS are positively associated with success factors of MkIS Model.
H3: Primary Characteristics of MkIS are positively associated with success factors of MkIS Model.
H4: Hindrance Factors of MkIS are negatively associated with success of MkIS Model.
H5: MkIS Sophistication is positively associated with success factors of MkIS Model.

3. Data analysis and Discussion
3.1 Survey based results:
Data has been collected through a self-structured questionnaire from 140 manufacturing industries of Punjab.
3.1.1 Design characteristics of MkIS:

Table 2		Design Characteristics of MkIS				
Nature of Firm		DC1	DC2	DC3	DC4	DC5
Cutting Tools	Mean	3.20	3.33	3.53	3.10	3.30
	N	30	30	30	30	30
	SD	1.27	0.99	1.13	1.06	0.98
Sports Goods	Mean	3.14	3.32	3.30	3.10	2.98
	N	50	50	50	50	50
	SD	1.24	1.26	1.05	1.35	1.31
Bicycle Components	Mean	3.05	3.38	3.40	3.43	3.26
	N	60	60	60	60	60
	SD	1.01	1.20	0.94	.88	1.07
Total	Mean	3.11	3.35	3.39	3.24	3.17
	N	140	140	140	140	140
	SD	1.15	1.18	1.02	1.11	1.15

As per Table 2, From sector- wise analysis it is evident that all three sectors, i.e., cutting tools, sports goods and bicycle components have given high priority to Accurate information and Timely information.

3.1.2 Capabilities of MkIS:

Table 3		Capabilities of MkIS			
Nature of Firm		CA1	CA2	CA3	CA4
Cutting Tools	Mean	3.43	3.36	3.86	3.56
	N	30	30	30	30
	SD	1.07	1.09	77	0.81
Sports Goods	Mean	3.30	3.30	3.54	3.76
	N	50	50	50	50
	SD	1.18	1.18	0.93	1.02
Bicycle Components	Mean	3.21	3.58	3.50	3.80
	N	60	60	60	60
	SD	1.00	0.99	0.89	0.91
Total	Mean	3.29	3.43	3.59	3.73
	N	140	140	140	140
	SD	1.08	1.08	0.88	0.93

As per Table 3, overall results indicate that in all three sectors, i.e., cutting tools, sports goods and bicycle components respectively have given highest rating to sophisticated analysis of data, which has an ability to make recommendations as an aid to decision making followed by that it provides invaluable decision support information.

3.1.3 Primary characteristics of MkIS:

Table 4   **Primary Characteristics of MkIS**

Nature of Firm		PC1		PC2		PC3		PC4	PC5	PC6
Cutting Tools	Mean	3.43	3.10	3.83	2.83	3.43	3.30	2.80	3.23	3.26	3.26
	N	30	30	30	30	30	30	30	30	30	30
	SD	0.67	0.92	0.74	0.83	1.04	0.65	0.80	1.27	0.98	0.82
Sports Goods	Mean	3.52	2.66	3.46	2.54	3.14	2.82	2.56	3.00	3.02	3.36
	N	50	50	50	50	50	50	50	50	50	50
	SD	0.64	0.71	0.61	0.61	0.60	0.74	0.61	1.42	1.40	0.92
Bicycle Components	Mean	3.56	2.75	3.48	2.40	3.23	2.88	2.41	3.05	3.20	3.51
	N	60	60	60	60	60	60	60	60	60	60
	SD	0.56	0.75	0.62	0.64	0.53	0.64	0.67	1.39	1.02	0.81
Total	Mean	3.52	2.79	3.55	2.54	3.24	2.95	2.55	3.07	3.15	3.41
	N	140	140	140	140	140	140	140	140	140	140
	SD	0.61	0.79	0.66	0.69	0.69	0.70	0.69	1.37	1.16	0.85

As per Table 4, Email as an Internet has highest usage in all the three sectors, i.e., cutting tools, sports goods and bicycle components. Also processed information (e.g., sales forecasts, market share, distribution trend, etc.) maintained in the database has a good preference amongst the three sectors.

3.1.4 Hindrance factors of MkIS:

Table 5   **Hindrance Factors of MkIS**

Nature of Firm		HF1	HF2	HF3	HF4	HF5	HF6	HF7
Cutting Tools	Mean	3.16	3.53	2.56	1.93	2.83	2.83	2.83
	N	30	30	30	30	30	30	30
	SD	1.17	0.81	0.85	0.69	1.05	0.83	0.98
Sports Goods	Mean	3.28	3.42	3.10	2.08	3.34	3.18	3.06
	N	50	50	50	50	50	50	50
	SD	1.14	0.97	1.21	1.06	0.96	1.18	1.09
Bicycle Components	Mean	3.56	3.45	2.78	2.53	3.01	2.60	2.58
	N	60	60	60	60	60	60	60
	SD	0.94	0.94	1.30	1.22	0.96	0.90	0.96
Total	Mean	3.37	3.45	2.85	2.24	3.09	2.85	2.80
	N	140	140	140	140	140	140	140
	SD	1.07	0.92	1.19	1.09	0.99	1.02	1.03

As per Table 5, all the obstacles are having a little higher mean score and hence deserve attention but in terms of individual factor the highest belief in all the three sectors, i.e., cutting tools, sports goods and bicycle components is that the computerized MkIS can solve all the management problems of planning and control of the business followed by that it is not as an information processing system.

3.1.5 MkIS Sophistication:

Table 6   **MkIS Sophistication**

Nature of Firm		SO1	SO2	SO3	SO4	SO5	SO6
Cutting Tools	Mean	3.30	3.70	3.03	3.30	2.93	3.26
	N	30	30	30	30	30	30
	SD	0.91	0.74	0.99	0.87	1.04	0.94
Sports Goods	Mean	2.86	3.60	3.44	3.26	3.18	3.06
	N	50	50	50	50	50	50
	SD	1.16	0.83	1.09	1.10	1.24	1.09
Bicycle Components	Mean	2.96	3.51	3.53	3.18	3.21	3.10
	N	60	60	60	60	60	60
	SD	0.97	0.89	1.04	0.85	1.02	1.03
Total	Mean	3.00	3.58	3.39	3.23	3.14	3.12
	N	140	140	140	140	140	140
	SD	1.03	0.83	1.06	0.94	1.10	1.03

As per Table 6, all the factors in all the three sectors, i.e., cutting tools, sports goods and bicycle components are having a little higher mean but the meeting customer needs has the highest priority followed by threat to new entrants.

3.2 MkIS (Marketing Information System) Model:

Table 7   **Marketing Information System Model**

Predictors	B	Std Error	Beta	T	P
(Constant)	1.624	0.398		4.077	.001***
Des Characteristics	0.148	0.054	0.219	2.708	.008**
Capabilities	0.128	0.053	0.189	2.427	.017**
Primary Characteristics	0.223	0.073	0.196	3.036	.003**
Hindrance Factors	-0.176	0.06	-0.214	-2.956	.004**
Sophistications	0.171	0.083	0.168	2.063	.041*

*** $p<.001$; ** $p<.01$; and * $p < .05$

As per Table 7,

The results of regression highlight that the value of B for Design Characteristics of MkIS is positive and is 0.148, thus the hypothesis H_1: *Design Characteristics of MkIS are positively associated with success factors of MkIS Model* has been accepted.

Regarding Capabilities of MkIS the value of B is 0.128, and it is positively related with Success Factors of MkIS. Thus the hypothesis H_2: *Capabilities of MkIS are positively associated with success factors of MkIS Model* has also been accepted.

Regarding Primary Characteristics of MkIS the value is 0 .223, it is positively associated with success factors of MkIS. *Hence,* the hypothesis H_3: *Primary Characteristics of MkIS are positively associated with success factors of MkIS Model* has been accepted.

Regarding Hindrance factors as expected the value is negative and is -0.176, thus the hypothesis H_4: *Hindrance Factors of MkIS are negatively associated with success factors of MkIS Model* has also been accepted.

In case of MkIS Sophistication the value of B is positive and is 0.171, thus the hypothesis H_5: *MkIS Sophistication are positively associated with success factors of MkIS Model* has been accepted.

Table 8   **MkIS (Marketing Information System) Regression Model**

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	R Square Change	F Change	df1	df2	Sig. F Change	Durbin-Watson
						Change Statistics				
1	.575a	0.33	0.32	0.25	0.33	68.33	1	138	-	
2	.641b	0.41	0.40	0.23	0.07	18.43	1	137	0.000	
3	.676c	0.45	0.44	0.23	0.04	11.47	1	136	0.001	2.102
4	.702d	0.49	0.47	0.22	0.03	9.68	1	135	0.002	
5	.713e	0.50	0.49	0.22	0.01	4.25	1	134	0.041	

*** $p<.001$; ** $p<.01$; and * $p < .05$

Design Characteristics[a] , Capabilities[b] , Primary Characteristics[c] , Hindrance Factors[d], Sophistications[e]

The regression model results are highlighted through Table 8. The value of co-relation is .713, co-efficient of determination is 0 .508 and adjusted co-efficient of determination is 0.490, these variables explain 49% of the variation and Durbin-Watson index is 2.102, which is acceptable for the model. The ANOVA results are also significant, which depict the overall significance of the model. Moreover the results of step wise regression depict that value of R^2 has improved from 0.331 to 0.508 with the introduction of all variables. That means the model can include all these factors as the predicting power has improved from 32.6 to 49 percent. Thus the results verify that success factors of MkIS are positively associated with Design Characteristics, Capabilities, Primary Characteristics and Sophistication. Regarding predicting power Primary Characteristics and Sophistication have higher value of 'B' and are relatively more important than other predictors.

3.3 Case-study validation of results:
Case study validation has been done for six firms of which 2 firms producing cutting tools from district Patiala, 2 firms producing sports goods from district Jalandhar and 2 firms producing bicycle components from district Ludhiana respectively.

3.3.1 MkIS Design characteristics – Study of 6 Manufacturing firms:

Table 9   **MkIS Design Characteristics – Study of 6 Manufacturing Firms**

Design Characteristics	F1	F2	F3	F4	F5	F6	Total of 6 Firms	Average of 6 Firms	Rank
DC1	5	5	3	2	2	4	21	3.5	3
DC2	4	4	3	5	3	5	24	4	1

DC3	5	4	4	3	3	4	23	3.83	2
DC4	5	3	3	4	4	2	21	3.5	3
DC5	4	3	4	1	5	3	20	3.33	4

As per the Table 9, importance accorded by the firms to different initiatives in context to MkIS Design characteristics with the highest priority is Timely information and followed by Accurate information in all the three sectors, i.e., cutting tools, sports goods and bicycle components respectively.

3.3.2 Capabilities of MkIS – Study of 6 Manufacturing firms:

Table 10   Capabilities of MkIS – Study of 6 Manufacturing Firms

Capabilities of MkIS	F1	F2	F3	F4	F5	F6	Total of 6 Firms	Average of 6 Firms	Rank
CA1	4	4	3	5	2	4	22	3.66	3
CA2	4	3	4	1	3	5	20	3.33	4
CA3	5	5	4	3	4	4	25	4.16	1
CA4	4	4	5	4	3	4	24	4	2

As per the Table 10, importance accorded by the firms to different initiatives in context to Capabilities of MkIS with the highest priority is that it provides sophisticated analysis of data, and therefore provides invaluable decision support information and followed by that it has the ability to make recommendations, if so required, as an aid to decision making in all the three sectors, i.e., cutting tools, sports goods and bicycle components respectively.

3.3.3 Primary characteristics of MkIS – Study of 6 Manufacturing firms:

Table 11   Primary Characteristics of MkIS – Study of 6 Manufacturing Firms

Primary Characteristics	F1	F2	F3	F4	F5	F6	Total of 6 Firms	Average of 6 Firms	Rank
PC1	2	3	3	4	4	4	20	3.33	3
	2	2	2	2	3	3	14	2.33	6
PC2	4	4	4	3	4	3	22	3.66	1
	4	4	3	4	2	2	19	3.16	4
PC3	4	4	3	4	2	2	19	3.16	4
	4	3	2	3	3	3	18	3	5
	4	3	3	3	4	2	19	3.16	4
PC4	4	4	2	4	4	2	20	3.33	3
PC5	2	3	4	5	1	4	19	3.16	4
PC6	4	4	4	3	3	3	21	3.5	2

As per the Table 11, importance accorded by the firms to different initiatives in context to Primary characteristics of MkIS with the highest priority is that of Emails of internet and followed by processed information which is maintained in the database in all the three sectors, i.e., cutting tools, sports goods and bicycle components respectively.

3.3.4 Hindrance factors of MkIS – Study of 6 Manufacturing firms:

Table 12   Hindrance Factors of MkIS – Study of 6 Manufacturing Firms

Hindrance Factors of MkIS	F1	F2	F3	F4	F5	F6	Total of 6 Firms	Average of 6 Firms	Rank
HF1	3	2	3	3	3	5	19	3.16	2
HF2	4	3	3	5	4	5	24	4	1
HF3	1	2	2	2	5	2	14	2.33	5
HF4	2	3	2	1	5	2	15	2.5	4
HF5	2	3	3	4	3	3	18	3	3
HF6	2	4	2	3	2	2	15	2.5	4
HF7	1	2	2	4	3	2	14	2.33	5

As per the Table 12, importance accorded by the firms to different initiatives in context to Hindrance factors of MkIS with the highest priority is that the computerized MkIS can solve all the management problems of planning and control of the business in the business systems respectively and followed by that MkIS is not as an information processing system in all the three sectors, i.e., cutting tools, sports goods and bicycle components respectively.

3.3.5 MkIS Sophistication – Study of 6 Manufacturing firms:

Table 13	MkIS Sophistication – Study of 6 Manufacturing Firms								
MkIS Sophistication	F1	F2	F3	F4	F5	F6	Total of 6 Firms	Average of 6 Firms	Rank
SO1	4	3	3	5	3	3	21	3.5	3
SO2	3	4	4	3	4	4	22	3.66	2
SO3	3	3	3	4	5	5	23	3.83	1
SO4	3	4	4	2	4	3	20	3.33	4
SO5	2	2	3	3	2	3	15	2.5	6
SO6	4	3	4	4	1	3	19	3.16	5

As per the Table 13, importance accorded by the companies to different initiatives in context to Factors Underlying MkIS Sophistication, with the highest priority is threat to new entrants and followed by meeting customer needs in all the three sectors, i.e., cutting tools, sports goods and bicycle components respectively.

3.4 Synthesis of Survey Based Results and Case Study Analysis:

This section deals with synthesis of the survey based results of 140 SMEs and case study analysis. The top two factors of each predictor are selected on the basis of the analysis of the priorities accorded by the manufacturing SMEs in all the three sectors, i.e., cutting tools, sports goods and bicycle components.

3.4.1 Synthesis for MkIS Design characteristics:

It is analysed that Accurate information and Timely information are the top priorities.

3.4.2 Synthesis for Capabilities of MkIS:

It is analysed that high priority to sophisticated analysis of data has an ability to make recommendations as an aid to decision making and also it provides invaluable decision support information are the top priorities.

3.4.3 Synthesis for Primary characteristics of MkIS:

It is analysed that Emails of Internet along with processed information (e.g., sales forecasts, market share, distribution trend, etc.) which is maintained in the database are the top priorities.

3.4.4 Synthesis for Hindrance factors of MkIS:

It is analysed wherein the belief is that the computerized MkIS can solve all the management problems of planning and control of the business followed by that MkIS is conceived as a data processing and not as an information processing system in the database are the top tpriorities.

3.4.5 Synthesis for MkIS Sophistication:

It is analysed that meeting customer needs and threat to new entrants are the top priorities.

4. Conclusion

As per the Fig. 1, top two factors of each independent variables of MkIS in three categories viz. cutting tools, sports goods and bicycle components have been taken with the validation of the survey based results of 140 SMEs and case study respectively for highlighting the overall scenario of Success of MkIS Model.

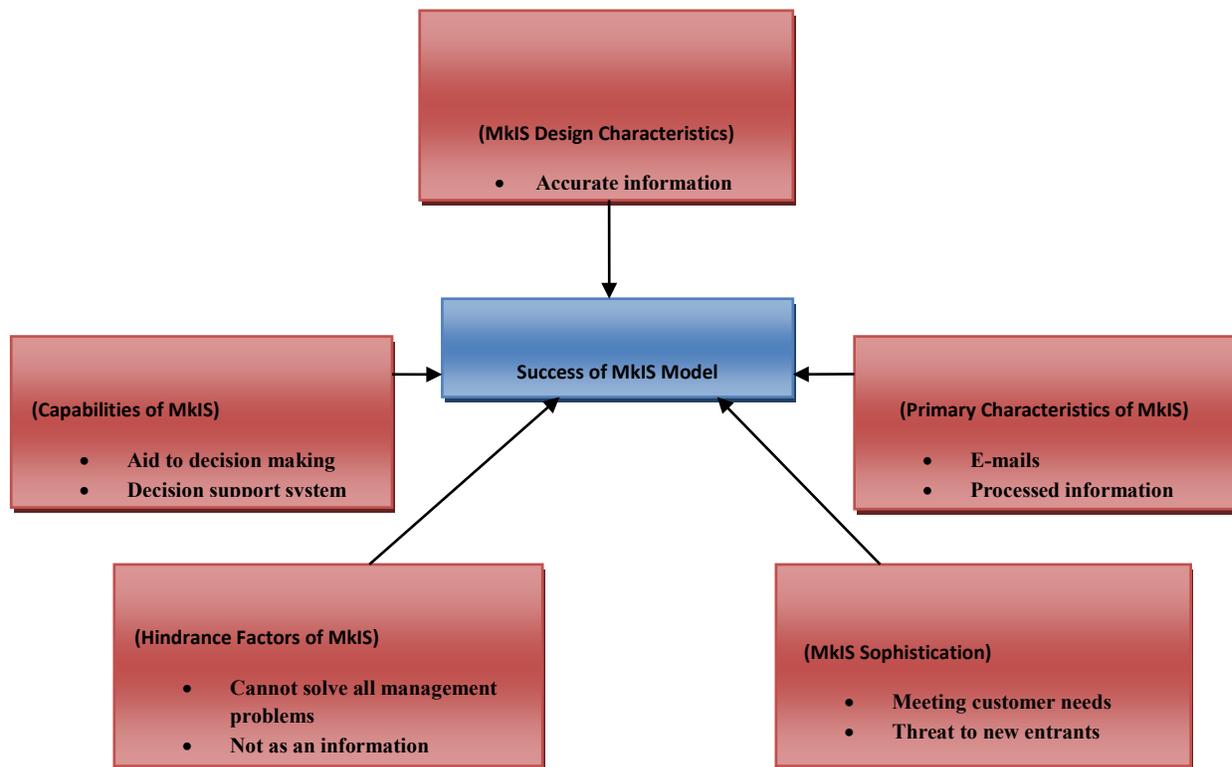
Many organizations use MkIS successfully, others do not. Though the hardware and the software is the latest and has appropriate technology, its use is more for the collection and storage of data and its elementary processing. There are some factors which make the MkIS a success and some others, which make it a failure. The results of the present study highlight that MkIS and developments in SMEs of Punjab are still at initial stage. It can be concluded that the consequent opening up of many SMEs, the enterprises have a variety of challenges in front. MkIS has made the SMEs sector today to rise up to the occasion by devising and formulating a number of marketing strategies. Efforts have to be made by this sector if it wants to survive in the present day world of competition. Further, though activities like management training programs, computerization, maintain of database, improvement in functional evidence etc. are being provided by SMEs, it is suggested that SMEs sector should also take a fresh look at these aspects and introduce necessary changes in them. It is recommended that SMEs, which are carrying out MkIS must make efforts to introduce new concepts in their systems.


Fig. 1. Success of MkIS Model with top two factors of each independent variable of MkIS in the three categories viz. cutting tools, sports goods and bicycle components.

Abstract

Computers which are the most significant tools of information age, have increasingly been used in each stage of education system. During the childhood period being one of the most important stages for human development, computer usage has become common especially in the institutions of pre-school education. The aim of this study was to determine the opinions of pre-school teachers about computer usage in education. The research was planned in accordance with the relational screening model. Within this research, the questionnaire form was applied to 215 pre-school education teachers. Towards the results of the study, suggestions have been made for pre-school education teachers.

Key words: Pre-school Education, Computer Education, Computer Teaching in Pre-school Education

1. Introduction

Education has been going on with its innovations over the centuries. In this renewal process, big developments have been experienced in the educational technology, especially the computer-aided education programs have played crucial roles in enriching and increasing productivity. Educational systems tend to develop themselves continuously and give ever-increasing importance to the usage of technology in education towards technological advances.

The most important reason of the technological progress in education may be relation between current educational problems and potential of new technology for solving these problems (Alkan, 2005).

In information age everybody agrees that the computer technologies need to be learned. Today the usage of computer technologies have been taught even in preschool education (Gündüz and Odabaşı, 2004).

It is appropriate to start computer-aided education in the period of preschool education for the reason that interest and curiosity as the factors facilitating learning are intensive (Kacar and Doğan, 2007). Guiding to the children, in accordance with their levels, computers which make them active participants, will help instructors to transfer their roles to private instructions. Instructors must understand that computers are beneficial for children to solve problems and be in cooperation with them (Arı and Bayhan, 2003). It is necessary that children both show skills of technology usage at a high level and use these technologies in the teaching-learning process at an optimum level of productivity (Gündüz and Odabaşı, 2004).

2. Methodology

This study which was done for describing preschool teachers opinions about computer usage and education, was planned as a relational screening model among the screening models.

2.1. Scope and Sample

The scope of the study consists of formal, independent nursery schools, nursery classes and private nursery schools as well as their teachers. The sample group includes total 215 preschool teachers working at nursery schools and nursery classes in different 46 cities of Turkey. Demographical information concerning teachers involved has

---

been shown in tables from Table 1 to Table 5. Based on the demographical characteristics such as *gender, school type, availability of computer schools where teachers work, teachers' computer education and city where teachers work,* the distribution results of the questionnaire for the participants have been shown below, respectively.

Table 1. Gender of Participant Teachers

Gender	f	%
Female	193	89.77
Male	22	10.23
Total	215	100

When examining Table 1, it has been seen that total 215 persons responding to the questionnaire consist of 89.77% female and 10.23% male participants.

Table 2. Types of Schools Where Participant Teachers Work

School Type	f	%
Formal Nursery Schools	118	54.88
Independent Nursery Schools	90	41.86
Private Nursery Schools	7	3.26
Total	215	100

At Table 2. it has been observed that total 215 persons participating in the questionnaire also consist of 54.88% of them working at formal nursery schools, 41.86% of them working at independent nursery schools and 3.26% of them working at private nursery schools.

Table 3. Availability of Computers at Schools Where Participant Teachers Work

Availability of Computers at School	f	%
Available	168	78.14
Non-Available	47	21.86
Total	215	100

According to Table 3; it has been also seen that there are computers at schools where 78.14% of them worked while there were not any computers at schools where 21.86% of them worked among total 215 persons participating in the questionnaire.

Table 4. Computer Education of Participant Teachers

Computer Education of Teachers	f	%
Available	44	20.47
Non-Available	171	79.53
Total	215	100

Looking at Table 4, among total 215 instructors involved in the questionnaire, 20.47% of them have computer education and 79.53% of them do not have any computer education.

Table 5. Cities Where Participant Teachers Work

Work City	f	%	Work City	f	%

Adana	1	0.47	İzmir	1	0.47
Afyonkarahisar	4	1.86	Kahramanmaraş	2	0.93
Ağrı	1	0.47	Karaman	1	0.47
Aksaray	1	0.47	Kayseri	1	0.47
Ankara	3	1.40	Kırıkkale	1	0.47
Antalya	1	0.47	Kocaeli	1	0.47
Aydın	2	0.93	Konya	135	62.79
Balıkesir	2	0.93	Kütahya	1	0.47
Bartın	1	0.47	Malatya	2	0.93
Batman	1	0.47	Manisa	2	0.93
Bursa	2	0.93	Mersin	4	1.86
Çanakkale	4	1.86	Niğde	1	0.47
Denizli	1	0.47	Osmaniye	1	0.47
Diyarbakır	1	0.47	Rize	1	0.47
Edirne	1	0.47	Samsun	1	0.47
Elazığ	2	0.93	Sinop	1	0.47
Erzurum	2	0.93	Sivas	1	0.47
Gaziantep	1	0.47	Urfa	4	1.86
Gümüşhane	1	0.47	Şırnak	1	0.47
Hakkari	1	0.47	Trabzon	2	0.93
Hatay	1	0.47	Van	4	1.86
Isparta	1	0.47	Yozgat	1	0.47
İstanbul	9	4.19	Zonguldak	2	0.93
Total	215				

When examining Table 5, maximum participation in the questionnaire come from the Konya city as 62.79% (135 persons). Respectively, the cities of İstanbul (4.19%), Afyonkarahisar-Çanakkale-Mersin-Şanlıurfa-Van (1.86%) follow this one.

2.2. Data Collection Tool

The questionnaire form which was designed for evaluating "instructor thoughts about computer teaching in preschool education", applied to the teachers involved in the research sample. As a result of the factor analysis, it was found that the questionnaire form used in this research consisted of two dimensions. The questionnaire form involved total 11 items, including 7 items as Positive Factors in Computer Usage and Education for the first dimension of the form and 4 items as Negative Factors in Computer Usage and Education for the second dimension of the form. The factor analysis was done for detecting at how many different dimensions the questions of the questionnaire form regarding instructor thoughts about computer teaching were perceived by the participant instructors. In order to test the appropriateness of data set for the factor analysis, the Kaiser-Meyer-Olkin (KMO) measure of sampling adequacy and Bartlett's test of sphericity were performed. As a result of analyses, it was determined that the data set was appropriate for the factor analysis since the KMO value was over 0.799 and 0.50, and the sphericity possibility of Bartlett's test was at 0.05. Necessary information concerning the reliability of the questionnaire form has been presented at Table 6, Table 7 and Table 8.

Table 6: Results of Factor Analysis Regarding Measurement of Computer Usage and Education In Preschool Education

Factor	Item	Factor Loads		Cronbach Alpha
		1	2	

Positive Factors in Computer Education	It significantly increases the quality of education.	0.813	
	It increases productiveness during activities.	0.766	
	It is important like educational books.	0.707	
	It makes activities more enjoyable.	0.683	%79.5
	It saves time in educational activities.	0.608	
	It can be used in every types of activities.	0.538	
	It makes measurement and evaluation more reliable.	0.515	
Negative Factors	The computer is as complex as everybody cannot use it, which makes its usage difficult in education.	0.730	
	It causes setbacks in education due to the technical problems.	0.695	%55.4
	Usage time for computers should not be over 15 min.	0.580	
	It reduces a teacher's communication with children.	0.481	

Eigenvalue	3.855	1.279
Explained Variance (%)	30.532	16.140
Total Variance (%)	46.673	

Notes: (i) Analysis of Principal Components with Varimax Rotation
ii) KMO = 0.799, Barlett Test= 618.131; p<.001

By using the method of principal components and the Varimax rotation, the responses regarding computer usage/teaching measurement were analyzed. In a consequence of the factor analysis, it was found that the measurement of computer usage/teaching involving 11 questions was dealt in 2 sub-dimensions by the participant instructors. The totally explained variance was found to be 46.673%. The factors were named as positive factors in computer usage and teaching (7 items) and negative factors in computer usage and teaching (4 items), respectively. The contributions of these factors to explain opinions about computer usage and teaching in preschool education were found to be 30.532% and 16.140%, respectively.

In estimation of the internal consistency of the factors, the Cronbach Alpha coefficient values were used. This coefficient was an adaptive value based on the correlation between the questions. The Cronbach Alpha value shows the reliability levels of the questions in total. On the dimensions for the measurement of computer usage and teaching in preschool education, the Cronbach Alpha values were found to be 79.5% and 55.4%, respectively.

Table 7. Positive Factors in Computer Usage and Education

Positive Factors	X	S
It significantly increases the quality of education.	4.33	0.69
It increases productiveness during activities.	4.24	0.77
It is important like educational books.	4.15	0.90
It makes activities more enjoyable.	4.13	0.77
It saves time in educational activities.	4.07	0.76
It can be used in every types of activities.	3.71	0.89
It makes measurement and evaluation more reliable.	3.53	1.05

Notes: (i) n= 215, (ii)Scale 1=Strongly Disagree and 5= Strongly Agree . (iii) According to the Friedman Two Way Anova test, $\chi2= 188.201$; p<0.001, the results statistically significant.

When examining at Table 7, it has been observed that they mostly give importance to the expression "It significantly increases the quality of education" among the expressions regarding the dimension of positive factors in computer usage/teaching for the instructors participating in the research. Also, the table includes the arrangement of all expressions in accordance with the significance level.

Table 8. Negative Factors in Computer Usage and Education

Negative Factors	X	S
Usage time for computers should not be over 15 min.	3.73	0.98
It causes setbacks in education due to technical problems.	3.03	1.07
The computer is as complex as everybody cannot use it, which makes its usage difficult in education.	2.96	1.23
It reduces a teacher's communication with children.	2.87	1.07
Notes: (i) n= 215, (ii) Scale 1= Strongly Disagree and 5= Strongly Agree anlamındadır. (iii) According to the Friedman Two Way Anova test, χ2= 93.852p<0.001 the results statistically significant.		

When examining Table 8, it has been also observed that they mostly consider the expression "The time for computer usage should not be over 15 min." among the expressions regarding the dimension of negative factors in computer usage/teaching for the instructors participating in the research. Also, the table includes the arrangement of all expressions in accordance with the significance level.

2.3. Data Collection and Analysis

The data were collected by face to face communication and online communication. The statistical analysis of data was done using the SPSS 16.0 package program chosen for data analysis in social sciences. The Mann-Whitney U test and the Kruskal Wallis One Way Variance Analysis were used to analyze whether teacher opinions related with computer teaching differ in gender, school type, availability of computer at school and computer education.

3. Findings

Among the variables of the questionnaire form within this section of the research, the H_0 and H_1 hypotheses were tested with regard to *the availability of computer at school and the teachers' computer education*.

3.1. Computer Usage and Education in Preschool Education With Regard to Availability of Computer, Dimension of Positive Factors

H_0: With regard to the variable of availability of computer, medians for the dimension of positive factors, that is, the computer usage and education in preschool education are equal.
H_1: With regard to the variable of availability of computer, medians for the dimension of positive factors, that is, the computer usage and education in preschool education are not equal.

Table 9. Opinions about Computer Usage and Education in Preschool Education with Regard to Availability of Computer, Positive Factors, Hypothesis Test Values

	X	S	U	W	Z	p
It is important like educational books.	4.15	0.90	3813.5	18009.5	-0.389	0.697
It significantly increases the quality of education.	4.33	0.69	3472.5	17668.5	-1.405	0.160
It increases productiveness during activities.	4.24	0.77	3772.5	17968.5	-0.516	0.606
It can be used in every types of activities.	3.53	1.05	3395.5	17591.5	-1.529	0.126
It makes activities more enjoyable.	4.07	0.76	3668.5	17864.5	-0.832	0.406
It saves time in educational activities.	4.13	0.77	3536	17732	-1.203	0.229
It makes measurement and evaluation more reliable.	3.71	0.89	3229	17425	-2.016	0.044
Group Variable : Availability of Computer						

Looking at Table 9, the values of Mann-Whitney U, Wilcoxon W, Z and p have been observed. Since the p value showing the significance value in this table (except for that expression *"It makes measurement and evaluation more reliable"*) is bigger than 0.05, the H_0 hypothesis will be acceptable. That is, in accordance with the availability of

absence of computers at nursery schools, it has been determined that the medians for the dimension of positive factors are equal in the computer usage and education in preschool education are equal. There is no significant difference in the availability of computers.

Since *the p value* in the expression "It makes measurement and evaluation more reliable" *is smaller than 0.05, a statistically significant difference can be mentioned in the availability of computers at nursery schools. This difference reveals that the teachers having no computers at their schools agree that "It makes measurement and evaluation more reliable" rather than the teachers having computers at their schools.* The reason for this is that there may be difficulties in making measurement and evaluation proceedings at schools having no computers by hand. Because when there are computers available in schools, registering the children's forms of evaluation or development in a computerized environment, assessing them and transferring to the center units will be easier.

3.2. Computer Usage and Education in Preschool Education With Regard to Availability of Computer, Dimension of Negative Factors

H_0: With regard to the variable of availability of computer, medians for the dimension of negative factors, that is, the computer usage and education in preschool education are equal.
H_1: With regard to the variable of availability of computer, medians for the dimension of negative factors, that is, the computer usage and education in preschool education are not equal.

Table 10. Opinions about Computer Usage and Education in Preschool Education with Regard to Availability of Computer, Negative Factors, Hypothesis Test Values

	X	S	U	W	Z	p
It reduces a teacher's communication with children.	2.87	1.07	3629.5	17825.5	-0.896	0.370
Usage time for computers should not be over 15 min.	3.73	0.98	2948.5	4076.5	-2.776	0.006
The computer is as complex as everybody cannot use it, which makes its usage difficult in education.	2.96	1.23	3521	4649	-1.189	0.235
It causes setbacks in education due to technical problems.	3.03	1.07	3743.5	4871.5	-0.568	0.57
Group Variable : Availability of Computer						

When Table 10 is considered; the p value showing the significance level (except for that the usage time for computers should not be over 15 minutes) is bigger than 0.05, that is why, the H_0 hypothesis will be accepted. That is, with regard to the availability of computers in nursery schools, it has been explained that the medians for the dimension of negative factors are equal in the computer usage and education in preschool education are equal. There is not any significant difference in the availability of computers.

Within the expression "The usage time for computers should not be over 15 minutes" *the p value is smaller than 0.05, in accordance with the availability of computers in nursery school, there is a statistically significant difference here. This difference shows that the teachers having computers at their nursery schools think "The usage time for computers should not be over 15 minutes" rather than the teachers working at their nursery schools where there are no computers.*

The teachers having computers at their schools in preschool education are more conscious of time than the teachers working at schools where there are no computers, the reason for this is that the teachers study on computers with the children of small ages, can observe the children's developments, interests, considerations and concentrations well in a computerized environment, and give education to them in such a way.

3.3. Computer Usage and Education in Preschool Education With Regard to Computer Education, Dimension of Positive Factors
H_0: With regard to the variable of computer education, medians for the dimension of positive factors, that is, the computer usage and education in preschool education are equal.
H_1: With regard to the variable of availability of computer, medians for the dimension of positive factors, that is, the computer usage and education in preschool education are not equal.

Table 11. Opinions about Computer Usage and Education in Preschool Education with Regard to Computer Education, Positive Factors, Hypothesis Test Values

	X	S	U	W	Z	p
It is important like educational books.	4.15	0.90	3571.5	18277.5	-0.565	0.572
It significantly increases the quality of education.	4.33	0.69	3614	18320	-0.448	0.654
It increases productiveness in activities.	4.24	0.77	3204	17910	-1.68	0.093
It can be used in every types of activities.	3.53	1.05	3217.5	17923.5	-1.544	0.123
It makes activities more enjoyable.	4.07	0.76	3600	18306	-0.494	0.621
It saves time in educational activities.	4.13	0.77	3625.5	4615.5	-0.408	0.683
It makes measurement and evaluation more reliable.	3.71	0.89	3323	4313	-1.261	0.207
Group Variable : Computer Education						

Looking at Table 11 above, the p value is bigger than 0.05, the H_0 hypothesis will be acceptable. In other words, with regard to the computer education in nursery schools, it has been suggested that the medians for the dimension of positive factors are equal in the computer usage and education in preschool education are equal. There is not any significant difference in the computer education.

3.4. Computer Usage and Education in Preschool Education With Regard to Computer Education, Dimension of Negative Factors

H_0: With regard to the variable of computer education, medians for the dimension of negative factors, that is, the computer usage and education in preschool education are equal.

H_1: With regard to the variable of computer education, medians for the dimension of negative factors, that is, the computer usage and education in preschool education are not equal.

Table 12. Opinions about Computer Usage and Education in Preschool Education with Regard to Computer Education, Negative Factors, Hypothesis Test Values

	X	S	U	W	Z	p
It reduces a teacher's communication with children.	2.87	1.07	2888.5	3878.5	-2.518	0.012
Usage time for computers should not be over 15 min.	3.73	0.98	3515.5	4505.5	-0.701	0.483
The computer is as complex as everybody cannot use it. which makes its usage difficult in education.	2.96	1.23	3746.5	4736.5	-0.044	0.965
It causes setbacks in education due to technical problems.	3.03	1.07	3362	4352	-1.137	0.255
Group Variable : Computer Education						

When Table 12 is examined, the p value showing the significance level at the table (Except for that It reduces the teachers'communication with children" is bigger than 0.05, that is why, the H_0 hypothesis will be acceptable. That is, with regard to the computer education in nursery schools, it has been suggested that the medians for the dimension of negative factors are equal in the computer usage and education in preschool education are equal. Any significant difference cannot be mentioned in the computer education. *In the expression "It reduces the teachers'communication with children" the p value is smaller than 0.05, there is a statistically significant difference in accordance with the computer education. This difference explains that the teachers not having computer education think "It reduces the teachers'communication with children" rather than the teachers teachers having computer education.* The reason for this is that the teachers do not have educational background for computer, show positive attributes to the computer usage and have any experiences about these subjects to share with the children.

4. Results and Suggestions

In this study, the preschool teacher opinions about the computer usage and education have been analyzed, and the following results have been obtained:

- The participant teachers attach much more importance to the expression "It significantly increases the quality of education",
- Within the dimension of negative factors, they put emphasis on the expression "The usage time for computer should not be over 15 min.",
- In nursery schools where there are no computers, the teachers agree with this expression "It makes measurement and evaluation more reliable", rather than the others in nursery schools where there are computers,
- The teachers not having computer education think "It reduces communication between instructors and children" rather than the ones having computer education.

Based on these findings from this research, it is possible to make following suggestions:

- Increasing the numbers of the credit for the computer lessons in schools cultivating teachers,
- Providing teachers to take in-service training with a view to using computers actively,
- Making a schedule of lesson time and teaching materials, and considering students' developmental characteristics for the teachers using computers,
- Creating the educational environments having enough equipment in terms of techniques,
- Increasing the applied training about how to give computer education to the preschool children, the computer programmes, etc. as well as the computer education to be given to the teacher canditates can be realized.

Abstract

This study examined the efficacy beliefs of nonnative English speaking (NNES) EFL teachers in terms of personal capabilities to teach English as a Foreign Language (EFL) and their perceived English language proficiency in selected language centers in one Middle-East country. Data were collected through a survey administered to 187 teachers. A modified version of the Teacher Sense of Efficacy Scale (Tschannen-Moran & Woolfolk Hoy, 2001) was used to assess efficacy for classroom management, student engagement, and instructional strategies. The results showed that the teachers' perceived efficacy was positively correlated with self-reported English proficiency.

Keywords: Self-efficacy; English language profociency; English as a foreign language; Language centre.

Introduction

Research on teachers' beliefs and their impact on teacher cognition has been a relevant topic for educational inquiry over the last four decades. Understanding teachers' perceptions and beliefs is important because teachers, heavily involved in various teaching and learning processes, are practitioners of educational principles and theories (Jia, Eslami & Burlbaw, 2006). Findings from research on teachers' perceptions and beliefs indicate that these perceptions and beliefs not only have considerable influence on their instructional practices and classroom behavior but also are related to their students' achievement (Grossman, Reynolds, Ringstaff & Sykes, 1985; Johnson, 1992; Prawat & Anderson, 1988). Thus, knowing the perceptions and beliefs of teachers enables one to make predictions about teaching and assessment practices in classrooms. One important belief that appears to be an important influence on teacher and student outcomes is teachers' sense of efficacy.

This study is based on self-efficacy theory proposed by Bandura, 1997. Self-efficacy theory, applied in the educational realm, has sparked a rich line of research into how teachers' self-efficacy beliefs are related to their actions and to the outcomes they achieve (Tschannen- Moran et al., 1998).

It is important to note that self-efficacy is a motivational construct based on self perception of competence rather than actual level of competence. Actions and behaviors are better predicted by beliefs rather than actual accomplishments. Bandura (1997) suggested that it is most fruitful when teachers slightly overestimate their actual teaching skills, as their motivation to expend effort and to persist in the face of setbacks will help them to make the most of the skills and capabilities they do possess (Bandura, 1977; Tschannen-Moran et al., 1998).

Based on Tschannen-Moran et al. (1998) teacher self-efficacy is cyclical in nature. At first, information about one's efficacy comes from four sources: mastery experience, vicarious experiences, verbal persuasions and physiological arousals (Bandura, 1997). Teachers then process the information by analyzing the teaching task and assessing their personal teaching competence. After the information is analyzed, teachers generate efficacy judgments or teacher self-efficacy. Next, teachers use these judgments or self-efficacy beliefs to set their goals, determine the amount of effort they invest in achieving these goals, and their level of persistence. The performance

* Corresponding author. Tel.: 0060-14-2277532.
E-mail address: farimahghasemboland@gmail.com

and outcomes of their efforts provide new mastery experiences that lead to future efficacy judgments. It is noted that "like all self-efficacy judgments, teacher self-efficacy is context-specific" (p. 118).

Meanwhile, Language proficiency constitutes the foundation of the professional confidence of non-native English teachers (NNES). Language competence has been rated as the most essential characteristic of a good teacher (Lange, l990). According to Doff (1987), a teacher's confidence in the classroom is undermined by a poor command of the English language. Poor command of the language can affect the self esteem and professional status of the teacher and interfere with simple teaching procedures. Furthermore, it can keep the teacher from fulfilling the pedagogical requirements of a more communicative approach to language teaching. As shown by research, perceived language proficiency is an important issue for NNES teachers and has an impact on their professional self-esteem and confidence (Medgyes, 1994; Reves & Medgyes, 1994; Samimy & Brutt-Griffler, 1999; Kamhi-Stein & Mahboob, 2005).

As it is clear, language proficiency seems to be a factor related to EFL teachers feeling of self-efficacy. Therefore, the aim of this study is to examine the relationship of self-efficacy and language proficiency in EFL teachers working in the English language centers in one Middle-East country. To this end, the following questions were proposed for this study:

1. What are the current levels of the self-efficacy beliefs of English language center teachers?
2. What do teachers report to be their English proficiency level?
3. What is the interaction effect between teachers' self-efficacy beliefs and their proficiency in English?

Based on the above research questions the following null hypothesis was suggested:

HO: There is no interaction effect between English teachers' reported proficiency in English and their self-efficacy beliefs.

Method

participants

The target population for this study consisted of English teachers working in the English language centers in the TESOL context in one Middle-east country in Asia. The questionnaire adopted a convenience sampling method and the researcher distributed more than 200 sets of the questionnaires among the teachers.

Research Design

This study included both descriptive research methods and correlational research methods. The study was designed to explore English language center teachers' sense of efficacy and its interaction effect with their reported proficiency in English, so a descriptive correlational design was used.

Instrumentation

The instrument used in this study consisted of two questionnaires: 1) Teachers' sense of efficacy in teaching English and 2) Teachers' reported English language proficiency. Both questionnaires were Likert-type scale and the participants indicated the degree they could do with each item and assessed themselves on the scale provided.

Teachers sense of efficacy in teaching English

This section was designed to measure the teachers' sense of efficacy (or confidence) in teaching English. For this, the 12-item short version of the Teacher's Sense of Efficacy Scale (TSES) by Tschannen-Moran & Woolfolk Hoy (2001) was adapted to fit the English language center context.

The TSES items were Likert scale from one to nine. Participants would indicate the degree to which they could do with each item. A rating of one indicated that the respondent could do nothing about the statement presented. A rating of nine indicated that the participant could do a great deal about the statement.

Three factors were identified in the TSES: 1. Efficacy for student engagement, 2. Efficacy for instructional strategies, and 3. Efficacy for classroom management.

The reliability of the original TSES was 0.90 with all of the 12 items (0.86 with the instructional strategies, 0.86 with the classroom management, and 0.81 with the student engagement) (Tschannen- Moran and Woolfolk Hoy, 2001). This showed that TSES could have been considered a reliable measurement of teacher self-efficacy.

Teachers' reported English language proficiency

This section was designed to examine the teachers' self-reported current level of English proficiency that the teachers believed necessary for them to teach English effectively in the English language centers. To this end, 25 items developed by Chacon (2005, 2002) and Shim (2001) were adapted based on this study. The items asked teachers to assess their level of proficiency in English on a 6-point Likert-type scale from "Strongly disagree" to "Strongly agree" to indicate how teachers evaluated themselves in listening, speaking, reading, and writing.

After piloting the test, 4 items of the language proficiency questionnaire were deleted and it was shown that the reliability of the test increased significantly. So the final version of the language proficiency questionnaire which was later distributed among the participants of this study had 21items.

Concerning reliability coefficient, the Cronbach alpha of the four skills of listening, speaking, reading, and writing were .958, .912, .947, and .907 respectively. After deleting the four items the reliability increased to .973, .920, .947, and .947 accordingly.

Procedure

Validity

The construct validity of the instruments of the present study was partially established by the instruments on which the current instruments drew. However, as some items were modified and some were newly added to the present study, there was a need to reestablish the validity of the instruments.

In the present study, content validity and face validity were established by the judgment of a panel of 3 experts and field testing. A panel of the experts and 5 English language center teachers who were teaching at different levels were asked to review the instruments in terms of validity, suitability, and clarity. They were requested to comment on appropriateness of expressions and general readability of the instruments. Comments on instrument's wording, ambiguities, and appropriateness were welcomed. Based on the advice of the panel of experts and field test participants, the instruments were modified and later the approved and corrected format was distributed among participants.

Tschannen-Moran and Woolfolk Hoy (2001) examined the construct validity of the TSES questionnaire. The results of the analyses indicated that TSES could be considered reasonably valid and reliable. It is of reasonable length and is a useful tool for researchers interested in exploring the construct of teacher self-efficacy.

Reliability

After field-testing the instrument, the reliability coefficient of the test was calculated by using Cronbach alpha coefficient. Cronbach reliability coefficients of the scales were: 0.96 (Instructional Strategies), 0.95 (Classroom Management), and 0.95 (Student Engagement) for the present study. The Cronbach alpha coefficient of the whole test was .956 which is significant and considered high. It means that all the three sub-categories of self-efficacy beliefs are highly correlated and it supports that the whole test is a reliable measurement of self-efficacy beliefs.

In addition, the Cronbach alpha was calculated for each of the sub-categories of Language Proficiency questionnaire after conducting the main study. The Cronbach Alpha was .973, .921, .946, and .946 for each of the skills of listening, speaking, reading, and writing respectively, which were all significant and favorable. The reliability of the whole test was .96 which was considered high and favorable. It showed that language proficiency questionnaire was completely reliable.

Findings

Levels of English teacher efficacy dimensions

The mean score of each component was calculated in order to examine the teachers' level of self-efficacy in teaching English. The teachers rated their self-efficacy in teaching English at rather high level in the all dimensions of Instructional Strategies, Classroom Management, and Student Engagement (Table 1). In other words, they believed that they could have some influence in the three dimensions. The teachers responded that they felt more confident in Classroom Management (M = 7.54) than in any of the other dimensions. In the meantime, it was found that the teachers felt least confident in their Instructional Strategies (M = 7.10).

Table 1. Means and standard deviation of teacher efficacy in teaching English

	Mean	Standard Deviation
Student Engagement	7.21	1.558
Classroom Management	7.54	1.550
Instructional Strategies	7.10	1.870

Note: 1 = Nothing/not at all, 3 = Very little, 5 = Some influence, 7 = Quite a bit, and 9 =A great deal

In examining the teachers' self-reported efficacy or confidence levels in teaching English, note that the present study did not report the overall teacher efficacy level by aggregating the three factors. The researcher believed that each dimension had its unique domain, while not convinced of the absolute value of the overall score in explaining the teachers' sense of efficacy in English teaching in general.

Besides that, the researcher decided to calculate the inter-item correlation of the self-efficacy items for each sub-category. It was shown that the items in each of the sub-categories of student engagement, classroom management, and instructional strategy had quite high correlation with each other and all the correlations were above 0.80 which was considered high.

Later, the researcher examined the correlations among all three subcategories of self-efficacy (Table 2). It was shown that all of them are highly correlated. The highest correlation was between Student Engagement and Instructional Strategy dimensions.

Table 2. Correlations among dimensions of self-efficacy

	Student Engagement	Classroom Management	Instructional Strategies
Student Engagement	1		
Classroom Management	.880**	1	
Instructional Strategies	.905**	.883**	1

Levels of English teacher language proficiency

The means and standard deviations for each of the 21 items were calculated and the result is shown in table 3.

Table 3. Mean and standard deviation of English language proficiency

	Range	Minimum	Maximum	Mean	Mean/Max	SD
Listening Score	22	8	30	19.06	0.63	8.118
Speaking Score	20	16	36	26.46	0.73	6.408
Reading Score	17	13	30	23.11	0.77	5.031
Writing Score	14	16	30	24.80	0.82	4.700

By looking at Table 3 it can be concluded that the variety of scores in listening skill of the participants is more than the other skills (SD = 8.11). It means that we have different levels of listening proficiency among the participants of the study. On the other hand, the standard deviation of the speaking, reading, and writing is lower, 6.40, 5.03, and 4.70 respectively. It shows that the variety of scores is lower and most of the teachers are relatively at the high level of their speaking, reading, and writing skills compared to their listening.

Based on the value of Mean/Max, we can conclude that the participants are stronger in writing skills (.82) and weaker in Listening skills (.63). So, for the participants of this study the order of Language skills from the strongest to the weakest is Writing, reading, speaking, and listening respectively.

This result is understandable, as the context of the study is EFL and English is not used in the society and daily lives of the participants. The participants have quite limited access to English in their daily lives, so they can not improve their listening and speaking skills of their language proficiency.

In addition, the inter-item correlation of the language proficiency items for each skill of listening, speaking, reading, and writing was calculated.

Table 4 shows that the items in Listening skills have quite high correlations with each other and all the correlations are above .83 which is considered high and significant.

Table 4. Inter-Item Correlation Matrix of the listening skill

Relationship between teachers' sense of efficacy and proficiency in English

Table 9 summarized the correlations of the language proficiency and the three dimensions of the teachers' self-efficacy (i.e., Instructional Strategies, Classroom Management, and Student Engagement). Overall, the correlations were significant and ranged from low (r = 0.202) to very high (r = 0.844).

**. Correlation is significant at the .01 level (2-tailed).

L= Listening, S= Speaking, R= Reading, W= Writing

ME=Mechanical, CM=Communicative

SE= Student Engagement, CM= Classroom Management, IS= Instructional Strategies

Very high positive relationships were found between the three dimensions of self-efficacy and the four dimensions of English language proficiency (i.e., listening, speaking, reading, and writing). The strongest relationship was between student engagement and writing (r = .916) which was considered very high. The weakest (yet still very high) relationship was between instructional strategy and speaking (r = .779).

Moreover, the student engagement was found to have a stronger relationship with English language proficiency dimensions (r = .811 to .916) than classroom management (r = .800 to .880) and instructional strategy (r = .779 to .898). It could be inferred that those teachers who are more proficient in English would engage students more in the English classrooms than managing the class and using the instructional strategies.

Discussion

In the current study, the teachers rated their self-efficacy in teaching English at rather high level in the all dimensions of Instructional Strategies, Classroom Management, and Student Engagement. In other words, they believed that they could have some influence in the three dimensions. The teachers responded that they felt more confident in Classroom management (M = 7.54) than in any of the other dimensions. In the meantime, it was found that the teachers felt least confident in their Instructional Strategies (M = 7.10).

In relation to the teacher efficacy levels among the teachers in the present study, it is important to note that the teachers' self-reported English teaching efficacy or confidence levels in the present study were found to be higher than those in the previous studies adopting the TSES. It indicated that the teachers in the present study felt more confident in carrying out the teaching tasks than the teachers in other studies. For example, in the only study that adopted the TSES to examine teachers' English teaching-specific self-efficacy beliefs in the EFL context, Chacón (2002, 2005) reported that her Venezuelan middle school English teachers rated their capabilities to carry out teaching tasks with their confidence at the "quite a bit" level (M = 6.59 on Student Engagement; M = 7.00 on Classroom Management; M = 7.13 on Instructional Strategies). Tschannen-Moran and Woolfolk Hoy (2007), taking a non-subject specific approach, have documented similar degrees of self-efficacy beliefs reported by U.S. teachers. Besides, Lee (2009) reported lower results in comparison with the others. Her teachers rated their capabilities to carry out teaching tasks with their confidence at the "some influence" (M = 5.53 on Student Engagement; M = 5.70 on Classroom Management; M = 5.36 on Instructional Strategies).

Although one should be cautious in making direct comparisons of the scores reported in different cultures due to the possibility that survey responses may reflect cultural biases (King, Murray, Solomon, & Tandon, 2004), Such a comparison can provide useful information in examining where the teacher efficacy levels reported by teachers in the present study are located in relation to other teachers, especially when there are no previous studies conducted in the Middle-East EFL context using the same instruments.

Regarding the self-assessment levels of English proficiency, this study found that the teachers tended to rate their current proficiency levels in writing skills higher than for the other skills (i.e., listening, speaking and reading). Based on the value of Mean/Max, it was concluded that the participants were stronger in writing skills (0.82) and weaker in Listening skills (0.63). So, for the participants of this study the order of Language skills from the strongest to the weakest was Writing (0.82), reading (0.77), speaking (0.73), and listening (0.63) respectively.

A possible reason for the teachers' lower proficiency in listening and speaking skills in this study could be found in the English education that the teachers received when they were students. English education in the EFL context of this study focused mainly on grammar and reading comprehension, not the development of listening or speaking ability. Also, in the EFL context of this study, teachers and learners have few opportunities to speak or listen in English for communicative purposes—the target language is not used in everyday life— but they can easily obtain writing and reading materials. Given this context, it seems unsurprising that the teachers felt less competent in listening and speaking skills than reading and writing skills (Park, 2006).

In Lee's (2009) study, it was found that the teachers tended to rate their current proficiency levels of receptive skills (i.e., Listening and Reading) higher than productive skills (i.e., Speaking and Writing). Park (2006) also found, by using a different instrument, that the Korean secondary English teachers rated their productive skills lower than their receptive skills. Meanwhile, language deficiencies particularly in listening, speaking were self-reported with low means in Chacon's (2002) study. English language deficiencies in speaking were mentioned as a factor that affected teachers' confidence in their capabilities to teach oral English.

The present study has found that self-reported English proficiency levels had high relationships with all of the English teaching-specific efficacy dimensions (r = .779 to r = .916), so the null hypothesis was rejected. This result means the teachers who rated their English proficiency higher in the four skill domains tended to believe more strongly in their capability for teaching English. This corroborates the previous studies that have reported significant relationships between teachers' sense of efficacy or confidence in teaching English and English language proficiency (Chacón, 2002, 2005; Lee, 2009; Shim, 2001).

The relationships of English proficiency levels with student engagement (r = .811 to .916) dimension of English teaching self-efficacy beliefs were stronger than with classroom management (r = .800 to .880) and instructional strategy (r = .779 to .898) dimensions. These results indicated that the variance on teachers' self-reported English language proficiency levels shared more variance on their beliefs about capability to carry out teaching tasks related to the student engagement than those related to classroom management and instructional strategies. Those who perceived they had sufficient English language proficiency tended to believe in their capability to carry out tasks related to student engagement more than the other dimensions of classroom management and instructional strategy.

In sum, the present study corroborates studies that have documented significant association between English language proficiency and teacher efficacy (Chacón, 2002, 2005; Lee, 2009; Shim, 2003). This suggests that improving one's English language proficiency can enhance English teaching-specific teacher efficacy or confidence.

Recommendation for future studies

As the first study that adopted the notion of teacher efficacy in conceptualizing teachers' confidence in teaching English in the EFL language center education context, the present study provides possible direction for future research as follows:

1. Teachers' perceived efficacy is a multifaceted construct that varies across tasks and contexts where teachers do their teaching. Additional research needs to be conducted to assess teachers' capabilities to teach English as a situated activity immersed in a sociocultural milieu. It would be useful to explore teachers' perspectives through additional studies that provide a deeper understanding of how teachers' sense of efficacy influences teachers' actions and decision-making in planning and conducting lessons. Observations of teaching performance, teaching techniques as well as multiple interviews should be used as another source of data to explore teachers' sense of efficacy and the teaching of foreign languages, English and others.

2. given the fact that the present study was based exclusively on self-reported data, additional research is needed that could include quantitative data on teachers' perceived efficacy in teaching English as foreign language using independent measures to investigate the relationship on this variable and student outcomes (e.g., ability to speak English as measured by purposeful sampling interviews) . This type of study is needed to determine if teachers' sense of efficacy correlates in statistically significant ways with student learning of English as a foreign language in certain contexts (e.g., language centers in EFL context).

3. Longitudinal studies are also recommended to investigate whether teachers' perceived efficacy to teach EFL varies across years. It is recommended to follow-up teachers to investigate whether or not and how their efficacy changes over the years.

Abstract

This study explores the expectations and possible mismatches that arise from cultural differences between local students and their foreign English language teachers with a global mindset in the classroom interaction as an important domain of the intercultural communication. The authors view the language classroom and teacher-student interaction as truly intercultural settings that need a close inspection which is likely to contribute to a high level of intercultural competence and improvements in the quality of language education. Thus, the aim of this study is to raise awareness in the English-medium intercultural communication in secondary and higher education ELT classes in Kazakhstan by describing several significant aspects of teacher-student interaction. The local and international teachers as well as the English language learners provided data on the role of the teacher, types of teacher guidance, attitudes to lateness, types of the tasks for assignments and exams, attitudes to cheating, responsibility for the learning process, teacher attitudes to students' questions and the degree of student's initiative to describe local ELT classes. The study includes practical recommendations particularly for international teachers of English in Kazakhstan; however, local teachers and educational administers, who need to work cooperatively with international teachers, may find the implications quite useful as well.

Key Terms: intercultural; communication; Kazakh; global; culture; ELT; class management

1. Introduction

Recent changes in the social and economic life after the collapse of the Soviet Union revealed a need in high competitiveness in all spheres including the education sector. ELT has become an important market where investors compete with others through their publications, technological innovations, and competent teachers in order to get superiority. In addition to the language schools that have been opened recently almost as many as supermarkets, universities, colleges, public and private schools comprise the organizations that invite ELT teachers from around the World. Nowadays respected language schools, universities or English courses have at least a few foreign teachers of English, usually native speakers. These international teachers of English are hired because they usually demonstrate a good standard of English at advanced levels. Since their existence also brings authenticity to the learning environment, they are treated with enthusiastic welcome. On the other hand, there is considerable concern about whether such foreign teachers really contribute to the quality of ELT services at their best. There seem to be three essential components that contribute to the success of English language teachers in any country. They are language, teaching techniques, and culture (Millrood, 1999). However resourceful a teacher is in the other two components, success is hardly an issue of end product that could be achieved if one of them is missing. Therefore, foreign language teachers' best contribution can only be provided if they are well aware of the peculiarities of the local culture and mindset, which determine the norms of learner behavior during the interaction in an ELT class.

In this paper, we will attempt to explore learner expectations on certain significant aspects of teacher-student interaction in ELT classes in Kazakhstan. These aspects focus on the authentic communication between the foreign teacher and local learners and comprise several issues such as the role of the teacher, types of teacher guidance, attitudes to lateness, types of the tasks for assignments and exams, attitudes to cheating, responsibility for the learning process, teacher attitudes to students' questions and the like. We further will compare them to those of the

international teachers who we assume to have adopted a second identity as they work in Kazakhstan. This second identity requires the promotion of global values and trends in students' personal development and language learning. We are also aware of the fact what gives these values a global acceptance is their popularity through the mass media rather than their truthfulness. As such an international teacher of English is likely to be a native speaker or an advanced speaker of English who tends to use a communicative approach to language teaching which basically promotes 'facilitator' or 'interlocutor' roles of teachers, 'democratic' and 'indirect' styles of guidance, 'linear' and 'exact' concepts of time management, 'critical thinking skills' and 'creativity' in assignments, 'accuracy' and 'objectivity' of assessment. They tend to encourage learners to develop autonomy and take more responsibilities for their own learning in a learner-centered class atmosphere. As one can easily notice that these features are based on the values of western cultures and the product of language teaching methodology that has been developed by English-speaking scholars who were born to or exposed to the western cultural environments.

Owing to the fast economic growth and educational policies that emphasize the nation's integration into the modern world, language teachers from abroad has been hired to work in local institutions recently. Therefore, the study introduces a new issue for ELT in Kazakhstan. In fact, there has been some research comparing Western and East Asian cultures and their influence on teaching. Kazakhstan, nevertheless, is in the Central Asia and has a different unique Eurasian culture, which belongs to both the East and West, without being Eastern or Western, remaining original according to the official identification that is given at the website of the Emblem and Flag of Kazakhstan.

Thus, this study will be practically useful for both Western and local teachers as well as the ELT managers of local educational institutions.

2. Background of the Study

The first axiom for any teacher, especially in a cross-cultural setting, is to adapt your teaching to the context of the students, school and community in which you are working (Barnhardt, n.d). Therefore, when teachers from abroad come to teach English in Kazakhstan, they should be aware of the cultural peculiarities of the local students. In other words, they should clearly understand what local students expect from a teacher and the teaching-learning process on the whole. Such teacher-student interactions comprise authentic communicative situations with an intercultural dimension which is provided by cultural differences between learners and their foreign teacher as well as the expectations that arise from these differences. In order to compare the two cultural backgrounds, first of all there is a need to define the conceptual framework of culture and to develop a set of criteria that can at least roughly measure any culture as an essential component of context for communication.

2.1. Defining and Teaching Culture

Adopting a relevant definition of culture is an important first step of incorporating it into foreign language teaching. A broad definition that comes to the mind first would be "civilization" represented in manners, arts and crafts and their products that are acquired through education in a society. Geert Hofstede, a Dutch academic who put corporate culture on the map (Guru: Geert Hofstede, 2008), calls this meaning of culture as the domain of a "ministry of culture" on his personal website. Bennett refers to the same notion of culture with "capital C", which is about the great literary works, historical figures and thinkers, as opposed to "small c" culture meaning "the learned and shared patterns of beliefs, behaviors and values of groups of interacting people" (Bennett, 1998, p.3). This second type of culture is about the particular way a group of people think, feel, and act in general. Hofstede has defined it as "the collective programming of the mind distinguishing the members of one group or category of people from another". The "category" in this definition refers to one's socio-cultural identity determined by nationality, regional or geographical belonging, ethnicity, gender, religion, occupation, or corporal organizations (Hofstede, n.d.).

Culture teaching received considerable conscious attention in language teaching after the introduction of the construct of intercultural communicative competence. (Hymes, 1972) Culture and language are believed to be inseparable and intertwined. Therefore, culture has always been taught along with the language though in the forms of separate courses known as *background studies*, *area studies, British life and institutions*, in Europe (Byram, 1989, pp. 58-60, 1998, p. 2) and *country studies* in the Soviet and early post –Soviet era in Kazakhstan. However such courses were limited to factual knowledge pertaining to the structure and functions of institutions and people's lives through generalizations and stereotypical perceptions (Mountford & Wadham-Smith 2000: 1). These courses also viewed culture "as mere information conveyed by the language, not as a feature of language itself" (Kramsch 1993:8). In other words, the teaching of culture, which was particularly known as 'the capital C culture" (Bennett,

1998, p.3), was considered to be supplementary to language teaching, not a part of it. In Bennett's terms, "the small c culture", which is represented in everyday lives of people and in their beliefs, values and skills, was just ignored. Traditional Grammar-Translation approach to teaching foreign languages in Kazakhstan probably considered cultural skills as inferior to the knowledge and skills of grammar and translation. Now that communicative approach has prevailed language teaching, it is believed that "the person who learns a language without learning a culture risks becoming a fluent fool" (M. Bennett, J. Bennett, & Allen, 2003, p. 237).

2.2. Identifying and Comparing Cultural Dimensions in Intercultural Communication

Two of the research proponents who investigated cultural differences have been Geert Hofstede and Edward T. Hall. Geert Hofstede researched cross-cultural groups and organizations and as a result, developed a systematic framework for assessing and differentiating national cultures and organizational cultures. His studies demonstrated that there are national and regional cultural groups that influence behavior of societies and organizations. The values that distinguished countries from each other could be grouped statistically into five clusters (Hofstede, n.d.). These groups, which have become the Hofstede dimensions of national culture, are known as 'individualism versus collectivism', 'power distance', 'uncertainty avoidance', 'masculinity versus femininity', 'long-term/short-term orientation'(Guru:Geert Hofstede, 2008). Moreover, among the research on intercultural studies, anthropologist Edward T. Hall's constructs of polychronic versus monochronic time orientation describes how cultures structure their time. A very brief review of such constructs enables a relative comparison and a better understanding of cultural peculiarities that provide a more meaningful context of ELT for foreign teachers in Kazakhstan.

2.2.1. Individualism versus Collectivism

As one of the Hofstede dimensions of cultural variation, 'collectivism-individualism' indicates the degree to which individuals are integrated into groups. On the individualist side of the spectrum, we find societies in which the ties between individuals are loose: everyone is expected to look after themselves and their immediate family. On the collectivist side, we find societies in which people from birth onwards are integrated into strong, cohesive in-groups, often extended families - with uncles, aunts and grandparents - which continue protecting them in exchange for unquestioning loyalty (Hofstede, n.d.). In collectivist cultures, people promote respect for authority and group consensus. In individualist cultures, the emphasis is on self-expression and individual thinking. When individualists are dissatisfied with the group they leave it; collectivists tend to stay. While collectivist cultures emphasize developing and sustaining stable, hierarchical roles, individualist cultures are associated with equalitarian relationships and flexibility in roles. In collectivist cultures, the boundaries of property ownership are more permeable. In individualist cultures, personal items are private property and are not to be shared. (Ho, Holmes and Cooper, 2004).

Education is a way of gaining higher status in collectivist cultures. In individualist cultures, the aim of education is to acquire knowledge and to improve one's competence in order to earn a better living. In collectivist cultures, students expect to learn "how to do" and tend to perceive that there is only one right perspective to a given problem. Learning in individualist cultures is about how students experience and organize the subject matter of a learning task. It is about "how" they learn, rather than "how much" they remember. In collectivist cultures, students usually do not freely express their opinion in a large class situation unless they are being called upon personally by their teacher. In individualist cultures, students are generally more willing to speak up (Ho, Holmes and Cooper, 2004).

The difference of student behavior is also visible in students' acceptance of the authority of their teacher, which lead them to cooperation and support the teacher at all times in collectivist cultures. They avoid confronting the teacher even when they disagree with the opinions that their teacher or fellow students expressed. The students in individualist societies have a weak face consciousness, so giving appropriate information is more important than saving one's face (Chang & Chin, 1999)

2.2.2. Power Distance

Another dimension of cultural variation is 'power distance' which means to measure the degree to which power, prestige and wealth are unequally distributed in a culture. Cultures with high 'power distance' scores believe that control and influence should be concentrated in the hands of a few. In cultures with low 'power distance' picture, control and influence are believed to be more equally distributed. For instance, employers are expected to stand in a line with their employees in a low-power distance business corporation.

In a high -power distance class, teachers are greatly respected by students because of their age and profession. The lesson tends to center around the teacher - they initiate most communication and students are rarely proactive or challenging. Teacher's main goal is to transmit his knowledge to students. On the other hand, teachers and students from low 'power distance' cultures have equal responsibilities; both contribute to the learning process. Students are usually active and initiative.

2.2.3. Uncertainty Avoidance

Uncertainty avoidance deals with a society's tolerance for uncertainty and ambiguity. It indicates to what extent a culture programs its members to feel either uncomfortable or comfortable in unstructured situations. Unstructured situations are novel, unknown, surprising, and different from the usual. For strong uncertainty avoiding cultures something new and different is dangerous, whereas people from weak uncertainty avoiding cultures are curious about new unknown things and situations.

Uncertainty avoiding cultures try to minimize the possibility of such situations by strict laws and rules, safety and security measures, and on the philosophical and religious level by a belief in absolute Truth. People in uncertainty avoiding countries are also more emotional, and motivated by inner nervous energy. The opposite type, uncertainty accepting cultures, are more tolerant of opinions different from what they are used to; they try to have as few rules as possible, and on the philosophical and religious level they are relativist and allow many currents to flow side by side.. People within these cultures are more phlegmatic and contemplative, and not expected by their environment to express emotions (Hofstede, n.d.).

2.2.4. Masculinity and Femininity

The binary opposition of masculinity versus femininity refers to the range of emotional roles between competitive-assertiveness and caring-sharing-modesty. Hofstede's studies for the IBM company revealed that women's values differ less among societies than men's values and men's values from one country to another contain a dimension from very assertive and competitive and maximally different from women's values on the one side, to modest and caring and similar to women's values on the other. The assertive pole has been called masculine and the modest, caring pole feminine. The women in feminine countries have the same modest, caring values as the men; in the masculine countries they are more assertive and more competitive, but not as much as the men (Hofstede, n.d.).

2.2. 5. Long-term vs Short Term Orientation

Hofstede's fifth cultural dimension is long-term versus short-term orientation which is based upon the teachings of Confucius. Confucianism looks at life in the long-term rather than the short-term by promoting the stability of society, considering family as the prototype of all social organizations, appreciating the virtuous behavior toward others with the principle of treating others as one would like to be treated oneself and encouraging such moral values as patience and perseverance (Hofstede & Hofstede, n.d.).

2.2.6. Monochronic and Polychronic Cultures

The monochronic time concept follows the notion of "one thing at a time", time is inflexible, while the polychronic concept focuses on multiple tasks being handled at one time, and time is flexible (Tamas, 2007)

A manager's office in a polychronic culture typically has an open door, a ringing phone and a meeting all going on at the same time. Though they can be easily distracted they also tend to manage interruptions well with a willingness to change plans often and easily. People are their main concern (particularly those closely related to them or their function) and they have a tendency to build lifetime relationships. Issues such as promptness are firmly based on the relationship rather than the task and objectives are more like desirable outcomes than must do's ("Cultural", 2012).

While in monochronic cultures schedule coordinates activity and appointment time is rigid, in polychromic culture interpersonal relations coordinate activity and appointment time is flexible. In a monochronic culture, the work time is clearly separable from the personal time, whereas in polychronic culture it is not. Another difference is that in monochronic culture's tasks are measured by output in time, but in polychronic cultures tasks are measured as part of overall organizational goal. Interactions between the two types can be problematic. Monochronic businessmen cannot understand why the person they are meeting is always interrupted by phone calls and people stopping by. Is it meant to be insulting? When do they get down to business? Polychronic businessmen cannot understand why tasks are isolated from the organisation as a whole and how one can separate the work time from personal time? Why would you let something as silly as a schedule negatively impact on the quality of your relationships? (Bhattacharyya, 2010, p.54).

2.2.7. Other Approaches to Understanding Cultural Differences through Bipolar Constructs

Obviously there are more studies on cultural differences and the ways of comparing cultures through bipolar constructs are not limited to the ones that we reviewed so far in this paper. For example, a dialogic versus dialectic model describes whether a certain culture favors a student-centered and collaborative class or a teacher-centered and competitive class (Hammond & Gao, 2002, p. 235)

Similar to Hofstede's uncertainty avoidance dimension is Hall's high and low context dimension. *High context* implies that a lot of unspoken information is implicitly transferred during communication. *Low context* implies that a lot of information is exchanged explicitly through the message itself and rarely is anything implicit or hidden.

People in low context cultures such as the UK tend to have short-term relationships, follow rules and standards closely and are generally very task-oriented ("Crosscultural",2012) (Jandt,1998). It influences whether a direct or indirect style is preferred in a certain culture. (Gao and Ting-Toomey, 1998).

The choices of formal or informal styles of communication, use of verbal and nonverbal communication styles, the interpretation of silence (Samovar & Porter, 2004), the use of space or distance in high and low contact cultures (Nishimura, Nevgi and Tella, (2008) may be common causes of miscommunication in intercultural interactions between representatives of different cultures when they meet.

3. Data Collection and Analysis

This study, which seeks to provide data about classroom expectations of Western teachers and Kazakhstani students, is based on interviews and questionnaires that revealed relevant data relying on participant observations in appropriate intercultural contexts where Kazakhstani students are taught by Western teachers of English. The participants of interviews were five Kazakhstani students studying abroad, seven Western EFL teachers who are currently working or worked in Kazakhstan, and eight local teachers. Questionnaires were conducted to sixty students in their 2nd, 3rd and 4th year of education at Suleyman Demirel University and forty of the 8th grade pupils at a local secondary school in Taldykorgan. All of the participants have been to ELT classes as a student or teacher, or as an observer. Local teachers also have had worked with foreign teachers of ELT in Kazakhstan.

The questionnaires were available both in English and Russian, but presented in Russian to locals and were responded anonymously and conducted by a third person - a senior student at the university as a part of the undergraduate research project - in order to achieve reliable results. Participants were asked to respond to the statements by choosing one of the four options on the basis of an 'agree - disagree range'. Data from the questionnaires are assumed to reveal student attitudes and analyzed globally together with local teachers' detailed responses to interview questions. Local teachers were asked about their own views of the description of their ELT classes whereas international teachers were additionally required to comment on differences in their expectations. One of the authors of this paper has been working as an ELT teacher and teacher trainer for almost two decades in Kazakhstan. Therefore the conversations with participant teachers have been productive as the author described himself as an international speaker of English who is originally from Turkey.

A part of the results that is relevant to describing language learners in terms of their expectations during their interaction with teachers in the intercultural atmosphere of ELT classes have been shared in the following sections of this paper.

3.1. Exploring Culture in Kazakhstan

Kazakhstan is composed of a multi-ethnic, multi cultural nation. As the citizens of a post Soviet republic, people in Kazakhstan mainly use Russian for inter-ethnic cross-cultural communication. However, the native language of the majority and the titular nation is Kazakh, which is slowly becoming a dominant language in all spheres of life owing to its status as the state language. For quite a long time Kazakhstan has experienced a multi cultural life through peaceful means of successful communication in a diverse community. There is a lot in common though there are also differences between them. "These differences are welcome, well known and viewed as richness in the form of a beautiful mosaic of cultures" said a Kazakh scholar, Ahmetzhanova Z. in a roundtable discussion at the 5th International Conference on Building Cultural Bridges in Almaty in 2013 (personal communication, April 26, 2013) In the light of past activities of this conference and the public opinion reflected in other social and academic events and in mass media, we drew following assumptions about the cultural features of locals, their beliefs, values and behaviors that determine the attitudes in relationships, particularly between teachers and students in language education.

Kazakhstan is a collectivistic country where strong family relationships, loyalty to friends, neighbors and colleagues, hospitality towards guests, respect for the aged and mercy for someone in need are greatly valued. Kazakhs historically preferred to lead a collective way of life and there are many proverbs about the importance and power of living in groups, not alone. *"Adamga adamsyz kyun zhok"*, or *"Kozsyz ali omyr syurup, adamdarsyz omyr syurmeisin",* are two of such proverbs which mean life is impossible without having people around you.

On the other hand, power distance is quite high in Kazakhstan. Social roles are well defined in a hierarchical way and this is visible in a typical Kazakh family where individuals are ranked according to their age. Younger members are expected to be obedient to the elderly. Education is meant to shape the younger generation to serve the above mentioned values. In a European country children may be allowed for equal voice and encouraged to develop autonomy, while being consulted by their parents instead of being obedient ("Kazakhstan", 2012).

The Kazakh society shows the features of a mixture of both masculine and feminine societies, though masculine qualities may be a bit more dominant. When there is a conflict in communication, they believe that the resolution depends on the loss of one of the sides. Perhaps some people who have interacted with a feminine culture would strive for a win – win type of resolution. However, if you look at gender roles in Kazakh society, you would notice the respect for the higher status of the male which does not discourage the female to take up significant positions in the social, economic and bureaucratic life. Traditionally there is a strict role distribution between men and women and children are brought up with appropriate roles to their genders. A commercial video broadcast by an international brand may receive negative feedback and reaction if stereotypical gender roles are ignored in the video clip. For instance, the man in the family preparing breakfast and making tea with an international tea brand for the wife and children who get up quite later than him is not a likely picture of a Kazakh family; so it may be protested by some academicians and community leaders.

People in Kazakhstan want stability, structure and security and due to this they have strong uncertainty avoidance. This can be seen especially in political, social, academic spheres of life. However, this does not coincide with how they conduct business. Since the society has a high-context culture, unspoken rules play an important role in communication. Locals are well acknowledged about the unwritten regulations and they may assume that their international interlocutors are also aware of them.

An interesting stereotypical opinion about Kazakhs is that they have polychronic time orientation. Therefore they usually do not follow an agenda ("Kazakhstan", 2012). Completing tasks in time is subordinated to interpersonal relationships, which influences decisions and coordinates activities. People attempt to do many tasks at a time, and usually succeed them. Appointment time is flexible. As one of the authors of this paper reported, if you want to go to a wedding party at the exact time that you are invited, it is not unusual to wait for almost two hours until the party starts since everybody will almost often be late.

3.2. The Culture of the ELT Classes

In any class students' or teacher's expectations as well as their preferred learning or teaching styles are greatly influenced by their cultural background. Cultural expectations are often coded or implicit in intercultural communication. Cultural differences can have a negative impact on learning outcomes if they are not attended during the lesson. When a teacher and students have different cultural backgrounds teachers can misdiagnose cultural peculiarities as learning problems. This study shows that there are some differences in classroom expectations of students and international teachers of English in Kazakhstan. We have investigated the following peculiarities of learner preferences that can be useful for foreign teachers in Kazakhstan.

3.2.1. Role of the teacher

Based on the data collected from questionnaires and interviews, we can conclude that a teacher in Kazakhstan is likely to be viewed and expected to have adopted the roles of an *authority, parent and font of knowledge*. The level of authority is stronger with younger students than those who study at university. Although students prefer to conform to teacher authority and avoid conflict with teachers, they feel rather close to them. This indicates the influence of the high power distance of Kazakh culture on schools.

6. Table 1. Students' attitudes to teachers

Accepted teacher roles	University (% of positive answers)	School (% of positive answers)
Authority Teacher's word is a law for me.	49	79
I will not contradict my teacher, even though he/she is not right.	35	63
Friend Teacher is my best friend.	56	41
I can talk about my feelings with a teacher	50	50

Pupils and students show respect toward a teacher, use formal communication, address the teacher by the title name and surname (patronym) such as "Professor Chris Kennedy", "Mr Holland", "Mehmet Teacher", "Anna

Ivanovna", "Toktar Agay" or "Kymbat Apay", which is always formal regardless of the language background of communication.

Here are some of the responses to the questionnaire for international (western) teachers reflecting their experience and opinion about ELT learners in Kazakhstan.

An American teacher at university said:

"Students here in Kazakhstan act very respectfully to the most part, for the very most part. I think the students here are cheerful and very forthcoming to all teachers. They show to all teachers a high-degree respect. I am not sure if this is the case in the United States or Canada. Not so much… They have even terms…expressions of respect for educators: "hodjam" in Turkish or "apay/agay" in Kazakh. I feel very welcome with that reception. It impressed me very much – such a welcome!" (Personal communication, November 8, 2011)

Another university teacher from a European country said:

"They are very respectful, and very interested in people from other countries. In the bigger cities, people are very interested in the west and western ways." (Personal communication, February 24, 2011)

A university teacher from Canada said:

"One major difference between US and Kazakhstani students is that Kazakh students may expect the teacher to be strict with them and force them to work. (Personal communication, April 27, 2012)

This is different in Western countries where students address teachers just by their first names. Teacher plays the role of a *friend*. The distance between teacher and students in Kazakhstan is bigger than it is in the West. In Kazakhstan he is like a guru, but in West teacher and students are equals.

One of the western teachers told a story that happened to him in an ELT class in Kazakhstan because of the cultural differences in expectations. Here it is:

An international native-speaker teacher from the South East Asia working at a school said:

"I didn't realize that it is common in Kazakhstan for the teacher to enter the classroom after the bell has rung. I like to go to my classroom early to get materials prepared, to hang up posters, write some things on the board, etc. When my students would enter the room (before the bell had rung) they <u>would apologize.</u> *I couldn't figure out why they were apologizing and then I realized that since I was there they thought that they were late and that class had already started!*(Personal communication, April 12, 2012)

A university teacher from Canada said:

"I am an educator but I am a learner as well." (Personal communication, February 20, 2012)

As the teacher comments speak for themselves, an international teachers' tolerance for ambiguity due to the self view as One more difference is that Kz teachers are supposed to have a deep knowledge about their subject, whereas W teacher does not have to know everything, because he is also learning.

3.2.2. Guidance

All students and pupils who participated in the survey agreed to teacher's moral guidance and expect their teachers to set a good example for them. Local teachers approached to the same point with reservation at university level. As a Kazakh student in Canada reports, the international (especially western) teachers, however, focus on just the academic knowledge and achievements in their home culture. Those who work in Kazakhstan seem to be cautiously meeting students' needs for guidance by just acknowledging them about general and universal moral values although they avoid teaching how to behave or take personal action on specific issues.

3.2.3. Lateness

Kazakhstan being a polychronic culture is supported by the results of this study. Ninety five per cent of the students and two third of the pupils believe that lateness is tolerated in schools in Kazakhstan. School teachers said that they allowed late students to get in the class, because they feel responsibility for them. If something happens to the late pupil outside the classroom during the lesson time, teachers will be responsible for it.

3.2.4. Assessment

Western institutions usually use tasks that comprise such lesson objectives as *explain, justify, compare, discuss, contrast, describe, analyze, evaluate, and review* for assignments and examinations, in order to develop independent thinking and problem solving skills. The preferred type of exams may be multiple-choice, true/false or gap filling when objectivity is more important than measuring advanced cognitive skills. Local teachers also prefer multiple-choice tests when the number of students is high, although some 39 % believe open ended questions and oral reports contribute to better levels of knowledge[10].

Few students prefer open ended questions because they give them freedom to express their thoughts. A majority of university students (91 %) and school pupils (77 %) would like the exams to be in multiple-choice format. However, local teachers usually ask questions that students can answer if they remember the instruction. Foreign teachers' questions usually require more knowledge and skills than what has been discussed during the lessons as a local teacher reports.

A major difference in assessment between local and international teachers is that local teachers tend to help with test instructions and even questions during an achievement or placement test. Most of them seem to be indifferent to objective measurement and evaluation and they probably still think of teaching during any type of test. This might stem from the old Soviet habits of ideological teaching and learning which did not prioritize measurement to teaching, because the younger generation of local teachers rarely help or give hints to examinees when they are asked for. A significant part of students (about one third) and pupils (42 %) find teachers' help acceptable and seek for teachers' help during an exam. It seems that the local culture of assessment in education does not match international systems. A Kazakh student from Canada said that she realized that she had not known what a real examination was like till she went to study there.

Research also unveiled a big problem in Kazakhstani classrooms. That is cheating and plagiarism. It seems that most students are unaware of how serious it is to attempt cheating and turning in an assignment just copied from a wiki site. The reason might be that they interpret the issue wrongly as cooperation which is an important value in other spheres of life in Kazakhstan.

3.2.5. Responsibility *for the learning process*

Western educational systems use student-centered approach, which emphasizes student's independent learning. The teaching style in Asian countries is mostly teacher-centered, where the teachers would give all or most of the information to the students. This makes the learning easier for students because they do not need to take much responsibility for finding the information on their own. In Kazakhstan, education is usually still teacher-centered, and there are some people who can blame the teacher for students' failure by all means (one fourth of student participants and about the same ratio of local teachers). However, the education system in Kazakhstan has aimed to integrate into the global system since they signed the Bologna Declaration in 2007. Higher education of Kazakhstan is in the transitional period between using a strong-teacher centered approach, which was used in Soviet Union time, and a student-centered approach, which is one of the main requirements of western credit system adopted in Kazakhstan in 2010.

3.2.6. The other issues

The cultural issues for a description of ELT classes are not only the ones mentioned above or limited to everything that is referred in this study. For instance, when students voluntarily ask questions, both international and local teachers would view their questions in class as active learning in progress. However, few of the local students (5 % to 18 %) prefer to keep quite in order not to appear to be trying to check the teacher's knowledge. So, a quiet classroom does not mean that students are not following the lecture. They will ask questions if they really need so, not for showing the teacher their activeness. Teachers and students believe that working in groups is very important part of the learning process, as it helps to teach collective responsibility, mutual help and sociability.

4.   Conclusion

In this study, attempts have been made to describe the current state of ELT in Kazakhstan with respect to a cross cultural comparison of learners' expectations and international teachers' attitudes to some key issues of discussion pertaining to the intercultural atmosphere of ELT setting. Initially, a review of identifying how national cultures differ from one another has been presented with reference to Hofstede's dimensions, Hall's constructs and some other bipolar definitions of differences. The study showed that there are several differences in classroom expectations of Kazakhstani students and teachers from the West. In Kazakhstan a teacher is expected to play a role of authority and parent, whereas in western countries he is a friend. Western student is more responsible for the learning process, while in Kazakhstan a teacher holds almost all responsibility, consequently, students are not autonomous and do not have well developed critical skills. The goal of the western teacher is often to guide learners only academically, whereas in Kazakhstan it is very important to educate students morally. Western teachers prefer to assess learners objectively through various types of questions on examinations and assignments, while Kazakhstani teachers' attitudes do not match international systems of assessment as they tend to help students during the exams or tolerate cheating unlike the international teachers. Lateness is tolerated in Kazakhstan probably more than it can be tolerated elsewhere in the World. Kazakhstani students may be passive during the lesson, not asking questions to the teacher, but western students are more active. This is also true about answering the teacher's questions. Unlike the western learners, Kazakhstani ones may keep quiet until the teacher points out particularly them. The last difference in classroom expectation is that in Kazakhstan doing assignments in groups is believed to teach mutual help, sociability, collective responsibility, while in the West it presents a risk of cheating and contradicting. The results of the research at school and university were similar.

This study reveals some of the challenges for international EFL teachers as a result of intercultural differences. However, it also partly unveils the current picture of ELT in Kazakhstan. Following tips are also based on the authors' selection of collective experience that is mostly acquired during this study.

- **Learn a little of source language (Kazakh or Russian).** This is particularly important if you have classes with elementary and pre-intermediate students. Sometimes students do not understand your explanations in English, and then they turn to their friends, who know English better than them, to translate your words. If you know at least a little Kazakh or Russian, you may try to help them figure out the meaning. You will see that your students will appreciate your efforts for communication in a language that you do not know well. This will help you build a good rapport with your class. They will try to communicate in English using different strategies even when they feel they are unable to do so. Moreover, such code-switching is something they are familiar with when they communicate in both Russian and Kazakh outside your classes.

- **Give feedback.** It is very important for the local students to hear or to see teacher's comments on their performance.

- **Show interest in their lives.** Ask them how their weekend was, for example, and really listen to their answers. They will appreciate it.

- **Use pair and group work.** Kazakh students enjoy working in groups. However, remember different personality types in your class and adapt you activities and types of student interaction according to their needs. Group work may be an opportunity for some students to overcome anxiety before they demonstrate their skills in public.

- **Use games and songs fairly often.** But remember that some students may feel that you are not taking your job seriously if there is too much fun and too often in the lesson.

- **Be ready to fight with cheating.** You will be surprised to know the extraordinary ways of cheating in you class. Be strict from the first examination or a quiz. Show the students that you will not tolerate cheating. However, remember that the school authorities and the society will be unwilling to punish the students who cheat. It is still easier r to prevent them from attempting to cheat than catching them cheat and punishing them for it.

- **Be ready to fight with plagiarism.** Tell your students that you are practicing checking the assignments with the help of special websites or software. Warn them about the consequences of plagiarism in real modern life. Persuade them that plagiarism is not only immoral, but illegal as well. Specifically, give them appropriate feedback on their essays on plagiarism.

- **Explain the tasks/assignments in a detailed way.** Tell your students about how to produce a good assignment. They may need detailed guidance on where they can find possible sources for relevant information. You can show one example of a good essay and explain why it is good.

- **Be ready for lateness of students.** Of course, this does not mean that you should welcome it, but sometimes you should be able to tolerate it.

- **Be strict enough when you follow your teaching agenda.** This can help you to win your students' respect.

- **Be ready for formal communication.** Do not try to make them call you just by your first name. It will be strange and not very comfortable for them.

- **Be available at office hours.** If you tell your students that you have an office hour on Friday from 3 to 4 o'clock, this means that they can come to you at that time without making an appointment.

We hope that the study presented above will help international speakers of English, who want to try their pedagogical talent in Kazakhstan, cope with the difficulties, caused by the mismatches in expectations and be very successful in all their professional undertakings. We also suggest that they should be provided with a cultural orientation training seminar before they start working in Kazakhstan.

Abstract

The simulation of motor complicated applications conventionally can be a challenge for both undergraduate and postgraduate levels. To easy implementation for several kinds of control structures of an induction motor (IM) drive, some simulators such as MATLAB/Simulink to be necessary-especially for students-to develop and test various motor control algorithms in conducting electrical machines courses. In this paper, how to teach and simulate an adjustable speed drive of IM using Simulink blocks for an indirect field-oriented control (IFOC) algorithm is presented. The effectiveness of the adjustable IM drive is verified by simulation results at different operating conditions over a wide speed range.

Keywords: MATLAB/Simulink, Educational tool, Adjustable speed drive, Induction motor, indirect field oriented control;

Introduction

To date, academics and practitioners have focused on power electronics education and new computer-aided teaching tools to develop a better learning environment (Keyhani, Marwali, Higuera, Athalye, & Baumgartner, 2002; Mohan et al., 2003). One of the challenging subjects in these areas is IMs which have been applied extensively due to their advantages such as quiet operation, compact form, simplicity, reliability, low maintenance, economical, rugged, and reliable (Saghafinia, Ping, & Rahman, 2010). However, the IM drives are nonlinear, time-varying and complex systems owing to their characteristics (Ojaghi, Faiz, Kazemi, & Rezaei, 2011; Qaseer, Purushothaman, & de Leon, 2012) which require the complex control, circuitry, and inverter over sizing (Bakshi & Bakshi, 2009). Finding out of the theory and applications of the IM drives need to some courses including motion control (Lorenz, Lipo, & Novotny, 1994), power electronics (Goulart & Consonni, 2001; Jimenez-Martinez, Soto, Jodar, Villarejo, & Roca-Dorda, 2005), electric machinery, electric circuits, and electronic courses as well as the related laboratory of these courses. So, the IM drive is developed through some available simulation software to allow students to develop in all of the aforementioned areas in this paper. The simulation of IM drive, as a teaching tool, supports the classroom teaching as much as its laboratory through the computer-generated graphics, to illustrate easily steady and dynamic state operation of the IM drive under different operation conditions (Hoang, 2001). One of the most widespread simulation software is Mathworks MATLA/Simulink package (Ayasun & Nwankpa, 2005). The Mathworks MATLAB allows to user for analyzing of complex static systems to be modelled through 'numeric computation and visualization. Also, Simulink allows systems to be simulated dynamically and allows a controller to be modelled with the aid of block diagrams. Moreover, the user is allowed to concentrate on the model, rather than its implementation (Rodriguez-Resendiz, Herrera-Ruiz, & Rivas-Araiza, 2011).

This paper develops a learning environment for IFOC of IM drive using MATLAB/Simulink in advanced electrical machine laboratory. Several MATLAB toolboxes, tools, and Simulink Blocksets including power system Blocksets, signal processing toolboxes, Digital motor control (DMC) library, and IQMath library are used to

optimize and design the Simulink model of IM drive. The Simulink model provides tracking of the speed and flux in the presence of an uncertain load disturbance and parameter variations using the real values of the d-axis and q-axis motor currents which utilized to estimate the stator flux angle. The IM drive is fed using voltage source inverter (VSI) which employed the space vector pulse width modulation (SVPWM) technique to optimize the harmonic content of current signal, and switching losses. To show the effectiveness of the simulated adjustable IM drive, simulation results are provided at different operating conditions such as a step change in command speed, load disturbance and parameter variations over a wide speed range.

Nomenclature

v^e_{ds}, v^e_{qs} Synchronous frame stator voltages

v^e_{dr}, v^e_{qr} Synchronous frame rotor voltages

i^e_{ds}, i^e_{qs} Synchronous frame stator currents

i^e_{dr}, i^e_{qr} Synchronous frame rotor currents

$\varphi^e_{ds}, \varphi^e_{qs}$ Synchronous frame stator fluxes

p Differential operator

$\dot{x}$ 1st derivative of x

ω_e, ω_r Synchronous speed and rotor speed, respectively

ω_{sl} Slip angular frequency

P Number of poles

R_s, R_r Stator and rotor resistance, respectively

σ Total leakage factor $\sigma = 1 - \dfrac{L_m^2}{L_s L_r}$

L_s, L_r Stator and rotor inductance, respectively

L_m Mutual inductance

J_r Inertia of rotor

B Friction factor

T_e Electromagnetic torque

T_L Load torque

Mathematical Model of IFOC for an IM Drive

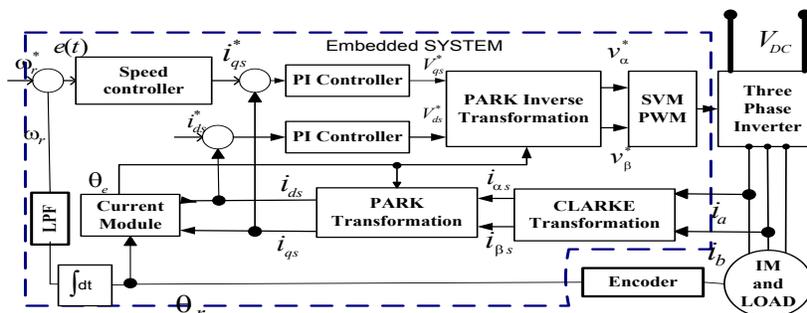
This section explores the mathematical model of IFOC an IM drive for simulation purpose. The Control structure of an IFOC induction motor drive is shown in Fig. 1.


Fig. 1. Control structure of an IFOC induction motor

The mathematical models of the induction motor model in d-q synchronously rotating reference axis are shown in (1)-(2).

$$
\begin{bmatrix} V_{ds}^e \\ V_{qs}^e \\ 0 \\ 0 \end{bmatrix} = \begin{bmatrix} R_s + \sigma L_s P & -\sigma L_S \omega_e & \dfrac{L_m}{L_r}P & -\dfrac{L_m}{L_r}\omega_e \\ \sigma L_S \omega_e & R_s + \sigma L_s p & \dfrac{L_m}{L_r}\omega_e & \dfrac{L_m}{L_r}P \\ -L_m\dfrac{R_r}{L_r} & 0 & \dfrac{R_r}{L_r}+p & -\omega_{sl} \\ 0 & -L_m\dfrac{R_r}{L_r} & \omega_{sl} & \dfrac{R_r}{L_r}+P \end{bmatrix} \begin{bmatrix} I_{ds}^e \\ I_{qs}^e \\ \phi_{dr}^e \\ \phi_{qr}^e \end{bmatrix}
\tag{1}
$$

and, $T_e = \dfrac{3}{2}\dfrac{P}{2}\dfrac{L_m}{L_r}(i_{qs}^e\varphi_{dr}^e - i_{ds}^e\varphi_{qr}^e)$ (2)

In IFOC, the rotor flux is oriented entirely in the d-axis by setting $\varphi_{qr}^e = 0$. So,

$$\varphi_r^e = \varphi_{dr}^e \tag{3}$$

The slip frequency is obtained as,

$$\omega_{sl} = \frac{L_m}{\varphi_r^e}\left(\frac{R_r}{L_r}\right)i_{qs}^e \tag{4}$$

The electromagnetic developed torque is given by:

$$T_e = \frac{3}{2}\frac{p}{2}\frac{L_m^2}{L_r}i_{qs}^{*e}i_{ds}^{*e} = K_t i_{qs}^{*e} \tag{5}$$

where,

$$K_t = \frac{3}{2}\frac{p}{2}\frac{L_m^2}{L_r}i_{ds}^{e*} \tag{6}$$

The mechanical equation of an induction motor can be presented as follows (Saghafinia, Ping, Uddin, & Gaied, 2012).

$$J_r \dot{\omega}_r(t) + B\omega_r(t) = T_e - T_L \tag{7}$$

7. Where J_r, B and T_L are represented as rotor inertia, friction factor and the external load disturbance, respectively.

8. As shown in Fig. 1, two Park's transformation and Clarke's transformation with along their inverse are used to implement IFOC for IM drive. Equations of Park's transformation and its inverse and Clarke's transformation and its inverse are shown in (8) to (10), respectively.

$$x_{dq} = T(x_{\alpha\beta}) = \begin{bmatrix} x_d \\ x_q \end{bmatrix} = \begin{bmatrix} \cos\theta_e & \sin\theta_e \\ -\sin\theta_e & \cos\theta_e \end{bmatrix} \begin{bmatrix} x_\alpha \\ x_\beta \end{bmatrix} \tag{8}$$

$$x_{\alpha\beta} = T^{-1}(x_{dq}) = \begin{bmatrix} x_\alpha \\ x_\beta \end{bmatrix} = \begin{bmatrix} \cos\theta_e & -\sin\theta_e \\ \sin\theta_e & \cos\theta_e \end{bmatrix} \begin{bmatrix} x_d \\ x_q \end{bmatrix} \tag{9}$$

$$x_{\alpha\beta} = T(x_{abc}) = \begin{bmatrix} x_\alpha \\ x_\beta \end{bmatrix} = \frac{2}{3} \begin{bmatrix} 1 & -1/2 & -1/2 \\ 0 & \sqrt{3}/2 & -\sqrt{3}/2 \end{bmatrix} \begin{bmatrix} x_a \\ x_b \\ x_c \end{bmatrix} \tag{10}$$

In the above equations, x can be phase variables of voltage or current so that α phase coordinates with d-axis. Since the Clarke's transformation has two inputs (shown in Fig. 1) considering balanced three phase induction motor, x_c is replaced with $-(x_a + x_b)$ and the Clarke's transformation is changed as,

$$x_{\alpha\beta} = T(x_{ab}) = \begin{bmatrix} x_\alpha \\ x_\beta \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 1/\sqrt{3} & 2/\sqrt{3} \end{bmatrix} \begin{bmatrix} x_a \\ x_b \end{bmatrix} \tag{11}$$

The PI controllers and speed controller as shown in Fig. 1 are initially tuned by the Ziegler–Nichols method based on stability boundary. The saturation of the controller is avoided by adding a correction of the integral term (*KC*) (Franklin & Powell, 2006) as shown in Fig. 2. This method has a good load disturbance attenuation which is also suggested by TI and MathWorks companies. According to the suggestion of the TI Company, KP (proportional gain), KI (integral gain), and KC (integral correction) are tuned (the readers are referred to (Akin; & Bhardwaj, 2010) for more details).

The Switching Technique of VSI Fed IM Drive

The SVPWM as the best method for switching technique (Bose, 2002) is considered for VSI fed IM drive in this work as shown in Fig. 3. In this method, the insulated gate bipolar transistors (IGBTs) must be controlled so that at no time are both switches in the same leg turned on or else the DC supply would be shorted. This requirement may

be met by the complementary operation of the switches within a leg. This leads to eight possible switching vectors for the inverter, V0 through V7 with six active switching vectors and two zero vectors as shown in Table 1.

The IM Drive Overview and Its Modeling

10. The digital motor control (DMC) suggested by TI and Mathworks Companies are used to optimize the Simulink models. TI and Mathworks Companies also provide a library of highly optimized and high precision math functions in the form of the IQMath library. These libraries allow the engineers/students to quickly build, or customize, their own systems. These libraries along with the discrete time Simulink libraries are employed to generate the IFOC of IM drive. The designed IM drive which configured using discrete-time Simulink with a sampling frequency 10 KHz for the tuned PI controller based IM drive are shown in Fig. 4. Parameters of the laboratory 1kw 2-pole IM are given in Table 2. To prepare the simulation of the whole system some consideration must be taken into account as follows:

11. • Since the Simulink models in the MATLAB library are designed carefully, the existing induction motor model in the power system library is used to simulate the induction motor in the proposed model.

12. • To implement the external load and speed reference command, the existing simulation signal in "Signal Processing" library along with manual switches are used to make different shapes of them as shown in Fig. 4.

13. • To change the sampling frequency from 10 KHz for each part of the model, the "Rating Transition" block must be employed.

14. • To implement the VSI inverter, the ideal switches are applied so that the switches are excited using the SVPWM technique as described in the previous section.

15. • The sensors including the rotary optical encoder as speed sensor and transducer as current sensor are modeled using a constant coefficient in accordance with their characteristics.

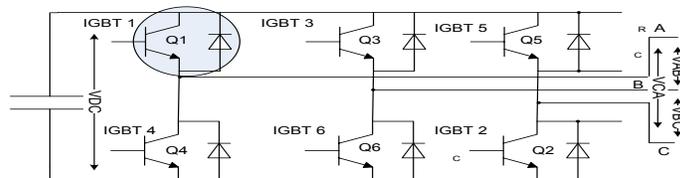
16.


Fig. 3. VSI fed inverter of the IM drive.

17. As shown in Fig. 4, a subsystem block is applied to generate the three-phase inverter using 600 Vdc. The duty cycle of this inverter is controlled using the vector control Simulink model which shown in Table 1.

18. Table 1. SVPWM technique switching

Vector	Q1	Q3	Q5	Q4	Q6	Q2	VAB	VBC	VCA
$V_0 = \{000\}$	OFF	OFF	OFF	ON	ON	ON	0	0	0
$V_1 = \{100\}$	ON	OFF	OFF	OFF	ON	ON	+VDC	0	− VDC
$V_2 = \{110\}$	ON	ON	OFF	OFF	OFF	ON	0	+ VDC	− VDC
$V_3 = \{010\}$	OFF	ON	OFF	ON	OFF	ON	− VDC	+ VDC	0
$V_4 = \{011\}$	OFF	ON	ON	ON	OFF	OFF	− VDC	0	+ VDC
$V_5 = \{001\}$	OFF	OFF	ON	ON	ON	OFF	0	− VDC	+ VDC
$V_6 = \{101\}$	ON	OFF	ON	OFF	ON	OFF	+VDC	− VDC	0
$V_7 = \{111\}$	ON	ON	ON	OFF	OFF	OFF	0	0	0

19. "Vector Control" block as the main part of the model (shown in Fig. 4) is shown in Fig. 5. As can be seen in Fig. 5, the currents in ABC coordinates are converted into the rotating reference frame of d-q axes coordinates through Clarke and park's transformation from the DMC library. Since the prototype system of the model in advanced electrical machine laboratory employees an encoder 5000puse/revolution, the rotor position obtained from the motor is scaled in pulse resolution by multiplying 4*5000/2Π. Based on the measured rotor position, the rotor speed is computed using numerical backward differentiation with sampling time 1 kHz which its detail is shown in Fig. 6. Then according to the actual and command speed, the q-axis reference current is calculated. Considering the nominal value for d-axis reference current, the current controllers calculate the d-axis and q-axis reference voltages. Finally, the six SVM pulses for the inverter switches are made through the inverse park's transformations, space vector generator, and "PWM Scaling" block as can be seen in Fig. 5. The "PWM Scaling" block is employed to adjust the switching frequency of SVM-PWM for 18 KHz.

The motor currents (I_a, I_b) calculated from the motor is scaled (by multiplying their inputs by 2048/10 and the getting results plus by 2048) to match the transducer sensor inputs which applied in the prototype system. It is worth to note that the maximum current measured by transducers is 10A. These currents are given to "scaling" block (shown in Fig. 4) for preparing the suitable value (by multiplying their inputs by 10/2048 and the getting results subtract from 2048) in ABC coordinates.

20.   Table 2. Induction motor parameters

Parameters	Value	Parameters	Value
Rated power	1000W	Rated torque	3.37NM
R_s	6	J_r	.0055Kg.m^2
R_r	5.72	B	.001Kg.m^2/s
L_s	428.7e-3H	P	2
L_r	428.7e-3H	Rated speed	2830rpm
L_m	416.6e-3H		

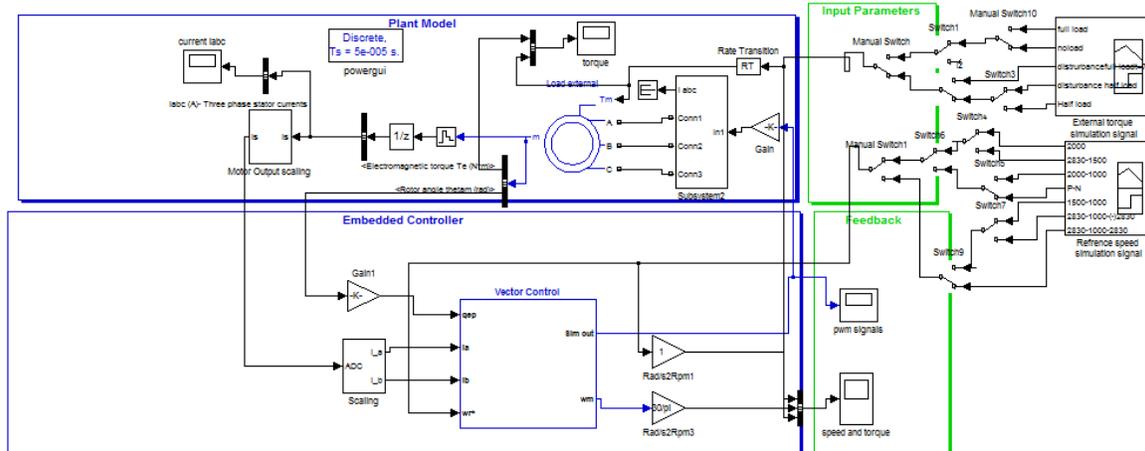
21.


Fig. 4. The main Simulink model for the IFOC of IM drive.

Fig. 5. The Simulink Model of Vector control to generate the space vectors.

To implementation IFOC algorithm properly, the real values of the d-axis and q-axis motor currents are applied to estimate the stator flux angle as can be seen in Fig. 7. The accuracy of this algorithm depends on the accuracy of some motor parameters such as rotor time constant which obtained for the model equal to 0.07149 as shown in Fig. 7. Some parts of the laboratory 1Kw motor can be seen by right clicking on the motor and choosing the "look under musk". The modelled motor parameters also can be changed by choosing "link options" and "break link" by right clicking on the part of the motor which must be changed.

Fig. 6. The Simulink model of speed calculation.

Fig. 7. The Simulink Model of stator flux angle estimator.

Simulation Results

For simulation tests, following cases including parameter variations and external load disturbance are considered. If not mentioned, other parameters are considered nominal in all the cases for the tuned PI. The PI parameters are

found as, Kp=0.3, Ki=0.0001, and Kc=0.0001. Step changes in command speed with no load is considered for case-1. Also, step increase in load from '0' to 75% of rated load at t=7s is done in case-2. Finally, inertia and friction coefficients are increased three times of nominal value at t=7s while half rated load is applied from the beginning in case-3.

For case-1, simulation results are illustrated in Fig. 8. From Fig. 8a, it can be seen that the tuned PI shows the acceptable speed response in the case of the dynamic and steady-state performance. It can also be seen from Fig. 8b that the suitable tracking response of speed and flux has been obtained for the tuned PI which verifies the suitable performance of the implemented IFOC algorithm.

For case-2, simulation results are shown in Fig. 9. From Fig. 9a, it can be seen that the PI controller shows a significant dip in speed ($\approx$ 60 RPM) when the step increase in load is applied at t=7s. It is also found that the tuned PI follows the q-d-axis commands despite the large uncertainties which shows the suitable performance of the IFOC algorithm in this case.

In case-3, simulation results are shown in Fig. 10. It is found from Fig. 10 that the PI shows the suitable responses in spite of the parameter variations and it has acceptable tracking performance in both speed & current. Thus, the high accuracy of the implemented IFOC algorithm is obtained despite uncertainties such as external load disturbance and parameter variations in the simulated model.

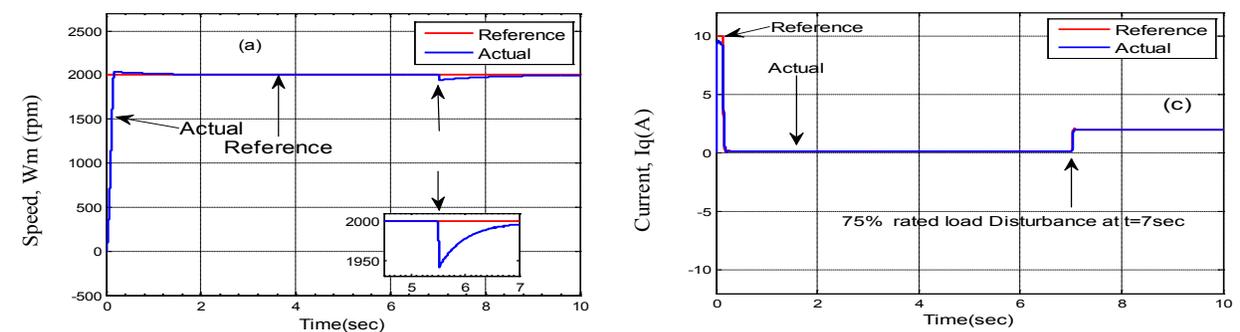

Fig. 9. (a) The simulated speed response of the PI based IM drive in case-2; (b) The simulated q-axis current response of the PI based IM drive in case-2
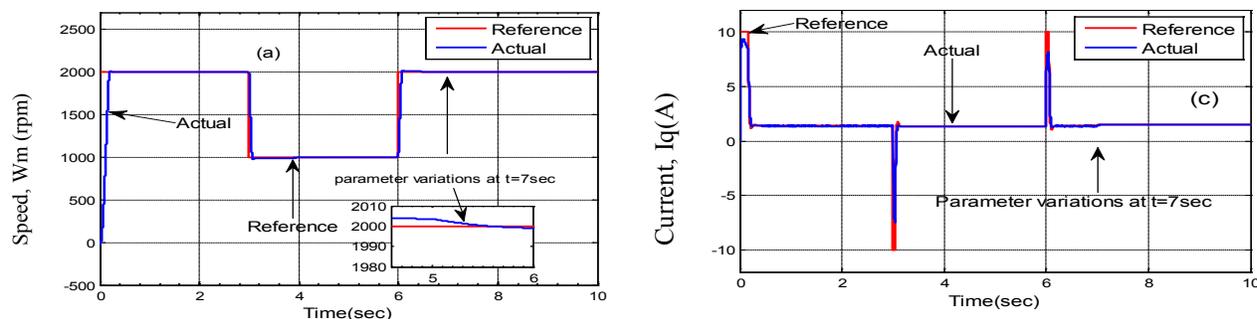

Fig. 10. (a) The simulated speed response of the PI based IM drive in case-3; (b) The simulated q-axis current response of the PI based IM drive in case-3

Conclusion

A simulation model of an adjustable speed drive of IM using the optimized Simulink blocks for an IFOC algorithm has been presented in this paper. The work presented has verified to be effective and valid for measuring IM drive parameters. Also, an educational tool in learning improvement of electrical machines course through the Simulink models for adjustable speed drive of 1 kW laboratory IM has provided in the method described. Moreover, all aspects of simulation implementation have been explored through the Simulink to give the student the opportunity to easy implement the IM drive. The system has been found to be well suited for simulation learning of the various motor control algorithms in advanced electrical machine laboratory for both undergraduate and postgraduate levels. The simulation results verify the effectiveness of the model.

Teaching Programming in the Higher Education not for Engineering Students

Gabor KISS[135]

Óbuda University, Institut of Mechatronics and Vechiletechnics, Budapest, Hungary

Abstract

The algorithmic thinking is important in all professions, not just in the engineering work. My experiences show that the creating of the algorithmic thinking by the girls in secondary grammar school and in the higher education needs more time and other teaching methods. The numbers of the girls in not-engineering program is higher than in the engineering programs. I evolved a different (game-based) method to teach programming and to help them to acquire the algorithmic thinking easier for my not-engineering students. I thought programming for Economic information technology students with two colleagues. My colleagues used the conventional teaching methods that they use with engineering students in teaching programming and I used my evolved way and we had the same time to teach the learning material. At the end of the semester I separated the paper results of students by different teaching methods and compared. My starting hypothesis was that the group that I used my evolved teaching methods would achieve better results in the papers. Significance level was 5% through the analysis. Significant divergence in knowledge of students who took part on my lectures and the students who followed the conventional way was found. The students could get a one mark better paper results when they followed my method to learn programming and pass the test in higher percent. We can say my evolved teaching method is productive, and the students get better result when writing papers. At the beginning of the second semester more than 70% of students chose my course to learn the next level of programming.

Keywords: programming, teaching, algorithmic thinking, girl, higher education, method

INTRODUCTION

Economic information technology students of the undergraduate course Programming I get acquainted with the basic programming knowledge (structured programming) in PHP. The Hungarian students do not have chance to learn programming before finishing the secondary grammar school and make the final exam (Kiss, 2012a; Kiss, 2012b), except for the students specialized in Informatics.

My earlier personal experiences in Higher Education showed that the majority of the students can not acquire the algorithmic thinking by following the traditional teaching process and they do not have too much chance to pass it. Unfortunately, I am not alone with this feeling. Three of the expert participants claimed that the difficulty in understanding the concept of programming and coding is because of the ineffective teaching strategies used during problem solving and coding (Ismail, Ngah, Umar, 2010). We can see all students have different levels of computer usage abilities by same Information Technology Education in other countries too (Isman, Celikli, 2009, Gastelú, 2013). It is the reason, that I think the creating of the algorithmic thinking by the undergraduate students need more time, or other teaching methods.

First of all we need to see how the human memory is working (Bloom, B.S.; Engelhart, M.D.; Furst, E.J.; Hill, W.H. and Krathwohl, D.R., 1956), the taxonomy of learning, teaching, assessing (Anderson, Krathwohl and Bloom, 2001) and the levels of learning to guide the students through the process of learning (Hoffmann, 2011). The performance of programming ability and thinking skills of students needs hard and concentrated work by teachers (Kurland, Pea, Clement, Mawby, 1986) and also subject Programming is important to attend the didactical methods of mathematic too (Ersoy, 2005).

Using playing games in teaching programming is productive (Esper, Foster, Griswold, 2013) and the kids can take the advantage of the different teaching methods. The situation does not change by students. My experience

shows the LEGO-Mindstorm is a very good tool for learning programming, because the students can construct a robot with different functions and write programs without syntax error (Kiss, 2010a). This tool is useful by teaching programming for girls too and the half of the economic information technology students are girls, who have more problems to learn programming (Kiss, 2010b) and they are not so motivated to learn programming than the computer science engineering students.

The subject Programming requires the logical and algorithmic thinking from the students and the teachers have to develop these skills in the students, but the teachers have to consider the motivation and the precognition of the students before starting to teach any topic.

Although I would be useful for the economic information technology students, I could not use LEGO-Mindstorm for teaching programming. I have to follow the formal of the programming subject and teach PHP as a first programming langue for these students.

I had an idea to write card games or dice games in my course. When the students could use the basic program elements like selection, iteration and can use the random generator in PHP after understanding the rules of the games, they could write a dice or a card games. The teacher can show the students how to use selection and iteration to build the ground for the game programs. For example the student play a dice game against the computer. The developed program generated randomly two (rolled) dice value, one for the student, one for the computer. We can choose a winner (who has higher value) by using selection. Another example can show how we can use the iteration combined with selection: the developed program generate randomly (rolled) dice values (more than one) for the two players (student and computer). The winner who has more rolled/generated "six" value. After this basic knowledge the students are able to combine these elements and write/develop complex game program with more rules.

We could not draw graphic for the game, we used just standard output opportunities to write the results after rolling the dices or taking a card and the computer was the second player with own decision progress. In this case the students could simulate a game against a computer. The students were very motivated to write different type of games (black jack, dice poker and so on) and they could understand easier how we can use the different programming elements to write complex program. The students were more interested for these examples than the traditional programming examples. I supposed those who learned programming by following this teaching method would have better paper results later. The economic information technology students attended the programming lectures held at same time in two groups. In the first group (group A) of lectures (36 students) I made the course by using the game oriented teaching methods while the courses for the second group (group B, 38 students) were followed the traditional way with normal examples from real life by my colleague who teach programming for computer science engineering students at the university. The learning material was the same in the two groups, just the type of examples and exercises were different. Now I wanted to know the usefulness of all the examples and exercises I used.

My starting hypothesis was that the group where the students followed the game oriented exercises would achieve better results in the papers.

After the semester I collected the paper results by groups and I tried to analyze whether this method was helpful or not for the students.

ANALYSING OF THE PAPER RESULTS

Some mathematical analysis was needed to decide whether using these game oriented exercises were helpful or not in understanding the lectures and get better paper results.

The Number of Participants in the Tests in the Two Groups and the Values of Mean and Std. Deviation

According to the table (Table 1.) the mean of the results of papers in group A is higher. This group wrote the papers with a better result. It does not give enough information to state that the use of game-based programming education results in better written tests because this can happen accidentally, too. So, we needed more analyzing to keep the chance of accident low. I used the IBM SPSS Statistics v.20 by analyzing the paper results.

Table 1. Group statistics of the test results

Group	Number of participants	Mean	Std. Deviation	Pass the test
A	36	2,72	1,28	82,9%
B	38	1,71	1,09	39,5%

If we spend more time looking at this table, we can see ~83% of economic information technology students who took part in the game-based programming education could pass the test and the students who used the traditional way of education passed the test in lower percent, but we still do not know if it is a coincidence.

Independent samples test

My null hypothesis was that the results of the paper written by the two groups of students would not differ significantly. Since we have two independent samples, we can use the independent sample test in SPSS to tell if the means of the paper of these groups differ or not (Table 2).

Table 2. Independent samples test of the test results

	Levene's test for Equality of variances		T-test for equality of means		
	F	Sig.	t	df	Sig. (2-tailed)
Equal variances assumed	1,55	0,28	-3,67	72	0,00
Equal variances not assumed (Welch's t-test)			-3,66	68,85	0,00

An analysis of the results of the economic information technology students showed, the variance of two groups are different, because the value of Levene's test is not significant (p<0,05) (Levene, 1960).

In this case the means could be compared with T-test (Korpás, 2006).This showed difference between the means, because the value of T-test is significant (p<0,05). It means the use of the game-based programming education had influence on the results of papers of the economic information technology students.

Measures of Association by the Paper Results

Earlier, significant differences could be detected between the means of the papers written by the economic information technology students. It means it is profitable to make a deeper analysis to reveal the influence of the game-based lesson on the calculated means. I could reveal the influence with the calculation of the Eta-squared (η^2) (Cohen, 1973). The calculated value in percentage shows how much grouping influences the difference between means. Square root from the Eta-squared gives a value between 0 and 1 (η).

This shows the measures of association, i.e. how strong the connection between grouping and the achieved result is. The higher the value is, the stronger the connection is. In the next table we can see the calculated values and the strength of the connection (Table 3.).

Table 3. How strong the connections between grouping and the achived paper results

η^2	η	Strength of the association
15,8%	0,40	middling weak connection

Calculating the Eta-squared, I tried to make the effect of the web-based education on the result of the papers written percentable and got ~16%. This means there is a middle weak correlation existing between using the game oriented programming education and the results of the papers written by the students. It seems the students could take advantage of using a game-based learning method before the test. We can remember the students who took part in the game-based lessons could pass the tests in higher percent (83% vs 40%).

Conclusion

After the analysing process, we can say my starting hypothesis is correct; students get better paper results by using a game oriented programming education method.

The economic information technology students could take advantage of this learning method tool before the test. The students could get a one mark better paper results when they took part in the game-based lessons and the number of the students who could pass the test ~doubled. The reason for this could be the fact that the game oriented lesson was preferred by the students who were motivated to write different type of dice or card game programs and passed the test in higher percentage. Before the students need to know and use it well the basic program elements like selection, iteration and so on. The traditional way to teach programming for economic information technology students was not so successful than the game-based examples. The students were more motivated to write game programs and more students could pass the test. It means by same learning material and test exercises the student who learned programming in game-based method could have better paper results and pass the test in higher percent. The presented game-based teaching method is successful. The economic information technology students had to choose from two different courses to learn Programming 2 at the beginning of the next semester and my course was filled and closed in 3 minutes and the other was open days long.

Future work

One semester later the economic information technology students started to learn object oriented programming in JAVA, which needs other thinking method than the structured programming that the students learned in PHP.

It would be interesting to analyze the paper results to see the game-based learning methods working in this case too or not.

Techi-Teaching: Productivity Analysis of Using Technological Devices in Teaching Business Subjects

Dr. Gualberto A. Magdaraog Jr.[136]

College of Business Adminstration, Bulacan State University, Philippines

Abstract

This study aims to analyze the productivity and effective utilization of technological devices used by faculty members of the College of Business Administration of Bulacan State University, Philippines. Technological devices aids the faculty member in classroom instruction, report preparation and presentation, record keeping, updating and dissemination of information thru social networks, mobile communication and the like. With the integration of the these technological devices in the performance of the function of faculty members, this study will look into its contributory improvements or dis-improvements and bring to light its usefulness or uselessness and other issues that might impact the user itself.

Keywords: productivity; utilization; techological devices

Introduction

In the advent of technology explosion, faculty members are inclined to adapt their performance of duty for improvement and facilitate faster and accurate data and information recording. As technology devices are integrated in their function, the delivery of their services is expected to improve and may directly affect the effective discharge of their roles in the transfusion of knowledge process. But, both the faculty and the machine or technological devices are limited. The objective of this study is to measure the productivity of the faculty in terms of time consumed to prepare lesson plan, finish the discussion of scheduled topic of the day in a business subject, evaluation through quizzes, seatwork and the like, and calculation of final grades. This study also intends to measure the utilization of technological devices used by the faculty based on its expected capacity. In light of the foregoing objectives, the research may result to the measurement of the effectiveness of the faculty with the aid of the devices and the over or under capacity of the devices.

Research Problem

This study aims to measure the degree of productivity of faculty in performance of function with the aide of technological devices. Specifically, the study aims to answer the following questions:

1. What technological devices used by the faculty members in teaching business subjects?
2. What is the degree of productivity change in using these devices in instruction of faculty?
3. What is the level of utilization of these technological devices in performance of functions of faculty?

Literature Review

In a case study published in *The Technology Source Archives* at the University of Northern California, entitled Using Technology Productivity Tools in Teaching (Morrison, 1997), the integration of information technology productivity tools in instruction results to great improvement to the students' oral and written communication and competencies. In the advent of globalization and with a massive impact of telecommunication in the economy, as well as downsizing and reengineering in the workload, the students are expected to be technologically literate and able to lead their organizations in using technology to enhance productivity and learning. Although the experiment resulted to a successful improvement, the students' evaluation was low due to substantial incremental class workload and the author failed to convey the importance of written and oral communication skills and the use of technological productivity tools.

Research Methodology

This study was conducted in the College of Business Administration of the Bulacan State University, Philippines involving thirty-five (35) faculty members. These faculty members are teaching business subjects to students from different courses and they were all using technological devices in one way or another. Survey method was utilized to quantitatively describe specific aspect of a given population. (Kraemer, 1991). The survey is used to gather data on the teaching load of the faculty, kind of technological devices used by the faculty and the frequency of time they spent in using these devices. An online questionnaire using Google documents was sent to their email if they were unavailable to answer the printed survey questionnaire. Individual and focused group interview was also utilized in the study to determine the time spent in every phase of instruction to analyze the productivity changes in terms of time spent by faculty. In some cases, a time log sheet were used to record their activity time spent and an observation was conducted to corroborate the time spent in preparing the lessons, discussion and evaluation of the students with and without the use of technological devices. A comparative analysis was conducted from these data to determine and calculate the changes in terms of time spent to finish each phases.

Research Instruments

The instruments used in this research were; a printed and online self-constructed survey questionnaire, equipment list from the College of Business Administration, time log for instruction observation, and a structured interview questions. The self-constructed survey questionnaire was used to gather data related to the number of hours rendered by the faculty, types of teaching devices used, and time spent in using these devices. This is a multiple choice survey questionnaire sent to the faculty via Google documents or personally in their faculty room. The questionnaire was answered in minimum time duration of about 3 to 5 minutes.

The equipment list from the College of Business Administration is used to determine the available teaching devices that can be provided to the faculty for instruction. This was used to determine the utilization rate of each technological device.

The time log sheet was used to record the time spent by the faculty under observation in the conduct of instruction. This is used only when the faculty was not available for personal interview or in a group interview. Both for with and without the use of technological devices, the time log were used.

The structured interview questions were used during one-on-one interview and focused group discussion with the faculty. This is to gather information on the time spent by the faculty in the different phases of instruction and to confirm or validate some data gathered in the printed and online survey questionnaire and the result of the observation. Also, descriptive or qualitative data that are not included in the survey questionnaire were collected during the interview.

Research Findings and Analysis

After summarizing the result of the questionnaire, the data revealed the most used technological devices by faculty as presented below. This data will be used to compute the utilization rate of each device to assess the sufficiency of supply.

Table 1. Technological Devices Used by the Faculty

Technological Devices*	F	%	Rank
LCD Projector	26	74	2
Laptop	30	86	1
Desktop	12	34	
Printer	19	54	3.5
Photocopying Machine	19	54	3.5
Digital Camera	5	14	
Mobile Phone	12	34	
Router (wifi)	9	26	
Tablet	12	34	
Lapel	0	0	

*multiple response

It can be gleaned from the table that Laptop is the most used devices by the faculty due to its portability. Since faculty transfer from one room to another during the change of class, they simply carry with them their personal laptops or the one provided by the college. And since lectures are already saved in their laptops, they find

it easier to present the topics or lessons. There is no need to rewrite it again in the board. Even during the class they can easily update their students records instantly. The second most number of responses is the LCD Projector. This implies that the faculty normally presents their lesson to a large class size, which is true in the university where class size ranges from 50 to 60 students per class. Normally, faculty borrows LCD projector from the college or if they have their own, they bring it with them during the class. The third and fourth most used devices are the printer and the photocopying machine. These devices aid the faculty in printing their lesson and disseminate it to the students in cases where the LCD projector is not available. Also, these devices are used to print quizzes, examinations and class records.

Utilization Analysis

Table 2. Utilization Analysis of Technological Devices based on Availability in the College

Technological Devices	Number of Units Available in the College	Total Number of Hours* Available per week	Average Number of Usage Hours of Faculty per week**	Utilization Rate (%)
LCD Projector	3	120	210	175
Laptop	1	40	420	1,050
Desktop	1	40	105	262.5
Printer	1	40	210	525
Photocopying Machine	1	40	210	525
Digital Camera	1	40	105	262.5
Mobile Phone	0	0	210	0
Router (wifi)	1	40	210	525
Tablet	0	0	105	0
Lapel	0	0	105	0

* 8 hours a day x 5 days x number of units available in the college
** based on the result of the survey

The table shows that almost all technological devices are fully utilized. In fact, it is more than 100% utilization, and therefore implies that there is insufficiency of available technological devices provided by the college. The excess of the utilization rate implies that the faculty provides their own devices used in their instruction function. Among the technological devices used by the faculty, laptop has the highest average usage time, and has the highest utilization rate and therefore very useful to the faculty. This also implies that faculty members of the college are becoming more reliant to this technological device.

Table 2. Recommended number of devices

Technological Devices	Number of Units Available in the College	Total Number of Hours* Available per week	Average Number of Usage Hours of Faculty per week**	Deficiency in time	Additional Units Needed***
LCD Projector	3	120	210	90	3
Laptop	1	40	420	380	10
Desktop	1	40	105	65	2
Printer	1	40	210	170	5
Photocopying Machine	1	40	210	170	5
Digital Camera	1	40	105	65	2
Mobile Phone	0	0	210	210	0
Router (wifi)	1	40	210	170	5
Tablet	0	0	105	105	0
Lapel	0	0	105	105	0

* 8 hours a day x 5 days x number of units available in the college
** based on the result of the survey
*** deficiency in time / total number of hours available per week per unit of device

Table 2 presents the number of additional units needed by the college to support the full utilization of technological devices by the faculty.

On the average, all faculty members render a total of 420 hours a week, or about 12 hours per faculty. The table below shows the utilization of technological devices within the hours of instruction of faculty.

Table 3. Utilization Analysis of Technological Devices per week during Teaching Hours

Technological Devices	Average weekly Teaching Hours of Faculty	Average Number of Usage Hours of Faculty per week	Utilization during teaching hours
LCD Projector	>9 but <15	>3 but <9	partial
Laptop	>9 but <15	>9 but <15	full
Desktop	>9 but <15	<=3	partial
Printer	>9 but <15	>3 but <9	partial
Photocopying Machine	>9 but <15	>3 but <9	partial
Digital Camera	>9 but <15	<=3	partial
Mobile Phone	>9 but <15	>3 but <9	partial
Router (wifi)	>9 but <15	>3 but <9	partial
Tablet	>9 but <15	<=3	partial
Lapel	>9 but <15	<=3	partial

As presented in the table, the faculty fully utilizes their laptops during instruction while other devices are partially utilized. This means that during instruction function, their teaching strategy is fully aided with technological devices and therefore makes them a techi-teacher.

Productivity Analysis

Table 4. Comparative analysis and Productivity Change

Activities	Average Time Spent		Difference in Time Spent (min)
	without devices	with devices	
1. Preparing and Conveying the Lesson Phase (i.e. reading and writing the lectures on the board and allowing the students to copy/preparing the power point presentation including set up of equipment/typing and printing and/or photocopying of lesson)	49 mins	120 mins	71 mins
2. Discussion Phase (i.e. explaining each topic in details, giving situational examples or applying sample calculation, interacting with the students thru question and answer)	87 mins	123 mins	36 mins
3. Evaluation of Students Phase (i.e. students were given quizzes, check it and record the score)	20 mins	30 mins	10 mins

The table above shows the average time spent by the faculty in each phases of instruction. It shows that in the preparation and conveying of lesson phase, the faculty took more time with the use of technological devices as compared to without the use of the devices with a computed productivity change rate of -1.45%. This implies that the faculty consumes more time in choosing and arranging or editing the topic from the source to the power point due to the fact they are not very much aware of the different shortcuts or functions. This includes choosing the amount of information to be included in the slides, rephrasing the sentence from the source, choosing the right font

size, color, font style and animation if necessary. Also, the faculty consumes more time in encoding formulas, tables, figures, operations and sample computations in the power point presentations. Other factors that increased the time spent are the set-up time, or the time used to set the projector and laptop; photocopying time and printing time. But, according to the faculty, it is more easy and convenient on the part of the students to have a copy of the lessons, since they can easily download it from their emails, group accounts, and social network site or simply reprint or reproduce for early distribution. And since the lessons in soft copy were available in advance, the students could study the topic before the scheduled classroom discussion.

The discussion phase shows that the faculty has more time of discussion and explanation of topic presented when technological devices are employed with productivity rate of 41%. This means that the time saved from writing the lessons in the board and allowing the students to copy were converted to additional time for more explanation and healthy discussion of additional topics. Also, since the topics are flashed on the board in a more concise form, and only a small space in the board is used, more topics were able to cover within the time allotted per meeting, and there is more space for writing of sample computation if necessary.

The student evaluation phase shows productivity rate of 50%, which means an additional time for the faculty to broaden the coverage of the quiz, seatwork or board work. The additional time available for evaluation is correlated to additional time saved from the discussion phase.

Result of the Interview

The individual and focused group discussion revealed other factors that affect the productivity of the faculty. In terms of preparing and conveying of lesson phase, the faculty states that they have difficulties in comprising as much information as possible in each slide, since the content in the slides is limited to the space available. On the discussion phase, they tend to focus on the topics flashed on board and forget other important information, which were not included in the slides but were provided in the source. The students also tend to limit their research and study on the topics included in the power point presentation only.

Conclusion

In general, the faculty of the College of Business Administration of Bulacan State University, Philippines is more productive when they use technological devices in their instruction in business subjects. Specifically, the study shows that there is a positive productivity in the discussion phase and evaluation of students phase during the instruction function of the faculty. The coverage of the discussion was broadened beyond the topics allotted within the day when the faculty utilized technological devices in instruction such as LCD projector, Laptops and printing devices. But since the preparation and conveying of lesson phase has a negative productivity, the study suggest that the faculty should be provided with ready-made power point presentation of topics in each business subjects to lessen the time of encoding and editing. A collection of the power point presentation of each subject should be maintained for updating and use of faculty. The research also shows that most of the technological devices are partially used during teaching hours. If funds will warrants, the technological devices needed to achieve full utilization of the faculty must be provided.

Appendix A. Structured Questionnaire for Personal Interview

1. What technological devices do you use in performing your function as a faculty?
2. How often do you use these devices?
3. What are your considerations in choosing these devices?
4. In what area do you use these devices in performance of your function?
5. What are benefits or advantages do you derive from these devices?
6. How about disadvantages? If there is any.
7. Do you consider yourself productive? If yes, how did you say so? If not, why?
8. Do you prefer to use teaching devices? Why or why not?
9. Have you encountered any difficulties in using these devices in preparing your lesson, discussing it, and evaluating your students?
10. Have you encountered any difficulties in not using these devices in preparing your lesson, discussing it, and evaluating your students?

13th International Educational Technology Conference

Technology Applications Used by First year Undergraduates in a Malaysian Public University

Dorothy DeWitt[137], Zahra Naimie, Saedah Siraj

Faculty of Education, University of Malaya, Kuala Lumpur, 50603 Malaysia

Abstract

Malaysia has embarked Malaysia has embarked on several ICT programmes since 1996. These programmes have contributed to developing the ICT skills of the digital natives in the institutions of higher learning. This study was aimed at determining the technology applications which digital natives in the first year undergraduate studies in a Malaysian public university had utilized. A survey of 50 undergraduates in their first semester in the Faculty of Education showed that social media in the form of microblogs like Facebook, was used by all the undergraduates. Popular applications are repositories for video, mainly Youtube; website development, namely blogs; discussion tools, as well as maps and location applications. File sharing, online games and digital materials were used by some of the undergraduates but were less popular. The findings show that microblogs, discussion forums, content repositories and blogs were used by digital natives. The significance of this study is that these undergraduates were more likely to use these applications for learning, and in their careers when they graduate.

Keywords: Information communication technology tools; digital natives; technology use, software applications

Introduction

Media has been used to deliver lessons effectively. Audio-visual (AV) aids were used in Malaysia since the 1950s (Shamsuddin Hassan, 2012). The advent of educational radio, *Radio Pendidikan,* in 1966, and educational television, *TV Pendidikan,* in 1972 saw a further increase in the use of teaching aids in schools (Shamsuddin Hassan, 2012). The advancement in the field of technology has transformed media from the analogue form to the digital form. During the Smart School Pilot Project (1999-2002), teaching-learning materials in the form of browser-based courseware were developed for access on the school's Local Area Network (LAN), and was complemented with courseware on CD-ROMs (Ministry of Education, 2001). This was the era of browser-based courseware for learning (Roblyer & Doering, 2010). When the internet era commenced in 1994, the shift was towards delivering learning objects and digital materials such as educational videos (www.eduwebtv.com) online. These digital materials could be accessed through online learning portals.

The Ministry of Education had initiated several ICT programmes for computer literacy before embarking on the Smart School Pilot Project in July 1996: 'Introduction to computer', 'Computer Literacy Project', and 'Computer Assisted Learning' Project (MOE, 2001). The Smart School Pilot Project was a project which integrated the various aspects on the use of technology in schools for the 88 pilot schools. Both the teaching and learning processes as well as school management was catered to in the Smart School Integrated Solution. The Smart School concept was rolled-out to all schools following the end of the project (Multimedia Development Corporation, 2006).

The Smart School Pilot Project and other computer projects, such as the School Computerization Project (*Projek Pengkomputeran Sekolah*), assisted in introducing Information Communications Technology (ICT) faciliticies in schools, The SchoolNet project provided all schools with internet access, and the policy of teaching Mathematics and Science in English helped in equipping the infrastructure in schools as laptops and LCD projectors with courseware for teaching mathematics, science and English language were provided (MOE, 2008)

The undergraduates students in our universities are the digital natives who have been exposed to the use of computers and its applications for learning. They should be skilled in the use of ICT applications usch as word processing, spreadsheets, and digital editing tools. In addition, these digital natives would have used social media and online repositories of knowledge to gather information for learning.

Objective of the study

This study provides an insight into the technology tools and applications undergraduates in their first semester in the selected public university are familiar with in order to answer the research question: What technology tools do first-year undergraduate students in a Malaysian public university use?

This study is important, firstly because lecturers need to be aware of the digital literacies of the digital natives they are teaching. This will in turn assist lecturers in planning and designing useful instructional experiences for the digital natives, optimizing the tools they are familiar with for learning.

This study is also useful for university administrators and policy planners can determine what systems need to be put in place for the strategic planning in producing a critical thinking and creative technology–literate work force. Effective staff development programmes can also be planned to equip lecturers with the technology skills to face these digital natives.

Finally, it is important for teachers in secondary schools as they would be aware of the technology applications their students have used in school before being enrolled in institutes of higher learning. Teachers could also determine how these tools can be optimized in schools for teaching and learning.

.

Digital Natives

The students in the school system are the digital natives who are more knowledgeable than their teachers in using ICT tools (Prensky, 2001). These natives were raised in an environment which applies technology, both at school and outside school for teaching and learning, social interaction and entertainment. (Gu, Zhu, & Guo, 2013). Most digital natives have easy access to computer and internet connection and use ICT tools intensively and more effectively than digital immigrants (Jones, Ramanau, Cross and Healing, 2010; Balkan Kiyici, 2012; Lei, 2009). Digital natives are able to multitask, prefer multimedia to text, can process information rapidly and view technology as friend (Prensky, 2001). Hence there is a need for teachers who educate digital natives, to recognise the abilities of digital native abilities so as to make teaching more effective and productive (Pinheiro and Simões, 2012).

Research has shown that students use ICT for a longer period at home as compared to school (Gu, Zhu, & Guo, 2013). In addition, high school students used ICT more than primary school students, both in school and out of school (Gu, Zhu, & Guo, 2013). Girls scored significantly higher than boys for in-class use of ICT, while boys had significantly higher scores for use of ICT out-of-class (Gu, Zhu, & Guo, 2013). It was interesting to note that Gu, Zhu, & Guo's (2013) study showed that digital natives in Shanghai did not use more ICT than their teachers, but accessed more ICT applications and used a larger variety of tools at home than at school. In addition, these students had higher self-efficiency and ICT competency on ICT (Gu, Zhu, & Guo, 2013).

Availability of ICT facilities in students' home is strongly related to students' ICT usage (Gümüş, 2013). Hence, initiatives to increase ICT programmes in schools, such as programmes implemented in Malaysia, will be effective in increasing opportunities for students to be involve in ICT-related tasks. On the other hand, increasing the hardware, such as the number of computers or other ICT devices, does not contribute to the students' usage of ICT (Gümüş, 2013). More important is the development of human capacity for both teachers and students.

ICT competency is important for teachers and teacher trainees. A study of Science teacher trainees who are digital natives showed that those who could use ICT tools at an expert level were more likely to use these tools in their teaching activities (Balkan Kiyici, 2012). Hence, it is advantageous for teacher trainees in public universities to use ICT throughout their undergraduates' studies for them to be expert users of ICT in schools.

Applications Software

Social Media Tools

Social media tools, or Web 2.0 tools refers to the interactive use of the internet in which tools where the user can contribute to in terms of generating content, promoting collaboration and interaction as well as sharing new knowledge (Balkan Kiyici, 2012; Oliver, 2007). The highest usage of ICT tools among Turkish science teacher trainees was social media. The use of instant messaging was popular, while least popular were blogs and wiki

(Balkan Kiyici, 2012). Although teacher trainnees used wiki, they were passive users who just read wikis but did not contribute (Balkan Kiyici, 2012). Although there was a difference in the use of image and document sharing between the gender, with males using it more than females, there was no significance difference in the use of blog, wiki, social networks and instant messaging among gender (Balkan Kiyici, 2012).

The media for social interaction and communication, or social media, affords social interaction and dialogue between peers, as well as between experts and learner. In this study, social media tools considered are emails, forums, chats, blogs and microblogs, wiki and Youtube. The tools allow for media content to be shared and for interaction to take place.

Interactions through e-mails allow for messages to be transmitted immediately to an individual or a group using attachments of document, audio and video files. Google or Gmail, and Yahoo mail are examples of free email services. This relative control of privacy and readership allows discussion to be on a more personal nature (Andrews & Haythornthwaite, 2009).

Forums provide a platform for discussion, dialogue and social interaction where questions and suggestions to solutions can be formed. Forums are also learning communities for support, which has features such as threading of postings and groupings of topics for easy review (Andrews & Haythornthwaite, 2009).

Instant messaging or chats are immediate text-based interaction delivered either through the internet or short message text (SMS) on mobile phones. The number of characters or words is limited. Yahoo Messenger, Whats Apps, Google Chat, Facebook Chat, and online conferences and online games have the chat feature combined (Andrews & Haythornthwaite, 2009). The privacy settings can be adjusted to the intended audience.

Blogs are an abbreviation of Web logs and is a diary of events or a personal journal published on a web page on the world wide web. Blogs written by experts on topics of interest may have followers from a community of practioners. Edublogs exmples are Cerita Ginggo and E-learning Coach. Blogs in different media can also be distinguished: video logs are vlogs; a log of links is linklog, and of photos is a photolog; and blogs writen on a mobile device is a moblog. Example of platforms for blogs to be created are Blogger and Wordpress.

Mircoblogs such as Twitter and Facebook enables logs in the form of status posts, or tweets with a limit on the file size on the text, graphic and video posted. In Twitter, a follower of the Twitter account holder to receives tweets in text form. Photo and video links can also be tweeted. Facebook enables friends to view, like and comment on status posts and share text documents, photos and videos can be uploaded and shared.

A wiki is a website or webpage for collaborative writing as users contribute to building the website by adding new pages and information. Wikis are useful for collaborative writing and problem-solving tasks as learners collaborate in publishing their work, they not only gather information by representing it in a new way, generating novel ideas and knowledge (Bonk, Lee, Kim, & Lin, 2009).

Repository For Information and interaction

A repository is a platform for storage of digital content. Repositories may be specific video repositories, such as EduwebTV are for curriculum materials and related guidelines issued by Ministry of Education (MOE, 2008), TED Talks for inspirational talks by famous people; Teacher TV for teaching resources.

YouTube is considered a repository for materials and many instructional resources can be found on YouTube and on the Teachertube channel. However, the quality of the material may be questionable as the content is user-generated and there is no quality control. Both Blogs and YouTube have features such as interactivity, where comments and questions can be given online. Social interaction can continue through comments on the uploaded video, and is also considered as social media. However, because of its storage capacity, we classify it as a repository. Blogs and some social media tools like Facebook can be used for storage or links to videos and other learning materials. These are almost like a repository of content materials but offer limited storage.

Content Interactive Tools

The interactions in content interactive tools are limited to interaction between learner and content (Moore & Kearsley, 2005). It differs from social media which affords social interaction among peers, between experts and learner. These content interactive tools are the mindtools (Jonassen, 2000) which encourages the cognitive processes to occur.

Glogster, a graphicblog, which forms a portfolio to summarize, organize and present content and information in a visual manner. The interactivity enables learning to take place. Padlet is another interactive mindtool which

enables postings in the form of "stickies" to be made on a wall and allows brainstorming, concept formation and comparisons to be done. Wordle is a category of online web resources called **"**Word clouds" in which words and paragraphs of text are converted to visuals. Higher level skills such as concept and principle formation are developed. Google Earth is an online interactive portal which uses satellite images for virtual learning in an environment controlled by the user. The learner can experience moving in different parts of the world and control the experience.

Content Development Tool

Content development tools are tools used to develop digital materials in the form of learning objects to be linked to repositories and learning management systems like *Spectrum* and, FrogAsia. Some tools are *Storybird* (for digital stories), Bitstrips (for cartoons), and Camtasia (for video screen captures). The advantage of using these tools is that the animation and graphic features engage young learners. Web pages are also content materials in the form of hypermedia which is published on the world wide web.

   User generated content, developed by teachers for instruction or assigned to students for learning can be developed using these tools. The benefits of employing user-generated content for learning is that is that the users, or students are actively engage in the construction of knowledge, and allow for the development of soft skills as they collaborate on their projects (Balkan Kiyici, 2012; Mason & Rennie, 2007). This in turn motivates and engages the student.

Method

Sample

First year undergraduate students in their first semester in a public institution of higher learning were selected to participate. The students were new to life in the university as they had completed their standardized examinations in school several months earlier.

Instrument

   An online survey form was prepared using Google Drive application, and the url was posted as a link for students to access during their coursework. The instrument listed the major applications and ICT tools such as mircoblogs, repositories, discussion groups, collaborative workspaces, website development, file sharing, website and digital materials development, online games and maps-location which the student might have used. Specific tools, such as Facebook, Twitter and Google+ was suggested and there was a open-ended option where the student could add other tools that might have been used. The survey was done to indicate the applications the student as a digital native has used.

Results

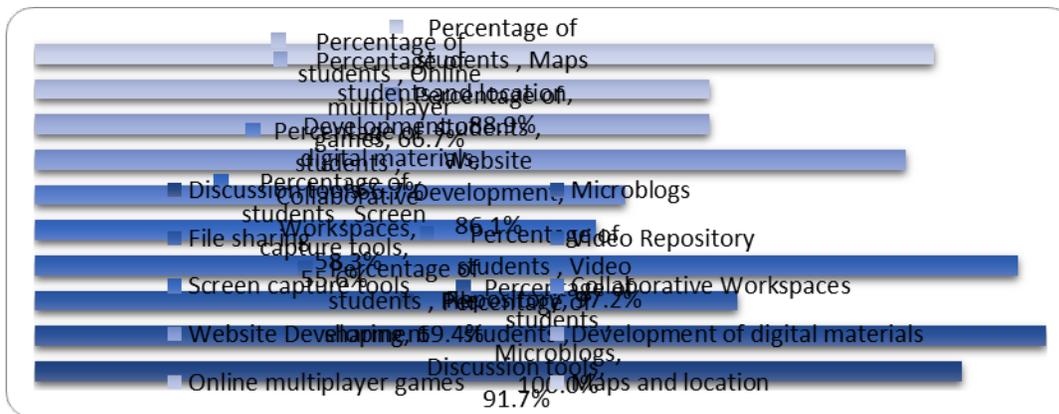
The use of ICT tools among first year undergraduates was high (Figure 1). The survey showed that all undergraduates (100%) used social media in the form of microblogs. This was followed by video repositories (97.2%), discussion tools (91.7%) and maps and location (88.9%) and website development (86.1%). Almost two thirds of the undergraduates surveyed participated in file sharing (69.4%), online multi player games (66.7%), and development of digital materials (66.7%).


Figure 1: Use of ICT applications among first year undergraduate students in the Faculty of Education

A survey of the technology tools which were actively used showed that some tools were more popular than others. The most highly used tools is tabulated below (Table 1) The social media tool in the form of microblogs: most popular is Facebook (97.2%) while Twitter was less popular (36.1%). Among the video repositories, only Youtube was the prominent tool (97.2%). Discussion tools which were actively used included Skype (58.3%) and Yahoo (58.3%), while chat tools like MSN (33.3%) and WhatsApps (30.6%) had lower usage. The prominent Map and location application was Google Maps (86.1%), while other Global Positioning Systems (GPS) for location such as PaPaGo (22.0%) was also used. Website development tools were also used, with blogs being the most prominent application (77.8%). The other website development tools which were less user-friendly was lower in use.

Table 1: Technology Tools Highly Used by Undergraduates

Technology Tools	Percent
Microblogs	
Facebook	97.2
Twitter	36.1
Goggle+	77.8
Others	8.3
Discussion Tools	
Skype	58.3%
Yahoo	58.3%
MSN	33.3%
WhatsApps	30.6%
Freewebs	8.3%
Video Repositories	
Youtube	97.2%
TEDtube	2.8%
Teachertube	5.6%
Others	2.8%
Maps and Location	Percent
Google Maps	86.1%
Google Earth	30.6%
Waze	13.9%
Others	22.2%
Website Development	Percent

Blog	77.8%
Frontpage	13.9%
Freewebs	13.9%
Dreamweaver	11.1%
Others	2.8%

Other technology tools were used less but had significant numbers of students using is also listed (Table 2). File sharing applications were moderately popular with SlideShare (36.1%) and Tumblr (30.6%), followed by Photobucket (25.0%). The application the undergraduates were most familiar for collaborative work online was Google Documents (52.8%). Other wikis were used less often. The online games which were surveyed was limited to multi player games in which the most popular was Farmville (50.0%) which might indicate that the social media tool which hosted the game, in this case Facebook, was popular among undergraduates for entertainment. World of Warcraft was one of the massive multiplayer online role playing game (MMORPG) more popular among the serious game player (19.4%). As for development of digital materials, Flash was the most popular (50.0%). It was also interesting to note that audio editing applications such as Soundforge (5.6%) and Audacity (13.9%), was also used. In addition screen capture tools such as Screenr and Jing were being used.

Table 2: Other Technology Tools Used by Undergraduates

File Sharing Application	Percent
Photobucket	25.0%
Tumbler	30.6%
Dropbox	11.1%
Prezi	8.3%
Slideshare	36.1%
Collaborative Workspaces	**Percent**
Goggle Documents	52.8%

Others	11.1%
Development of Digital Materials	**Percent**
Macromedia	16.7%
Authorware	5.6%
Flash	50.0%
Audacity	13.9%
Exe	16.7%
Sound Forge	5.6%
Screen capture tools	**Percent**
Screenr	41.7%

Jing	22.2%
Snagit	2.8%

Discussions And Conclusion

Digital natives of the twenty first century are immersed in the use of technology. Social interaction is very important as blogs, microblogs, discussion tools and video repositories with social interaction were used by many. It is interesting to note that online social interaction was lacking in the teaching and learning materials developed by the Ministry of Education in the 1990s, but the digital natives have naturally undertaken this *digital socialization*.

The digital natives used tools which had a purpose. Maps and location finders such as Google Maps and Global Positioning System (GPS) devices, such as Gamin and PaPa Go were used. In addition blogs were used to develop their own content. Although less popular, digital content was also shared as well as developed by the digital natives. The culture of user-generating their content is not new to the students.

The implication of this study is that in institutes of higher learning, digital natives are highly socially interactive and used technology for a purpose while developing their own content. Lecturers in these institutes of higher learning should optimize these characteristics and design lesson that require online interaction to engage their students. In addition, opportunities for these learners to create user-generated digital materials may have attractive results. Further studies could be done to determine if the digital content generated by these digital natives were suitable and could fulfil their objectives. And what media was preferred in generating digital content.

This study also shows that teachers in schools could optimize their students' skills for social interaction and user-generated content to design their lessons for integrating ICT. The students were already using the internet for social interaction and developing digital content. Could not the students develop their own digital content for project-based learning? This may internalise learning and make learning more meaningful and relevant. This is relevant now as the Ministry of Education has provided a learning management tool for social interaction and storage of digital content, FrogAsia, which can be used by both teachers and students.

This study is significant as it shows the technology tools, and games, being used by the digital natives at present. The tools which are used by the digital natives may differ after three years in the institution of higher learning, and when they start to work. New tools may be developed and new literacies may be required. Teachers and lecturers will need to be aware of the changes in the world of technology and update themselves to take advantage of what technology has to offer.

Technology transfer training in the Czech Republic

– pilot of European certification

Ivan Dvořák[a], Kateřina Čihařová[b138]

[a] ILA s.r.o., Zubatého 295/5, Prague 5, 150 00 Czech Republic
[a] ILA s.r.o., Zubatého 295/5, Prague 5, 150 00 Czech Republic

Abstract

Low qualification of Technology Transfer professionals has been identified as a significant obstacle to improvement of TT in the CR. Trainings in this field are numerous but unsystematic and lack necessary quality standards. Situation being similar in many EU countries, EC funded two projects aimed at establishing standards for accreditation of TT training providers and certification of their students. As their outcome EuKTS was launched as EU-wide TT accreditation and certification body. The paper reports implementation of this initiative in the Czech Republic: in three related projects more than 900 students were trained and about 300 obtained the EU certificate.

Keywords: knowledge and technology transfer; accreditation; certification; training quality standards

Introduction

European Union pays a great deal of attention to improving competitiveness of its economy. In its Lisbon strategy approved in 2000 (Presidency Conclusions, Lisbon European Council, 2000) and again in its Europe 2020 strategy (Europe 2020, 2013) approved recently and still tuned, necessity to build knowledge-based society is stressed. An important role in this endeavour is attributed to increasing intensity and efficiency of the technology transfer (TT), nowadays more often denoted as transfer of knowledge and technology (KTT), between academia and industry and valorisation of R&D results by their practical utilization in all fields of industry and services. However, in spite of billions of EURs allocated to reach this goal, results are still regarded as not fully satisfactory (State of the Innovation Union 2012, 2013).

Czech Republic is a small country in the heart of Europe (10,5 million of inhabitants, area of 78 867 km^2) with long and colourful history. It has fairly educated populations and comparably robust R&D base of universities and other research facilities. It has become a member of EU in 2004 and currently occupies an average position among the EU countries in majority of parameters scoring the competitiveness, innovativeness, productivity of labour etc. Problems with low intensity and effectiveness of TT (KTT) and hence insufficient valorisation of knowledge resulting from R&D activities of its universities and research institutes trouble its government and scientific representatives equally, if no more, than officials of the European Commission (EC) and governments of many other EU countries.

Various analyses have been performed in the last decade on the EU as well as on the member states´ level aimed at finding out and analysing reasons of this unsatisfying situation and proposing appropriate measures for remedy. As early as in 1995, ERAC (European Research Area Committee, formerly CREST) has been established as a strategic policy advisory body of the European Commission and the Council of the European Union for research and technological development (see: Council of the European Union: Resolution on the developments in the governance of the European Research, 2010) and it has made many recommendations in this respect since. In the Report of the CREST OMC Expert Group on Intellectual Property (2006) is stressed, among other, that significant problem lies in the insufficient and unsystematic training of TT/KTT professionals in the EU. It pointed out namely

E-mail address: ivan.dvorak@ila.cz

- lack of TT/KTT skilled people in general,
- absence of registered TT/KTT profession,
- absence of TT/KTT education / training standards recognised,
- absence of career path for TT/KTT professionals

and gave several strong recommendations how to improve this weakness.

Cert-TTT-M and EuKTS projects

As a reaction to findings and recommendations of CREST (ERAC) in the field of training of TT/KTT, a bottom-up initiative has arisen among EU institutions interested in active promotion of TT/KTT professionals. It gave birth to two subsequent projects (funded from FP 6., and FP 7., respectively) that have marked out the direction how to implement the CREST (ERAC) recommendations.

Cert-TTT-M project

Already in 2006 consortium of 11 members coordinated by Austria Wirtschaftsservice GmbH (and bolstered by experts from nine other renowned institutions later on) designed a project Certified Transnational Technology Transfer Manager (Cert-TTT-M project, 2011) that won funding for its realization from FP 6. The project started in 2007 and was terminated in early 2009. Its aim was

- to create a training framework for technology transfer managers in order to professionalize their role,
- to help to create a more defined career structure for them and to assist with mobility of managers within the European Union,
- to provide a legal and organizational framework for the mutual recognition aiming at accreditation of the course on a pan-European level.

These goals were successfully reached and thus in this project a framework to qualify TT(KTT)-managers on a trans-national level and with mutual recognition in Europe has been built up.

EuKTS project

From Cert-TTT-M project grew up another project entitled European Knowledge Transfer Society (EuKTS project, 2013) financed from FP 7. In this project 14 European institutions, mostly participant in the Cert-TTT-M project, joined efforts under co-ordination of ERDPA (Emilia Romagna Region, Italy). Its realization started in 2010 and ended up in early 2013.

The original aim of this project was elaboration of a detailed Feasibility Study how to implement outcomes of the Cert-TTT-M project. During its realization, however, this aim was substantially extended to more ambitious one – not only the way how to build up the EU-wide structure for accreditation and certification of TT/KTT professionals was elaborated in detail, but also the accreditation and certification body (EuKTS, an association under the Belgian law) was launched and properly registered, and three pilot accreditation and certification projects were realized at the Charles University in Prague, University of Bologna, and Management Center Innsbruck (affiliated to Innsbruck University).

TT/KTT Curriculum

The pivotal role in the devised system is played by the "EuKTS TT/KTT curriculum" (EuKTS official brochure, 2013). It defines eight basic competences that should be mastered by TT/KTT professionals:

- Information analysis and management
- Strategy and IP portfolio
- Intellectual Property protection
- Opportunity assessment and valuation
- Knowledge transfer and innovation marketing
- Negotiation and contracting
- New businesses development and financing
- Project management

These competences are industry independent, it is supposed, however, that for different industry specializations, as well as for different TT/KTT the depth and broadness of mastering of these competencies may be different.

Moreover, the competencies are further structured into two levels – basic and intermediate – in accordance with structured certification levels (see below). Detailed breakdown of all competencies into teaching themes has been developed for both levels.

System of training and recognition of TT/KTT professionals

The system for accreditation and certification of TT/KTT professionals consist of two basic components:
- accreditation of training providers,
- certification of successful trainees (students).

Accreditation for training in TT/KTT according to EuKTS curriculum is granted to training providers upon request. The accreditation process encompasses demonstrating of the teaching curriculum compatible with the EuKTS curriculum, teaching history and capacity, as well as availability of qualified teachers. International committee supported by verdict of a local expert has the final word.

Certification of trainees – TT/KTT professionals is performed on three levels: basic, intermediate and advanced. For the level basis, which can by taught in any local language, is certification awarded by the training provider after successful passing the multiple choice quiz. The title for professionals certified on this level is "associate". Certified TT/KTT professionals are then registered with EuKTS. For the level advanced, which can be taught only in English, the certification is awarded directly by the EuKTS after successful passing the standardized multiple choice quiz. The title for TT/KTT professionals certified for this level is "professional". Certification for the level advanced is awarded by EuKTS on the basis of general assessment of the applicant by an international jury. The title granted to TT/KTT professionals certified for this level is "expert".

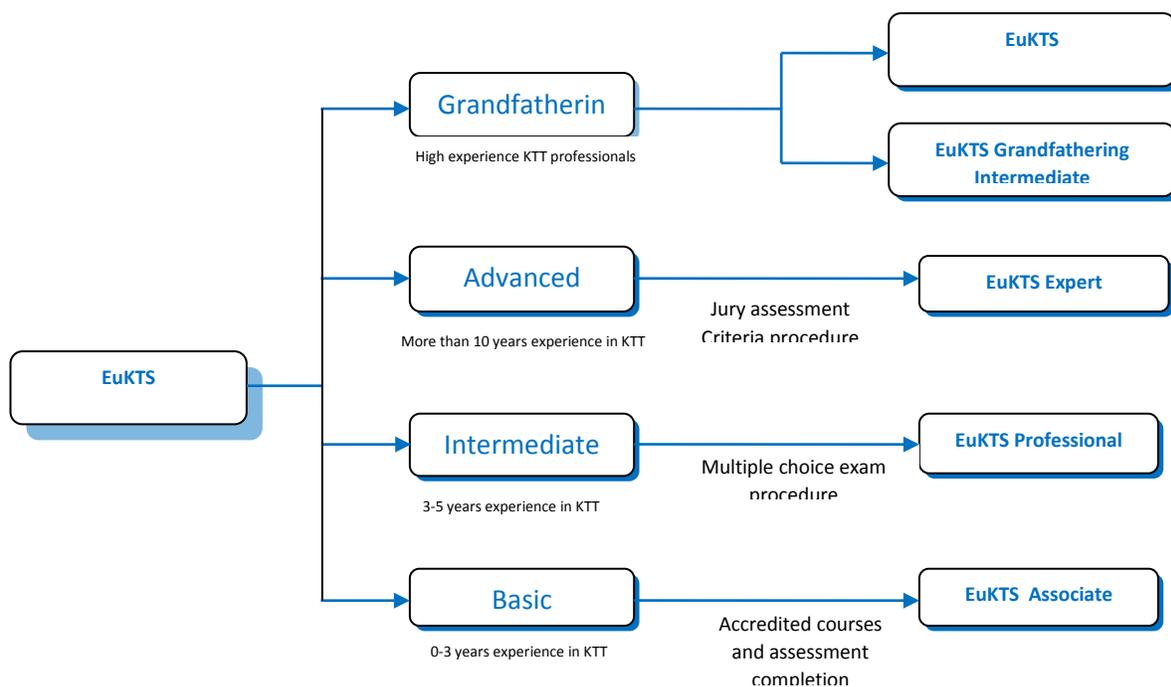
The whole system of certification developed by EuKTS is depicted in the Figure 1.


Fig. 1.: EuKTS certification scheme

The three certification levels described above are supplemented here by a fourth "grandfathering" level important for the take-off of the system, when at the beginning there will be virtually no certified TT/KTT professionals on higher levels. It is also intended for awarding of high qualified life-long experienced TT/KTT professionals who cannot be expected to pass the certification system from the very beginning.

Take-off and deployment of the whole accreditation/certification structure is a question of today. More than 30 institutions from 15 EU countries + Turkey, Macedonia and Serbia already expressed their interest to enter the scheme. Intensive discussions on further funding of the take-off (the structure is supposed to be self-financed from the accreditation and certification fees in the mature state) and official recognition by the EC authorities are going

on. The latter is a bit hampered by similar activities of ATTP (http://www.attp.info), but reasonable way of co-operation and mutual recognition of both systems is already on the horizon. Hopefully, in the next EU planning period (2014-2020) we shall see full deployment and thriving of the devised system.

Pilot implementation in the CR

Authors of this contribution participated in both Cert-TTT-M and EuKTS projects, first as external experts and later as representatives of the Charles University in Prague. Access to funding from EU Structural funds together with the close contact with the EuKTS "think tank" rendered them possible to initiate three successive projects in KTT training in the years 2009 – 2014. These projects originated first at the Charles University in Prague followed by the Biological Centre of the Czech Academy of Sciences in České Budějovice (South Bohemia), where subsequently another 9 partners entered them.

Thanks to close coordination of these projects with EuKTS project the Charles University won a chance to register the junior level of these training as pilot project for EuKTS accreditation on the level "basic", which paved the way for awarding a part of students by the EuKTS certificate.

As already mentioned, similar pilot projects were also realized at the University of Bologna and Management Center Innsbruck, but the number of registered and certified students was significantly lower there.

Structure of the teaching projects

In these teaching courses the curriculum followed strictly the EuKTS curriculum. Because of historical reasons the levels "basic" was labeled as "junior" and level "advanced" as "senior". The level "expert" was modified – instead on peer assessment it was developed as "project-based".

Teaching method used a blended model with introductory and closing seminary and tutored distant learning. Each course was composed of 16 to 24 modules devoted to all important topics of TT/KTT theme. One third to one half of modules have been explanatory texts, while another half or even two thirds of modules have brought the case studies.

Project KTT in the regions I

The first project of the series, which was realized in the years 2010-2012, was entitled Knowledge and Technology Transfer in Selected Regions based on European educational model "Technology Transfer Manager" (abbreviated "KTT in regions I"). It relied heavily on experience of the Charles University in Prague in teaching KTT accumulated during preceding project IPUK, which was realized in the years 2006-2008. In this project a blended teaching model with strong distant component (using MOODLE e-learning platform) was successfully tested and a core of trainers in all necessary specializations was formed.

The main coordinator of this project was Biological Center of the Czech Academy of Sciences in České Budějovice, Charles University in Prague, as the main bearer of the know-how, was a partner. Six other partners including the South-Bohemian University joined the project and send their students to the courses. ILA s.r.o. was a managing partner and the professional supervisor of the project. A part of students of the "junior" level, who passed successfully special tests, was awarded the EuKTS certificate for the KTT level "basic". The project was financed from Operational Program Education for Competitiveness funded from European Social Fund.

Project KTT at the CUNI

The second project of the series called Transnational Technology Transfer Manager - Application of European Educational Model at Charles University in Prague (abbreviated "KTT at the CUNI") was fully engaged with 14 faculties of the Charles University located in Prague. It was realized again in 2010 – 2012. In this project were no partners, its structure and teaching method was very similar to the preceding project. Experts of ILA s.r.o. guaranteed the high level of the courses. Also in this project a part of students of the "junior" level, who passed successfully special tests, was awarded the EuKTS certificate for the KTT level "basic". The realization of the

project was financed Prom the Operational program Prague – Adaptability, funded again form the European Social Fund.

Project KTT in the regions II

The third project Knowledge and Technology Transfer Manager – Extension of European Educational Model "Technology Transfer Manager" in other regions in the Czech Republic (abbreviated KTT in regions II) started in 2011 and it is still running on until February 2014. It was launched by the Medical faculty of the Charles University in Pilzen. Its structure and teaching method was very similar to preceding two projects. In addition to the Charles University, other three partners joined the project - University of West Bohemia in Pilzen, University Hradec Králové, and ILA s.r.o., who again guaranteed the high level of the teaching. Also in this project a part of students of the "junior" level, who passed successfully special tests, has obtained the EuKTS certificate for the KTT level "basic". This project is also being financed from Operational Program Education for Competitiveness funded from European Social Fund.

Number of students

Number of students that were registered and passed successfully the tests in all training courses in aforementioned three projects up to date is summarized in the following table:

22. Table 1. Number of successful students

Project	Level Basic			Level Advanced		Level Expert	
	Registered	Passed	EuKTS certified	Registered	Passed	Registered	Passed
KTT in the regions I	144	93	27	82	64	14	5
KTT at the CUNI	112	68	18	42	37	2	2
KTT in the regions II	344	277	256	238	?/*	3/*	?/*
Total	600	438 (73 %)	301 (50,2 %)/**	362	101/*	19/*	7/*

/* The number is not final as the last courses "S" and "E" in the project KTT in the regions II are still going on.
/** EuKTS certification of the courses "S" was available only for the second runs.

Number of students registered and their positive reaction in feedback questionnaires confirm that both the substance and the form of courses have been rather popular. Average success rate in the course basic (that are all completed now) has been about 70 %.

Lessons learned

As each course was repeated twice in each project, it was possible to tune the teaching materials with respect to students´ reaction. Among many interesting findings following main conclusions were made - the first of which resulted in rather considerable reworking of the teaching courses:

1. The first version of the teaching materials was descriptive and rather dry. After repeated remarks and complaints of students many case studies were added, not only "success stories", but also "brilliant failures stories". These studies were tied with the explanatory text into an organic "flow of knowledge". Reaction of the student was much more positive thereafter.

2. The students coming from different scientific branches were lost in the specific KTT terminology, thus asking for an explanatory dictionary, which has been added to the introduction of the 2nd run courses.

3. In the last course the budget was cut by the regulatory body so that the tutors for the distant learning were not available. Alas this resulted in considerable decrease of the course quality and commitment of the students. Unfortunately, it was not in powers of the course designers to correct this failure, but importance of tutors is a message for the future continuation of teaching activities.

In addition to these conclusions another interesting finding concerns the accreditation of teaching providers. All the trainings were in fact realized under one umbrella of accreditation obtained by the Charles University in Prague, though they concerned several different institutions. In the pilot project it caused no harm, but in the mature state of the accreditation and certification system the same approach would reduce the number of accredited bodies, bringing thus considerable decrease of accreditation fees for the accreditation body (that is EuKTS). This problem has not yet been solved.

Conclusion

Accreditation of KTT training providers and certification of their students in Europe is still in its early stage. The foundation has been laid, but there remains a lot to accomplish. Current state of the art is encouraging: system for accreditation and certification has been worked out and is being step by step implemented. Its formal recognition by the European Commission is being negotiated. Curriculum for KTT professionals training is generally consented and developed and improved further on. Hopefully also appropriate funding is found for take-off of the whole process. Experience gained in the pilot projects realized in the Czech Republic, where more than 900 students were registered, more than 400 of them successfully passed the tests in the course basic, and 301got the EuKTS certificate for this level, shows interest of students in EU accredited courses and their positive reaction to the devised curriculum. It discovered, however some unclear steps in the accreditation process that should be fixed in the future. The accreditation and certification process is not strictly limited to EU member states, it is open also to training providers and students from non-EU European countries and non-European countries as well.

Abstract

When the educational Technologies, which are used in the process of learning-teaching process, are associated with sensory organs, the least used one becomes the olfactive stimuli. Nowadays, because of being foreground of visual-audio Technologies, Positivism is based on vision and audition but it ignores the other senses. Although seeing and hearing play important roles, the ineffectiveness of other senses is delusion in this process. In this delusion the impact of visual-audio Technologic devices from telescope to television, internet, mobile phones is inevitable. However sensation and learning is wholistic and based on togetherness of five senses. Thus, with the delusion olfactive stimulus which is rejected from the educational field is effective on senses, attention, concentration and memory in learning.
The purpose of this study, which is in form literature review, is to discuss the nature of olfactive stimulus , the effectiveness in education, areas of usage in context of educational technology, to deduce and to make suggestions.

Key Words: Olfactive stimulus, Olfactive educational technology, Sense of smell and learning.

1. Introduction

Can many notions, strategies and methods used in classes at present as if they were pedagogical principles and necessities in fact be composed of an inclination? When these practices, which are called inclinations since they have been implemented for a long time are considered closely, the case can be understood better. Moreover, it is a fact that these practices that are implemented without questioning in the classrooms are indeed inclinations "dressed with pedagogy", impositions, inducements and deceptions. This case is more common in countries like Turkey, which constantly import without knowing (in terms of source, meaning and context) what they get.

A typical example of this deception is concerned with the role of sense organs in the process of learning. Currently, sight and hearing have been regarded as the sole ways of learning in the notion of education in Turkey. This presupposition resulting from positivism, the source of which is a reality of the civilisation of the west, prevails all the phases of education in theory and practice. As a matter of fact, philosophers like Aristoteles, Darwin, Freud, Arnheim, Condillac and Kant, who are the important keystones of western culture, consider sight and hearing as intellectual "superior" senses; and other senses as animal "inferior" senses. Darwin and Freud among them overshot the mark and stressed "sight" as the sense of civilisation. These views gained ground and accepted as culture with the support of visual technologies like photograph, cinema, telescope and television that became widespread in the west especially in 19th and 20th centuries (Howes, 2002 as cited in Classen, 1997).

Another reason of ignoring the senses except for sight and hearing in the perception and learning process is that research on these senses is limited. Even though some part of this results from cultural bias, the subjective quality of senses with bio-chemical transmission system (olfaction and tasting) depending too much on personality characteristics is an important factor (Finnegan, 2002; Köster, 2002; Hudson and Distel, 2002; Bodnar et al., 2004). Finnegan (2002) stated that underestimating the olfaction in daily culture was an approach that is ideological and having a historical content. Departing from the studies carried out by Paabo, Holden (2004), who considered the subject anthropologically stated that smell genes adapted themselves to visuality by transforming as visuality was

assigned more importance. If all these are true, it can be said that visuality leads to functional defects in olfactive perception and it usurps the roles of olfactive sense not only in cultural respect but also in biological respect.

The culture (ideology) deeming sight and hearing senses as the sole way in education prevails in Turkey as if it were a scientific principle. All the central exams having a critical role in determining the destiny of individuals in Turkey are carried out with this presupposition in mind. When the issue is handled in the context of Multiple Intelligences Theory, it can be claimed that central exams favour the ones with dominant "visual" ability. The fact that people are mostly visual or sight has a significant role in perception and learning does not alleviate this problem. In education, each individual no matter what his/her personal qualities are is valuable and should not be pushed out of the system. Above all, this is necessary for "justice in education". The example cited here is a typical example of the fact that what wrong presupposition concerning pedagogy, epistemology, intelligence etc. can lead to in practice.

Another drawback of deeming the senses of sight and hearing as the unique ways of learning in education is that this viewpoint delays the comprehension of the phenomena of perception and learning with all their dimensions. Furthermore, this viewpoint, which can be summarised as sight and hearing's shadowing the roles of other senses, has resulted in an error (at least a deficiency) of "prioritising only visual-audio stimuli and ignoring others" in the practices of instructional design and educational technology. This notion has led to a one-way pedagogical notion like "the setting teaches" in the realm of educational technology with the support of behaviourism and resulted in the underestimation of instructional methods in the process of instruction and learning. Focusing on just the setting or prioritising one or two senses in the class restricts holistic perception and learning. It also prevents the stimuli other than sight and hearing in educational technology. All the senses should be used as ways to reach the individual in learning. Otherwise, how can stimuli-method variety be ensured in the process of instruction and learning. All these risk the quality in education. Also, although sight and hearing have important roles in perception and learning, the possibility of other senses' having significant roles in this process can open up new horizons for education.

For years, this information (perhaps statement) has been almost imposed on educators without questioning and doubt: "The influence of sensory organs in the process of learning; sight 83%, hearing 11%, olfaction 3.5%, touch 1.5% and taste 1%" (Ergin, 1998 as cited in Cobun). Is this information true for every culture and period? Or is it valid for all the ages? If this information was obtained through an experiment or observation as is the case with natural sciences, how many times was the experiment or observation repeated? These questions the number of which can be increased obscure whether the ratios pertaining to learning process-sensory organs should really be understood with quantitative reasoning or not. For example, is 3.5% role of olfactive sense in learning quantitative or qualitative? Is this 3.5 ratio valid for the realms of gastronomy and perfumery? These questions support the suspicion that visual and audio stimuli disabled the other stimuli in the process of instruction and learning after the enlightenment era (Howes, 2002 as cited in Classen, 1993). The experimental studies carried out especially in recent years have shown that olfactive sense may have an effect far more than the 3.5% allocated to it in learning process. Research on olfactive sense has demonstrated that it has significant influence on attention, perception, memory and mood. What is more, it was stated that olfactive stimuli used in learning environment in the context of olfactive sense had positive effects on cognitive performance, creativity, mathematical achievement and writing skill (Tildesley et al., 2005; Ceccarelli et al., 2004; Moss et al., 2002; Sprinkle, 1999). Hudson and Distel (2002) have described olfactive stimuli as cognitive organisers and they have attracted attention to their roles regarding behavioural, physiological and psychological functions. All these point to the fact that sight has limits in learning process and other senses should be involved so as to understand the learning process fully with all its dimensions. In order to acquire alternative perspectives on the implementations in both learning and educational technology, the roles of olfactive stimuli in the processes mentioned will be discussed in this study.

2. Olfactive Stimuli and Learning

The most important output of education process is undoubtedly learning. In order to regard any activity or attempt intended for people as "education", the process has to end in learning. Currently, complaints are made frequently about the issue that labour and money allocated to education aren't converted to learning at the same rate. It is undeniable that some of the complaints are concerned with the "transmission losses" in this process. So, these transmission losses should be minimised to increase productivity in education. Although there are a lot of dimensions of the problem of transmission losses in instructional process, the issue is somewhat concerned with extrinsic stimuli, which are intended to stimulate intrinsic processes, which we think lead to learning. It is known that multiple stimuli (rich environments) result in more efficient and permanent learning in this process. However, when the related literature is examined, it can be seen that multiple stimuli are restricted with visual-audio stimuli. Moreover, what is meant by multiple stimuli and rich environments is just visual-audio stimuli. Psychology,

philosophy, anthropology and medical data support the idea that these two stimuli play a significant role in learning. However, is it possible to ignore other stimuli in such an important issue even if they have relatively less contribution to the process? Isn't it a waste of resources to say the least not to take into consideration "the contributions regarded as minor" on the way to obtain a very precious product (learning), which has cost considerable money, labour and effort? The point where the learning environments taking into consideration the variables (stimuli), which are known and considered serious regarding learning have taken us is quite clear. This point, which houses a number of transmission losses is far from being satisfactory.

At the point where it is obvious that what is achieved in education is far from being satisfactory, what is lost by paying attention to alternative ideas that means a paradigm shift in learning process? These alternative perspectives may contribute to the understanding the nature of "learning", which is fairly complicated. At this point, discovering whether olfactive stimuli are efficient in learning process or not may contribute to the literature in terms of determining the limits (framework) of the phenomenon of learning. Because, learning is not only a phenomenon based on sight and hearing but it is also a multidimensional, complicated process, which interests learners as a whole. This process is a true living. If learning is a living, then doesn't this living process include sight, hearing, smelling, touching and tasting? Otherwise, basing learning on just sight and hearing is considering that other senses are "dead".

In this study, the roles of olfactive stimuli as alternative or more precisely complimentary learning variables have been studied departing from the fact that the objectives achieved in learning with variables, which are known and taken into consideration is not satisfactory. The roles of olfactive stimuli in learning process are handled in different contexts based on the literature. First of all, when the subject is handled in accordance with the existing literature, it is seen that the effect of olfactive sense in learning process is 6% (Küçükahmet, 1998; (Rıza, 2003) and 3.5% (Ergin,1998 as cited in Şahin and Yıldırım 1999) proportionately. The effects of olfactive stimuli in learning process can be classified as pharmacological (interaction with groups such as hormones and enzymes), physiological (stimulant effect) and psychological (Durell, 2004). Some information is found in the literature regarding the effects of olfactive stimuli on learning even though its framework hasn't been drawn clearly for today (Artan, 2003; Given, 1999; Getzels 1974 as cited in Türnüklü, 2000; Johnson, 1990 as cited in Taş, 1996; Akpınar and Ersözlü, 2008).The problem is concerned with not taking into consideration this information and how to utilise this information or how to reflect it in educational technology.

When the roles of olfactive stimuli in learning process are handled in the context of classroom atmosphere, which is an important factor in this process, the following can be said: the data in hand demonstrate that stress resulting from psycho-social and physical conditions of the classroom affects learning negatively; the comfortable and peaceful environments facilitates learning. This case is concerned with the chemistry of learning. During learning, the messages reaching the brain as a result of a complicated process are stored as chemical softwares. The learning capacity of the brain is explained through the relations among neurons and the number of bonds among them rather than its physical structure and number of neurons. When an individual feels well, the brain excretes "endorphin", which is called as "the chemical of pleasure" and this facilitates the formation of bonds among neurons and paves the way for more bonds. During this process, stress prevents the development of message receptors on brain neurons and restricts the bonds among neurons. This case affects the thinking process, reduces learning and even leads to mental retardation (Özden, 1999; Given, 1999). At this point, olfactive stimuli (Hofmann 1987 as cited in Mccutcheon, 2004), which are known to be influential in this case may help to facilitate learning. Keeping the genetic, personal and cultural characteristics of students in mind, the right olfactive stimuli serving to ease learning can make classrooms more peaceful for students than they are today.

Olfactive stimuli can be studied in the context of making the learning messages meaningful. Research has demonstrated that students don't perceive the messages only but they perceive them with environment properties. Concerning this issue, Özden (1999) points out that we should upload images, sounds and experiences into our brains regarding learning messages. To this end, olfactive images can be used as well as music and images. At this point, olfactive stimuli (aromas) (Donald et al., 2005; Hofmann, 1987 as cited in Mccutcheon, 2004), which are known to be supportive of memory and have effects on the perception of environment in learning process, can be used. The effect of olfactive stimuli in this process results from their ability to manipulate emotions, which are pretty important in attributing meaning to messages. Because, there is close relationship between considering a message attractive or repellent.

Olfactive stimuli can contribute significantly to the cognitive and affective education of normal students and the ones with learning disabilities. In literature, some information is available regarding the roles of olfactive stimuli

like controlling emotions and organising long-term memory (Aromafloria 2004, Brosh and Barkai, 2004; Dade et al., 2001). For instance, abstract and difficult concepts can be perceived more easily by matching them with aromas. Moreover, the concepts to be learned can be matched with nice scents and concepts to be avoided with bad ones and thus the efficiency of affective education in classrooms can be increased. When the fact that olfactive stimuli support memory and mental imaging (Herz, 1997; Bodnar et al., 2004) is taken into consideration, olfactive stimuli can be effective in supporting the codification of messages in learning process. Besides, since some olfactive stimuli are quite stimulative, these can be utilised in emergency as life saving association factor (Herz, 1997). Education intends to prepare individuals for life and all phases of life are important. In this case, olfactive sense can have role in preparing individual for life phases in which sight and hearing don't intervene.

3. Olfactive Stimuli and Instructional Technology

Educational technology, in the widest sense, is a bridge between information and learner; instructional technology is to organise (design) human and non-human resources in the classroom in the light of psychological, pedagogical and communication data so as to ensure maximum learning. Instructional technology basically focuses on solving instructional problems. One of the series of implementations that instructional technology applies to reach this aim is message design. The purpose in the design is to produce (fictionalise) the most effective message leading to maximum learning and to transmit it to receivers (intended population) with the most efficient ways possible. It is seen that visual-audio stimuli are employed to a great extent in current practices and other stimuli are neglected when the existing instructional technologies are evaluated from this perspective. If the receiver, learner (human), of instructional technology were composed of only eyes and ears, this application would be enough or true. In fact, instructional technology's sufficing with just visual-audio stimulants is a fortuitous case caused by enlightenment. However, this case, which has an ideological dimension, has by time been adopted as a pedagogical inclination. What is overlooked in this fortuitous case is that other senses including olfaction may have important effects in this process even though the senses of sight and hearing have the dominant effect in perception and learning. Besides, departing from the fact that senses work together, olfactive stimuli may increase the perceiving quality of visual and audio messages. Because, perception and learning are holistic like individual himself.

The holistic nature of learners each of whom are basically "human" consisting of a number of dimensions (body, mind, emotions, and spirit) and sensory organs requires that stimulants to be employed in the process of teaching should be designed so as to address maximum number of sensory organs if not all of them. Because, as a philosopher says, a person has a single sense with five channels rather than five separate senses. The efficiency of these senses in transmitting messages to the brain depends on their supporting eachother. Accordingly, it is pointed out that senses of sight and hearing have limits and efficient learning can be achieved through all the senses' working together (Howes, 2002). Hebbe (1959, as cited in Özyurt and Girgin, 2000) explains this as "sensory richness helps the organism to form more cell masses and successive phases". Based on this information, olfactive stimuli can play significant roles in augmenting the efficiency of visual-audio messages in teaching process. This role doesn't have to be equal in teaching each discipline or each of the areas of intelligence. For example, olfactive stimuli can play important roles in teaching gastronomy and educating individuals with dominant naturalist intelligence as well as supporting the efficiency of visual-audio stimuli in general.

The basic role of olfactive stimuli in teaching process is not getting ahead of visual-audio messages by playing a major role in sending messages to brain but augmenting the efficiency of these messages. For instance, the efficiency of a visual or audio message employed to teach an abstract subject can be increased by matching it with an appropriate olfactive stimulus selected in accordance with the genetic, individual and cultural characteristics of the learner. Here, the olfactive stimulus, in a sense, helps the visual or audio (or both) message to be coded by brain more efficiently by adding an emotional mode to them. Because, there is a close relationship between cognitive interpretation and emotional mode. In literature, it is stated that olfactive stimuli (aromas) may have important effects on efficiency, speed and permanence of learning by affecting the mood, which has a considerable effect in directing human behaviour (Barocelli et al., 2004; Tildesley et al., 2005; Roberts and Williams 1992 as cited in Mccutcheon, 2004; Buchbauer et at., 1991; Van Toller and Dodd, 1988 as cited in Moss et al., 2002). Regarding this subject, Hudson and Distel (2002) describe scents as cognitive organisers.

Supporting visual-audio messages with olfactive stimuli can be done as follows. During the learning process, learner can be directed towards positive information, attitudes and behaviour by matching positive information, attitudes and behaviour to be acquired by the learner with pleasant scents; and undesired information, attitudes and behaviour with unpleasant scents. This matching is directly related with message improvement mission of instructional technology. Besides, the use of olfactive stimuli in learning environment can contribute to make this

learning environment more attractive and peaceful. The peaceful learning environment mentioned here can contribute to reduce stress, which is an important barrier to learning. This, in turn, can support coding the messages in learning environment by learners more efficiently.

Attention is one of the most important factors in launching and ensuring learning on which instructional technology focuses. The research on this subject demonstrates that olfactive stimuli have notable effects on attention (Field et al., 2005; Kelvin, 2005; Warm, Denber and Parasuraman 1990 as cited in Köster, 2002; Degel and Köster 1999 as cited in Köster, 2002; Teerling and Köster 1988 as cited in Köster, 2002; Baron 1990 as cited in Köster, 2002; Sprinkle, 1999). The roles of olfactive stimuli on attracting attention can be made use of in teaching process. To this end, various olfactive stimuli can be employed by being arranged in accordance with the principles of instructional technology. For example, at the beginning of the class, the main themes can be presented in company with various scents or class materials can be adorned with different scents. This presentation can be in such a way that pure essence oils can be released to the setting by vaporising or the attraction of various materials can be increased by scenting them. It shouldn't be doubted that various technological applications will be developed in this subject as long as we believe in the importance of olfactive stimuli in educational process. Similarly, olfactive stimuli can be used in increasing concentration, an important variable in learning, and focusing. Because, it is known that olfactive stimuli have positive effects in this subject (Tildesley et al., 2005; Almedia et al., 2004; Barocelli et al., 2004; Moss et al., 2002). One of the reasons of using scents in temples and sanctuaries is this fact. So, olfactive stimuli that are selected in the light of the data of aroma literature and medical data can be released to the classroom setting in different phases of the course or scenting the stationery and class equipment may increase learners' concentration or at least sustain it.

Another very important variable of learning is memory. Memory is the ground of all perception and learning although it isn't emphasized much. This ground can be developed to code stimuli and messages more efficiently and easily. This development has a crucial significance for learning process. Thus, instructional technology, the main aim of which is to provide and develop learning, shouldn't neglect any method or means in supporting memory. Olfactive stimuli can contribute significantly at this point. It is known that aromas have positive effects on memory (Howes and Houghton, 2003; Engen 1991 as cited in Hudson ve Distel, 2002; Finnegan, 2002; Moss et al., 2002; Herz, 1997; Welzl and Stork, 2003; Lamprecht and LeDoux; 2004). Toller (2000 as cited in Köster, 2002) ,as an evidence of memory being supported by scents, has demonstrated that people who lose their olfactive sense have troubles in remembering. Thus, olfactive stimuli can be used in supporting memory. This support provided by olfactive stimuli is fairly important in terms of the permanence of the knowledge learned. This importance is more significant these days on which it is stated that intensive use of technology weakens memory. The use of olfactive stimuli in supporting memory can be in such a way to match the messages with scents, to release scents into the learning environment (for association), or to repeat the class with some scents. However, the use of olfactive stimuli isn't restricted with these applications and different ways of use are needed with the help of research to be carried out in the field of instructional technology.

Conclusion

Olfactive stimuli, which have been pushed out of the realm of perception and learning with the effect of positivism and enlightenment to a great extent, can contribute to the solution of problems regarding learning, the basic study domain of instructional technology. According to the existing literature, the contribution of olfactive stimuli to learning ranges from 3.5% to 6%. Can a proportion of 6% be neglected on the way to obtain a very precious jewel like learning, which is the most important focus of teaching process? Moreover, research demonstrates that this contribution can be more. Besides, focusing solely on visual-audio stimuli in education is in contrast with the contemporary educational notions like "enriching learning environment" and "referring to all domains of intelligence in education". Olfactive stimuli can contribute in preparing the individual for life more holistically by enriching the learning environment and referring to all domains of intelligence.

The contribution of olfactive stimuli to learning is increasing the effects of visual and audio messages or adding some value to them rather than replacing visual and audio messages, which are believed to have dominant roles in learning. Olfactive stimuli can do this by adding emotional mood to visual and audio messages, making them more meaningful and enabling the coding of them more meaningfully. To this end, classrooms can be converted into more peaceful learning environments which are filled with proper scents that are selected keeping the genetic, personal and cultural characteristics of learners in mind. Thus, learning rate can be increased by reducing stress, which is an important barrier to learning. This increase can be achieved by enhancing the secretion of

learning chemicals, which are admitted as the chemical software of learning and help brain cells come together. For this purpose, natural essence oils can be emitted to classroom environment by vaporizing and in proper doses.

Olfactive stimuli can contribute significantly in supporting attention, focusing and memory processes, which are important learning processes. For this purpose, olfactive stimuli selected accordingly (preferably obtained through natural essence oils) can be used by being added to stationery and instructional equipment used in teaching process somehow. Besides, olfactive stimuli can be used in affective learning. So, olfactive stimuli can be arranged in accordance with the principles of instructional technology. For example, learners' acquiring positive attitudes can be supported by matching the desired learning messages (or concepts) with pleasant scents and undesired messages or concepts with unpleasant scents.

Another possible usage area of olfactive stimuli is supporting the learning of individuals with learning disabilities. To this end, olfactive stimuli can be used to support attracting attention, focusing and memory as well as coding the learning messages for learners having learning disabilities. There are applications like "scent garden" in literature concerning this issue.

As the final analysis, olfactive stimuli should be considered as an alternative in addition to the existing processes and applications on the way to ensure maximum learning, which is the basic aim of educational and instructional technology. However, there are a lot of uncertainties on this issue due to the fact that olfactive sense is the least-known sense and there are few studies examining the relation of this sense and education. So, research findings are needed on the nature and use of olfactive stimuli.

13th International Educational Technology Conference

The Application of Information Technology among Trainee Counselors

Hamidah Sulaiman[140], Megat Ahmad Kamaluddin Megat Daud, PhD

Faculty of Education, University of Malaya

Abstract
The study seeks to establish the requirement for the Information and Communication Technology (ICT) competency among counselors in the effort to assist clients that is in need of guidance and counseling. A total of twenty students from the Department of Educational Psychology and Counseling, Faculty of Education, University of Malaya that is currently undergoing professional training in various organizations have been selected as respondents in this study. The study establishes whether or not the knowledge in ICT benefits the trainers in their professional training and facilitates their counseling activities at the respective organizations. Data collected through a combination of interactive observation, documentary analysis and recording sessions of structured interviews are analyzed utilizing a qualitative data analysis approach. Initial findings show that the knowledge and skills in ICT assist the trainers in assessing the needs requirements of the clients based on four areas identified as problematic to the client namely; (1) personal (2) social (3) education and (4) career. The findings also hoped to be able to further assist trainee counselors at institutions of higher educations to augment their skills in counseling and ICT in the pursuit to become competent counselors of the future.

Keywords: ICT Competency – Professional Training – Trainee counselors – Needs Assessment – Qualitative Approach

Introduction

The global advancement of technology today is also affecting counselors. Competent counselors must now possess skills in the ICT and adapt themselves to keep abreast with contemporary technology.

Research Background

Counseling is a process of assisting an individual carried out by the counselor through various number service approaches. These approaches have expanded and transcend the temporal and spatial limitations. Counseling process no longer is confined to a face-to-face approach. Rather it had gone beyond the usual use of available media and information technology. The Use of ICT in counseling processes is intended to provide a more efficient, interesting, interactive counseling service that is not confined to mere space. Despite that, the counseling process is still rooted in the counseling codes of ethics.

The Department of Educational Psychology and Counseling, Faculty of Education University of Malaya offers this program in the objective to prepare professional counselors that have the skills to function in a variety of organizational settings both public and private. All trainee counselors must complete132 credit hours and professional training (PPEC 3172) which is also known as practicum undertaken in Semester 8 for the duration of 3 months. The main objective of the practicum is to ensure that trainee counselors would be able to apply all the skills and knowledge gained throughout the duration

---

[140] Corresponding author.
E-mail address: hamidah4804@yahoo.com

of the study in real time environments. In addition the practicum also serves as mediator to gauge the knowledge, skills and competency of trainee counselors in real time environment.

The objective of this research is to identify the effectiveness of the ICT application to trainee counselors in undertaking the practicum in the effort to prepare them for employment. In addition the findings of the research are integral in informing the institutions with regard to enhanced effectiveness of the delivery of the counseling programs here in the University of Malaya. It is further expected that the trainee counselors at this faculty would become a competent and confident counselor.

The research questions are as follows:

a. What are the expectations of the trainee counselors when undergoing practicum?
b. How would a trainee counselor apply the ICT in preparing counseling materials during the practicum?

Research Method

This research is qualitative in nature in the effort to investigate in detail the perceptions of trainee counselors of their own expectations when undergoing practicum. As such, data are collected from a combination of methods such as interactive observation, structured interviews and review of documents in order to verify the collected data.

Data Analysis

Data obtained from interactive observation, structured interviews and review of documents are based on the discussions of earlier mentioned research objectives, that is:

a. What are the expectations of the trainee counselors when undergoing practicum?
b. How would a trainee counselor apply the ICT in preparing counseling materials during the practicum?

Expectations of trainee counselors undergoing practicum

Trainee counselors are required to answer a questionnaire on "what are your expectations in undergoing the professional practicum at your current training organization?" The response to this question is dependent upon their environment (public, private or school sectors) which provides for amenities during their stay as interns.

However, all 20 trainee counselors agree that they expected to be able to apply all the learned skills both in theory and practice at the faculty to their internship organizations. They responded that all the knowledge and skills obtained are very useful and assisted in their in their practicum. In addition, the mastery of counseling techniques in subjects PPEC2132, PPEC2133 and PPEC 3170 increased their level of confidence and competency in handling counseling sessions effectively.

Reports from field supervisors are also in agreement that ICT-savvy trainee counselors are able to master counseling techniques better that those who lack ICT competency.

ICT Assistance in preparing counseling materials

Respondents list the reasons for the need of ICT skills, among others:

  a. Understand and able to apply ICT
  b. Skilled in ICT
  c. Able to vary the use of ICT in counseling process
  d. Able to create, innovate and evaluate an interactive program
  e. Able to use technology as a counseling tool

The benefits of utilizing ICT

The use of ICT would be able to facilitate the counseling works in matters such as:

  a. Facilitate counselors in arranging, finding and using data
  b. Ensure data confidentiality through encrypting and secured access
  c. Facilitate communication among individuals and groups with ease and relatively lower costs
  d. Allow for non F2F communication with clients
  e. Transforming the ICT as enhancement tools in counseling programs
In undergoing the practicum, all trainee counselors utilize ICT in preparing counseling materials through needs assessment questionnaire forms. In this respect there are 4 emerging themes of clients' requirements; individual problems, social problems, academic problems and career problems. All programs are designed to overcome the problems are prepared in ICT assisted material such as poster, modules, booklets, pictures and comics.

Guidance and counseling activities that are assisted by electronic media are, among others:

Audio recording (role playing)

- Psychodrama
- Sociodrama
Video recording , Multimedia, Interactive CD and films

- Psychodrama
- Sociodrama
- Games

Proposals to enhance ICT in counseling

Findings of this research prove that the need for trainee counselors to master ICT skills would assist them in discharging the counseling functions effectively. Competencies in ICT have become a critical need for a counselor. In the digital age, this would mean that the competency would facilitate the works of a counselor saving precious time in accessing counseling materials and latest information. Counselors are

becoming more creative, enhanced knowledge and are able to vary teaching and learning techniques to be more creative and effective. Learning is no longer a dull process when ICT is utilized optimally.

Counselors that are ICT competent would benefit, among others:

a. Access to information, electronic documents and information from the internet
b. The use of email, webpage and others
c. Online counseling process
d. Software of interactive counseling program delivery
e. Enhanced counseling materials with interesting visuals and graphics
f. E-learning media platform, a new teaching and learning platform that uses the internet

Summary

In line with the advancement of ICT, the relevant skills and competency has become indispensable in the curriculum of counseling at institutions of higher learning. The spatial and temporal limitations of and individual need for counseling is obviated with the use of ICT. Counselors are now accessible with on-line sessions, emails and internet.

The Assessments of Media for Sufficiency Economy Project Public Relations in Krabyai Sub-District, Ratchaburi Province, Thailand

Cherdpong Kheerajit[a141], Chatchai Keosonthi[a]

aDepartment of Agricultural Extension and Communication,Faculty of Agriculture at Kamphaeng Saen,

Kasetsart University Kamphaeng Saen Campus, Nakhon Pathom, 73140, Thailand

Abstract

The Assessments of Media for Sufficiency Economy Project Public Relations in Krabyai Sub-District, Ratchaburi Province, Thailand aims to 1) Study the status and problems in the farmer's work. 2) Study the media exposure of the community. 3) Design and develop the media for project public relations. 4) Evaluate the project public relation media.

The research found that 1) the farmer needed to develop the knowledge in agricultural development, such as, appropriate soil management, farm management, and pest management for economic crops in the community, good practice for economic crops in the community and utilization from farm and household waste for cost reduction. 2) About the media exposure, there were a billboard, broadcasting tower, website, journal and personal media, moreover, there were four community radio stations in Ban Pong District that could broadcast to Krabyai Sub-District and three local newspapers. 3) The researchers brought the information from the studied of media exposure in the community to analyze, design and develop the media to suit for the media exposure in the community and conform to the project plans, which consisted of brochure, leaflet, radio spot, billboard, newsletter and website. These media has been approved from the media specialists and community leaders who worked as public sector committee. 4) About the public relation media assessment, the researchers had set up the focus group discussion to evaluate the media and project public relation plans by media specialists, executives and officers who concerned with public relations in the community, representatives from mass media associations in Ratchaburi province and concluded that the dissemination and public relation plans should be separated to two stages, that meant, before conducting the activities, they should use television, community radio and billboards because these media could be produced and disseminated immediately, which were appropriated to motivate, provide information and encourage the community to participate in the activities. Another stage, after the activities finished, they should use the local newspapers to provide the information of the activities or public relations. The contents should be mainly focused on the benefit for the community and the farmers. For the radio spot, they should make the public relation spot with no longer than one minute length because it would be suitable for radio station in broadcasting. Furthermore, there should be more project public relation sources in the schools in Krabyai community. The

members of municipal council should be responsible for public relation in their own area. About the number of media and frequency in project public relations, there should be more dissemination by the mass media.

Keywords: Media assessment; Public relations media

INTRODUCTION

Media for development communication plays a major role in information distribution in developing countries. Communication is defined as a systemic process in which individuals interact with and through symbols to create and interpret meanings. It is ongoing and always in motion, moving forward, and changing continuously. Communication is a process, which depends on communicator's perception including culture, communication skill, physical-emotional states, experience, attitudes, memory, and expectation. Communication does not to inform but also influences the behavior of the receiver of information.

Media is also very important in agricultural extension; it is utilized for development in agriculture. However, the effective of utilized media for development in agriculture should be use participatory communication method under rural development as a shift from the dominant paradigm of top-down to self-development wherein villagers and urban poor would be the priority audience, and self-reliance and building on local resources would be emphasized. Participation is the exchange of information from both parties the people and organization. In this process, it is the people or grassroots that identifies the problem and the solutions for those problems. The people are given the opportunity in the decision-making.

Kasetsart University, Kamphaeng Saen campus has the community development for sufficiency economy project in Krabyai sub-district, Ratchaburi province. For this project to be successful, it should design development media for public relations the project for community members to motivate and transfer the knowledge. Consequently, it is interesting to explore the assessments of media for sufficiency economy project public relations in Krabyai sub-district, Ratchaburi province. The results will be used to determine and improve strategies for public relation the project in Krabyai sub-district, Ratchaburi province and could be used as reference for future studies concerning media for public relation in the community. This study can also provide policy-makers, researchers, agricultural extension workers, and community development workers, information that can be used as bases for evolving a functional framework of media for public relation, and help the Thai government to analyze, develop, implement, and evaluate media for public relation in the future.

OBJECTIVES OF THIS RESEARCH

This research generally aimed to study the assessments of media for sufficiency economy project public relations in Krabyai sub-district, Ratchaburi province in Thailand. Specifically, the study targets to: 1) Identify the status and problems in the farmer's work. 2) Study the media exposure of the community.   3) Design and develop the media for project public relations and 4) evaluate the project public relation media.

METHODOLOGY

The research followed these processes: 1) Surveyed the status and problems in the farmer's work by review of secondary data and available information about the research site is gathering from secondary source and personal inquiries 2) Determined media exposure of the community through key informants interviews and observation. 3) Design and develop the media for project public relations. 4) Evaluate the project public relation media by focus group discussion. The populations of this study were 16 respondents. They are media specialists, executives and officers who concerned with public relations in the community, representatives from mass media associations in Ratchaburi province.

RESULTS AND CONCLUSION

1. The status and problems in the farmer's work the research found that the farmer needed to develop the knowledge in agricultural development in five issues 1) appropriate soil management, 2) farm management, 3) pest management for economic crops in the community, 4) good agricultural practice for economic crops in the community 5) utilization from farm and household waste for cost reduction.

2. The media exposure the research found that there were eleven billboards for eleven villages, broadcasting tower for announcement community news, community website, community journal publishing by municipal and personal media such village headmen, municipal committees, moreover, there were four community radio stations in Ban Pong District: The community radio Ban Pong Mass Media FM 102. 75MHz, My House FM 96. 25MHz, Amazing Radio FM 95. 35MHz, and the Life Style Radio FM 101.00 MHz that could broadcast to Krabyai Sub-District and three local newspapers.

3. Design and develop the media for project public relations. The researchers brought the information from the studied of media exposure in the community to analyze, design and develop the media to suit for the media exposure in the community and conform to the project plans, which consisted of brochure, leaflet, radio spot, billboard, newsletter and website. These media has been approved from the media specialists and community leaders who worked as public sector committee.

4. Evaluate the project public relation media. the researchers had set up the focus group discussion to evaluate the media and project public relation plans by media specialists, executives and officers who concerned with public relations in the community, representatives from mass media associations in Ratchaburi province. The results of the focus group discussion can concluded following this:

4.1 The dissemination and public relation plans should be separated to two stages, that meant, before conducting the activities, they should use television, community radio and billboards because these media could be produced and disseminated immediately, which were appropriated to motivate, provide information and encourage the community to participate in the activities. Another stage, after the activities finished, they should use the local newspapers to provide the information of the activities or public relations.

4.2 The contents should be mainly focused on the benefit for the community and the farmers. For the radio spot, they should make the public relation spot with no longer than one minute length because it would be suitable for radio station in broadcasting.

4.3 The participating of community for public relation there should be more project public relation sources in the schools in Krabyai community and practice the students to be the press in their community. The members of municipal council should be responsible for public relation in their own area.

4.4 The number of media and frequency in project public relations, there should be more dissemination by the mass media such as television, radio, and newspaper.

The challenges in the usage of e-journal amongst lecturers at a public university

Mohd Yahya MOHAMED ARIFFIN [a142], Arzmi ABU BAKAR [b]

[a]Faculty of Leadership and Management, Universiti Sains Islam Malaysia, 71800 Nilai, Malaysia
[b]Faculty of Communication and Media Studies, Universiti Teknologi Mara, 40000 Shah Alam, Malaysia

Abstract

This study was carried out to assess the usage of e-journals amongst education lecturers at a public university in Malaysia. A total of 55 education lecturers participated in the study by completing a self-developed questionnaire to answer the following questions: (1) What are the challenges or constraints that they faced in using e-journals? and (2) What are their suggestions which would improve the use of e-journals for academic purposes? The major findings revealed a "neutral" perception amongst the education lecturers on the challenges that they faced in using e-journals; although they were challenges none were too detrimental towards the usage of e-journals. The education lecturers also responded by giving 5 aptly suggestions on how to improve the usage of e-journals; by providing more training for lecturers, provide training for students, providing better Internet facilities, encouraging more sharing of information on e-journals, as well as encouraging the use of e-journals in teaching and learning.

Keywords: challenges, education lecturers, e-journal, teaching and learning

1. INTRODUCTION

Electronic journals, also known as ejournals, e-journals, and electronic serials, are scholarly journals or intellectual magazines that can be accessed via electronic transmission. In practice, this means that they are usually published on the Web. It is therefore probable that in this modern age of technology one can presume almost everybody has access to e-journals due to the simple fact that the Internet in its truest nature is basically, free. One only needs to have access to any piece of technology which allows them the ability to surf the web such as computers, personal digital assistant or commonly known as PDA, or even mobile phones which is considered to be an essential item for our every-day living nowadays.

Together with this presumption of the ease of accessibility of the Internet, one could also presume that it is not only logical that all academicians; lecturers and students, are able to easily use this advantage for their academic purposes but should also greatly integrate this technological advancement of e-journals into all of their scholarly works. In any practice of education, a piece of scholarly work is considered to be more exquisite in terms of its content, validity and professionalism if a good amount of journals related to its field is used as one of its data and referential tool. Furthermore even the effort of proclaiming the journals itself is highly deemed as one of the act of the true pursuit of knowledge and in some cases, being current.

2. THE USAGE OF E-JOURNALS

Journals therefore play a major part in any academicians' scholarly work and are also one of the most preferential tools of the trade apart from books. A survey done by Kling (2003) indicated that 85% of scholars preferred e-journals over print and additionally other research shows how this preference is transformed into reading patterns (Tenopir & King, 2003). Kling (2003) indicated that scholars highly value e-journals access and most of the scholars preferred e-journals over print mostly for the following reasons: e-journals saves time, makes work easier, result in better quality research, and enable the scholar to find more materials. One of the main key point in Kling's study (2003) is that the ease of accessibility and the wide range of e-journals on the Internet; literally being able to access

---

a plethora range of journals from as many field as possible, highly promotes the usage of e-journals amongst scholars. Supported by this it is by all means safe to make the assumption that most scholars largely tend to use and accommodate e-journals in their scholarly works.

According to Isman (2012) educators are increasingly using technology in all aspects of the profession including work assignments. This trend can be enhanced by educating the educator about cultural and cognitive aspects of technology and technikos.

Ansari and Zuberi (2010) explore the use of electronic resources among academics at the University of Karachi, Pakistan. About one-third of 70 respondents use electronic resources for research. One-quarter to one third use it to prepare lectures and gain subject knowledge. The 90% of academic staff believe electronic resources are reliable, however majority of the respondents consider only those electronic resources are reliable which are produced by authentic organization or publisher (p.5).

Ollé and Borrego (2010) conduct a study of the impact of e-journals on scholarly information behavior of academics at Catalan universities. About 75% of the survey respondents stated that they consult more journals and read more articles than they did in the past. Regarding the benefits of electronic access the respondents stated that speediness and convenience of electronic access meant that they have more reading time and, more generally, more time for doing research (p.6-7).

A study by Upadhyay and Chakraborty (2008) shows that Science Direct and IEL online are the two most popular online journal packages about which researcher's and faculty members of Banaras Hindu University are aware. All 64 respondents answered the question on satisfaction with existing online journal and databases. 43.75% respondents indicated average, 34.37% indicated good, 12.5% indicated excellent and 9.37% indicated fair about satisfaction with content, coverage and availability in the subject area (p.651-653).

Gulbahar (2008) investigated the ICT usage in higher education in Turkey. Results show that 95% academic staff used computers for communication, preparing examination ad course material (92%) and research in Internet (90%). Majority of academic staff recognized computer as a supportive tool for instruction and other activities. Almost all of the respondents were willing to use technology in their courses effectively (p.35). Shuling (2007) conduct a study on the use of electronic resources in Shaanxi University of Science and Technology among the library users. It was found that that nearly 80% of respondents knew little about electronic resources. Nearly 50% the respondents use both printed and electronic resources.

Apart from these preferential, this study aims to uncover other aspects of characteristics which may or may not factor in the usage of e-journals. Certain preferences which would directly be in question relates to the possible constraints faced during the search and usage of e-journals online which would determine if any constraints might exists, and if it does would it discourage the usage of e-journals amongst students. Although it is suggested and proved that lecturers and scholars are avid users of e-journals, a study needs to be done to discover and assess their preferential characteristics in an e-journal and whether they are advocating or influencing their students to purposely accommodate and integrate e-journals in their studies. Due to mainstream use of e-journals by scholars, there is definitely a pre-emptive assumption that students should by all means incorporate the same tool in their works as not only is e-journals easily accessible but it is also held in high regards in the education world. As to how far scholars advocate the use of e-journals on their students, a study to determine this current situation needs to be carried out especially amongst lecturers and students at an institution of higher learning in Malaysia.

3. OBJECTIVES

The objectives of this study are to look at the challenges or constraints faced by the academic members or lecturers at the Faculty of Education at a public university when using e-journals and to identify their suggestions which would improve the use of e-journals for academic purposes. In order to achieve these research objectives these following research questions were developed for this study:

- What are the challenges or constraints that they faced in using e-journals?
- What are their suggestions which would improve the use of e-journals for academic purposes?

This study involves respondents who are academic members or lecturers from the Faculty of Education, Universiti Teknologi Mara (UiTM), which is one of the largest public universities in Malaysia. The selected participants in this study will be assessed by gauging their usage and preference of using e-journals for academic purposes and their usage of e-journals in their instruction. Through assessing the compiled data, it would represent the best model of influential power as by principle; it is the medium with the highest probability in spreading the influence as their main profession and perfection is in molding and developing future teachers.

4. METHODS

A mixed method combining both quantitative and qualitative research design was employed in order to get both quantitative and qualitative data. According to Creswell (2005), mixed methods research is a good research design as it allows the researcher to assess both outcomes of the study (quantitative) as well as the process (qualitative). The combination of research design provides a rich and comprehensive picture of any social phenomena. There are three types of mixed method research designs presented by Creswell (2005) which are the triangulation design, explanatory design and exploratory design. For the purpose of this study, the exploratory design was used as it permitted the researcher to simultaneously collect both quantitative and qualitative data, merge the data compiled and use the results to understand a research problem. A survey method using a questionnaire specially designed for this study was utilized to gather both quantitative and qualitative data.

The research population will consist of 70 lecturers from the Faculty of Education, UiTM, comprising of lecturers, senior lecturers, associate professors and professors. A minimum of 50 samples represents more than 70% of the total academic members of the faculty thus is adequate to provide a valid and reliable research data for the study. The total sample of this study is 55 lecturers from the faculty. The former will be implemented in the form of questionnaires which would assist in answering the study's two research questions. The questionnaires will attempt to identify what are the challenges or constraints of e-journals which factors in its usage amongst the respondents. This section contains eight (8) items which are constructed according to a 5 point Likert-scale from 1-Strongly Disagree to 5-Strongly Agree. Each question directly assesses the level of specific challenges or constraints of e-journals amongst the respondents for academic purposes. The questionnaires will ask for suggestion by the respondents which could improve the usage of e-journals amongst education lecturers.

5. ESEARCH FINDINGS AND DISCUSSIONS

5.1 The challenges on using e-journals

Table 1 presents the respondents' perception on the challengers or constraints of e-journals. Of the 8 items that were listed, 7 were rated as "Neutral" and one "Disagree". The data is presented in order of agreement as follows: were listed; (i) Internet connection issue (mean=3.34), (ii) limited facilities (mean=3.23), (iii) monetary issues (mean=3.20), (iv) technical difficulties (mean=3.12), (v) validity of e-journals (mean=2.90), (vi) too many to choose from (mean=2.72), (vii) lack of exposure (mean=2.69) and (viii) time consuming (mean=2.47). Each item was given a 5-point value ranging from 1 "Strongly disagree" to 5 "Strongly agree".

A mean of 3.34 or "Neutral" was achieved on respondents perception that Internet connection issues is one of the challenges of e-journals; which 3 (5.5%) respondents rated "strongly disagree" and 13 (23.6%) respondents rated "disagree". 8 (14.4%) respondents rated "neutral". However 24 (43.6%) respondents rated "agree" and 7 (12.7%) respondents rated "strongly agree"; with a standard deviation of 1.14.

A mean of 3.23 or "Neutral" was also achieved on respondents perception that limited facilities is one of the challenges of e-journals; while 2 (3.6%) respondents rated "strongly disagree" and 16 (29.1%) respondents rated "disagree". 9 (16.4%) respondents rated "neutral". 23 (41.8%) respondents rated "agree" and 5 (9.1%) respondents rated "strongly agree"; with a standard deviation of 1.08.

A mean of 3.20 or "Neutral" was achieved on respondents perception that monetary issues is one of the challenges of e-journals; with another 2 (3.6%) respondents rated "strongly disagree" and 15 (27.3%) respondents rated "disagree". 12 (21.8%) respondents rated "neutral". 22 (40.0%) respondents rated "agree" and 4 (7.3%) respondents rated "strongly agree"; with a standard deviation of 1.04.

A mean of 3.12 or "Neutral" was achieved on respondents perception that technical difficulties is one of the challenges of e-journals; with 3 (5.5%) respondents rated "strongly disagree" and 15 (27.3%) respondents rated "disagree". 11 (20.0%) respondents rated "neutral". 24 (43.6%) respondents rated "agree" and 2 (3.6%) respondents rated "strongly agree"; with a standard deviation of 1.03.

A mean of 2.90 or "Neutral" was also achieved on respondents perception that the validity of e-journals is one of the challenges of e-journals; with 5 (9.1%) respondents rated "strongly disagree" and 20 (36.4%) respondents rated "disagree". 8 (14.5%) respondents rated "neutral". On the other hand, 19 (34.5%) respondents rated "agree" and 3 (5.5%) respondents rated "strongly agree"; with a standard deviation of 1.14.

A mean of 2.72 or "Neutral" was achieved on respondents perception that there is too many e-journals to choose from is one of the challenges of e-journals; with 7 (12.7%) respondents rated "strongly disagree" and 17 (30.9%) respondents rated "disagree". 17 (30.9%) respondents rated "neutral". However, 12 (21.8%) respondents rated "agree" and 2 (3.6%) respondents rated "strongly agree"; with a standard deviation of 1.06.

Table 1. Challenges of E-journals

Perception on the challenges with E-journals	Frequency and Percentage					Mean	Std. Dev.
	Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree		
Internet connection issue	3	13	8	24	7	3.3455	1.14209
	5.5%	23.6%	14.4%	43.6%	12.7%		
Limited facilities	2	16	9	23	5	3.2364	1.08804
	3.6%	29.1%	16.4%	41.8%	9.1%		
Monetary issue	2	15	12	22	4	3.2000	1.04350
	3.6%	27.3%	21.8%	40.0%	7.3%		
Technical difficulties	3	15	11	24	2	3.1273	1.03735
	5.5%	27.3%	20.0%	43.6%	3.6%		
Validity of electronic journals	5	20	8	19	3	2.9091	1.14298
	9.1%	36.4%	14.5%	34.5%	5.5%		
Too many to choose from	7	17	17	12	2	2.7273	1.06205
	12.7%	30.9%	30.9%	21.8%	3.6%		
Lack of exposure	6	21	12	16	0	2.6909	1.01603
	10.9%	38.2%	21.8%	29.1%	0.0%		
Time consuming	6	27	14	6	2	2.4727	.95945
	10.9%	49.1%	25.5%	10.9%	3.6%		

1.00 – 1.49 = Strongly Disagree   2.50 – 3.49 = Neutral
1.50 – 2.49 = Disagree   3.50 – 4.49 = Agree
4.50 – 5.00 = Strongly Agree

A mean of 3.20 or "Neutral" was achieved on respondents perception that lack of exposure towards e-journals is one of the challenges of e-journals; while 6 (10.9%) respondents rated "strongly disagree" and 21 (38.2%) respondents rated "disagree". 12 (21.8%) respondents rated "neutral". 16 (29.1%) respondents rated "agree"; with a standard deviation of 1.016.

All the data suggests that respondents were neutral or unsure with the statements as some who disagreed with the statements while there were also some who agreed with the statements. Only one items was rated as "Disagree" with a mean of 2.47 "Disagree" was achieved on respondents perception that e-journals is time consuming is one of the challenges of e-journals. 6 (10.9%) respondents rated "strongly disagree" and 27 (49.1%) respondents rated "disagree". 14 (25.5%) respondents rated "neutral". 6 (10.9%) respondents rated "agree" and 2

(3.6%) respondents rated "strongly agree"; with a standard deviation of 0.95. This data suggests that overall, they disagree that using e-journals is time consuming.

Analysis on open-ended question shows that perception on other challenges of using e-journals is the limited access to quality articles from cited or high impact journals as many are not readily available electronically since they are only available to subscribers. As such, in certain cases, lecturers only get access to abstract and titles only and not the full paper or article.

5.2. Suggestions on the use of e-journal for academic purposes
The following suggestions and recommendations based on the findings of the study are intended to assist the Faculty to increase the usage of e-journals amongst education lecturers for academic purposes and to incorporate e-journals in teaching and learning.

Training for Lecturers
The study indicated a high percentage of lecturers who preferred to use e-journals for academic purposes and in their teaching sessions. Respondents suggested training and retraining to be organized by the faculty on how to carry out better and efficient online searches while some suggested the faculty to organize workshops, seminars or talks on on-line search. Based on the feedback, it is recommended that the faculty conduct occasional training sessions through formal training, workshops, seminars or talks on effective online searches in order to increase the usage of e-journals amongst education lecturers.

Training for Students
Respondents also indicated that they encouraged students to use e-journals and some preferred their students to use e-journals in terms of their academic studies. Some respondents suggested that similar training be given to students on conducting online searches. Based on the data and to further encourage students to use e-journals for their academic studies, similar training, workshop, seminars or talks should also be organized for the students.

Better Internet Facilities
In relation to their perception on the challenges with regards to e-journals, four of the top challenges that respondents indicated were Internet connection issues, limited facilities, monetary issues, and technical difficulties. Respondents also indicated on the need to improve Internet connection and Internet facilities. Based on the responses, it is recommended that the Internet and related facilities be improved as an effort to increase the usage of e-journals amongst education lecturers.

Sharing of Information on E-Journals
Respondents also recommended that the faculty establish a sharing of information through bulletin, blogs or newsletter on current and related e-journals which are available. Based on these responses, it is recommended that the Faculty of Education, UiTM establish a printed bulletin or online information on current e-journals available in order to keep lecturers updated.

Encourage the Usage of E-Journals in Teaching and Learning
Responses on open-ended items indicated lecturers use e-journals in their teaching sessions and also encourages students to use e-journals for their academic studies. It is recommended that the faculty encourage more lecturers to incorporate e-journals in their teaching sessions as well as encourage students to do assignments involving the use of e-journals for their academic studies.

6. CONCLUSION
This study examined the challenges that the educations lecturers faced in using e-journals for academic purposes. The findings revealed a "neutral" perception amongst the education lecturers on the challenges that they faced in using e-journals. However, they gave some suggestions in improving the use of e-journals in teaching and learning. With more exposure, training and encouragement, the usage of e-journals amongst education lecturers for preparation for teaching may increase in the future.

The Design of Quality Documentation System at Higher Education Using ISO 9000 Model

Ika Sartika[143]

Institute of Home Affairs Governance, Jl. Ampera Raya Cilandak Timur, Jakarta Selatan 12560, Indonesia

Abstract

As a part of national education system under the authorization of the Ministry of Education and Culture, the objective of Higher Education in Indonesia must be in line with those of national education, namely: Indonesian national education based on *Pancasila* to improve the quality of Indonesian students, human possessing faith and belief to A Supreme God, noble character, good personality, high discipline, hard working, tough and responsible, self reliant, smart, and skill as well as physically and spiritually well.

To achieve such objectives above, the Higher Education in Indonesia needs to own a high quality of performance in running their education activities. To put more clearly, there must be directive standards on teaching activities at Higher Education in order to produce qualified human resources as national education objectives mentioned above.

The research is aimed at observing the possibility of the implementation of the ISO 9000 in Higher Education to yield an expected standard. Specifically, the objectives of the research is to make assessment as well as to design quality documentation system based on the ISO 9000 model – A Translation for Education extended by Edward Salis. The Higher Education selected, as observation object is Institute of Home Affairs Governance.

The result of assessment using the elements of the ISO 9000 – A Translation for Education shows that the entire performance of Institute of Home Affairs Governance is a **weak** category. In other words, there are many aspects not yet associated with the ISO 9000 requirements – A Translation for Education.

What to do in the following step is to design quality documentation system for the ISO 9000 – A Translation for Education linked with academic activities in Institute of Home Affairs Governance, for the system already operated and still has weaknesses according to ISO 9000 requirements – A Translation for Education.

Keywords: A Tranlation for Education; Higher Eucation; ISO 9000 Model

Introduction

Higher Education in Indonesia is an organization engaged service education for Indonesian people. Activities undertaken Higher Education always refer to Three Responsibilities of Higher Education that include: education, research, and community service. As a part of national education system under the authorization of the Ministry of Education and Culture, the objective of Higher Education in Indonesia must be in line with those of national education, namely: Indonesian national education based on *Pancasila* to improve the quality of Indonesian students, human possessing faith and belief to A Supreme God, noble character, good personality, high discipline, hard working, tough and responsible, self reliant, smart, and skill as well as physically and spiritually well.

To achieve such objectives above, the Higher Education in Indonesia needs to own a high quality of performance in running their education activities. To put more clearly, there must be directive standards on teaching activities at Higher Education in order to produce qualified human resources as national education objectives mentioned above.

One of the most popular quality management system standards now, and has been adopted by more 70 countries, is ISO 9000. At first, this standard only be considered as a market driven, but in its development, it provides a lot of value added for the companies that apply this standards, such as the increasing of productivity and efficiency, decreasing of cost, and increasing of customer satisfaction, so it began to be felt as a necessity for the companies. Edward Salis had developed an ISO 9000 model for education that known as ISO 9000 – A Translation for

Education. This research wanted to see how far the possibility of ISO 9000 implementation in Higher Education to produce standards expected by all parties.

Research Objective

1) Doing assessment to performance of quality system and quality management in Institute of Home Affairs Governance based on ISO 9000 requirements.
2) Designing documentation system appropriated for Institute of Home Affairs Governance based on ISO 9000 requirements.

ISO 9000 – A Translation for Education

At first, both British Standards Institution and International Standards Organization were just talking about manufacturing. The increasing of industry practices on professional services such as lawyers, architects, and management consultants, so the registration was start to be required. However, not enough educational practices provide definitive answers about the feasibility of ISO 9000 in education. Edward Salis had held a variety of adjustments of ISO 9000 into the world of education as in Table 1, called as the term of ISO 9000 – A Translation of Education, and then became elements of this research.

Research Method

The design used in this study was exploratory study. Through exploratory, the researchers developed the concept more clearly and make a priority. Some of the tools used in the exploratory study are: literature review, experience surveys, focus groups, and two-stage approach. Sources of data used in this study are as follows: (1) primary data, there are data obtained directly from the original respondents. In this study, the respondents were: students, lecturers, the leader of institute, faculties, and departments, staffs, and public society; (2) secondary data, that are data obtained from the first data sources that has been collected and reported by other outside researchers, such as the organizations, number of employees, and the result of previous relevant studies.

Table 1 ISO 9000 – A Translation for Education

ISO 9000	Translation for Education
1. Management Responsibility	1. Management's Commitment to Quality
2. Quality System	2. Quality System
3. Contract Review	3. Contracts with Internal & External Customer (Student/pupil entitlements, & the entitlements of the external customer e.g. parents)
4. Document Control	4. Document Control
5. Purchasing	5. Selection and Admission Policy
6. Purchased Supplied Product	6. Pupil/Student Support Services, including Welfare, Counseling, and Pastoral & Tutorial Arrangements
7. Product Identification & Traceability	7. Records of Pupil/Student Progress
8. Process Control	8. Curriculum Development, Design & Delivery – Teaching & Learning Strategies
9. Inspection & Testing	9. Assessment and Testing
10. Inspection, Measuring & Test Equipment	10. Consistency of Assessment Method
11. Inspection & Test Status	11. Assessment Records including Records of Achievement
12. Control of Nonconforming Product	12. Diagnostic Procedure & Methods of Identifying Underachievement & Failure
13. Corrective Action	13. Corrective Action of Pupil/Student Underachievement & Failure, The System for

14. Handling, Storage, Packaging & Delivery		Dealing with Complaints and Appeals
		14. Physical Facilities & Environment, Other Entitlement Offered e.g. Sport Facilities, Clubs & Societies Unions, Drop-In Learning Facilities
15. Quality Records		
16. Internal Quality Audits		15. Quality Records
		16. Validation Procedures & Internal Quality Audits
17. Training		17. Staff Training & Development, including Procedures for Assessing Training Needs & Evaluating The Effectiveness of Training
18. Statistical Techniques		18. Methods of Review, Monitoring & Evaluation

The next step was data collection. This step has an objective to collect information about actual condition of quality management system in Institute of Home Affairs Governance. The data collection was done through some ways, namely:
- Interview that was guided by the use of questionnaire, made with focusing to assessment criteria explained above;
- Documentation of Institute of Home Affairs Governance related to research problems.

The assessment system was done based on scoring method, because the assessment developed was focused to see the appropriateness between actual conditions and standards, related to the existence of quality system element required ISO 9000. So, the questionnaire was not the assessment of internal party preferences about good or bad actual management system of Institute of Home Affairs Governance.

Each question in the questionnaire has own score, with 10 is the maximum score. The accumulation of questions score formed score for each element with 90 is the maximum score. Considering that quality system and quality management in Higher Education was specific, so the assessment obtained from respondents will be changed into the same of scale score that are 0-100. The assessment structure completely can be seen in Table 2.

Table 2 Structure of Questionnaire Assessment

Element	Number of Item	Maximum Score
1. Management's Commitment to Quality	9	90
2. Quality System	3	30
3. Contracts with Internal & External Customer	5	50
4. Document Control	7	70
5. Selection and Admission Policy	5	50
6. Pupil/Student Support Services	4	40
7. Records of Student Progress	4	40
8. Curriculum Development, Design & Delivery	9	90
9. Assessment and Testing	3	30
10. Consistency of Assessment Method	5	50
11. Assessment Records including Records of Achievement	4	40
12. Diagnostic Procedure & Methods of Identifying Underachievement & Failure	7	70
13. Corrective Action of Student Underachievement & Failure	4	40
14. Physical Facilities & Environment	5	50
15. Quality Records	4	40
16. Validation Procedures & Internal Quality Audits	5	50
17. Staff Training & Development	7	70
18. Methods of Review, Monitoring & Evaluation	5	50
Amount	95	950

However, the interpretation of each element can be seen in Table 3.

Table 3 Interpretation of Criteria Assessment Score

Score Interval	Category	Description
$0 \leq P < 25$	Nil	Practically there is no appropriateness with the requirement of ISO 9000 standards
$25 \leq P < 50$	Weak	Many aspects were not appropriate with the requirement ISO 9000 standards
$50 \leq P < 75$	Fair	Many aspects that were appropriate with the requirement of ISO 9000 standards
$75 \leq P < 100$	Strong	Most aspects that were appropriate with the requirement of ISO 9000 standards

P: score in 100 scale

To see the performance of Higher Education quality system at whole, score each element was summed then converted into 0-100 scale, so it will be visible the category of Higher Education quality system performance as shown in Table 3 above.

Data processing that was done on the next step cover the calculation of each element performance score and the sum of whole element. Processing method used is scoring method, with the objective to gain performance score for element that was measured. The steps are as follows:
- To add item score of each quality system element to gain each element performance score;
- To add each element of quality system score to gain Higher Education performance score based on the requirement of ISO 9000 – A Translation for Education;
- To transform performance score above into scale of 100 to uniform maximum score of the whole of quality system element.

Next step is analysis with the main focus to:
- Performance of Higher Education quality system elements and its interpretation;
- Analysis of Higher Education quality records and documents;
- Analysis of running system in Higher Education.

Based on the result of analysis above, so the next step is designing quality documentation system for Higher Education that consists of Level I Document (Higher Education Policy); Level II Document (Work Procedures); and Level III Document (Work Instruction and Supported Documents).

Result

Table 4 Performance Score of ISO 9000 – A Translation for Education Elements

Element	Assessment Result	Maximum Score	Score (Scale of 100)
1. Management's Commitment to Quality	25	90	27,78
2. Quality System	5	30	16,67
3. Contracts with Internal & External Customer	30	50	60,00
4. Document Control	0	70	0,00
5. Selection and Admission Policy	35	50	70,00
6. Pupil/Student Support Services	15	40	37,50
7. Records of Student Progress	25	40	62,50
8. Curriculum Development, Design & Delivery	50	90	55,56
9. Assessment and Testing	20	30	66,67
10. Consistency of Assessment Method	25	50	50,00
11. Assessment Records including Records of Achievement	30	40	75,00

13. Corrective Action of Student Underachievement &	20	40	50,00

Failure			
14. Physical Facilities & Environment	40	50	80,00
15. Quality Records	10	40	25,00
16. Validation Procedures & Internal Quality Audits	15	50	30,00
17. Staff Training & Development	35	70	50,00
18. Methods of Review, Monitoring & Evaluation	5	50	10,00
Amount	415	950	43,68

Table 5 Interpretation of Each Element of ISO 9000 – A Translation for Education

Group	Score Interval	Category	ISO 9000 Quality Element
1	0 ≤ P < 25	Nil	Document Control
			Methods of Review, Monitoring, & Evaluation
			Quality System
2	25 ≤ P < 50	Weak	Quality Records
			Management's Commitment to Quality
			Validation & Internal Quality Audits
			Pupil/Student Support Services
			Diagnostic Procedures & Methods of Identifying
			Underachievement & Failure
			THE WHOLE OF PERFORMANCE
3	50 ≤ P < 75	Fair	Consistency of Assessment Methods
			Corrective Action of Student Underachievement & Failure
			Staff Training & Development
			Curriculum Development, Design and Delivery
			Contracts with Internal & External Customers
			Records of Student Progress
			Assessment & Testing
			Selection & Admission Policy
4	75 ≤ P < 100	Strong	Assessment Records including Records of Achievement
			Physical Facilities & Environment

Discussion

The grouping above shows the performance difference among each quality system element. The performance difference indicates the degree of appropriateness of quality system and standards requirement, which also shows the weak point of standards. Table 6 below shows the strength and the weakness of each element of quality system in Institute of Home Affairs Governance.

Category	ISO 9000 Quality Element	Strengths	Weaknesses
Nil	Document Control		No document master list, no written procedures to identify, publish, and replace documents, no responsible parties.
	Methods of Review, Monitoring, & Evaluation		No method that be committed by all parties about monitoring and evaluation; no identification, usage, and evaluation of the methods

			used
	Quality System		No quality guidance, no procedure and work instruction based on the requirements of ISO 9000
Weak	Quality Records		No guidance and system to identify, use, maintenance and replace of quality records.
	Management's Commitment to Quality	There is quality policy	No job description; no work instruction; no management representative; documentation of management review result is still weak
	Validation & Internal Quality Audits	Internal quality audits every year	No follow up of audit results
	Pupil/Student Support Services	There are academic supervisors	Not effective and no written procedure
	Diagnostic Procedures & Methods of Identifying Underachievement & Failure	There improvement action	No written procedure, the causes of failure are not identified
Fair	Consistency of Assessment Methods	There are assessment method to evaluate student achievement	Rarely to evaluate the methods
	Corrective Action of Student Underachievement & Failure	There are corrective action to help students who are fail	Rarely to evaluate corrective action
	Staff Training & Development	There are training program depends on the invitation from another party	No initiative to create training based on needs assessment
	Curriculum Development, Design and Delivery	There are curriculum based on national curriculum	No written procedure and work instruction for lecturers
	Contracts with Internal & External Customers	The requirements of student and lecturer are complete	No written procedure
	Records of Student Progress	Records of student progress are well documented.	No written procedure
	Assessment & Testing	Records of assessment and testing are well documented.	No written procedure
	Selection & Admission Policy	- There are special committees for new admission. - Clear criteria for new	No written procedure

		admission and lecturer	
Strong	Assessment Records including Records of Achievement

Physical Facilities & Environment | There are some records about student status and achievement completely.
- There are many physical facilities that can be used by lecturers, students, and staffs.
- The responsible of physical facilities inventory, store, and maintenance has been defined, that is under Affairs Section authorization;
- The activities of inventory, store, and maintenance have been run well that proofed by tidy records about it. | No written procedure to identify student status and achievement.
No written and documented procedures for the activities of physical facilities inventory, store, and maintenance. |

Closing

1) The whole of quality system performance in Institute of Home Affairs Governance based on ISO 9000 – A Translation for Education was include weak category. It means many aspects were not appropriate with the requirements of ISO 9000. The un appropriateness indicator are:
   - No job description for all function;
   - Work procedures just cover some works;
   - No written work instruction for all works;
   - No good controlling about quality records and documents.
2) The reform priority that must be done by Institute of Home Affairs Governance in order to improve the process of education service providing was the design of quality documentation system that appropriate with the requirements of ISO 9000 – A Translation for Education.

Abstract

In this study, we proposed a cubic net assisted learning system by using Kinect sensor technologies for enhancing learners' spatial ability. The content of the system is based on the geometric learning theory, and 3D real-time objects used to provide the different viewing angle control. The goal of the proposed system is to facilitating learners' motivation by providing realistic 3D-visual materials and to evaluate the effects of specific operating experiences. As the advantages of Kinect SDK (Software Development Kit), our system employs body and depth tracking function to help learners using their hand to operate objects. The result of the System Usability Scale (SUS) showed that our system is usability and learnability. According to the evaluation results, we concluded that Kinect sensor assisted learning system not only could promote in developing the students' spatial visualization skills, but also encourage them to become the active learner.

Keywords: Kinect sensor; augmented reality; spatial ability; geometric learning theory; system usability scale

Introduction

Learning with virtual objects integrated into reality interactive technologies has led to new digital learning type (Lin, Chen, Hsieh, Lee, & Huang, 2012) in recent years, and has become the heated discussion issue of e-learning research. However, in order to guide learners to learn scientific knowledge quickly and efficiently, the integration of innovative technologies into scientific learning activities without distracts their focus of learning should be an important research topic.

With the increasing usage of physically interactive and augmented reality, game-based learning requirements for digital learning application have become more critical. Learners are able to learn better since they use multimedia assisted learning system, which would make them more motivated to pay attention to the information presented and better retain the information. Lu & Yao (2002) also stated that presenting abstract material using multimedia enables learners to understand the material better, and audio and visual displays allow learners to interact with the material. Although teachers' professional education seemed to play an important role in the teaching process, but we still need an innovation instructional designs which differ from traditional teaching. We have to change education mode from "Technology-adapted Instruction" to "Instruction-adapted Technology" (Sung, Chang, & Hou, 2005). It is difficult for most learners to reasoning and conversion of Shape and Space in the field of elementary school mathematics education, so it causes lower learning achievement than the other units (Wang & Wang, 2008). However, spatial ability plays a very important role in the learning of mathematics geometry (Wheately, 1990; Wu, 2004; Wei, 2005).

The NCTM (2000) consider that the geometry help students to analyze characteristics of geometric shapes, as well as to use visualization, spatial reasoning, and geometric modeling to solve problems. Van Hiele (1986) describes a theory of mathematics education, the development of geometric thought, to enhance the achievement of learning and to promote learners' comprehension. Van Hiele suggested five teaching phases to design teaching methods and materials step-by-step. This model of teaching phases is used as the main theoretical framework for this

study. Game-based learning (GBL) is an instructional method that incorporates educational content or learning principles into video games with the goal of engaging learners. The use of this method in the field of natural science and technology has increasingly been the object of study in recent years. Learning through digital games not only increase motivation, active learning, and provide individual learning opportunities, but reduce the learning pressure of learners (Wu, 2007).

The main issues of this study focus on developing and evaluating a cubic net interactive system by using Kinect sensor for enhancing learners' spatial ability. We will develop a courseware for interactive learning on cubic net in elementary school refers to a lesson of "Mathematics Space Geometry". The content of the system is based on the geometric learning theory, and 3D real-time objects are used to provide the different viewing angle control. A qualitative analysis is also performed to show learners' interactive of the Kinect sensor design through observation record, video recording, and structural interviews. And the questionnaire of system usability scale is utilized to evaluate system usability.

For these objectives to be achieved, the article is structured as follows. The first section deals with the foundations for the development of the research. After which research methodology is presented, with full details of the system development, and of the instrument and procedures used. Results and then presented, with a thorough description of the system usability. Finally results are discussed and conclusions are drawn.

Literature Review

Spatial visualization skill

Bishop (1989) refers to the power of spatial ability to help learner in visual and figural representation and to introduce complex abstractions in mathematics. Piaget & Inhelder (1967) think that the child first recognizes various objects by sense of touch alone and is followed by building up and using certain primitive relationships (topological space). Contrary to the historical development of geometry which began with treatment of straight lines, angles, distances, and plane figures, the child begins by noting the topological as opposed to the metric properties of objects (projective space and Euclidean space). Lohman & Kyllonen (1984) and Linn & Petersen (1985) think that spatial ability includes spatial visualization, spatial perception, spatial orientation, spatial imagination, and spatial translation and transformation. In this study, we focus on the spatial visualization skill which is the ability to mentally manipulate complex spatial 2-dimensional and 3-dimensional figures. Van Hiele (1986) describes a theory of mathematics education, Development of Geometric Thought, to enhance the achievement of learning and to promote learners' comprehension. Van Hiele suggested five teaching phases to design teaching methods and materials step-by-step (see Table 1).

Table 1. The model of the Development of Geometric Thought

Level	Phases of learning
Level0 Visualization	Inquiry/information
Level1 Analysis	Directed oriented
Level2 Informal deduction	Explication
Level3 Formal deduction	Directed oriented
Level4 Rigor	Integration

Kinect for Windows

Kinect for Windows gives computers eyes, ears, and the capacity to use them (Kinect for Windows, 2013). Its OpenNI framework and SDK architecture show in Fig. 1. Kinect sensor gets the information stream (such as video, depth, and audio stream) and delivers to Natural User Interface (NUI) library. We operate through application interface (API) to control all functions of Kinect sensor, such as hand tracking, skeleton tracking (Kar, 2010), speech commands, and face tracking.

Game-based learning

Game based learning (GBL) is a specific term of instructional strategy or activities that deals with applications that have defined learning outcomes. As an emergent learning process, game-based learning is designed to balance the subject matter with the gameplay and to help the player to retain and apply the subject matter to the real world (Kiili, 2005; Prensky, 2001). Game-based learning usually uses video-game technology, scoring strategy, interactive interface, flexibility course, and real-time feedback to engage learners into their learning (Drummond, 2003). It not only makes learning more meaningful but also creates a mental model which is response to participants' motivation (Chumbley & Griffiths, 2006; Provenzo, 1992).

With the rapidly development of information and communication technology, computer and simulation games have become the most popular leisure activities in our daily life. Many educational scholars claim that computer game is the natural and necessary element of student's learning and it should be integrated into the instructional design as well as learning environments (Kiili, 2005; Prensky, 2001). They also believe that playing computer games applies the concept to "learning by playing", which helps students overcome the boredom of learning in the classroom (Nanjappa, 2001; De Freitas, 2006). However, there are still some weaknesses and drawbacks in the implementation of game-based learning: (a) Game-based learning needs a lot of preparations and efforts; (b) the subjects and contents usually are pre-defined and fixed. More specifically, the workload of these tasks is very large and the completion of the application may not really meet the demand (Charles, Charles, & McNeill, 2009). On the other hand, e-learning systems are usually designed to support alternative methods for traditional instruction in order to improve the quality of student learning and to reduce the costs of instruction (Twigg, 2003). Hence, the game-based e-learning has been proposed. As Clark and Mayer (2003) noted in their review of e-learning, well-designed system can help generate the contents of entertaining scenario that correspond to the learning subject. Stated another way, game-based e-learning system should make the preparations of learning applications with less efforts and better efficiency.

System Development

Teaching materials

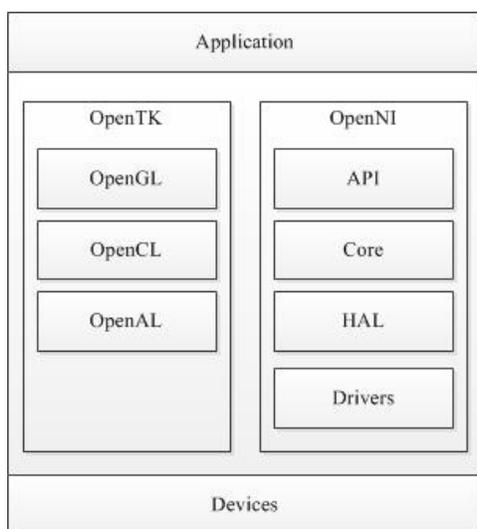
To develop material employing Kinect sensor, different programming frameworks must be surveyed, the OpenNI architecture to control Kinect sensor and OpenTK to provide cross-platform library (Fig. 2). By employing Kinect senor to present the questions and interactive games, and including a hand-mouse function, learners can learn the geometric learning theory and related information (Fig. 3 shows the system process.).


Fig. 2. System stack overview
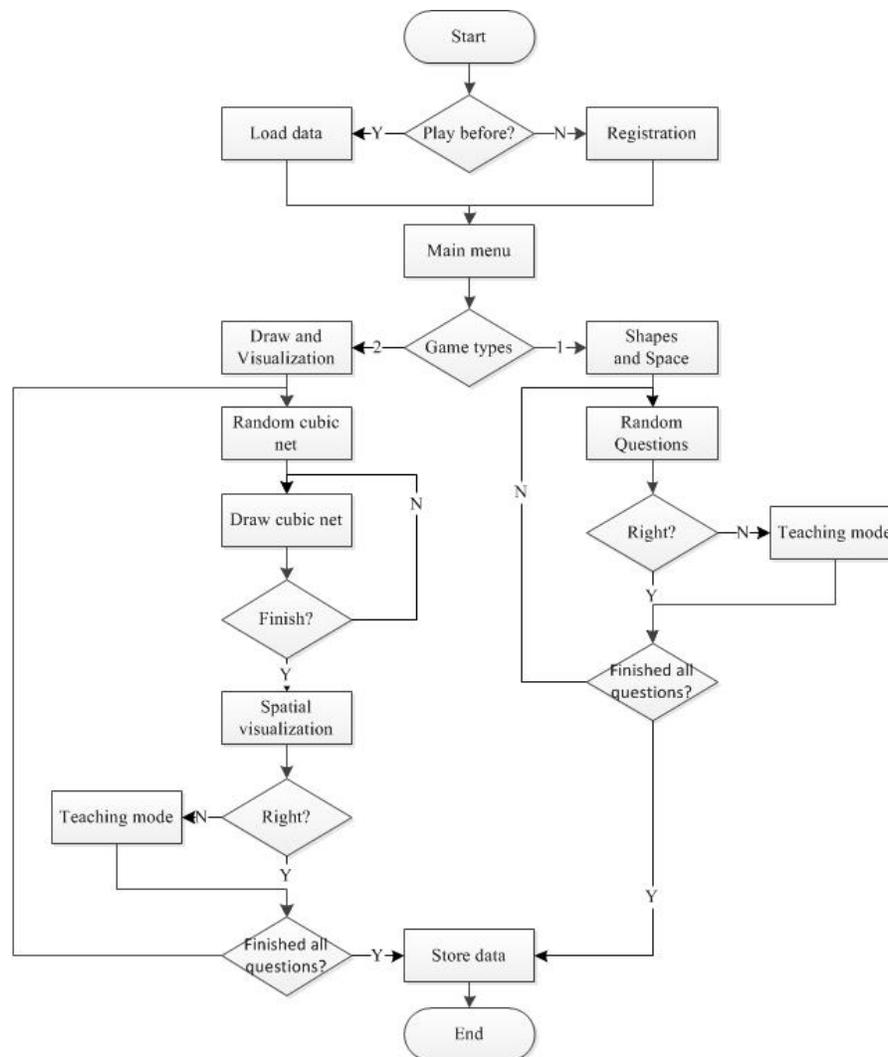

Fig. 4. Kinect sensor assisted learning system process.

Experimental subjects and operation

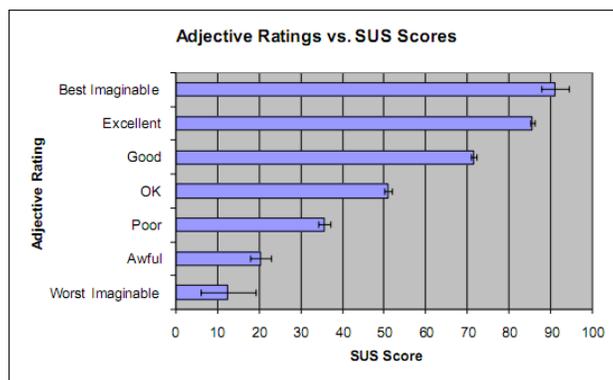
Subjects are 98 students from the University of Technology in north Taiwan and they take information technology and science courses. We utilize System Usability Scale (SUS) (Brooke, 1986) which is a questionnaire of Likert Scale to assess system usability, learnability and users' subjective satisfaction with specific aspects of the interactive interface. In addition, we add an adjective scale to rating our SUS scale (Fig. 5), this SUS was highly reliable (alpha = 0.91) and useful over a wide range of interface types (Bangor, Kortum, & Miller, 2009). While SUS was only intended to measure perceived ease-of-use, Lewis, & Sauro (2009) show that it provides a global measure of system satisfaction and sub-scales of usability (items 1, 2, 3, 5, 6, 7, 8, 9) and learnability (items 4 and 10) (multiplied their summed score contributions by 3.125 and 12.5, respectively).


Fig. 5. Mean SUS score ratings corresponding to the seven adjective ratings.
(Data source: Bangor, Kortum, & Miller, 2009)

The teaching materials employing Kinect sensor developed in this study required the use of computers. The learners were stand in front of Kinect sensor and provided information regarding the course (see Fig. 6).

Fig. 6. Learner operation example.

Evaluation Results

Subjects finish operating the system and fill out the SUS questionnaire. As summarized in Table 2, the mean score of SUS is 71.73 (SD=13.06). According to the adjective ratings score, the assisted learning system in this study closely matches subjective label between Good and Excellent. We have discussion with these subjects on their idea about the interactive learning system after they complete operating the system and filling out the SUS questionnaire. Subjects generally agreed that interactive learning system increase their interest in the concept and make them to find different things.

For the analysis of the questionnaire, will further discuss the mean score, usability score, and learnability score and help us to improve system. Hence, we summarized the following reasons may affect the system satisfaction.
- The control and learning interface are not smooth enough.
- The materials cannot display properly due to the angle and distance, this situation may confuse learners' operation.
- Learners need the support of technical assistant. Some learners do not understand how to operate the system. So we will provide teaching documents or assistant to help them.

Table 2. SUS scoring

Mean	SD	Min	Max	Median	Usability	Learnability
71.13	13.06	45	100	70	71.08	74.36

Conclusion and Future Work

In this paper, we present the results of the usability and the learnability of cubic net assisted learning system by using Kinect sensor. Regarding the SUS questionnaire, most learners highly appreciated the teaching materials employing Kinect sensor and considered the materials interesting, easier to control and play, and easy to operate using the interactive functions. The learners also reported that the teaching employing interactive system enhanced

their motivation to learn and was helpful for learning spatial skills. In the future, there are still many parts of system to improve. A small portion of the learners reported that the teaching material employing Kinect sensor performed less desirable response speed during interactive operation. The buttons should be clearly defined, the cubit net knowledge should be highlighted, and proper instructions should be provided to ensure the learners are more focused on learning the knowledge expressed in the teaching materials.

The Development and Testing of Multimedia-assisted Mastery Learning Courseware with regard to the Learning of Cellular Respiration

Fazzlijan Mohamed Adnan Khan[145a], Mona Masood [a]

^aCentre for Instructional Technology and Multimedia, Universiti Sains Malaysia, Malaysia

Abstract

This paper discusses the development and testing of Multimedia-assisted Mastery Learning Courseware (MMLC) with regard to the learning of cellular respiration. The model for the instructional system design and the a combined theory of instruction are introduced as the macro and micro stages of developing the courseware. The design of the prototype is reported followed by the alpha test using usability evaluation. Beta testing was carried out after revisions were made based on expert comments. The findings of this study show that the courseware is well designed in terms of using mastery learning elements which goes through a series of systematic testing stages. In conclusion, the MMLC is ready to be implemented in order to discover the effectiveness in terms of enhancing student's performance with regard to learning cellular respiration.

Keywords: multimedia learning, learning biology, computer-assisted learning, e-learning, mastery learning, testing prototype

1. Introduction

Recently, the advent of Information and Communication Technology (ICT) systems offers new capabilities for the delivery of instruction throughout the range of educational settings. At the moment, educators are exploring ways of providing flexible learning systems that will meet the ever-increasing demands of a complex and diverse student group. Moreover, many cases regarding student performance are reported, such as the difference between low achievers and high achievers (Guskey, 2007). To overcome this problem, various interventions have been suggested, including curriculum-based assessment (Hintze, Christ & Methe, 2006), tutoring (Sleeman & Brown, 1982), mastery learning (Bloom, 1984), formative assessment (Guskey, 2010) and so forth. Unfortunately, most of these interventions required additional resources such as teachers' effort, workload and time. However, the advancement of ICT has eased the burden on the resources needed for teaching and learning processes. The employment of computers in teaching and learning is seen as the only way to maintain and promote the quality of instruction.

2. Multimedia-assisted Mastery Learning Courseware in Biology

Biology is one of the subjects offered as part of the Matriculation science programme in Malaysia. This subject contains many abstract concepts that are difficult to understand. Students must be able to conceptualise and construct abstract concepts in biology in order to understand and make sense of them. Many students' demonstrate common misconceptions concerning biology, including their understanding of topics such as respiration, photosynthesis, ecology, genetic, classification and the human circulatory system (Tekkaya, 2002). Furthermore complex processes and the use of technical terms such as in the topic of cellular respiration, make them difficult to learn (Patro, 2008). Hence, it is important to design a high quality instructional system to enhance the teaching and learning of difficult and abstract topics as part of the subject of biology.

The mastery learning method divides subject matter into units, each of which has a module with predetermined objectives which has to be completed. In doing unit tests, students should achieve mastery, typically 80%, before moving on to subsequent units. Students who do not achieve mastery receive remedial instruction, while students who achieve mastery have the opportunity to participate in enrichment activities. With the use of computers, mastery learning has a high potential to become an effective and extensive teaching and learning tool (Kulik et al., 1990; Fike et al., 2011) For each learning module, students are allowed to test and re-test until competency is achieved with regard to each unit. This allows students to proceed at their own pace based upon their unique learning styles and capacities for learning. Each time that students complete a test on a learning module, they are informed promptly of their performance, and receive immediate feedback on those items with regard to which they have not demonstrated competency. Accordingly, students who learn at a slower pace or who have an inadequate academic background, are provided with an opportunity to catch up with those students who have stronger backgrounds or who learn at a more rapid pace. This tends to create an equalizing effect for students. In this research, all the instructional elements as part of the mastery learning strategy, are delivered via multimedia interactive tools. With the advent of ICT as a teaching tool, and the availability of computer hardware in schools, the problem of applying mastery learning can be improved by using interactive courseware. Feedback activities could also be easily conducted using computers. In addition, in terms of recording the students' performance, the technology could also reduce the time and effort required to implement the comprehensive interventions needed as part of the mastery learning process.

3. Methods

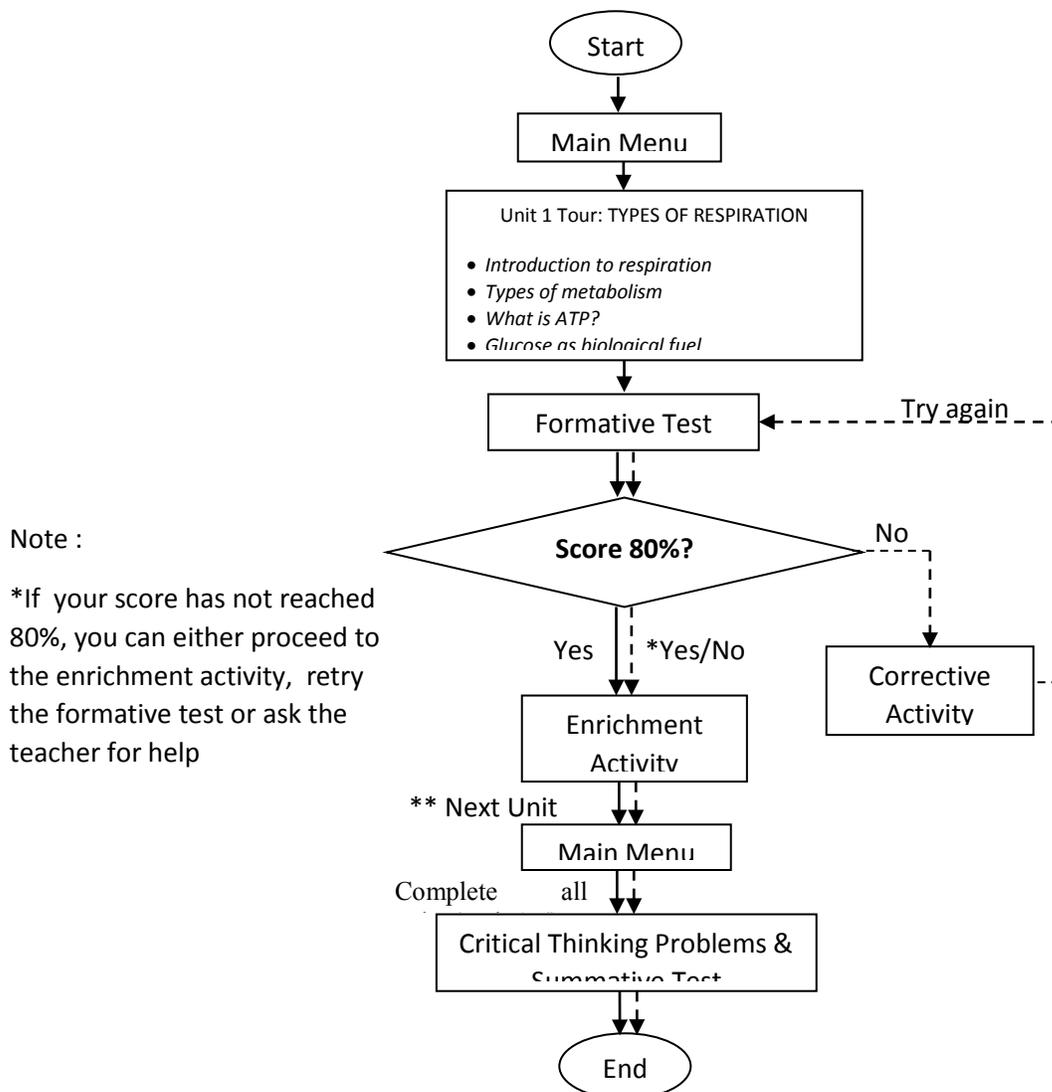
Learning courseware is a relatively recent application with regard to Computer Based Learning. This refers to the use of computers for the delivery of instruction involving an interactive approach. The researcher had developed courseware entitled "Cellular Respiration" to improve student's performance and understanding with regard to this topic. The design of the courseware was based on a macro and micro design. Bloom's mastery learning strategy (Bloom, 1984), Mayer's Cognitive Theory of Multimedia Learning (Mayer, 2003) and Alessi and Trollip's instructional design model (Alessi and Trollip, 2001) were used for the macro design. Gagné's nine events of instruction (1985) was used for the micro design of the courseware. Motivational elements were incorporated into the courseware which was created based on Keller' ARCS model of motivation. These were incorporated into the courseware which was created based on Gagné's nine events of instruction. Keller's model suggests strategies for increasing the motivation to learn. ARCS is an acronym for the four essential strategy components for motivating instruction, namely (1) Attention strategies for arousing and sustaining curiosity and interest, (2) Relevance strategies linked to learner' needs, interests and intentions (3) Confidence strategies that help students develop a positive expectation for successful achievement, and (4) Satisfaction strategies that provide extrinsic and intrinsic reinforcement for effort. Attention involves the arousal of interest on the part of learners, the stimulation of an attitude of inquiry and the maintenance of attention. Relevance refers to tying instructions to the student's personal interest or goals. Confidence refers to the students' expectations for success, while satisfaction refers to the process or results of the learning experience. In this research, an authoring software, Adobe Flash CS4, was used to design the courseware. Thumbnails that allow the development of the courseware through rapid prototyping were created by using this software. It allowed and illustrated the correct navigation within and among the modules. Furthermore, objects in the form of animations, graphics, texts and sounds were built as a knowledge base by using Micromedia Fireworks, Adobe Photoshop and Sound Forge. Figure 1 explained the flowchart of the courseware in general.


Figure 1 : Flow chart of Multimedia-assisted Mastery Learning Courseware

4. Testing and Revision

The final step of the development process was testing and revision. At first the researchers checked in advance with their two experts biology lecturers experienced in the Matriculation program to ensure that all the teaching content be included in the courseware was correct, accurate and timely before the programming process. After the prototype was developed, the researchers conducted a comprehensive evaluation involving two phases. The first phase was the alpha testing while the second phase was the beta testing. These two phases were part of the assessment process as proposed by Alessi and Trollip (2001) to ensure the validity and reliability of the courseware being developed. Alpha testing involves the process of quality inspection involving content experts who undertook an evaluation of the courseware design. The evaluation process was done by each evaluator using a checklist evaluation of multimedia instructional materials. Three other biology teachers and two instructional design experts determined the validity of the content and evaluated the accuracy of the design and content presentation.

5   Results

5.1 Alpha testing

The alpha test results involving content experts indicated that the courseware met the learning needs associated with the cellular respiration topic. The contents of this courseware was accurate, complete and timely in terms of the Matriculation biology syllabus. Content experts also found that the audio quality used by the narrator was good and matched the quality of the animated video presentation that had been constructed. However, the content experts identified several minor errors in spelling such as acetyl-CoA, mitochondria and the symbols for oxygen (O_2) and carbon dioxide (CO_2). Some of the illustrations used such as in the Krebs cycle and the oxidative phosphorylation process was not clear and could be further improved. They also advised that the researchers used graphics relevant to the topic as a display montage and interface.

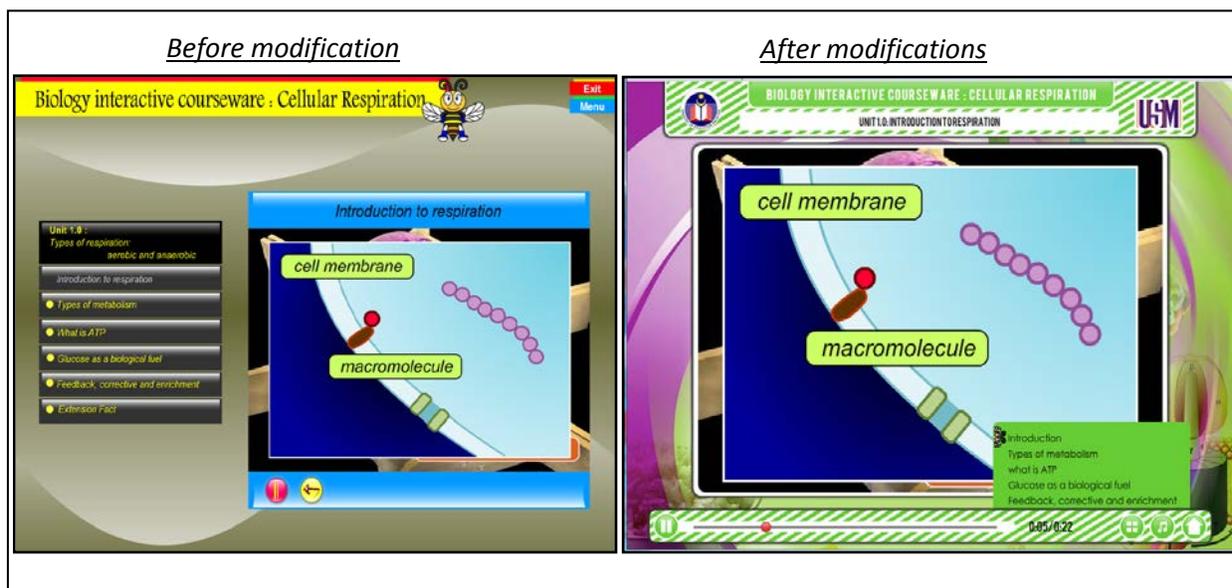
From the instructional design experts' point of view, they were not satisfied with the selection of the background graphics for the montage display and the interface. In addition, the control button arrangement was also thought to be disorganized. The video animation did not have a complete set of control buttons (just a stop and a pause button). A video control button should be included so that students can control the speed of the video to match their individual needs. This is relevant to one aspect of multimedia design principles in the form of the principle of segments as proposed by Mayer (2009). The experts also suggested that the researchers should build a more uniform systematic control buttons set up below the display interface to clarify the teaching segments. However, they found that the design and programming of the mastery learning strategy was easy to follow. Using a biology teacher as a character is suitable since it acts as an important guide during the exploration of the courseware. Based on the feedback, a few modifications and amendments were carried out. All the modifications were carried out before the beta testing was done on students from the target population. Figure 2 shows prototype interface screen displays before and after a series of modifications were done.


Figure 2 : Ordering interface display reconfigured to create a more systematic button control. Background graphic interface display changed to be more relevant to the topic and the video display

5.2 Beta Testing

Beta testing follows revisions and utilises the full product for testing. The beta test was performed by the students with collaboration with the researcher. It was a formal process to determine the usefulness and the usability of the courseware, with clear procedures about what to do and what to observe. Usefulness refers to the extent that the courseware was useful in supporting the learning process. Meanwhile, usability was related to software technical

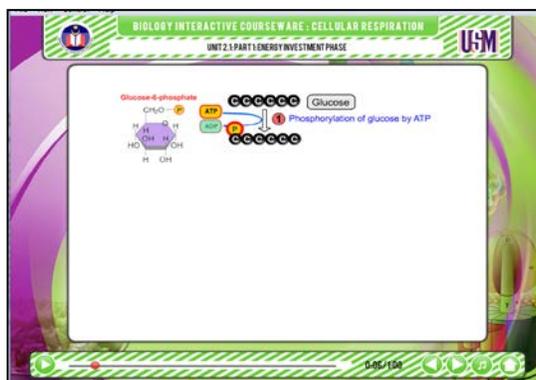
operations which consisted of the interface and the interaction. The beta test was carried out to serve as a useful trial run of the courseware. Also, it provided the researcher with information with regard to any unexpected problems which may arise from the usage of the computer or the contents of the courseware. Indirectly, the researchers were able to identify any weaknesses or problems from the perspective of the students in relation to the use of the developed software. The researcher conducted two stages of beta testing namely; 1) one-to-one evaluation and 2) small group evaluation by students. One-to-one evaluation involved three target users with a range of biology academic achievement. Firstly, the researcher explained the procedure by informing the learners the reasons they were testing the courseware. During the evaluation session, the researcher observed the students going through the courseware. The researchers unobtrusively made note and observed the changes in behaviour, facial gestures, and the body language of the students. A short interview was conducted to get their reactions and feelings. From the testing, the three of them were satisfied with the courseware they explored. They responded positively especially from the aspect of language level, animated graphics and exercise provided. After the one-to-one evaluation, the researcher continued with the same method to a small group of students in a real classroom environments. Twenty seven students were brought to the computer laboratory to run the courseware and give feedback. This is regarded as a summative evaluation whereby a student's approval is needed (Alessi & Trollip, 2001). Overall, it was found that the students were satisfied and could cope with the courseware without any problems. Figure 3, Figure 4, and Figure 5 show two scenes of the MMLC for the topic of cellular respiration.


Figure 3: The presented instruction material created through enhanced cues

Figure 4 : Screen shot of a biology teacher character giving immediate feedback

Figure 5 : Screen shot of the feedback given on a formative test

Conclusion

Based on the evaluation carried out at all levels, it was found that the courseware was built to consider ideal characteristics such as interface design, audio quality, quality graphics, use of appropriate colours, good quality animation and ease of use. In addition, the results of the beta test and feedback from random interviews conducted with the students showed absence of programming errors. Overall, the students were satisfied with the content and operation of the courseware. It is hoped our MMLC will be a viable alternative approach for students leading to a significant increase in student achievement in terms of learning about cellular respiration. There are also positive possibilities to extend this courseware beyond biology with fruitful results.

The Development Model of Knowledge Management via Social Media to Enhance Graduated Student's Self-Directed Learning Skill

Dr. Nattaphon RAMPAI [146]

Department of Educational Technology, Faculty of Education, Kasetsart University, Thailand

Abstract

This research explore that the model of knowledge management and social media technology for graduated student as well as its impact in the classroom on learning and teaching, especially in graduated student's self-directed learning skill and practices that refer to knowledge creating, analyzing, nurturing, disseminating, and optimizing process as part of the learning quality improvements. In this process, web technology particular social media has a necessary role to drive and integrate knowledge and learning activities within the knowledge management process. In this respect, this research aims to study the appropriate model of knowledge management via social media and enhance the graduate student's self-directed learning skill.

Keywords: Knowledge Management (KM), Social media, Self-Directed Learning skill.

Nomenclature

A	Knowledge Management via Social media
B	Self-Directed Learning skill
C	Graduated student

Introduction

Graduate student quality is the top contributing factor to student achievement. Quality ongoing professional development contributes to student growth and success. The needs for professional development that can meet today's educators' demanding schedules, that uses quality content and resources that are available to teachers from any place and any time, and that can deliver relevant, accessible, and ongoing support has stimulated the development of online teacher professional development programs. Online teacher professional development programs make it possible for educators to communicate, share knowledge and resources, and reflect via asynchronous interactions. Moreover, Dabner (2011) suggest that the many current ICT-supported reform efforts demand teachers to assume the role of epistemic facilitator of knowledge construction supported by technology. In addition, Davis et al. (2011) explored the characteristics of such technology training programs were discussed to help students learn how to use technologies as instructional tools to enhance their teaching and students` learning. The condition of education in Thailand today still has several problems. Especially, the quality of learners seems shortages (Secretariat of the Council of Education, 2010: 53). Along with the lack of pedagogy skills that is not match in the actual practical needs for higher education. Particularly, the lack of the self-directed learning skill of graduate students to use that knowledge management let the opportunity to exchange and share knowledge is decreased between them and focuses on the upstream of training from real situations process furthermore, Lee, et al (2010) have suggests that the common difficulties and limitations regarding the implementation of knowledge management into classrooms cultures. In addition, Erkunt (2010) exhibited that students' collective inquiry relied on socially distributed cognitive resources that were generated by their social interactions in class and online using

E-mail address: fedunpra@ku.ac.th

technology. The concept of social media that based on the appropriate tool and the medium to deliver knowledge, and helps learners can communicated with each other (Catherall, 2008) especially in teaching and learning using the potential of internet network to access with various sources of learning (Belleghem, 2011). The main purpose of this study is to research and develop activities to be appropriate with the learners that integrated with the concept of knowledge management and social media. The question then becomes, "How to develop the appropriate model of knowledge management via social media". The expected benefits are the appropriate model that is the systematic approach to enhance graduated student's self-directed learning skill. More over the results of quality assessment of model that is body of knowledge to develop the learning skill of graduated students. In addition the results can be the information to support the higher education systems policy maker.

Objective

This research primarily sought to study, develop, and evaluate the model of knowledge management via social media to enhance graduated student's self-directed learning skill.

Methodology

The first phase: Studying the model of knowledge management via social media to enhance graduate student's self-directed learning skill.

1. Analyzing the elements of knowledge management (KM) are included the knowledge management activities: Creating (Explore and Capture), Analyzing (Identify and Organize), Nurturing (Utilize and Demonstrate), Disseminating (Transfer and Diffuse), and Optimizing (Evaluate and Improve)

2. Analyzing the elements of social media are included the elements of web-based learning (instruction, interaction, and internet) and web technology (collaboration, communication, and storage technology).

3. Analyzing the elements of self-directed learning skill.

4. Integrating the elements of knowledge management, social media and self-directed learning skill.

The second phase: Developing the model of knowledge management via web-based learning to enhance graduate student's self-directed learning skill and assessment tools.

1. Developing the model of knowledge management via social media.

2. Developing the competency assessment tools that include the achievement test, attitude test, and performance test.

3. Developing the efficacy of the model of knowledge management via social media to enhance graduate student's self-directed learning skill.

The third phase: Evaluating the model of knowledge management via social media to enhance graduate student's self-directed learning skill.

1. Research design by following the Two-Group Posttest Only Design.

2. Population and samples:

2.1 Population is the graduate students (Master and Doctoral degree) who study in 2nd semester, 2012 academic year at Faculty of Education, Kasetsart University, Thailand.

2.2 Samples are random sampling the 60 graduate students that divided into 2 groups: The first group is 32 peoples for experimental group and the other group is 30 peoples for control group.

3. Research tools:

3.1 The model of knowledge management via social media.

3.2 The competency assessment tools (knowledge test, attitude test, and performance test).

4. Data analysis:

4.1 Descriptive statistics ($\bar{x}$ and S.D.) are used to describe the basic features of the data.

4.2 Inferential statistics (t-test with independent sample) are used to compare the data between control and experimental group.

Results

The model of knowledge management via social media to enhance graduate student's self-directed learning skill was appropriated with the criterion of quality, detail are as follow:

1. Knowledge management are include the KM activities of <u>C</u>reating (Explore and Capture), <u>A</u>nalyzing (Identify and Organize), <u>N</u>urturing (Utilize and Demonstrate), <u>D</u>isseminating (Transfer and Diffuse), and <u>O</u>ptimizing (Evaluate and Improve).

2. Social media are driven the Knowledge management by Facebook, Tweeter, YouTube, Wikis, and Blogs.

3. Self-directed learning skill are include the components of Planning, Strategies, Resources, Motivation, Monitoring, Evaluating, and Summary (Figure 1).

Figure 1: the model of knowledge management via social media to enhance
graduate student's self-directed learning skill.

Conclusions

The research results exhibited that the model of knowledge management via social media to enhance graduate student's self-directed learning skill was appropriated and fit to the quality of educational media. Online learning skills development is an emerging trend it is still a "new frontier." Educators around the world experience many demands on their knowledge, time, and professional development. Developing and sustaining an effective online

learning community can be challenging even in the midst of an era of much technological advancement. More over developing and sustaining an effective large-scale online community is even more challenging. In addition, professional development has mainly centered on learning processes that involve updating knowledge, yet it has made little headway as a construct that includes both the professional and personal characteristics and working conditions. It has also focused more on developing. Finally, online learning technologies have the potential to transform the professional development of students; penetrate cultural, discipline, and other barriers; bring educators together to learn, share successes and challenges; and co-construct and transfer learning.

The Development of a U-Learning Instructional Model Using Project Based Learning Approach to Enhance Students' creating-innovation skills

Mahachart INTHACHOT [a] [147], Saroch SOPEERAK [b], Nattaphon RAPAI [c]

a Department of Educational Technology, Faculty of Education, Kasetsart University, 10900, Bangkok, Thailand
b Assoc.Prof.Dr., Department of Educational Technology, Faculty of Education, Kasetsart University, 10900, Bangkok, Thailand

c Dr., Department of Educational Technology, Faculty of Education, Kasetsart University, 10900, Bangkok, Thailand

Abstract

This study aimed to develop a u-learning instructional model using project-based learning approach to enhance the students' creating-innovation skills. In addition, this model will be used as a framework in the development and evaluation of effective u-learning systems in higher education in Thailand. The design of the model was based from the analysis of various researches and literatures on u-learning. The model illustrated the four factors that influence u-learning. This research highlighted the interplay of these factors in the processes of project-based learning. Finally, the model discussed the four creating-innovation skills for 21st century learners.

Keywords: u-learning instructional model, project-based learning approach, creating-innovation skills

Nomenclature

A   U-Learning Instructional Model

B   Project-Based Learning Approach

C   Creating-Innovation Skills

Introduction

Developments in science and technology have continuously evolved through time. Everybody has moved to an era of an information society that affects the ways of living of the consumers regarding using technology to make life easier and more efficient in the social, political, economic and educational aspects.

In the field of education, recent developments in science and technology applications have influenced the learning process. The education in this present time is classified as the education for a social learning focusing on the integration of modern technology. A result of the integration of information technology with borderless communication makes this society become a timeless learning society. In the 21st century learning, computer and internet technologies have greatly affected the delivery of learning. These technologies made learning accessible to everyone, anywhere, and anytime. One of the learning approaches that have been used today is Ubiquitous Computing which responds to continuous learning that happens anywhere and anytime and leads to Ubiquitous Learning or U-Learning.

In Thai educational context, a model of U-Learning has yet to be developed and designed in order to effectively facilitate and implement the learning approaches adopted by various higher education institutions. Educational management is one important mission of any educational institution, especially in higher education, which is expected to produce qualified graduates to the labour market and to develop the country. Thai education has to

---

develop both educational management, and engaging teaching and learning activities in order to make it at par with recent innovations in educational communications and technologies and to cope with the recent issues trends in the international educational system.

Objective

This study primarily aimed to develop a u-learning instructional model using project-based learning approach to enhance the creating-innovation skills of students in higher education in Thailand.

Methodology

The development of a u-learning model is the first phase of a research on u-learning applications in higher education in Thailand. The second phase of the research will involve the testing and evaluation of this model to different higher education institutions in Thailand.

This study only discussed the first phase. In developing the u-learning instructional model in higher education, this study analyzed various researches and literatures on u-learning. The process of developing the model included the following:

1. Analyzing the elements of the u-learning
2. Analyzing the elements of project based learning
3. Analyzing the elements of creating-innovation skills
4. Designing and developing the model.

Results

Based from the analysis of various literatures on u-learning, this research highlighted the three factors that influence u-learning.

The first group of factors includes the elements of u-learning. These elements are Person, Approach, Context, and Technology. Person refers to the participants of the learning process – student and teacher. They possess different characteristics and share knowledge and skills. They engage in different Contexts or learning environments using various Approaches such as using internet and computer applications and Web Blog. Learning activities inside the classroom such as teacher-learner approach and learner-learner approach can also be utilized. To facilitate the learning process, different Technologies are used. These educational technologies include mobile and wireless technologies such as tablet PC and smart phones.

The second group of factors involves the six processes in project-based learning – Introduction, Selection, Planning, Collecting, Presentation and Evaluate of U-Learning activities. The first process, Introduction, aims to attract the attention of the students to motivate them to learn, The second process, Selection, allows the students to carefully choose topics during the learning process that interest them. In the third process, Planning, students design and develop their own work plans and implement these plans. The fourth process, Collecting, involves gathering of data, information, and other resources to prepare them for the fifth process, Presentation. The last process, Evaluation, assesses the project implemented and all the components involved in the implementation such as goals and objectives, tasks, and resources used, among others.

The third group of factors includes the levels of creating-innovation skills developed by the students after engaging in u-learning. Tenkely (2010) explained these creating-innovation skills of Bloom's taxonomy at various levels from Plan (Level 1), Design (Level 2), Imagine/Invent (Level 3), Create/Compose/Construction (Level 4) (Tenkely, 2010).

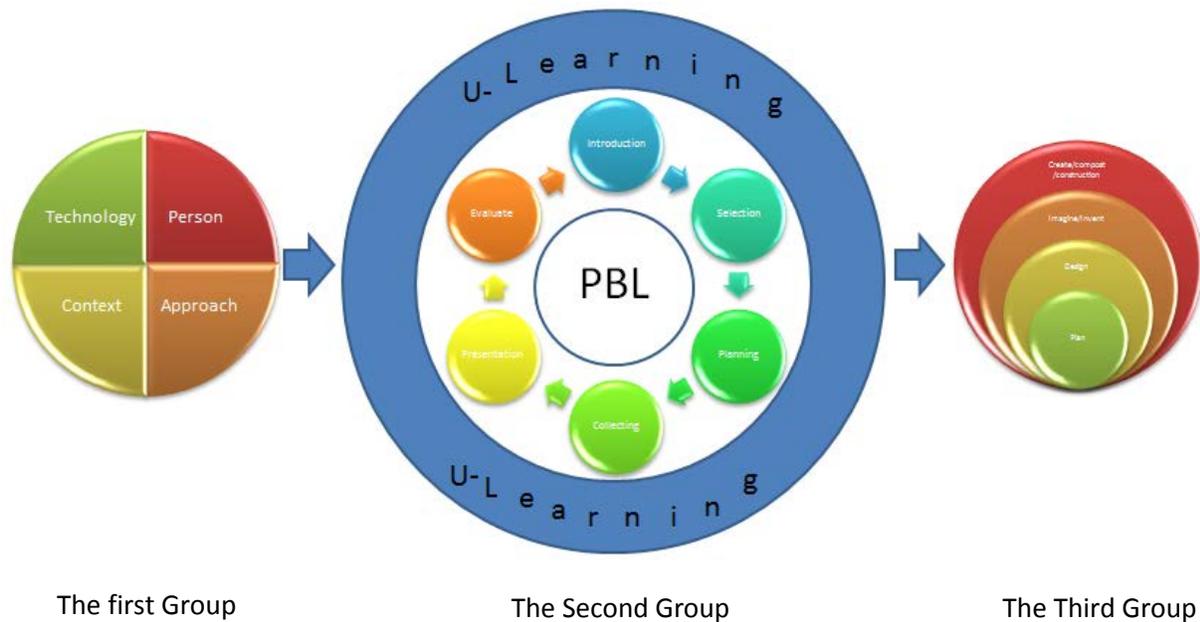
The first Group   The Second Group   The Third Group


Figure 1: The U-Learning Instructional Model Using Project Based Learning Approach to Enhance Students

Conclusions

This study reported the first phase of the research on u-learning in higher education in Thailand. This showed the three groups of factors that were involved in the development of a u-learning instructional model using project-based learning approach to enhance the creating-innovation skills of the 21st learners. This model will be evaluated during the second phase of the research which involves the actual implementation of u-learning in higher education using this instructional model.

13th International Educational Technology Conference

The Development of Working Design through Characterized Technology Pedagogy and Content Knowledge in the Elementary Schools' Instructional

Aisyah.A.R[148]

Faculty of education, sriwijaya university Indonesia

Abstract

ICT-based characterized instructional can lead the learners become more creative and get higher quality output. This study aimed to determine the practicalities and potential effects of the use of characterized technology pedagogy and content knowledge to the learners' outcome. This study is a development research through characterized TPACK model and the evaluation will use Tessmer' procedure. The sample of this research is 38 students of the third class of elementary school in Palembang. The steps in doing this study are: 1) emerging, 2) applying, 3) infusing, and 4) evaluating. This model possess a very good validity, the potential effect of this model can be seen from the students' outcome, that is 65,79% success with good score, which means more than half of the students manage to learn based on this model.

Keywords: Technology, pedagogy and content knowledge, character education

Introduction

Nowadays, the ICT relevance in the instructinal which was originally only as a tool to increase its role as a learning resource. According Hinostron JE, et al (2008) (Sutrisno, 2012:11) in his paper entitled "Traditional and emerging ICT applications for learning" stated that there are three trends of instructional based ICT, namely: 1) provide opportunities in broadening the learning opportunities in flexible and easy way, 2) teachers can develop their creativity in developing the instructional scenarios, 3) ICT can enhance the instructional process for teachers and students. Teacher readiness in responding ICT integratively in the instructional is the main goal in developing the instructional activity, the ideal and competitive students need creative, innovative, and reflective teachers. to respond the demands, it is needed supporting program: , standardization, assessment, curriculum development, instructional development, professional development and the provision of a conducive learning climate. Especially in the development of teaching programs and profesional teacher, the teacher should be able to use ICT and the develops the instructional by integrating ICT. According to the American Associon Colleges of Teacher Education (AACT 2010) (in Sutrisno, 2012:16) it is stated that 21st century's teacher must master the competencies that can facilitate the students in accordance the learning outcomes that have been required, so the teacher must: 1) successfully combines the technology

---

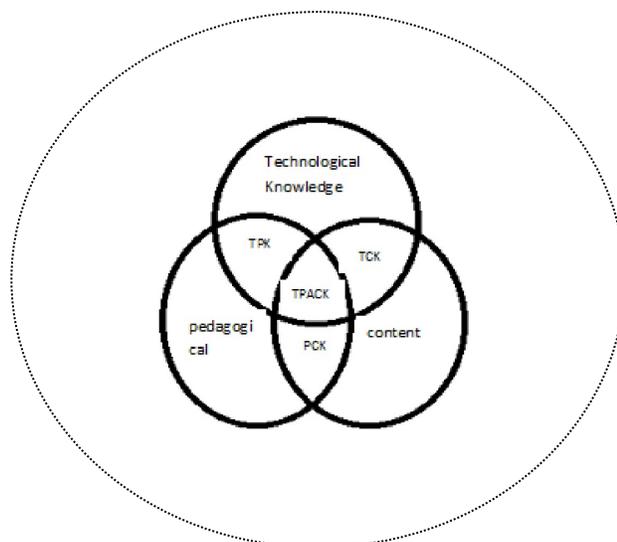
[148] Corresponding author
E-mail address: araisyah@ymail.com

with instructional materials pedagogy, 2) incorporate appropriate instructional with specified in the curriculum with 21st century the demands of, 3) the balance of the instructional strategies and problem-based learning method. 4) masters the various assessment models to determine student performance, 5) acts as a mentor and exchange the ideas with the students, 6) always develops his/her professionalism.

The integration of ICT in the instructional

In 2010, there were three important issues concerning the development of what is called the Technology Pedagogy and Content Knowledge (TPCAK), namely: 1) professional teachers development on strategies, understanding and application of TPACK, namely the relationship analysis with technology (T), pedagogy (P) and subject matter (C) applied in the instructional process. 2) TPACK focused on learning technologies which are designed in accordance with the stages. 3) designing an observation measurement

Instructional-based Tecnology Pedagogy, Content dan Knowledge (TPACK) **model**

Tecnology Pedagogy, Content dan Knowledge (TPACK) model: this model was developed by Mishra and Kohler, (2008). The focus of this model as a framework for teacher or designer in integrating ICT in the instructional. This model is based on the development of models of Pedagogy Content Knowledge (PCK) proposed by Shulman (1986) (in Sutrisno, 2012). The basic concept of TPACK emphasis more on the relationship among the subject matter, technology and pedagogy. The interaction of the three has the power and appeal to foster active learning focused on students, can also be interpreted that it was teacher-centered learning, and TPACK student-centered learning. TPACK in the model is described as follows:


Explanation: TPACK = Tecnology Pedagogy, Content dan Knowledge

TPK   = Tecnological PedagogicalKnowledge

TCK   = Tecnological Content Knowledge

PCK   = Pedagogy, Content dan Knowledge

Figure1: *Tecnology Pedagogy, Content dan Knowledge (TPACK)* Model *adopted from Koehler dan Mishra 2008*

The Form of Character Education in School

The implementation of character education in all life aspects, especially school life, refers to the basic form of character education that writer can explain based on the configuration of elements of character education. Can be seen in the following table:

Table 1   value and material proposed by teacher in subject and material taught

Basic value of character	Instructional material
Honesty	The concept of self-knowledge, self-motivation, self-control, relationship with God, self righteousness, self-value system, sincerity, and sincerity, self-sacrifice, giving and sharing
Smart	Self concept as an achiever, analyzing ability, decision making ability
Tough	The concept of environmental influences destructive or constructive, working ability, resilience
Caring	Realize a wide range of interests, the community concept, understand social ethics, the concept of the common goodness, the concept of tolerance
Discipline	Consistent, clear, paying attention to self-esteem, praise reward, punishment, being supple, be firm, not be emotional
Self confident	Giving compliments to every achievement, teaching students to be responsible, teaching students to be friendly, glad to help others, do not reprimand in front of many friends, support something that interests the students, not coddle students
Independent	Forming students' independent attitude, allowing students to organize their own time, students are given the responsibility, implementing a healthy body condition and strong, giving freedom to the students to define their own goals, students realize that teachers are parents who are always at their side
Firm	Giving the students opportunity to express their opinion, giving a freedom to be creative, giving a chance to make decision.

Responsible	Giving tasks and reprimand, amends when doing wrong, consequent, discussing about the importance of responsibility
Creative	Learning beyond the facts, learning the correct way of thinking, constructing learning new facts
Critical	Explaining about the forbidden cause and effect thinking, thinking about something that happens for some reason.

Widely, the application character education in school can be classified into three events, namely: the development in instructional from each subject, the development in extracurricular activities and in school culture development, strategy development of character education in school subject of elementary school included in sport, religious, Indonesian, science, math and social studies. Ahmad Tafsir (2009:85) states that the process of integrating the character education in the instructional can be done in several ways, among them: (1) instructional material, (2) selecting material, (3) selecting instructional media integration.

Reserch problem: Tecnology Pedagoy, Content dan Knowledge (TPACK) model which is developed suit to the indonesian society, namely: technology pedagogy model, content and characeterized knowledge. The research question is: do Tecnology Pedagoy, Content dan Knowledge (TPACK) model have practical character and have potential effect to the learners' learning, while the objective of this research: to find out the potential effect of the use Tecnology Pedagoy, Content dan Knowledge (TPACK) model to the learners' outcome.

Research Methodology

Research methods: the initial apporach is by using survey, observationa, interview and documentation, then proceed by research and development proposed by TPACK theoretical framework developed by Mishra dan Kohler, (2008), and Tessmer (1998) will be applied as the evaluation. Then, this model is developed into certain situation, tested, revised and retested until it becomes perfect and productive result. Finally, it is found a characterized TPACK instructional model. The sample of this research is the third class of elementary school in Palembang

Characterized TPACK flow

ENERGING STAGE

Preparation

Media Setting

Action 1

The researcher introduces to the teacher the animation program, simulation, laboratorium, instructional system throuch internet access

Character value

Action 2

Teacher observes, tries, get to know the access program from the internet adjusted to the teaching material

APPLYING STAGE

Application

The teacher design the lesson plan explored by the curriculum, instructional based theme syllabus

Stage 2

The researcher equips the teacher the characterized TPACK and finds the suitability for the program animation, simulation, and well structured by the teacher

Character value

Stage 4

The teacher connects and designs the correspondence among technology, learning objectives, and pedagogical material

INFUSING STAGE

Continued

Continuation

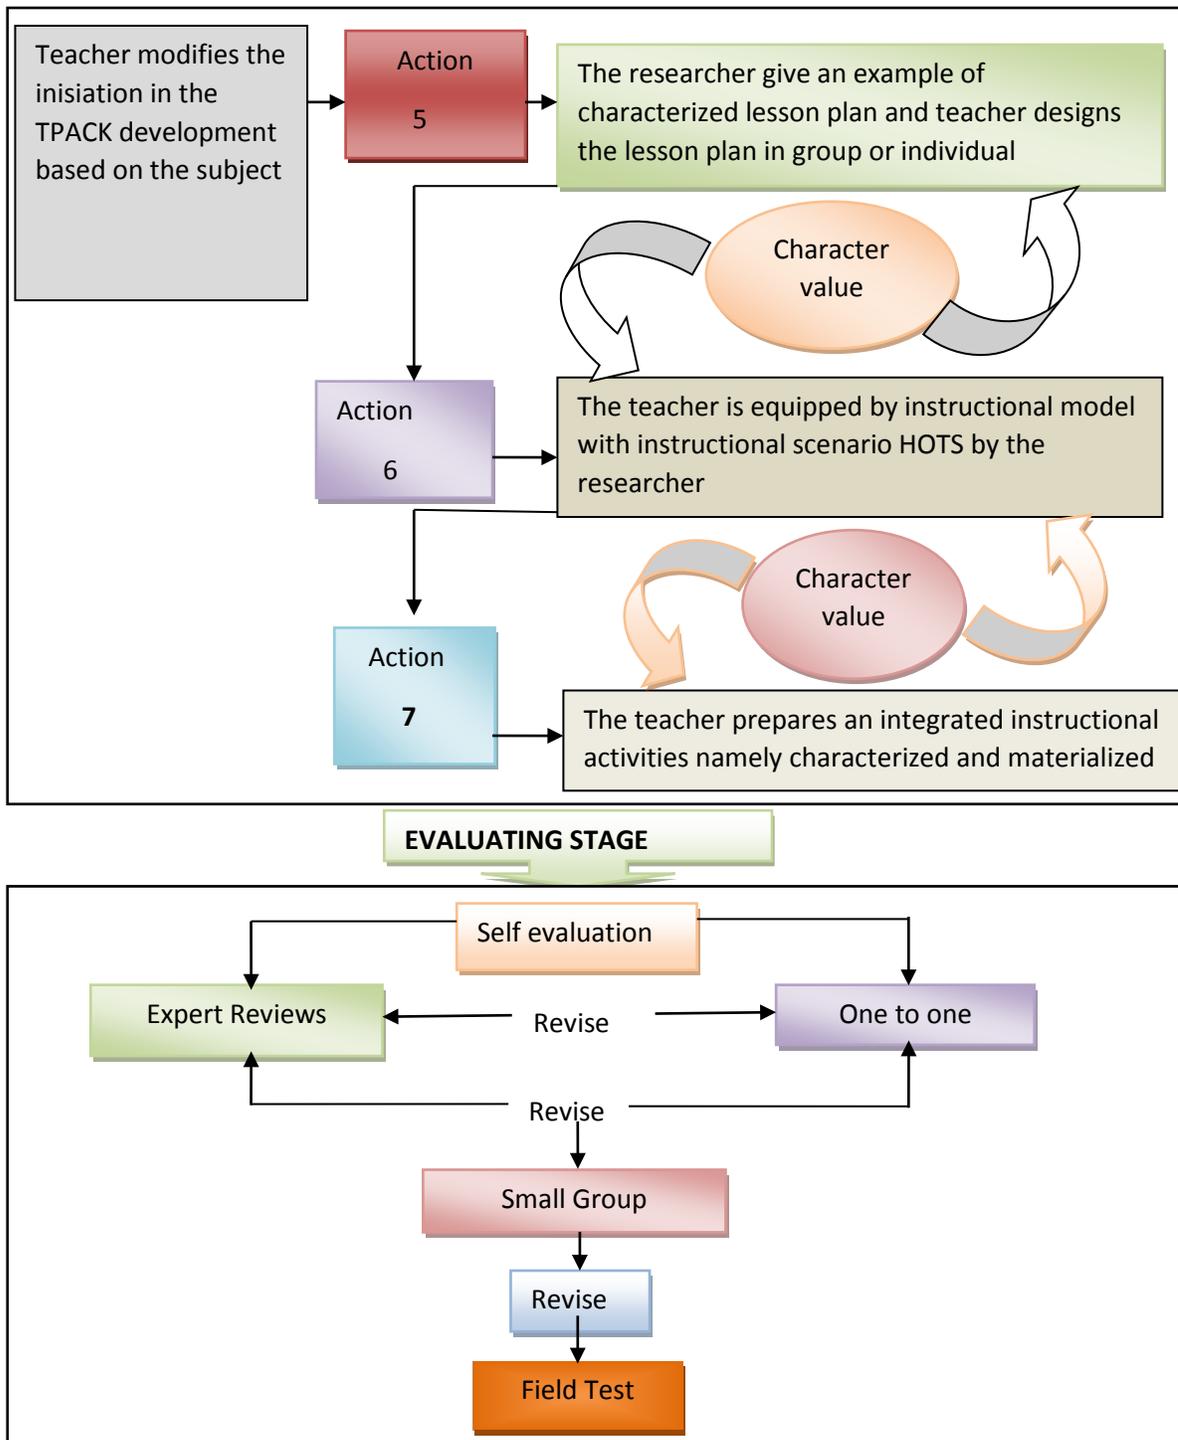
INFUSING STAGE


Figure 2: Characterized TPACK Model Development and Tessmer (2011)

The Development Results and Discussion

This instructional model is a student-centered instructional model and provides opportunities to use strategies and ICT-based instructional method. The instructional model

which is developed in this research is characterized TPACK instructional model that is intended to foster critical thinking skill and ICT mastery for third grade elementary school. Instructional model created in this study include, the design, implementation, characterized TPACK instructional evaluation, in terms of practicality and potential effect.

Validity test of TPACK model

1) Design

Material validation and media accuracy were done three times. The final validation get very good score (90%) were seen on the accuracy model with characterized TPACK model and the scope of character values to the used media was appropriate (87%). The validity test of instructional material is compliant to the theme taken from the third class with 85% score. Lesson plan validity is 88% or very good because it contains materials and characters and the media related to ICT in elementary school

2) Practicality

The result of small group or one to one: instructional activity: respondent A category low scored 40, respondent B good category scored 75 and respondent C very good category scored 88. While the achievement gained by each student in small group is respondent A get 80, B get 90, and C get 60. It means they get high achievement

3. Final evaluation (potential effect)

To see the potential effect of the use of characterized Tecnology Pedagoy, Content and Knowledge model, it is done a small group and carried on with test. The potential effect of instructional media in the application of PATCK viewed by learner's activity: 1) the students can follow the instruction of the used media, 2) they can listen teacher's explanation, 3) learners take note to the important aspect, 4) learners can solve the task given, 5) they can answer teacher's question and express their arguments, the potential effect of the instructional media to the learners' outcome. It can be gained through three ways, they are: a test which is conducted after teaching and learning process, exercises, and homework. The final score was analyzed by combining the test result, exercises, and homework, then, it is gained from 38 students, 10 (26.32 %) categorized very good, 25 (65.79%) are in good category and 3 (7.90%) in fair category

Conclusion

The development of characterized TPCK model in the instructional development for elementary teacher is vey useful. It has good validity level, practicality and potential effects from characterized TPACK model. The experts say that this model is valid. In practicality test , characterized TPACK is effective in the third class of elementary school, while the potential effect of this model shows very high level, where 65.79% of the students applies ICT-based instructional

The Education of Analytical Chemists in Polish Universities

Marek BIZIUK[149], Jacek NAMIEŚNIK

Committee of Analytical Chemistry of Polish Academy of Science (PAS)
Gdansk University of Technology, Department of Analytical Chemistry, Chemical Faculty Gdansk, POLAND

Abstract

Analytical Chemistry plays a very important role in the modern world. The main reasons are; the need of environmental monitoring, quality of food and water control, human health, quality of industrial production control, nanotechnologies and material science. Together with Inorganic Chemistry, Organic Chemistry and Physical Chemistry, Analytical Chemistry is a fundamental chemical course. The education of Analytical Chemists is carried out in 52 Polish universities introduced already in the Bolonia Process, ECTS points and three steps of education: Bachelor's degree (at universities of technology – Engineer's degree), Master's degree and Doctoral Studies. The first level, Bachelor's degree, contains the basic knowledge: gravimetric analysis, electrogravimetry, acid-base titration, oxidation-reduction titration, precipitation titration, complexometric titration and quality assurance and quality control of results. The second level (Master's degree) contains more developed analytical techniques: gas and liquid chromatography, spectrophotometric methods, electrochemical methods, elemental analysis etc. A bachelor's projects as well as a diploma and doctoral thesis very often are prepared in the field of Analytical Chemistry. It is very popular with students, each year we have in Poland about 100 doctorate in this field. The laboratory on Polish universities are well equipped in specialist apparatuses, but it's strongly depended on university profile and how big it is. Some students are doing studies and thesis abroad, in the frame of LLP ERASMUS Program or other international programs. It promotes the international dimension and improves the quality of education by encouraging innovation in education.

Keywords: analytical chemistry, teaching, Polish universities

Analytical Chemistry plays a very important role in the modern world. From the society there is the huge demand for information on various material objects that can be obtained in the course of analytical examination of collected samples. Therefore, the analytical information resulting from the work of analysts is a response to society's demands, as is pictured in the diagram shown in Figure 1. The crucial role plays the specialist education.

During the 20th century Analytical Chemistry had expanded from the discipline treated commercially to the independent and very important science. Analytical Chemistry can be divided into:

- *Analytical Chemistry* - the basic discipline about the analytical process, which covers development of new analytical methods and techniques together with apparatus, and
- *Chemical Analysis*, named *Analytics* - practical application of analytical methods.

---

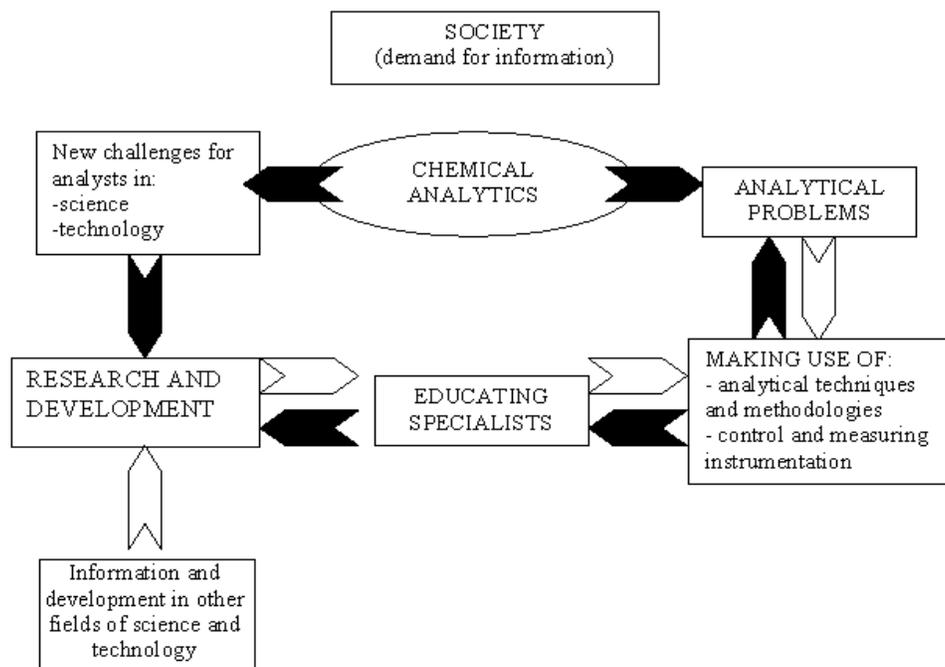
[149] Corresponding author.
E-mail address: marbiziu@pg.gda.pl


Fig. 1. Demand for analytical information as a stimulus for the development of analytics

Generally, Analytical Chemistry responds to a few basic questions, such as: what is in our surroundings? (qualitative analysis), how much is it? (quantitative analysis), how is it organized? (structural analysis) and how does it change over time? (process analysis and monitoring). The source of information is the analyzed sample. A information is obtained by decoding the analytical signal (of the measured physical or physicochemical value). Almost each physical or physicochemical property can be the basis for determination of a given element or compound. On this stage, it should be underlined that Analytical Chemistry can be treated as a challenge for scientific staff and people, who are responsible for the arrangement of the programmes of studies.

Analytical information is indispensable in different industrial branches, medicine, biology, agriculture and food industry, judiciary and criminology, atomic power engineering, environmental protection, archeology, history and geology. The obtained result should be reliable, it is extremely important in analysis. Analytical chemist is officially, disciplinarily, penally and financially responsible for the reliability of the analytical results. The quality control of the results of measurements can be treated as a next challenge for Analytical Chemistry programmes and teachers. The Committee on Analytical Chemistry of the Polish Academy of Sciences developed the main assumptions and standards for education in Analytical Chemistry. The aim of education within the framework of the subject named „Analytical Chemistry" is to introduce the students to the chemical and physical principles of analytical techniques, basic chemical operations, analytical apparatuses and to prepare them to take an active part in the analytical process. It means the knowledge of the particular steps of the analytical process, specificity of the analytical problem, collection and preparation of the sample for analysis, analytical measurement and interpretation of the obtained results. Each graduate of the chemical studies should have the ability to :

- use monographic and normative treatises and original literature,
- calculate masses and volumes of the reagents appropriate for preparation a solution of a given concentration,
- prepare the standard solutions for volumetric determinations,
- choose the appropriate analytical method in relation to the type of the analyzed material, determined analyte(s) and the aim of analysis,
- collect the representative sample and prepare it for analysis,

- choose the separation method and apply it to a given analytical problem,
- make the measurement by applying chemical and physical techniques suitable for a given analytical problem,
- calculate the analytical result, estimate the possible uncertainties, determine the parameters characteristic for a given analytical method and the obtained results,
- know the basics of validation process of a given analytical procedure and apply it in practice.

The course Analytical Chemistry should be included in the programmes of studies after, or in the worst case during, the subjects, such as: Inorganic Chemistry, Organic Chemistry and Physical Chemistry. The knowledge of these subjects is essential for proper understanding of Analytical Chemistry.

The education of Analytical Chemists is carried out in 52 Polish universities, including medical universities. All these universities are introduced already in the Bolonia Process, ECTS points and three steps of education: Bachelor's degree (at universities of technology – Engineer's degree), Master's degree and Doctoral Studies. The lectures are carried out by a highly qualified scientific staff. The main university and the staff carrying out courses from Analytical Chemistry and related subjects are listed in Table 1. The number of independent employees (professors and habilitated doctors) reaches 13 at Adam Mickiewicz University in Poznań, 12 at Warsaw University of Technology and 11 at Gdansk University of Technology and Poznan University of Life Sciences. Other employees have in a great measure long teaching experience. Obviously, it is difficult to compare well-known universities with diploma profiles connected with analytics with small institutes of other teaching profile.

Table 1. Polish universities and the staff teaching Analytical Chemistry and related subjects

The following aspects should be involved in the fundamental course of analytical chemistry :

- basic determinations in the model systems as a test of competence for people working in the laboratory : titration (**acid-base titration** – preparation of the titrant solutions, chemical indicators, chemical equilibrium, titration curves, pH determination by means of pH indicators and potentiometric methods; **redoxometry and precipitation analysis** – titrant solutions, indicators, chemical equilibrium, titration curves, determination of the end point of the potentiometric titration; **complexometry** – complex formation equilibrium, stability constants of complexes, properties of complexons and indicators), gravimetric and electrogravimetric determinations;

- **separation techniques** in the multicomponent systems: ion-exchange chromatography, solvent extraction, precipitation without and with carrier. Volatility, electrolytic separation. Selectivity. Analysis of real multicomponent systems;

- **evaluation of the reliability of the analytical results**: statistical evaluation of the analytical results, quantitative characteristics of analytical methods, elements of information theory in Analytical Chemistry, evaluation of precision and accuracy. Basics of chemical metrology. Method validation, reference materials, interlaboratory studies;

- application of physical and physicochemical techniques to analytical chemistry. **Spectroscopic methods** (flame atomic emission spectroscopy, atomic absorption and emission spectroscopy, UV, VIS, IR spectroscopy, mass spectrometry), **electrochemical methods** (potentiometry, amperometry, voltamperometry, coulometry, conductometry); **separation methods** (chromatographic and electromigration techniques);

- apparatus aspects of instrumental methods and their analytical application;

- application of analytical methods to particular analytical processes (for example : environmental, industrial, clinical etc.).

Table 2 Examples of courses carried out at chosen Polish universities

University	Courses
Jagiellonian University in Krakow	Basis of Statistics and Chemometry, Chemometry and Biometry, Flow Analysis, Pharmaceutical Analysis, Ecotoxicology and Environmental Toxicology, Clinical Toxicology, Forensic Toxicology, Radiometric Analysis, Analytical Calibration, Criminological Physicochemistry, Mass Spectrometry, Environmental Chemistry
University of Lodz	Applied Electrochemistry, Electrochemistry and Nanoelectrochemistry as Methods and Tools for Modern Technology, Environmental Analytical Chemistry, Monitoring and Analysis of Surface Water, Speciation Analysis, Basis of Chromatographic Analysis and Its Application in Modern Environmental Research, Application Modern Analytical Techniques in Monitoring and Environment Protection, Affinity Chromatography, Hyphenated Analytical Techniques in Environmental Analysis, Basis of Criminological Analysis, Analytical Techniques in Archeology
Adam Mickiewicz University in Poznań	Cosmetic Analysis, Spectrophotometric Methods, Environmental Monitoring, Bioanalytic Chemistry, Water and Soil Pollutants Analysis, Chromatographic Methods, Atomic Spectrometry, Air Pollutants Analysis, Speciation Analysis
Copernicus University in Torun	Environmental Chemistry and Ecology, Analytics and Control in Environmental Chemistry, Separation Techniques in Trace Analysis, Statistic Methods, Biomedical Chemistry, Toxicology, Basis of Separation Techniques, Mass Spectrometry in Analytics, Miniaturization and Automatization in Analytics, New Materials for Chromatography
University of Warsaw	Chemical Metrology, Methods of Isolation and Preconcentration, Chemometry, Liquid Chromatography, Instrumental Analysis, Environmental Analysis, Electrochemical Sensors, Automatization in Chemical Analysis, Speciation Analysis in Biological Samples, Trace Analysis of natural Samples
Medical Univ. of Gdańsk	Spectroscopic Methods in Drug Analysis, HPLC as a Method for Phenolic Extracts from Plants Analysis
Medical University of	Analytical Chemistry, Instrumental Analysis, General and Inorganic Chemistry, Medical Analysis, Environment Protection, Toxicology, Drug Analysis, Food Science,

Wroclaw	
Gdańsk University of Technology	Analytical Chemistry, Modern Analytical Techniques, Monitoring and Analysis of Environmental Pollutants, Water Quality Control, Air Quality Control, Ecotoxicology, Statistical Methods and Data Analysis, Chemical Metrology, Chemometry, Separation Techniques, Methods of Structural Analysis, Modern Techniques in Food Analysis, Biological Methods in Environmental Analysis, Process Analysis, Technical Analysis,
The Silesian University of Technology	Instrumental Analysis in Environment Protection, Speciation Analysis, Industrial Analysis, Analytics in Environment Protection and Clinical Research, Modern Apparatus in Physicochemical Measurement, Monitoring and Analysis of Environmental Pollutants, Trace Analysis, Separation Methods in Bioanalytics, Bio- and Electrochemical Methods in Analytics, Electrochemical Methods and Biosensors,
Warsaw University of Technology	Environmental Pollutants Analytics and Monitoring, Modern Analytical Techniques, Miniaturizations in Analytical Chemistry, Analytical Control in Industry, Chemical Sensors in Analytical Control, Spectrochemical Methods for Material Research, Chromatographic Techniques in Materials Characterization, Analytical Ford Control Using Mass Spectrometry, Bioanalytic Methods, Spectroscopic and Spectrometric Techniques, Analytical Electrochemistry, Methods and Techniques for Separation, Chromatography and Electrophoresis, Speciation Analysis

Both a Bachelor's (engineer's) projects as a diploma thesis very often are prepared in the field of Analytical Chemistry. The same is with Doctoral Studies, very often students choose subject matter connected with Analytical Chemistry. It is why each year we have about 100 doctorate (Table 3) in the field of Analytical Chemistry. The laboratory on Polish universities are well equipped in specialist apparatuses (HPLC, GC, GC-MS, LC-MS, NMR, CI, ICP-OES. ICP-MS, AAS) but it's strongly depended on university profile and how big it is. Students can participate in the scientific research carried on by the didactic staff, especially doing diploma thesis or doctorate. Other way of teaching are summer schools, postgraduate studies and courses from specific techniques organized at the most of Polish universities.

The big challenges for teaching is its international dimension. International cooperation is very important for education. It gives the chance for students to realize their ideas in different laboratories, where their can meet new problems and new tools for solving the problems. It's very important also for a students self-development. Such cooperation is especially profitable in the field of analytical chemistry. Students can utilize a modern and expensive equipment, which doesn't exist at home university, for example for neutron activation (INAA) methods there is a need of nuclear reactor, which can be available only in few scientific centers.

Table 3 Masters, PhD, habilitation and professors in 2003-2012

University	Master	Bac.	PhD	Habilita-tion	Prof.

Wrocław University of Technology	**75**		**8**	**2**	**1**

Students and staff exchange can be realized in the frame of LLP ERASMUS Program, very popular in Europe. Our department (Department of Analytical Chemistry, Gdansk University of Technology) has more then 50 Bilateral Agreement with different universities in Europe. Each year about 10-12 students are doing their thesis abroad in the field of Analytical Chemistry. Also some of our doctoral students are preparing part or even all their PhD thesis abroad in cooperating universities. Each year about 5 foreigner students and doctoral students are doing their thesis or part of Ph.D. thesis in the field of Analytical Chemistry in our department. We cooperate in this field not only with European universities, but also with Canada, USA, South Africa, Israel etc.

Our department participates in two European projects for Master Studies. The first one - *European Joint Masters in Quality in Analytical Laboratories (emQal)* (in the frame of ERASMUS-Mundus) - is coordinated by University of Algarve and except of University of Algarve and Gdansk University of Technology also universities from Barcelona, Cadiz and Bergen participate in this project. GUT in the academic year 2009/2010 played role "the host university". The second program, *Euromaster, Analytical Science at the Interface* is coordinated by University of Pau and University of Aberdeen, Gdansk University of Technology, University of Oviedo and University of Liege are the member of the project.

23. The other activities in the frame of international cooperation are exchange of teaching staff. Our teachers give lectures at other European universities and we invite teachers from abroad (each year about 15 scientists), the best specialists, for courses at our university, especially for doctoral students. Its courses (free of charge) are open also for teaching staff from our university as well as for students from other universities located in Gdansk and the vicinity. It promotes the European and world dimension and improves the quality of education by encouraging innovation in education. From 2003 to 2006 Gdansk University of Technology has the Centre of Excellence in Environmental Analysis and Monitoring (CEEAM) financially supported by the European Commission. During this time CEEAM, among other things, edited 6 books in the field of Analytical Chemistry and organized as the educational activity:

- summer school 2003 "New Horizons and Challenges in Environmental Analysis and Monitoring" (50 participants);

- summer school 2004 "Analysis of Environmental and Food Pollutants (30 part.);
- summer school 2005 "Chemometric Aspects of Environmental Analytics" (30 part.);
- 3 courses: High Performance Liquid Chromatography, Sample Preparation for Analysis and Biotests in Assessment of Environmental Pollution;
- International Seminar for PhD students.

Similar activity you can find also in other Polish universities. Very popular is also CEEPUS (Central European Exchange Program for University Studies). Other activities, for example:

- Nicolas Copernicus University from Torun has more then 10 Bilateral Agreements in the frame of Erasmus Program. In The Research Educational Center BioSep, located at Faculty of Chemistry, each year more then 25 Polish and more then 10 from abroad participants attend courses from Analytics in Environment Protection. It's the center training in the field of chromatographic and electromigrative methods, validation and sample preparation. There are 2 Net-programs CEEPUS;

- Jagiellonian University in Cracow has very active cooperation with Nottingham Trent University (common diplomas), Université des Sciences et Technologies de Lille (courses), Lund University, Strathlyde University etc. UJ is a member of Erasmus-Mundus (ASC – Master of Science: Advanced Spectroscopy in Chemistry) and TEMPUS, projekt nr JEP_41105_2006 pt. „Education System in Forensic Sciences for the Republic of Macedonia" (EDUFORMAK);

- Wroclaw Univeristy organizes summer schools from analytical chemistry for students from University of Minnesota, Duluth, USA (for 11-16 students);

- Warsaw University of Technology has more then 20 Bilateral Agreements in the frame of Erasmus Program;

- Technical University of Radom participates also in a lot of programs, as: courses „Principles and Applications of Metrology in Chemistry; TrainMic - Training in Metrology in Chemistry (network in the frame of EC Research Center, coordinated by Institute for Reference Materials and Measurements, Belgium) and SURUZ - Scientific Network-Surfactants and Dispersed Systems in Theory and Practice, AIRCLIM – NET.

In our opinion teaching of Analytical Chemistry at Polish universities is on good level and is realized by well prepared stuff with modern aspects of teaching. The courses contains, except of traditional classical Analytical Chemistry, also very modern techniques and the assurance of results quality and validation of methods are included. The practice part is carried on in well equipped laboratories with modern apparatuses. The graduated students are well prepared to the work in modern industrial and environmental laboratories.

13th International Educational Technology Conference

The effect of different interaction levels on instructional design learners

Magdy Aqel[150]

Palestine,Gaza, Islamic Univesrsity o f Gaza

Abstract

The study examines the effect of different interaction levels on instructional design learners, the instrument of this research was a Assessment sheet to collect data about students' instructional design course, The sample consisted of (26) males and (21) females from master program students at the Islamic university of Gaza- faculty of education, the web environment of this study based on different interaction types such as learner to (learner, teacher, content and interface), the web environment also used different interaction levels (passive interaction, limited interaction, complex interaction and real time interaction). The findings from this study showed that there was an statistical difference at($\alpha \leq 0.05$) between instructional design skills before and after the study in favor to using different interaction levels after the study, also there no statistical difference at($\alpha \leq 0.05$) between males and females in instructional design skills after the study

Key words: Instructional design, interactive levels, web environment.

Introduction

Interaction in a traditional classroom is much different than the interaction that occurs in a Web-based course (Thurmond & Wambach, 2004), This difference due to the environment of the web, it consist of much stimulus and response.

Gilbert and Moore (1998) note that an accepted definition of interactivity in the literature on computer-mediated instruction is a reciprocal exchange between the technology and the learner, a process which he says is referred to as "feedback." Gilbert and Moore use the terms "interaction" and interactivity" interchangeably, Wagner (1994, 1997) draws a sharp distinction between them. Like Gilbert and Moore, she says that "interaction" is an interplay and exchange in which individuals and groups influence each other Roblyer & Ekhaml(2004), Chickering & Gamson (1987) also define The concept of interaction as a core element of the seven principles of good practice in education.

Literature review

Types of interaction

This research used four types of web-based interaction (learner-teacher, learner-learner, learner-content and learner-interface), see fig.1, these types of interaction are used the most by previous studies (Moore & Kearsley, 1996; Swan, 2001; Leasure et al., 2000; Palloff & Pratt, 2001; Chen, 2002; Ehrlich, 2002)

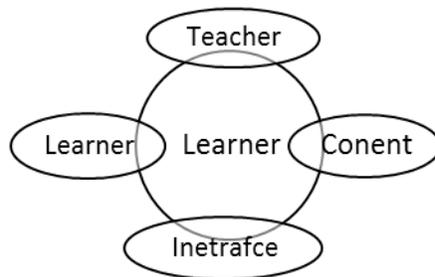

Fig. 1. Types of interaction

levels of Interaction

"The Levels of Interactivity as defined by the Department of Defense (DoD) provide a basis for developing effective and interactive eLearning in accordance with your corporate and training objectives". (Carter & Lange, 2005).
Carter & Lange(2005) also classified the interaction into Four levels:

Level I: Passive
The interaction in this level is so simple, The learner acts solely as a receiver of information. The learner is required to read the text on the screen, view graphics, illustrations, charts, and use the navigational buttons to progress forward through the program or move back.

Level II: Limited Interaction
The learner makes simple responses to instructional stimulus, The eLearning includes learning activities that listed in Level I as well as scenario-based multiple choice and column matching related to the text and graphic presentation.

Level III: Complex Interaction
The learner makes a variety of responses using varied techniques in response to instructional stimulus, The responses include those listed for a Level II as well as text entry boxes and manipulation of graphic objects to test assessment of the information presented.

Level IV: Real-time Interaction
The learner is directly involved in a life-like set of complex responses.This involves engaging the learner in a simulation that mirrors the work situation with stimuli-and-response coordinated to the actual environment.

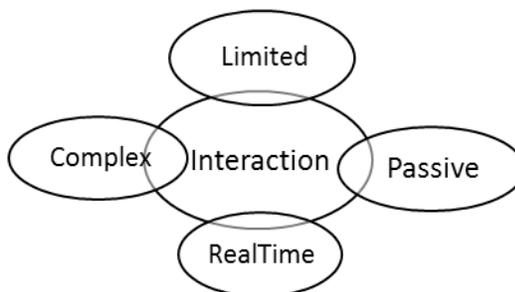
This research used all of previous levels in learning the student how to start there instructional design, see fig.2-6, web-based environment was built using all the previous levels, students used very simple interaction(Passive) as button navigations, also the students used the others levels such as answering question(Limited Interaction), Write sentences(Complex Interaction) and work in simulation screen(Real-time Interaction) to design an activity.


Fig. 2.Ineraction levels

Fig. 3.Passive Interaction level(hyperlink navigation)

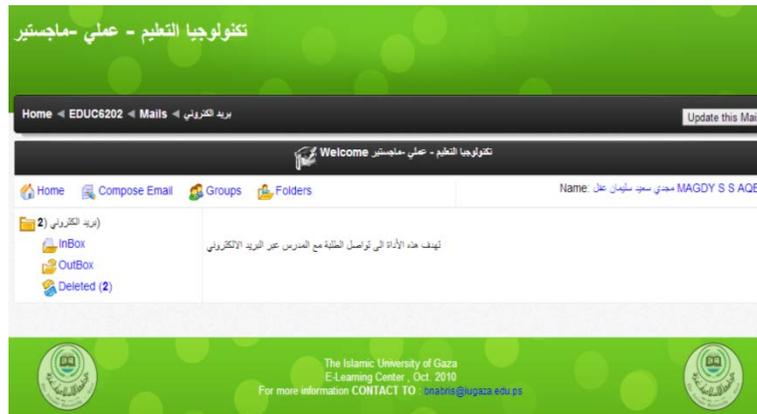
Fig. 4.Limited Interaction level(explore the content)


Fig. 5.Complex Interaction level(internal email)
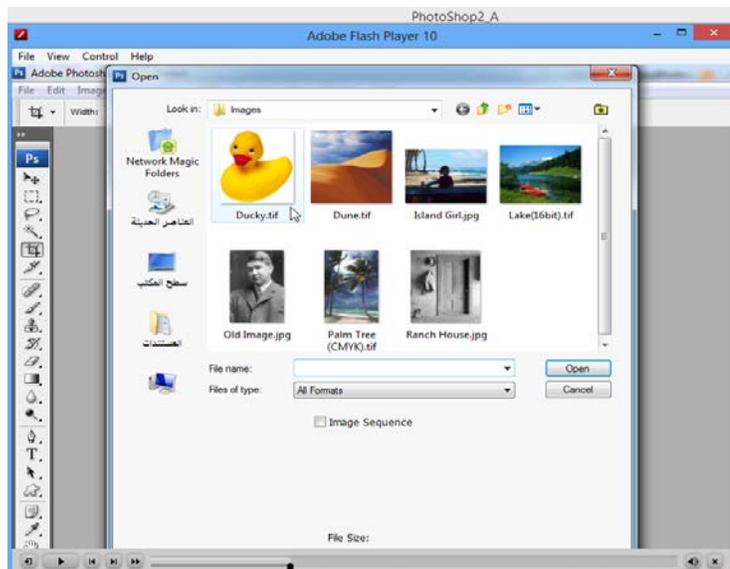

Fig. 6.Real-time Interaction level(Using simulation)

Instructional Design

Effective teaching begins with effective planning, Instructional design provides a systematic process for planning instructional events based on a systematic process of applying principles of learning and instruction to plans for instructional systems (Gagné & Driscoll, 1988; Gagné, Wager, Golas, & Keller, 2005), instructional designers and developers use principles of learning and instruction to inform their instructional design practices (Seels & Glasgow, 1998).

In this research, students tried to build their suitable instructional design by themselves, that is like shifting instructional design principles and practices from objectivism to constructivism (Bonk & Cunningham, 1998; Cooney, 1998; Jonassen, 1992).

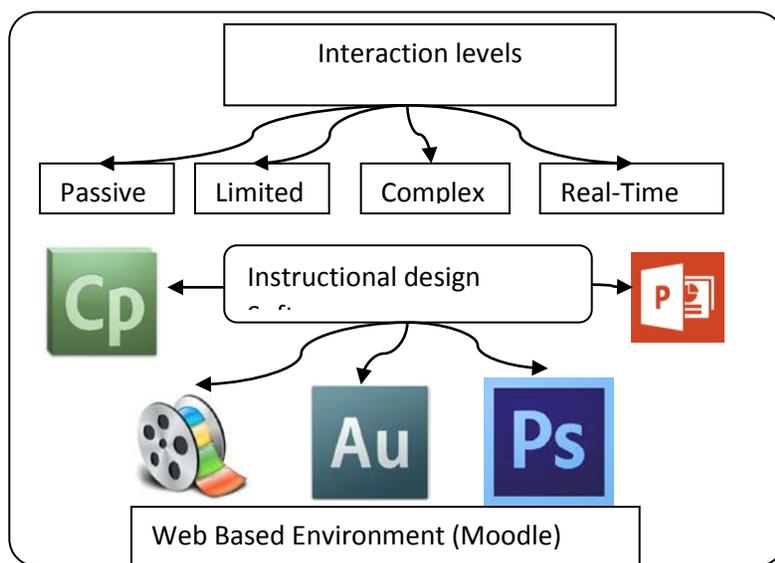
In this research, The researcher developed web-based environment with different interaction levels, see fig7, learning course management system(Moodle) was used in this research that is already available at the Islamic university of Gaza(IUG), also the students learned many instructional design software such as (MS PowerPoint, Adobe Photoshop, Adobe Audition, Windows moviemaker and adobe Captivate), as shown in figure6, all interactive levels mixed in the web-based environment.


Fig. 7.Instructional design environment

The Aim of Research

The aim of this research is to examine The effect of different interaction levels on instructional design learners, This study seeks to answer the following research questions:

- What are the interaction levels that need to learn the master student how to design their instructional program?
- is there any statistical difference at($\alpha \leq 0.05$) between instructional design skills before and after the study?
- is there any statistical difference at($\alpha \leq 0.05$) between males and females in instructional design skills after the study?

Scope and Limitations

the sample of this study consisted of (26) male students and (21) Female student from the master program at the faculty of education level(1), the sample included all that students at level(1) in the term (2012-2013), Four interaction levels were used in this study(passive, limited, complex and real time).

Instruments

The research develop an Assessment sheet to measure the difference in students skills before and after the study (appendix A), the Assessment sheet consisted of (7) main domain and (30) sub domain, The instrument has a Cronbach alpha reliability score of (0.82).

The content of the instrument was validated by three methodology teachers and five instructional technology teachers with more than 10 years working experience.

Results

To answer the first question of this research which titled " What are the interaction levels that need to learn the master student how to design their instructional program?", the researcher used four levels of interaction (passive, limited, complex and real-time) that classified by Carter & Lange(2005).

The second question of this research titled as "Is there any statistical difference at($\alpha \leq 0.05$) between instructional design skills before and after the study?", the researcher used t-test to determine if there were significant differences between the groups in the instructional design skills. Table 1 and Table 2 shows the results of t-test comparison of pre/post test skills for (males).

Table 1. t-Test comparison of pre/posttest instructional design skills for males

Group	N	Mean	SD	t-value	p	Effect size
Pre Test	26	7.78	5.33	58.9	< .05	0.9
Post Test	26	84.28	4.51			

Table 1 shows that there is a significant difference between pre-test (mean = 7.78, SD=5.33) and post-test (mean = 84.28, SD=4.51) marks, t (25) = 58.9, p < .05. The mean scores indicate that post-test have significant higher achievement towards the interaction levels than pre-test.

Table 2.t-Test comparison of pre/posttest instructional design skills for Females

Group	N	Mean	SD	t-value	p	Effect size
Pre Test	21	7.71	4.95	75.02	< .05	0.9
Post Test	21	84.648	3.66			

Table 2 shows that there is a significant difference between pre-test (mean = 7.71, SD=4.95) and post-test (mean = 84.64, SD=3.66) marks, t (20) = 75.02, p < .05. The mean scores indicate that post-test have significant higher achievement towards the interaction levels than pre-test.

The Third question of this research titled as" is there any statistical difference at($\alpha \leq 0.05$) between males and females in instructional design skills after the study?", the researcher used t-test to determine if there were significant differences between the males and females in the instructional design skills. Table 3 shows the results of t-test comparison of males/females after the study.

Table 3: t-Test comparison of males/females instructional design skills after the study.

Group	N	Mean	SD	t-value	p
males	26	84.28	4.51	0.29	> .05
females	21	84.64	3.66		

Table 3 shows that there is no a significant difference between males (mean = 84.28, SD=4.51) and females (mean = 84.64, SD=3.66) marks, t (45) = 0.29, p > .05. The mean scores indicate that males have not significant higher achievement towards the interactive levels than females.

CONCLUSIONS

This study aimed at investigating how different interaction levels affects students' skills in instructional design, four interaction level(passive, limited, complex and real-time) were used at web based environment(Moodle). Assessment sheet was developed to collect data about students' instructional design, From the results of this research, using interaction levels was very effective table(1,2), also males have not significant higher achievement towards the interaction levels than females.

Appendix A. Assessment sheet

Instructional design Skills	Weak	Good	Excellent

A-Analysis in instructional design model.

1. Use exact instructional model.
2. Follow the instructional model steps.
3. Write the learning objectives in details.
4. Using suitable evaluation.
5. Detect the learning content.
6. Design content scenario.

B- Learning Resources.

7. Collect the needed learning object from the web.
8. Design the suitable learning object.
9. The learning resources suitable for learning objectives
10. Use learning object in high quality.

C- Texts in instructional design.

11. Use the font color with suitable background
12. Highlight the main object learning
13. Use suitable font size
14. Use suitable font style

D- Images in instructional design (Using Adobe Photoshop).

15. Add a suitable filter for the used image.
16. Use high quality image.
17. The image relate to leaning object.
18. Merge one more image file.

E- Sound in instructional design (Using Adobe Audition).

19. Add a suitable filter for the used sound .
20. Use high quality sound.
21. The sound relate to leaning object.
22. Merge one more sound file.

F-Implementation in instructional design(MS PowerPoint).

23. Build his/her master slide.
24. Use button navigation.
25. Use specific motion.
26. Detect interactions navigation.
27. Use mouse effects.

G- Evaluation in instructional design.

28. Use suitable evaluation after each learning objective

29. Validate the instructional design by the experts

30. Build the suitable feedback according to student results

The Effect of Game-Based Learning on Students' Learning Performance in Science Learning – A Case of "Conveyance Go"

Eric Zhi Feng Liu[a,b151], Po-Kuang Chen[a]

[a]Graduate Institute of Learning and Insruction, National Central University, No.300, Jhongda Rd., Jhongli City, Taoyuan County 32001, Taiwan (R.O.C.)

[b]Center of Teacher Education, National Central University, No.300, Jhongda Rd., Jhongli City, Taoyuan County 32001, Taiwan (R.O.C.)

Abstract

Many previous studies have demonstrated that learning motivation and efficiency can be enhanced through educational games, and the recent introduction of enriched gaming elements has made such games increasingly popular. The main purpose of this study was to help elementary school student learn science-related concepts by participating in an educational card game, named Conveyance Go. We then investigated the perceptions of students regarding the integration of the game into science learning as well as the educational benefits of the game with regard to learning performance. A one-group pretest-posttest design was used with eighteen 5th grade students from a single elementary school in northern Taiwan. The students demonstrated positive attitudes toward the use of the educational card game in science learning. Our results also demonstrate the effectiveness of the proposed education card game in improving the students' scientific knowledge of transport and energy.

Keywords: game-based learning; educational card game; science learning; game design

INTRODUCTION

Papert (1991) advocated the promotion of learning through real-life situations and the shaping of concepts through making. In recent years, many researchers have investigated the effectiveness of digital technology in the promotion of learning, the process of which is often conducted using games. The incorporation of games into education is often more effective than traditional teaching methods in enhancing learning motivation, active participation, and concentration among students. Furthermore, games can enhance the social skills of students as well as improve their skills in understanding and solving problems (Kirikkaya, Iseri, & Vurkaya, 2010).

Game-based learning has recently become an important domain of research. In a review of articles in seven major SSCI journals associated with technology and learning between 2001 and 2010, Hwang and Wu (2012) discovered that Taiwanese researchers published 22 articles on game-based learning, second only to researchers in the US (30 articles) and followed by researchers from the UK (20 articles). These studies focused primarily on the achievements, motivation, and attitude of students involved in learning various subjects and most of the researchers in Taiwan investigated the issue of learning achievements (Liu, Lin, Hsiao, Chen et al., 2009). Game-based learning has been applied in many science-related school subjects. Yien, Hung, Hwang, & Lin (2011) used game-based learning in a nutrition course, discovering that this approach was more effective in enhancing the learning effectiveness and attitudes of students than traditional PPT teaching and even influenced their dietary habits. Using a game similar to Monopoly to teach students about the area of circles (Lin, Liu, Chen, Liou, Chang, Wu, & Yuan, 2013) and obtained similar results. Through game-based learning, participants learn more actively and with greater interest, enabling the learned content to leave a deeper impression than would be possible using conventional methods (Papastergiou, 2009).

Most studies on game-based learning have focused on digital game-based learning. Digital games provide animated graphics and audio effects as well as immersive stimulation. Lin and Liu (2009) included game

mechanisms in typing practice, inviting learners to beat their rivals. Although the progress of these learners was not significantly greater than that of learners using conventional teaching techniques, their typing skills were significantly better than before the experiment. Lin and Liu also observed that learners in the game mechanism group spent considerably more time practicing typing than their counterparts in the regular class, thereby demonstrating that multimedia can influence the learning motivation of students. Chiang, Lin, Cheng, and Liu (2011) explored the influence of various computer games on the flow experience and positive emotions of students and discovered that violent games did not induce violent emotions or conduct in students. Moreover, they found that both violent and non-violent games were capable of eliciting flow experience and positive emotions. As shown in these studies, digital games can enhance learning motivation and arouse positive emotions in students; however, a digital game environment cannot provide face-to-face interaction.

In a classroom situation, teacher-student interactions and student-student interactions exert a profound impact on learning. Unlike interactions in digital games via computers, face-to-face interaction exposes people to human expressions, physical action, and verbal tones (Billinghurst & Kato, 2002). Thus, using educational card games as a medium for game-based learning could enhance the direct interpersonal interaction between teachers and students as well as among students to a degree unmatched by the sound and audio effects of digital games. This study designed a science lesson using an educational card game. By handling the cards and moving the character pieces themselves and competing or cooperating with peers through direct verbal communication, students can interact with one another and learn happily from within.

In recent years, research on learning with card games has made a substantial contribution to the discipline. Siegler and Ramani (2008) speculated that a lack of skills in the use of numbers among children from low-income households might be due to their limited opportunities to play number games during their childhood. Thus, a series of number card games for children from low-income households was designed to narrow the differences between poor children and those from middle-income households. Their results demonstrate that the learning effectiveness of high-priced equipment for digital games can be matched by using inexpensive or even self-handmade card games. Alexander, Sevcik, Hicks, and Schultz (2008) designed a card game to teach students the symbols of chemical elements and gain subject knowledge. Kirikkaya, Iseri, and Vurkaya (2010) designed a card game to assess one's knowledge of galaxies and space; the game is also applicable in areas other than learning. Through semi-structured interviews, they discovered that this educational card game not only increased the learning motivation of students but also assisted them in the formation of higher conceptual abstractions. The use of such a card game for assessment purposes could help to reduce test anxiety and promote better learning effectiveness. Using thematic cooperative learning, Huang, Liu, Liu, and Lin (2012) had participants in a teacher education program divide into groups to design card games with subject knowledge for secondary level students. Their results showed that the process of designing educational card games significantly increased self-efficacy.

Few Taiwanese studies have explored game-based learning in the form of educational card games. It is hoped that the achievements of this study will demonstrate the effectiveness of card games in promoting interpersonal interaction during the process of learning.

2. Methodology

2.1. Research participants

This study recruited 18 students from an elementary school in northern Taiwan, of which 10 were male and 8 were female. In age distribution, the participants comprise 3 third graders, 2 fourth graders, 7 fifth graders, and 6 sixth graders.

2.2. Procedure

The total duration of the teaching experiment was 120 minutes. Prior to the formal learning activity, a 20 minute pre-test was administered to assess science knowledge according to a standard assembled by the authors. Following the pretest, the participants were randomly divided into groups of 4 or 5 students. The rules of the game, Conveyance Go, were outlined in a 10 minute explanation. The formal learning activity with educational card game then proceeded for 60 minutes. After the learning activity, a a post-test (containing the same questions as the pre-test but reordered) as well as a learning satisfaction questionnaire were administered. The post-test and questionnaire required 30 minutes for completion.

2.3 Design of science educational card game Conveyance Go

This study referred to the revised Bloom's Taxonomy established by Anderson and Krathwohl (2001) as the design standard for the educational card game. In the knowledge dimension of the revised Taxonomy, knowledge is divided into four levels from concrete to abstract: factual knowledge, conceptual knowledge, procedural knowledge, and meta-cognitive knowledge. Cognitive processes are divided into six levels from low complexity to high: remember, understand, apply, analyze, evaluate, and create. The primary scientific concepts selected for development in the card game were found in the "Means of Transport and Energy" unit of a fourth grade science text. The subject knowledge was divided as follows (Chen, Liu, Lin, Chang, Hsin, & Shih, 2012):

1. Remember – Factual knowledge: Pictures and text on the game cards present the appearances and names of various forms of transport.

2. Remember – Conceptual knowledge: Game cards explain the amount of energy required by each type of transport.

3. Understand – Conceptual knowledge:
(1) If a given form of transport consumes petroleum products (oil), then the game card will also show a pollution value, demonstrating the principle that the use of oil produces pollution. Transport modes that use electricity, wind power, or solar power, do not produce pollution.

(2) Solar power energy cards can be used to replace other energy cards such as oil to demonstrate the convenience and wide applicability of solar power.

(3) Two types of terrain are included in the game (land and sea) and three forms of transport travel by land, sea, or air. This helps students to understand the differences among various modes of transport with regard to their appearance and the environment in which they operate. In the game, ship transports can only travel by sea, land transports can only travel by land, and aviation transport is not limited by terrain. This helps students to understand the limitations of each form of transport.

(4) Problem cards require that students group transport modes according to energy source, appearance, or function. Based on the answers provided by the students, appropriate feedback may be given.

4. Understand – Meta-cognitive knowledge:
(1) Event cards integrate daily environmental concerns (such as vehicle emissions testing) into the content of the game.

(2) The event cards also include an 'Oil Crisis' card. When this card appears, all oil energy cards are useless, demonstrating that oil depletion will occur someday.

5. Apply – Procedural knowledge: Once the students understand the rules of the game, they can play the game smoothly according to a given procedure.

6. Analyze – Procedural knowledge: Two strategies are provided to score the games and students may adjust their tactics according to the circumstances of the game.

7. Evaluate – Meta-cognitive knowledge: During the game, students learn via self-discovery by evaluating the pros and cons of each transport mode.

In designing the educational card game in this study, we referred to the seven design principles proposed by Liu (2011): Analyze the traits of the learners and understand their prior knowledge; establish clear teaching objectives and select appropriate gaming equipment, combine the teaching objectives with the game content; remember that teaching is the primary goal and that the game is a supplementary tool; take advantage of game characteristics to arouse student interest; enable students to enjoy learning while they take control of learning; and periodically assess learning effectiveness and improve teaching.

We also evaluated the game design according to the five indices proposed by Liu and Lin (2009): Whether the game information is in accordance with the game descriptions of the learners and the game includes a learning theme; whether the pictures in the game are associated with the learning theme and can arouse student interest; whether the structure of the game is simple and operations are easy to learn; whether the overall content of the game

is interesting, and include many pictures for presentation; and whether the game provides instant feedback. By referring to these principles, we ensured that the card game designed in this study is capable of conveying subject knowledge that is easy to learn and elicits the interest of participants.

2.4 Learning satisfaction scale

We developed a satisfaction scale according to the structure of the technology acceptance model (TAM) to evaluate the degree to which students accepted the educational card game according to four constructs: Perceived usefulness, perceived ease-of-use, attitude towards usage, and intention to use (Davis, Bagozzi, & Warshaw, 1989). Each construct included five question items. To improve scale validity, we enlisted the aid of three experts (two elementary school science teachers and a scale development expert), to revise the descriptions in the question items. A pilot test was administered to twenty students. Reliability analysis of the pilot test results returned a Cronbach's α and remaining number of question items in each construct after item elimination were $\alpha=.84$ and 4 items in perceived usefulness, $\alpha=.66$ and 3 items in perceived ease-of-use, $\alpha=.78$ and 4 items in attitude towards usage, and $\alpha=.63$ and 3 items in intention to use. The questionnaire included 14 question items after item elimination, with a reliability of $\alpha=.82$. We employed a five-point Likert scale in which the students answered strongly agree (5 points), mostly agree (4 points), agree (3 points), disagree (2 points), or strongly disagree (1 point) based on their learning satisfaction.

2.5 Science assessment

The primary objective of the science assessment tool was to gauge the comprehension of elementary school students with regard to scientific concepts associated with transport modes and energy. The content of the assessment was based on the learning content in the unit. In the development of the assessment, we referred to problems and questions in textbooks compiled by Ministry of Education and made revisions according to suggestions provided by three elementary school science teachers. The assessment included eight true or false problems, six multiple choice problems, and six matching problems, each contributing points for a total score of 100 points. The assessment was given to the participants before and after the learning activity, with the problems from the pretest reordered in the posttest to reduce the effects of repeated exercise.

3. Results

3.1 Acceptance of elementary school students towards educational card game

Mean and standard deviation derived for each construct of the satisfaction scale are presented in Table 1. The results show that the students exhibited consistently positive responses for all constructs. Perceived usefulness and intention to use received particularly high scores, indicating that the students felt they could gain scientific knowledge by learning with the card game and that it was useful to the learning of science knowledge. These results also show that game-based learning aroused student interest. The results in future intention to use and perceived ease-of-use show that the students readily accepted this learning method, felt that it facilitated learning, and hoped to continue using this method in the future.

Table 1 Mean and standard deviation of scores in the student satisfaction scale

	Mean	Standard deviation
Perceived usefulness	4.14	1.08
Perceived ease-of-use	3.85	1.16
Attitude towards usage	4.00	1.10
Intention to use	3.85	1.21

3.2 Influence of educational card game on science learning achievement among elementary school students

We performed a dependent sample t-test to examine whether the participants improved in the science assessment after playing the educational card game. The results indicate that the posttest scores of the students (M=92.13, SD=8.80) were significantly higher than the pretest scores (M=83.33, SD=11.43) (t=-3.319, p<0.01), as shown in Table 2. According to these results, we can infer that the scientific card game designed in this study, Conveyance Go, can assist students in gaining knowledge regarding transport modes and energy.

Table 2 Results of paired sample t-test on science assessment for elementary students

	Mean	Standard deviation	t
Pretest	83.33	11.43	
			-3.32**
Posttest	92.13	8.80	

** p<0.01

4. Discussion

The purpose of this study was to determine whether game-based learning using cards could assist elementary school students in the acquisition of knowledge related to energy and transport. The participants displayed positive attitudes toward the use of the science card game and felt that the approach contributed to learning. The majority of students accepted this learning method and hoped to continue using this approach in the future. The students also expressed that learning with the educational card game could assist them to gain scientific knowledge and that the game-based learning method increased their interest in modes of transport and energy. The pretest and posttest results demonstrate that the card game significantly increased the student's scientific knowledge related to energy and means of transport. These results correspond to the use of digital games in game-based learning in previous studies (Lin et al., 2013; Papastergiou, 2009; Siegler & Ramani, 2008; Yien et al., 2011). Moreover, the use of the card game to promote game-based learning also enhanced learning motivation and learning effectiveness.

We suggest that future studies conduct in-depth surveys on student attitudes towards learning using card games to identify the elements that arouse interest and how knowledge is acquired from playing games. The authors and the homeroom teachers discovered that following the interactions elicited by the card game, the students became closer to their teacher and their peers. The students also preferred a grouped arrangement rather than single separated arrangement in rows. Thus, future studies could conduct further analysis on the learning process and student-student interaction during educational card games and investigate how they influence game-based learning. Finally, this study focused on science; we suggest that future researchers create educational card games for other subjects such as English and mathematics.

[b]Selçuk University, Faculty of Business Administration and Economy, Konya, Turkey

Abstract

Today, the situation of the higher education in the state and the society has been more important. While the values of higher education have been determining by the external factors, itself has been increasing the effect power on higher education institutions as an external factor. The cause and result of this transformation has been intersection ares of universities with the dynamics of global competition. As a result in this process universities have taken care of their relationship with stakeholder to able to read the changes beter. Academicians are in the first place among stakeholders without a doubt. Gaining qualifications of universities in the sense of regional and international in this environment is appearing as an important result of this process. This point has provided a platform of European Higher Education Areas theorotical reasons. Thus, both the variation process and the discussions about theories and applications of European Higher Education Area have always been tha agenda.
From this point the subject of this study is researching the correlation between the changing higher education values and EHEA requirements in the axis of a conceptual model designed for the satisfaction of stakeholders and the quality level of universities. In this study first, historical and conceptual transformation of higher eduation and university has been discussed. Second, an analytical evaluation of changing values of higher education has been presented. Also the history of European Higher Education Area and its components have been searched with a critical view. Consequently the process and system suggestions have been developed for building up cooperation with stakeholders and meeting the targets of EHEA through a conceptual model.

Keywords: Changing values, EHEA, higher education,

1. Introduction

Higher education is a description which has problem and discussion in what accepted as "higher" in higher education and used for third degree education institutions after all second degree education (high school) that awards diploma or not at the end of study (Denman, 2005: 17).

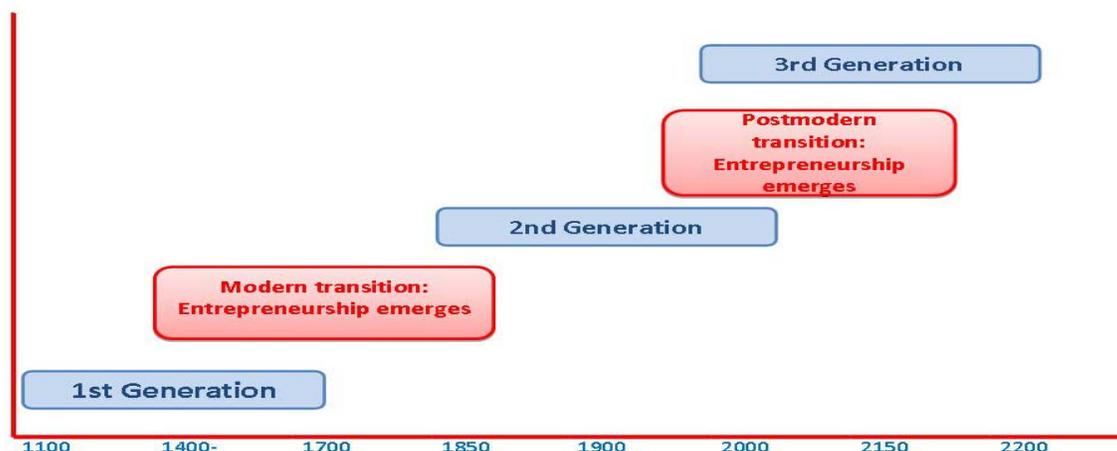
Until the 19th century, according to the dominated thought, Universities, the most fundamental higher education, is a place where universal knowledge is taught and its purpose is intellectual. In the 20th century, under pressure of commercial thoughts, education has been redefined with thought of that education should be practicable to daily living immediately and practical. According to this understanding, education is considered as a process which has been generated as a public sphere, collecting these people as nationals who have power on knowledge generation and acquisition and being generated political agents at the same time with not only knowledge (Giroux, 1996).

Today, universities have an important role to develop and advance countries. Universities, which are ranked as head actor in social transformation in itself and contributing for changing, rank on focus point of transformation based knowledge society and globalization. Generally, reflection of political, economic and social developments on higher education brings up management and quality into the agenda (Vidovich, 2002).

Influences of middle age, which is called as feudal period, generating agricultural society and after then modern period which nation states increase with industrial revolution after commercial development and post-modern period with knowledge age and globalziation, are great to the history of world. In research of university history, it is shown that three periods have been based on literature.

Three mentioned periods are called as three generations as well as being transition period among these periods. Obtaining three generation as interactive with together, being principles of modern period university influences

---

which has been accepted commonly among today's university, show that university history is an articular and integrated structure (Wissema, 2009; Kyrö and Mattila, 2012). Three periodic university histories under Middle Age have been summarized on Figure 1.1:


Resource: Wissema, 2009; Kyrö and Mattila, 2012.

Figure 1. Universities development history

University, which has taken shape in Middle Age, has brought some qualifications into today. A name and central place, academicians, students, courses, exams and degrees which have autonomy in a certain extent, an administration, which has "faculties", may be shown samples for extant fECTS. Besides, Bachelor of Arts, master's degree and doctor of philosophy terms have been used for Middle Age (Kerr, 1982).

According to Humboldt who is the founder of the first sample of modern university, ideal university purpose is to be increased total human knowledge with research method. It is required to be redefined the relation between student and academician. According to this, one sided relation led to from academician to student between these give way to a relation based on interaction. Thus, true science may be generated from interaction between experience and excitement. Here, lecturer presents experience while students present excitement. Relation based on interaction, provides to reach true science. Thing to relate is to reveal the characteristic structure of model. According to this, university institution should have academic freedom. Academic freedom has two dimensions called "*lehrfreiheit*" and "*lernfreiheit*". It is defined that *Lehrfreiheit* is freedom to choose the subject which lecturer will research and teach and *lernfreiheit* is freedom to choose thing that the student want to learn. This freedom, given to lecturer and student provides to relate priceless intellectual relations between them (Lay, 2004: 48).

Modern university is organized in various shapes in different counties from 1900s until today and relates different relations with society, state and business world. Especially, at the end of the 20th century, it is considered that university institution is not organized and arranged around only one idea with globalization, incorporating-business administration and becoming marketable in a part of countries influenced by America and America. "Market" is replaced instead of "government" on higher education policy of some countries with free market conditions. Student leads to "customer", lecturer/assistants lead to "supplier" and learning/teaching relation lead to "a secret contract" between seller and purchaser (Peters, 2007).

For 1980s, the mentioned developments, which generate in the field of innovation policies, result to be established close relations different from past between university and industry. This tendency concretized with science parks, innovation center and autonomous brokerage establishment which has been established in order to generate the required ground for cooperation and gathering the university and industry, has been referred as rise of "entrepreneur university" system (Lazzeroni and Piccaluga, 2003: 38-39).

The other important name which contributes to development of "entrepreneur university" term is J. G. Hans Wissema. In 2009, published "Towards the Third Generation University: Managing the University in Transition" he stated that research and education activity are two fundamental components of modern university mission; pointed out that entrepreneur university mission includes knowledge sage in addition to this two activity (Wissema, 2009: 29).

According to Wissema, typical modern university deals with only research and education activity. In the end of this activity, it is not made effort to practice the produced knowledge; this field is left for other institution entrepreneur (Wissema, 2009: 39).

Increasing role of knowledge in society and university in economy, results to be analyzed with triplex of university-industry-government (Triple Helix) relations. This triplex has been generated around university, industry and government as interlocking circles with motivation of encouraging the academic research and economic development. Entrepreneur University, which is a product of constellation, goes beyond education and research functions limits which are primer academic mission. Economic development mission contributes to systematic scientific innovation development and re-establishment of knowledge base (Leydesdorff and Etzkowitz, 2001).

In current situation, change dynamics, which influence the higher education over the world, can be summarized as follow (Aktan, 2007):

- Globalization
- Regional cooperations
- Knowledge society and new Technologies
- Competition
- State reforms
- Increasing the higher education demand in result of population increase
- Becoming widespread of English

The changing process of higher education has driven the universities to create regional and international cooperations. The most widespread of these dynamics developed to keep up with the internationalizing tendency is the Bologna Process. Bologna Process is a structure in which the member countries have no obligation to obey any treaty among nations and put no force over them and in which they are also free to go in accordance with this process. This process, started with the participation of 29 countries – into which Turkey has become a member in 2001, initially aimed to create a European Higher Education Area, but reached to 47 member countries today with their participation outside Europe.

The most important development transforming the European higher education system after the Bologna Process is the transition to the two-three-level system. Most of the member countries in Bologna Process completed their transition to two-three-level system. However, such countries as Germany, Spain and Austria didn't complete their process yet and they have a low number of students involved in this new system (Rauhvargers *et. al*., 2009). For such applications as ECTS and diploma supplement, taken as a key to success in an easily comprehensible and comparative higher education system, which is another important dynamic in Bologna Process, the process has been completed thoroughly in 23 countries starting from the year 2012. The application level of this system is between 50-77% in Turkey (Eurydice, 2012).

In the framework of qualifications, it is seen that such countries as Germany, England and Portugal completed the process in terms of work load, level, learning outcomes, skills and profile description and work steps, and that Turkey has completed most of them. The area in which the countries fail in these terms is the inability to provide a systematic integration by defining the previous education system (Eurydice, 2012).

In terms of quality assurance system, 28 agencies from 13 countries got involved into the European Quality Assurance Register for Higher Education (EQAR) in 2012, which was established in 2008. Such countries as Germany, Austria, Romania, Holland, Spain, Finland, Denmark, France and Ireland are involved in this list at least with a single agency (Eurydice, 2012).

The realization level of the objective to increase the mobility of students, researchers and academicians and to make European Higher Education Area (EHEA) more competitive as one of the biggest aims of Bologna Process was quite low. The rate of becoming a member of EHEA other than EHEA itself was lower than 5% (Eurydice, 2012).

2. Aim and Methodology of the Study

This study aims to contribute to the explainability of the connection between the changing values of higher education and the requirements of European Higher Education Area, which is a regional cooperation, within the transformation process in terms of historical and conceptual context of higher education as evaluated in the introduction in a conceptual model framework. By using the conceptual resolution methods via literature review and

research model in the investigation, the interaction between EHEA requirements are explained within the context of changing values of higher education.

The changing values of higher education and the interaction of EHEA requirements are explained via four main elements. These elements are as follows:

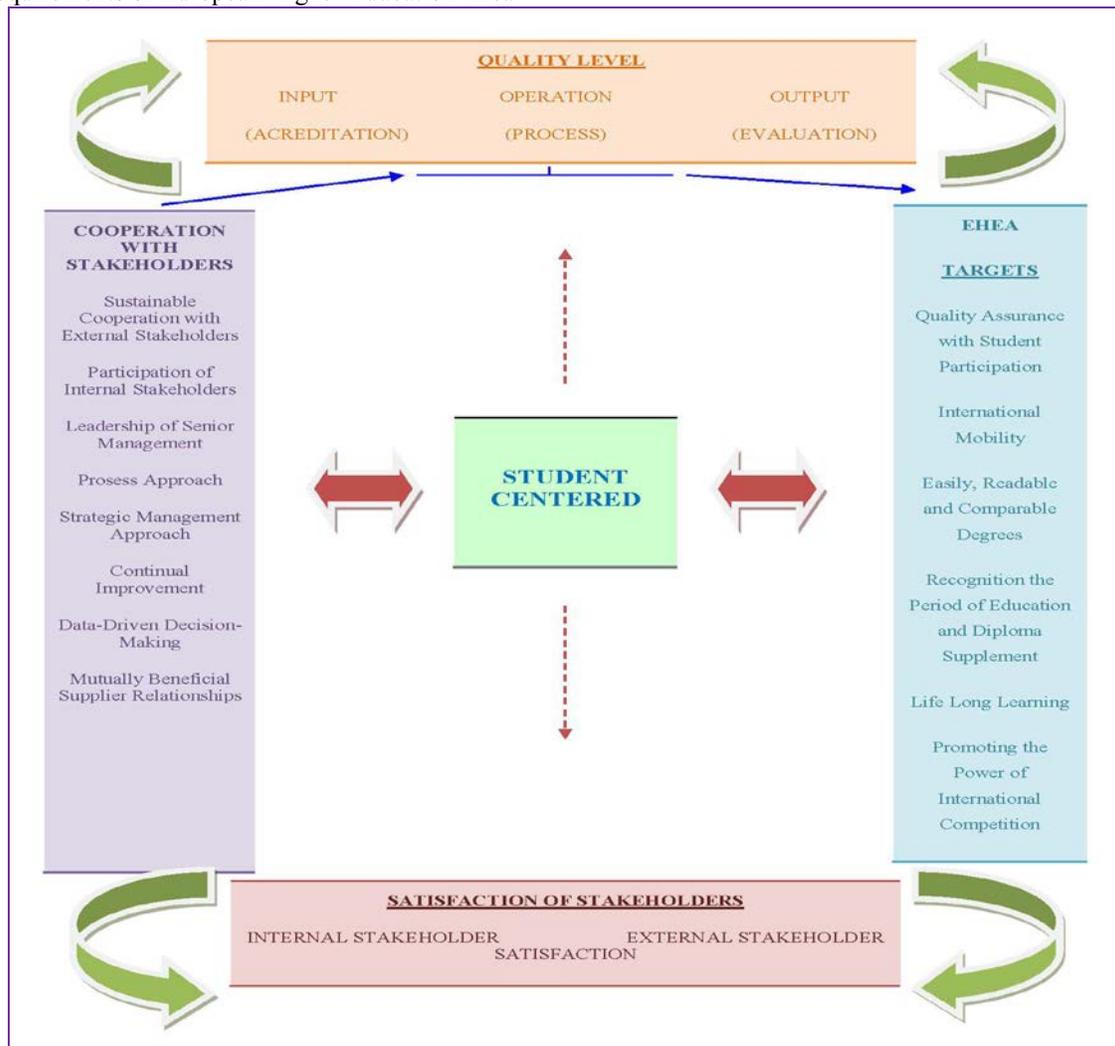
- Quality Level of Higher Education
- Stakeholder Satisfaction in Higher Education
- Cooperation with Stakeholders in Higher Education
- Requirements of European Higher Education Area


Figure 2. Interaction Scheme for the changing values in Higher Education and requirements of EHEA

While the elements of cooperation with stakeholders seen in quality management systems as a variable to affect the quality level and stakeholder satisfaction in higher education are prioritized as a primary factor in the dynamics given in Figure 2, the dynamics of EHEA objectives seen as an exit gate to internationalize the regional universities are taken as a secondary factor. While the circular and integrated interaction setup of the model makes a reference to the dynamic and complicated structure of the changes in higher education, the phenomenon of student-focus, the applications of which have increased a lot inside EHEA and American Universities, is placed in the center. As the models, in which the students are actively involved within all processes and active participation and student centered issues other than student-focus are classified as other elements under this concept, "center" is preferred instead of using the term "focus" in this model. Therefore, it is believed that the participation of both internal and external stakeholders must be involved in all processes at universities. It is agreed that the priority in stakeholder

participation (because the students are both the important stakeholders of the process and direct benefactors of this service) must be directed to the student participation.

3. Conclusion

Bologna Process aims to increase the international power of competition in European higher education system, to generalize the cooperation and mobility among universities in Europe and to protect the autonomy, uniqueness and diversity of these universities. There is also another criticism, which claims that a uniform higher education system removes the diversity in Europe in spite of the positive developments on this issue. Examples of these claims are indicated as overloaded bureaucracy in ECTS, qualifications and quality assurance studies after the transit into two-three –level system (Appleton, 2009; Grove, 2012; Keim and Keim, 2010).

On the other hand, it is thought that the connection and interaction between European Higher Education Area and one of its biggest competitors in American higher education within the competitive system of European Higher Education Area. The studies in accordance with leveling structures of Europe and ECTS applications have increased the interest of America into Europe. With this new three-level structure, it is expected that higher education institutions in EHEA will be more appealing to American students just like the other countries (Ward, 2007).

Many harsh criticisms have been made upon this process in such countries as Germany in which a serious structural transformation underwent in higher education systems after the Bologna Process. The most important criticisms made are that the process has not realized most of its objectives. The scope of these criticisms involve the development of European competitiveness, inability to bring in more students outside of the EHEA, and inability to realize the objectives of student, academician and researcher mobility in higher education (Rauhvargers *et al*., 2009; Eurydice, 2012).

The most important criticism is that uniformization is seen as the worst feature in terms of the standards and qualifications of higher education system in relation to the Bologna Process. It is argues that learning quality is degraded by the shortening of learning durations and lessening it into three years besides compressing the curricula in higher education. In addition to this conclusion, it is also determined that early-graduated students are unable to bring in the economy (Eurobarometer, 2007).

The criticism made to EHEA is summarized under these titles:
- Standardization (Accreditation, ECTS, work load, plans and programs)
- Uniformization (ranking system and qualifications framework)
- Decrease of learning quality (reducing the learning duration)
- Quality control and commercialization of higher education by accreditation
- Starting of a paid education
- Bureaucratization
- Weakness of student mobility

In parallel to the criticisms made so far, the interrogative systematic provision of formational requirement of universities in terms of local needs in European Higher Education Area will cause the perceptions of internal and external stakeholders to be positive in relation to the European Higher Education Area. Taking the criticism into consideration about the applications basing on the systems other than Continental Europe tradition in order to increase the competition between European Higher Education Area and American Universities will contribute to the effectiveness of this process. As a result, the evaluation of this issue with a critical viewpoint on the qualifications levels of European Higher Education Area will reduce the dilemma between standardization and uniformization of European Higher Education Area.

Abstract

The accounting information system, considered as sub-branch of the management information system, produces needed information about internal and external environment of enterprises to make major decisions. In this sense, the accounting information system can be defined as a system that produces financial and nonfinancial information about enterprises' goods, services, market, and consumers etc.

In today's global competition environment, the accounting information system offers information that entrepreneurs need to make versatile decisions about past, present, and future periods. Moreover, a business manager takes various strategic decisions and directs the operations to ensure sustainability of business by using accounting data.

Developing technology, increasing competition and changing consumer demands affect production. These developments have brought the necessity of realization a number of changes to enterprises, as well. In other words, the changes accounting at external around of businesses have forced internal changes within businesses. As a requirement of sustainability, businesses have had to change/renew the strategies (policies) of management, production, and marketing in accordance with the current changes. These changes have also affected the accounting information system which has direct relation with other units of businesses. Furthermore, changes have made the accounting information system insufficient and have made it necessary to turn to the new systems.

The accounting information system, besides the functions it holds within the enterprises, provides enterprises with healthy communication with tax and social security institutions by preparation (submission) of information and documents timely and accurately.

In this study, a research about today's accounting education sufficiency, enterprises' owners and top managers' expectations related to accounting information system have been carried under the accordance of business with current changes at the Aksaray Organized Industrial Zone. The Enterprises' expectations and satisfaction level in today's accounting education have been examined in the research.

Keywords: Accounting Education, Entrepreneurs, Accounting Information System

1. Introduction

It requires moving systematically to get, classify and canalize truly of continuously renewed information in today's era of information, because management of information has become a more important term than getting it. So, various systems have been developed in order to manage information that continuously rises and becomes more sophisticated effectively, and focus has been on the right use of the gained information truly in mechanism of decision making.

Obviously, enterprises also need the information element that leads the steps of countries, states, non-profit organizations and consumers in daily life, and they make their movements in the light of information. Like any

E-mail address: halukduman70@hotmail.com

organization or individual of the society, enterprises that always interact with the environment also get information and they use it appropriate to their aims (Rebele, 2002). Here, information is an important input element like other production factors. In other words, the required element in order an enterprise to be successful in its decisions is information (Gökçen, 2007: 3). Especially, the information produced by accounting departments that are directly in relation with all departments of enterprises and its (inner/outer) environment is vital in the point of sustainability of enterprise operations.

2. Accounting Information System (AIS)

As being a sub-branch of management information system, AIS is related to following increases and decreases of an enterprise's assets and resources, evaluating and reporting it. In other words, AIS is the process of recording assets that an enterprise has and are represented as money and the resources of those assets. AIS passes the information it produces, such as changes in assets and resources, measurement of the performance related to the business, to managers, shareholders, credit providers etc. Presenting the outputs gained as a result of activities to information users, AIS holds an important role in delivering the information completely, at the right time and rightly (Atabey et al, 2012:3).

Besides presenting information in order to enlighten the public, AIS gives information about how the enterprise is managed and the performances of enterprise units and in general. Managers take decisions related to the future and existing activities depending on this information. This situation makes AIS more important (Güzel and Mersin, 2007).

Enterprises states the necessity of having enough AIS knowledge to meet the needs of the enterprises by those that take professional accounting education and/or students taking accounting education at university (Chang and Hwang, 2003), because accuracy, timing and reporting of the information provided by AIS are directly related to system user's vocational adequateness. No matter how well the system is built, knowledge and ability level of AIS user effects system outputs like any other interactive systems. In addition, sub systems of AIS, financial accounting and cost and management accounting systems provides basic information on financial decisions, such as product pricing- costing- investment- production volume, related to the future. As being the system that produces the information which stands as the basic of important decisions for the enterprise, AIS users' adequacy in knowledge and ability becomes more important.

- *2.1. Accounting Education and AIS Relation*

AIS has the feature of being basic information source of the enterprise through its life, starting from foundation until ending its activities and divestment. AIS- due to the information it provides- is at the center of the process of activities such as planning enterprise activities, determining the amount of the investments, counting the costs and determining product sale prices etc. Also, it provides light to the steps through the future by showing the past in evaluating the enterprise activities (Hatunoğlu, 2004). Generally, AIS provides information related to following aims (Güzel and Mersin, 2007):
- Creating long-term plans and developing strategies related to them,
- Taking decisions on distribution of enterprise resources,
- Costing planning of activities and its control,
- Evaluating and analyzing of performance,
- Creating of financial information required by laws and its reporting.

Technologic developments affect AIS as well as the production. An important part of data processing and recording have been transferred to the electronic environment together with technologic developments. This situation has made information management and commenting on the financial status of the enterprise and developments it make easier. Besides, it enables reports that make the results of enterprise activities understandable, reliable, adequate and comparable with the past. Control of these results have also been adapted to technologic developments and the operations of making the reporting appropriate to the laws and determining its reliability have become easier (Acar and Aktaş, 2010). Enterprises generally expect the followings from accounting education (Korukoğlu, 1998):
- Integrating the theory and practice in accounting education and increasing practice part,
- Sharing education programs, publication and information by establishing a cooperation with enterprises,

- Increasing the knowledge of the personnel by forming practice centered (master's etc.) programs for accounting staff of the enterprises,
- For sustainability of accounting science, organizing seminars and conferences on accounting; providing an environment in which practical information and experiences are shared by invited experienced accounting managers,
- Providing students with integrating the theory and practice by giving more importance in their apprenticeships.

The expectations of the enterprises from AIS and accounting education take place in various studies. However, according to Karasioğlu and Duman's (2004) study on function of the accounting in the point of practitioners and taxpayers, practitioners apply AIS due to the enforcement by legal obligations. From this point of view, it is possible to say that the expectations of enterprises from accounting education and AIS will be in the frame of legislations and legal obligations. So, we can say that enterprises expect from individuals educated in accounting to have required knowledge and ability in using AIS to form and report the information required by laws rather than using it in activity planning, performance evaluation and distribution of resources.

3. Literature Review

In the studies on accounting education, there generally exists the idea that theoretical and practice sides of accounting education do not match up with each other. Accounting education is typically given theoretically in the frame of basic terms of accounting related to AIS, widely accepted accounting principles and standards and legislations in effect. Although it is stated in the studies that participants with an education on accounting should have an ability to transfer theory into practice, it is observed that participants have inadequate education in terms of practice (Boyce, 2004; Rebele, 2002; Dellaportas and Hassal, 2012). Determining educational policies that will train the staff adaptable to the developments in economy, technology and legislations and meet the expectations of the entrepreneurs and forming the education standards and quality that will carry out these policies hold great importance (Demir, 2012).

Kelly, Davey and Haigh (1999) claim the necessity of using "holistic education" that combines the student and environmental factors in education. Similarly, Boyce (2004) states that accounting education given at universities does not carry out needed functions in today's conditions in which rapid changes are experienced due to globalization, so reforms should be done. The reasons of this inadequacy are stated as lack of communication between academicians and students and not taking environmental conditions that are prominent in practice into account in accounting education. In the study, it is argued to use "critical accounting classes" model as a suggestion for efficiency of accounting education.

In his study, Korukoğlu (1998) tries to show to what extent enterprises include accounting education and practices in their organization and current situation in cooperation of enterprises with universities in this education process. The results show that enterprises do not give enough importance to their accounting personnel's education, and they prefer to employ personnel studied accounting instead of educating their staff.

Study by Acar and Aktaş (2010) argues that accounting education cannot carry out its function because of changing conditions and suggests using "practice education model" in order to meet the expectations from accounting education.

Çürük and Doğan (2002) researched expectations of large scaled enterprises in Turkey on accounting knowledge level of and which accounting courses should be taken by the staff that they would employ. According to the results, enterprises expect from the staff they will employ to take courses on practice centered accounting education. Also, they expect accounting classes to be given in detail to students that are educated in accounting. Besides, enterprise managers state their expectations on directing students towards apprenticeship that will support theoretical information given in accounting education and increasing the opportunities of apprenticeship.

Ünal and Doğanay (2009) made a research on expectations of lead auditors, auditors, vice auditors working at Audit Court from accounting education given in undergraduate level and adequacy of these courses. The results show that accounting group courses are adequate among all the courses given in undergraduate level, but curriculum of accounting cannot meet the expectations and needs of organizations. Followings are suggested: this inadequacy can be resolved by updating accounting curriculum; efficiency in accounting education can be increased and the shortfall between theory and practice can be resolved by joining of experienced managers and practitioners to the lessons.

Çelik and Ecer (2009) evaluated the adequacy of accounting education in 45 public universities in Turkey according to American Assembly of Collegiate Schools of Business (AACSB) criteria. According to the study, while the education is found to be generally adequate, the quality of it can be increased more in the condition of improving use of resources.

Yıldız and Durak (2011) evaluated the expectations of small and medium sized enterprises in Kırklareli region from accounting education. The data gained by the survey shows that accounting education at universities does not satisfy the needs of enterprises in Kırklareli region.

İbiş and Çelikdemir (2011) evaluated the expectations of banking sector from accounting education. The results show that knowledge of legislations and judicial information will generally enable accounting education to be permanent; however, those that have been educated on accounting cannot transfer the information they learned at school into practice. According to the study, the expectations of banking sector, in short, is an accounting education in which theory and practice are combined, supported by real examples and case analysis and adaptable to the developments rapidly.

In their study on thoughts of independent accountants working in Antalya about vocational adequacy of students that are educated in accounting at universities, Kultuk, Dönmez, Utku and Erdoğan (2012) found that their knowledge of accounting is inadequate. Defending that students graduate without adequate accounting knowledge, accountants also think that students are inadequate in understanding modern enterprises' AIS processes and financial structures and satisfying the expectations of enterprises.

Dellaportas and Hassal (2012) state that students getting their knowledge by traditional teaching methods used in accounting education may have difficulties in using them in professional life. The study supports using concept of experiential and situated learning in order to resolve the inadequacy of theoretical information given to students in meeting the needs of professional accounting occupation.

Empirical studies show the need of a reform in increasing efficiency and productivity of accounting education. AS a result of International Accounting Standards' becoming local by converging, a student educated in accounting in any university in the world will need to have the adequacy of carrying out this occupation in any country and/or region. So, a model of accounting education should be presented that will satisfy the needs of modern entrepreneurs globally, enable students to get minimum vocational adequacy, lead the theoretical information into practice within the enterprise, take vocational ethical codes into account and infuse life-long learning into students. The important point here is the requirement of providing the harmony by critical thinking on both accounting education that is affected by economic developments and changes and professional life (Çelenk, Atmaca and Horasan, 2010). By the enforcement of change by business world, it is really important in accounting education: how an organization will be designed and managed; constructing an information system on determining problems and solutions; carrying out the activities that will change risks-opportunities caused by the change into advantages in terms of organization and business; infusing life-long (Kaya, 1999).

4. Research

In order to determine the expectations of entrepreneurs from Today's accounting education and the level of the expectations met survey study was carried out in the Aksaray organized industrial zone (AOIZ). Research findings are evaluated through data obtained from one to one meetings and e-mail.

- *4.1. Scope and Method*

About 130 businesses that operate in the Aksaray organized industrial zone is crossed and from 92 businesses survey data obtained. The survey measuring the expectations of enterprises from accounting training consists of 2 parts. The first part aims to obtain demographic characteristics of enterprises; with the questions in the second part is intended to measure the expectations of enterprises from the accounting education and accounting staff. The questions in second part are organized on a scale as *1 = Never/None* and *5 = Complete* (Likert scale). The research process the data obtained analyzed with the SPSS package program, 20.0. Demographic characteristics of enterprises took part in the survey carried out, are shown in table 1.

Table 1 : Demographic characteristics

	Frequency	Percent (%)		Frequency	Percent (%)
Business-Type		**Facility Field Of the Business**			

Private	47	51,1	Manufacturing	24	26,1
Limited	34	37,0	Service	32	34,8
Joint-stock	11	12,0	Trade	32	34,8
Other	-	-	Other	4	4,3
Total	92	100,0	Total	92	100,0
Level of education of the person Answering the questionnaire			**Number of Employee Employed in enterprise**		
High School	19	20,7	1-30	59	64,1
Associate	8	8,7	31-60	16	17,4
Undergraduate	56	60,9	61-90	4	4,3
Graduate	9	9,8	91 and over	13	14,1
Total	92	100,0	Total	92	100,0
Position of the person answering the questionnaire			**The preferred method of accounting personnel's employment**		
Owner of the business	60	65,2	Having Professional experience	37	40,2
General manager	3	3,3	Raising in the company	8	8,7
Manager of the business	6	6,5	Purchase service outside	28	30,4
Manager of the accounting	7	7,6	Conduct by myself	19	20,7
Chief of the Accounting	9	9,8	Other	-	-
Other	7	7,6			
Total	92	100,0	Total	92	100,0

According to the results of the survey 47 enterprises in AOIZ continues their activities as private (51.1%), 34 as limited (37%) and 11 as joint stock (12%) company. 32of enterprises in the sample (34.8%) are in the service sector, 32 are in trade sector (34.8%) and 24 are (26.1%) in the manufacturing sector. 59 of the enterprises (64.1%) employ between 1-30 staff, 16 (17.4%) between 31-60, 4 (4.3%) between 61-90 and 13 employ 91 and over staff. 65% of survey respondents is the owner of the business, and 60.9% have a graduate degree. Survey respondents who consist of business owners (60 people) and Bachelors (56 people) makes the research findings acceptable and reliable in today's competitive environment in order to meet the expectations of the accounting education of entrepreneurs. According to the survey, businesses would like to have professional staff having experience in employing accounting staff (Table 1). Training accounting personnel within the company is not preferred.

- *4.2. Findings and Analysis*

Before the assessment of the data obtained from the survey for measuring the reliability of posed questions to the participants Cronbach alpha value is determined (Table 2). Cronbach alpha value is greater than 70% (90%) and the scale is reliable and the analysis is appropriate to do.

Table 2 : Reliability Statistics

***Cronbach's Alpha* : ,905**	*N of Items :* 41

As a result, enterprises ' accounting unit interviews entrepreneurs employed staff receive training in universities (s) of expectations reached the conclusion that it should be "sufficient" level. In this respect the value of test is determined 4 (sufficient) in the research and analyses conducted over this value. Here are the research hypotheses.

H_0 = *the average level of today's accounting training meeting the expectations of entrepreneurs is 4.*
H_1 = *the average level of today's accounting training meeting the expectations of entrepreneurs is not 4.*

In the process of analysis of the study the questions in the second part of the scale (41) has been converted into a single question and the One-Sample T-test was performed. One-sample t test, the results shown in Table 3.

Table 3 : One-Sample Test

	Test Value = 4				
	T	df	N	Sig. (2-tailed)	Mean
Mean	-11,590	91	92	,000	3,4401

Corresponding to the value of the Sig-test performed -11,590 T (2-tailed) value of $P \leq 0.05$ so H_1 hypothesis is accepted whereas H_0 hypothesis is rejected. According to the H_1 hypothesis, the expectations of entrepreneurs in AOIZ from today's accounting training are not met in adequate levels. So business owners cannot meet the expectations from the accounting staff that they employ.

Similarly, the questions in the second part of the survey are grouped as factors according to their content of accounting courses given at universities. These factors are identified as follows;

1. *Tax laws*: sufficiency in legislation, applicable tax laws and accounting standards Turkey,
2. *General Accounting*: sufficiency regarding accounting registration scheme, preparation of financial statements and the use of accounting programs.
3. *Cost accounting*: sufficiency in cost calculations and the inventory process
4. *Managerial accounting*: sufficiency regarding investment decisions, capacity, sales and performance evaluation
5. *Entity and resource management*: sufficiency in management of entity and resources effectively,
6. *Market*: sufficiency in making healthy relations with market and public institutions of enterprises.

Depending on the outcome in Table 3 accounting education offered in universities do not meet the expectations of entrepreneurs. in order to determine the factors which impact this, accounting courses given at universities are grouped and factors are determined. In other words, it is tried to name the accounting courses that do not meet entrepreneurs' expectations. For this purpose, the survey questions are grouped according to accounting courses and their content. As for the question groups created on factors One-Sample T test is done, and the analysis are made according to the hypotheses test value. The results achieved are shown in Table 4.

Table 4 : One-Sample Test

	Test Value = 4				
	T	df	N	Sig. (2-tailed)	Mean
1.Tax_Acts_Compute	1,559	91	92	,122	4,0408
2.General_Accounting_Compute	1,865	91	92	,065	4,0628
3.Cost_Accounting_Compute	1,519	91	92	,132	4,0696
4.Management_Accounting_Compute	-12,871	91	92	,000	2,8090
5.Assets_Resource_Compute	-11,020	91	92	,000	2,8540
6.Market_Conditions_Compute	-14,224	91	92	,000	2,7138

According to Table 4, the result obtained from table 3 is affected by *Tax laws, General Accounting and cost accounting* factors in a positive direction; *Management accounting, asset and resource management and market* factors in a negative way. According to Table 4;

- In terms of *tax laws* factor accounting education meets entrepreneurs' expectations (T = 1,562 corresponds to the value of the Sig (2-tailed) $P \geq 0.05$).
- In terms of *general accounting* factor accounting education meets entrepreneurs' expectations (T = 1,865 corresponds to the value of the Sig (2-tailed) $P \geq 0.05$).
- In terms of *cost accounting* factor accounting education meets entrepreneurs' expectations. (T = 1,519 corresponds to the value of the Sig (2-tailed) $P \geq 0.05$).
- In terms of *management accounting* factor accounting education does not meets entrepreneurs' expectations (T =-12,871 corresponds to the value of the Sig (2-tailed) $P \leq 0.05$).
- In terms of *asset and resource management* factor accounting education does not meets entrepreneurs' expectations (T =-11,020 corresponds to the value of the Sig (2-tailed) $P \leq 0.05$).
- In terms of *market* factor accounting education does not meets entrepreneurs' expectations (T =-14,224 corresponds to the value of the Sig (2-tailed) $P \leq 0.05$).

According to the factors shown in Table 4 the first three factors which meets the expectations of the entrepreneurs from accounting education may be accepted as a result of law and legal legislation. Tax laws and legislation requires all transactions of cost accounting and general accounting transactions to be accurate and complete. In this case the accounting information system and accounting personnel are employed as system users are naturally sufficient. Especially the entrepreneurs' preference of employment of trained personnel in the field indicates that students have theoretical education in universities will not meet the expectations of entrepreneurs unless they get sufficient level of experience in the business. Therefore, the evidence of the first three factors in terms of the expectations of entrepreneurs are met, in addition to the accounting education in the universities of individuals is a result of the experience in business life. For inexperienced individuals first three results can be said to be negative.

The study reached the conclusion that the formal accounting education at the college level and ahead cannot meet entrepreneurs ' expectations. The reason for this is that changes occurring in commercial activities with the globalization are also affects the accounting profession. In order to train staff who has professional competence and to meet the expectations of entrepreneurs, lifelong education centers should be founded (Şengel, 2010).

Conclusion and Suggestions

AIS is an important element in the company sustainability. It provides important and useful information in the establishment, continuing their activities and liquidation periods of businesses. The expectations from AIS, which is in a continuous interaction with both the company's internal environment and the external environment, is changing due to the globalization and the changing environmental conditions and hence associate and graduate accounting education is also affected.

In order to measure the expectations of today's entrepreneurs from accounting education the data were obtained via research carried out in Aksaray Organized Industrial Zone. The analysis carried out in accordance with the data obtained and it has been concluded that accounting education in general does not meet the expectations of today's entrepreneurs. Similarly, as a result of the analysis of the survey data it has been concluded that accounting education is focused on the tax laws and the functioning of AIS required by legislation. This result met the expectations of entrepreneurs in terms of financial reporting required by the tax laws, so it can be said that AIS is used to the extent required by the legal obligations. Entrepreneurs cannot get a large part of the benefits offered by AIS because of poor accounting education received by the staff employed to use AIS.

Entrepreneurs prefer qualified personnel in the accounting field rather than training accounting personnel and external service procurement, this indicates that individuals receive accounting education are insufficient in terms of the ability to combine theory and practice. In general, we can say that today's entrepreneurs and universities have some tasks to increase the efficiency of accounting education and to meet the expectations. These are:

- In accounting education offered in universities more focus should be given to practice-oriented education. With this education that supports and assimilates the theoretical knowledge, the participants will be able to have an advantageous position in business life and be able to meet the expectations of entrepreneurs.
- Lecturers of accounting education in universities should shift learners from passive to active learners by interacting with them. Lecturer and learners may review the issues together by questions and discussions and increase the efficiency in accounting education with of case studies.
- In cooperation with enterprises students should be guided to do internship during their university education so that they may learn about the business world and to combine their theoretical knowledge and practice. This may also help to create job opportunities after graduation.
- It should be provided to discuss the expectations of business world from students by contacting accounting firms operating in different sectors during the training of entrepreneurs and inviting accounting managers to give a seminar. In this way, students will be able to find the opportunity to learn the business world and structure their study in line with expectations.
- The use of technology in accounting education and teaching practical accounting package software will enhance the effectiveness of accounting education as a large portion of accounting transactions are on the electronic environment.
- The tutor factor which is one of the factors affecting the effectiveness of the accounting education, also affects the effectiveness of the students. In this context, to make tutors have pedagogical formation will increase the effectiveness of an accounting education and so entrepreneurs' expectations will be able to get met.
- With the provision of university-industry cooperation and mutual sharing of information and documentation effectiveness in accounting education will be provided.
- Establishing and supporting lifelong education centers will increase effectiveness of both students after graduation and individuals employed in enterprises in their fields with the philosophy of lifelong learning.
- Harmonization of the teaching content and teaching resources of universities to change is important for the effectiveness of accounting education. Similarly, accounting education should be supported with practices adapted from real business world to course content and resources.
- By increasing internet facilities in universities, reaching scientific databases should be facilitated and by providing access to these databases the students should be encourage to follow innovations in their fields.

To meet the expectations of today's Entrepreneurs on accounting education will be provided with the improvement and harmonization of factors affects accounting education such as the tutorial, the student and the physical facilities. Similarly, the provision of university and industry cooperation will enhance the effectiveness of accounting education in general. This is because of that measurement of the quality of education is only possible to

know the expectations beneficiaries and to reform the process in line with the expectations. As well as universities, entrepreneurs also have some tasks to do at this point. Exchanges will take place with increased interaction with entrepreneurs and expected and inaccurate trends will be able to be determined. With the innovations in this context, process will be improved and the quality of the outputs will be increased.

Abstract

The present time, which is described as the information age, internet is a very important source of knowledge. It is known that students widely make use of internet resources for their courses, research and projects. However, at this point, it is discussed that how reliable the internet resources are. Regarding this issue, there are people defending that internet resources are reliable as well as people suggesting that they are not. In order to make the discussions on this issue clear, it is useful to evaluate internet resources epistemologically and scientifically. So, students' views on internet resources, their point of view and finally getting information about their awareness concerning this issue are important.

In this study, the aim is to determine university students' views on internet resources and to analyze them interms of different variables. The analyses will be realized in the context of educational technology. The study is a descriptive one and the data are obtained through likert-type items and analyzed with descriptive statistical techniques. It is expected that the results obtained through analyses will contribute to the discussion in question.

Keywords: Internet, Internet resources, Epistemology, Educational technology and internet

Introduction

Mankind, who got knowledge from oral and written sources of knowledge for a long time, met a new source of knowledge in late 20th century described as virtual. Being different from the one stored in mind, tablet, signboard and paper, this knowledge travels on internet, which is called the virtual environment. Internet (web) is basically a strong communication system linking a computer anywhere in the world to another (Davenport ve Erarslan, 2001). In another definition, internet is the largest network of communication and data bank consisting of computers linked to eachother (Şahan, 2005). This source of knowledge on the internet line has led to a radical change in habits like accessing, saving and sharing knowledge to the extent that it has given 21st century its name, the information age.

In short, the knowledge in virtual environment described as internet resources, has changed the progress of philosophies, theories and activities concerned with knowledge. Thus, with the pervasion of the internet technology, accessing knowledge (information) is no longer a problem. So, internet is accepted as the fastest and cheapest way to access knowledge at present. When it is remembered that people went far away from their hometowns in the past to to access knowledge facing a lot of difficulties, this transformation can be onderstood better.

One of systems that the internet has fundamentally changed is the education. Essentially being a "knowledge-making process" and have organized for this purpose, the school system has been degraded almost to *a centreless circle* with the widespread of internet. As a result, to establish schools and classes only to reach knowledge has largely lost its meaning. It is because the internet has made knowledge (and education as well, if it is merely transferring knowledge) free from time and space. Internet is a time-and-space-free technology that offers the whole world to school, teachers and students. Furthermore, the internet frees students from chalkboard, teacher, and book trilogy and provides them opportunity-rich environment full of visual materials, resources, and experts; and thus

---

* Corresponding author. Tel.: 05335141507.
E-mail address: hasan.aydemir@inonu.edu.tr

learning becomes more meaningful, more enjoyable and longer lasting (Sen, 1999). Removing the boundaries of learning, the internet provides students the opportunity of virtual school without walls and global learning (Halis, 2001; Askar, 2003). From a different perspective, internet eliminates significant differences in education such as age, class, gender, nationality, religion, special needs etc. (Ergun, 1998). As for the internet which is called as wider source of information than a teacher, Baykal (2008), has evaluated that "computer is a more patience test expert, magnetic memory has already left organic memory in the lurch, artificial intelligence is at the door" and asks "what is left to school?" and answers himself that "what is left to school is a pair of eyes gazing into your eyes, a head leaning on your shoulder, a compassionate hand patting you on the back, the taste of the anger, the pain of separation".

What is the point in erecting buildings costing a lot which are so-called schools and which have been established on valuable premises particularly in cities merely for teaching while the internet cut the ground out from under school that they have deployed for centuries (school for transferring knowledge and teaching)? When the matter is handled from the perspective of accessing to knowledge or getting knowledge, it can be said that school has experienced a significant loss of meaning against to the internet reality. In this case, it can be foreseen that the school system cannot lean to a goal like merely teaching but it will have to find some other rightful bases in these times when the internet is common as such. If school will remain as its present form (a centre for information or knowledge distribution) in the future, it will have to find new forms and bases concerning its mission by making radical knowledge-based changes. The leading debate about education in the years to come can already be estimated to be on school's mission of giving knowledge. It is because epistemological problems have always been at the forefront in educational process, which is a process of giving knowledge in a sense (Büyükdüvenci, 2001).

In the last twenty years, internet has been included in every aspect of life in Turkey as in the world. According to the data, %30.5 of the world population is internet users in 2011. This rate is %41.6 in Turkey (Esgin, Baba and Aytaç, 2011). Correspondingly, it is observed that there is a radical change in school systems. This change can be seen in a wide range from using the internet as the source of knowledge or learning environment to online universities. However, in Turkey, the reflection of internet to school systems appears in the classrooms equipped with internet facilities and students to access it. The most typical example of it is Fatih Project which is put forward with great hope and with its huge cost.

Internet which has been included into the education system resulting in important changes may have a lot of functions. One of them is to use it as the source of knowledge in the classrooms. With this function internet has become one of the fundamental learning variables. In the historical process, in terms of knowledge book-teacher-student triplet with the addition of the internet has changed into quartet or internet has replaced the book and the system has turned into student- internet- teacher.

With different forms and positions internet is now one of the fundamental variables in the classrooms as well as in higher education. It can be said that internet has been gradually replacing the teacher and the book and is candidate to become the unique source of the classroom and the problems occur at this point. These problems are all about the new position of internet as the source of knowledge. The first problem is that internet is seen as the only source of knowledge. And this situation is not appropriate for Constructivist approach which has been applied since 2005-2006 education year. The first problem is the inconsistency between internet and the current education system principles because in constructivist approach the primary source of knowledge is individuals like teacher, students, others...etc. The second one is that based on a verbal culture if the social culture will adjust to an imaginary culture constructed via internet and how correct it is. The third one is that basically based on informative approaches. Turkish education system has lost its prestige and the question is that how this situation will be prevented. The fourth problem which is arising from the perception of internet as the only source of knowledge in the classroom is also the focus of this study. This problem is the reliability of internet sources in the process of learning. As the school and education construct mind, this problem in fact is a problem which has roots in philosophy, epistemology, and axiology. This construction problem is a future problem for the society, because the survival of a society is also a problem of national mind construction. In this sense, it is important that internet sources are studied to understand the problem.

Method

This study was carried out in survey design and it is a descriptive one. Survey design is a model based on describing and explaining the existing situation by taking samplings from the population (Arseven, 1994; Balcı, 1995; Karasar, 2005).

2.1 Population and Sampling

The studying population of the study includes the last year students attending various faculties of Fırat and İnönü Universities in 2012-2013 Spring term. The sampling consists of 517 students chosen from the population using the random sampling method and volunteered to be involved in the study. The distribution of these students into universities is as follows; Fırat University (n=234; %45.3), İnönü University (n=283; %54.7). When the fact that a sampling of 356 participants is enough for a population of 5000 people in 95 % confidence interval in a scientific study (Balcı, 1995:110 as cited in Anderson, 1990), it can be said that a sampling consisting of 517 students for this study is enough. The distribution of students making up the sampling according to some variables is seen in Table 1.

Table 1. The Distribution of Students Making up the Sampling According to the Variables

Variables		N	%
Gender	Female	273	52.8
	Male	244	47.2
Faculty	Education	169	32.7
	Science	115	22.2
	Humanities and Social Sciences	105	20.3
	Engineering	67	13.0
	Divinity	61	11.8
Total		517	100

2. 2. Means of Data Collection

The data in this tudy were obtained through questionnaires developed by the authors. While preparing the questionnaire, an item battery was formed consisting of a sum of 22 items, 2 items for personal information and 20 for internet resources, as a result of searching the related literature. And then, these items were given to five academicians to get their views on content validity. Following this, the draft questionnaire was ready for pilot study as a result of making necessary corrections in accordance with the suggestions of the experts. The pilot application was carried out for 68 students who weren't involved in the study. Factor analysis was made for the data obtained from the pilot study so as to test the content validity of the questionnaire. The results obtained from the factor analysis were KMO= 0.631; Bartlett= 151.890 (p=0,000) Cronbach Alpha= 0.67. In the analysis, the items with a factor load of 0.35 or more were taken and eight items below this value were omitted and a questionnaire of fourteen items was shaped finally. The factor loads of the items in the questionnaire were between 0.381-0.657. Taking these values (Büyüköztürk, 2002:120) into consideration, it can be said that the questionnaire was reliable. The items in the questionnaire was graded as "yes", "partly" and "no".

2. 3. Collection of Data and Analysis

In this study, the items were analyzed with percentage and frequency techniques. Chi square (X^2) technique was applied to determine whether there were significant differences among students' views according to the variables. Only the items with a significant difference among students' views were involved in the study.

3. Findings and Interpretations

Table 2: Students' Views on Internet Knowledge Sources

	Views	(1) Yes		(2) Partly		(3) No	
		%	f	%	f	%	f
1	Do you make use of internet as a source of knowledge?	46.8	242	42.9	222	10.3	53
2	Do you question the knowledge sources on the internet?	17.6	91	28.6	148	53.8	278
3	Is the knowledge on internet reliable in your opinion?	62.9	325	27.5	142	9.7	50
4	Is the knowledge on internet reliable in terms of ethics in your opinion?	52.4	271	40.2	208	7.4	38
5	Is the knowledge on internet scientific in your opinion?	66.5	344	24.6	127	8.9	46
6	Do the resources on internet have the quality of knowledge in your opinion?	47.2	244	37.7	195	15.1	78
7	Do the resources on internet have the quality of knowledge in your opinion?	51.1	264	39.7	205	9.3	48
8	Can knowledge at wisdom level be reached on internet in your opinion?	42.9	222	37.9	196	19.1	99
9	I s your aim of reaching knowledge sources on internet just "getting knowledge"?	63.6	329	24.0	124	12.4	64
10	I s your aim of reaching knowledge sources on internet just "learning"?	50.7	262	35.4	183	13.9	72
11	I s your aim of reaching knowledge sources on internet just "surfing"?	64.5	334	20	103	15.5	80
12	Is the primary source of knowledge in the class course boks in your opinion?	54.2	280	33.3	172	12.6	65

When the opinions of students in Table 2 are analyzed, it is understood that they take advantage of the internet to a large (%46.8 yes+%42.9 partly) extent. This evidence could be interpreted in a way that the monopoly of the teacher and books has been overcome as a traditional source of knowledge. If it is considered that the internet is involved in every phase of life, it also reflects on education process as a matter of course.

Here 42.9% "partial" rate could be related to the problem of students in getting access to the internet rather than their distrust of the internet. Because same students find it reliable to a large (62.9%) extent. Also the students accept knowledge on the internet without questioning and it supports this interpretation. Furthermore, the students consider knowledge on the internet reliable by 66.5% and they find the knowledge ethical by 52.4% and these can be considered as a sign of reliance. This would be pleasing if the source of knowledge on the internet was really reliable.

However in literature many suspicions are uttered against knowledge originating from the internet. (Ergönül, 2011). In this case, students' reliance on knowledge from the internet might be based on two possibilities. First, students might be unaware of the aspects of knowledge as the source of knowledge, its types or its being ethical, since students are epistemologically inefficient. Hence there is no (except one or two) epistemological lectures or contents in higher education. Second, students' reliance on the internet sources might be related to easy access to this source. Because it is more difficult to obtain knowledge from textbooks and lecturers than the internet. Therefore in this regard, it is defined as a technology developed in accordance with needs of humanity on "sharing/keeping the produced knowledge and getting access to it easily". It is possible to reach knowledge on many subjects with the help of this technology in an easy and a cheap, fast, reliable way (Korcuklu and Balay, 2005).

The internet has three functions as a source of knowledge. These are scanning, presenting and linking. (Syidoğlu, 1997:221). Akkoyunlu and Orhan (1998) state the benefits of the internet as "researching, reviewing, answering questions, sharing knowledge". When the answers of students participating in the research are analyzed it is understood that 64.5% of the students use the internet "for browsing", 63.6% of them use it "to obtain knowledge" and 50.7% of them "to learn something." These evidences can be interpreted in a way that students use the internet to receive superficial knowledge and for browsing as well as they use it for the purpose of learning and education. In fact, the knowledge (more like information) obtained pointlessly and acontextually (almost through skimming) does not mean so much for learning. Because the benefits of knowledge for mankind make it valuable and meaningful (Yalçın, 2012)

Knowledge can be defined differently in literature. This diversity is related to adoptions about knowledge. Mengüşoğlu (1992, Akt: Cihan, 1998) defines knowledge in general as "the result of relation between the subject and the object." The diversity in the definitions of knowledge -according to its nature, dealing context and the philosophy relied on- is also a case in classification of it. For instance, the most classical classification of knowledge in educational sciences is Bloom's Taxonomy. In this taxonomy the simplest form of cognitive knowledge is "remembering", the most complex one is "evaluation." (Bloom, 1998).

Knowledge can be classified as verbal and cognitive knowledge. Knowledge, with a more traditional approach, is classified as "ilm-el yakin" (knowing by knowledge), "ayn-el yakin" (knowing as seeing) and "hakk-el yakin" (knowing all about). In literature, information is classified as "phenomenon","information", "knowledge" and "wisdom". Bellinger, Castro and Mills (2013) grade this classification as: Data, information, knowledge, understanding, wisdom. In this classification the nuance between information and knowledge is missed. In contrast to information, knowledge provides a sound base. (Akgün, 2000). Furthermore, within the context of diverse disciplines, knowledge is also classified as phenomenal knowledge, conceptual knowledge, principle-generalization, law-hypothesis (Kaptan and Korkmaz, 2012). Apart from those, in respect of its sources, knowledge can be classified as given and gained knowledge.

In this study, several questions are added to find out how the students perceive internet-based knowledge and whether they are aware of various forms of knowledge. The answers given by students are seen in table 2. According to this, %51.1 of the students perceive internet-based knowledge as *information*, %47,2 of them perceive it as knowledge and %42.9 perceive it as *wisdom*. Although this finding can be interpreted as students are aware of the order of knowledge from simple to complicated or from superficiality to profundity, the fact that the rates of grading are close to each other brings presence of students' awareness into question. Hence, the same students considering schoolbook as the primary source of knowledge at the rate of %54.2 supports this suspicion. When these findings are handled as a whole, it can be said that students don't have *information* about knowledge indeed or they are confused. Taking into account that they haven't had classes related to this in education process, the situation can be considered as normal. In order to demonstrate the depth of students' perception of internet based knowledge in the context of classification of knowledge, more comprehensive studies (including interviews) are needed.

Chi square test was applied to determine whether there are significant differences among students' views on the items included in Table 2 in terms of variables. Test result shows that there is significant difference according to gender for the items 1. (X =17.135; p=0.000) and 7. (X =8.465; p=0.015). The difference of the 1st item is in countenance of male students. Accordingly, male students has answered as 'yes' to the question 'Do you make use of internet as the source of knowledge?' at the rate of %60.3 while female students has given the same answer at the rate of %39.7. Consequently, it can be said that male students make use of internet as the source of knowledge more than female students do. Similarly, the significant difference in 7th item is in the countenance of male students. According to this difference, male students answer 'yes' at the rate of %56.8 to the question of "Do the resources on internet have the quality of knowledge in your opinion?" while female students do at the rate of %43.2. When this finding is taken into account, we can say that male students find internet based knowledge more superficial than female students do.

Among the students opinions about the items in Table 2, only the item 5 (X =20.192; p=0.027) has the significant difference in terms of faculty variable. According to this, Faculty of Science students are the ones who said 'yes' to the question of "Is the knowledge on internet scientific in your opinion?" more than other faculties(%80) while Faculty of Social Sciences students do the opposite (%55). This finding shows us that students of Science Faculty consider internet sources as scientific more than students of Social Science Faculty do. One of its potential reason could be the way students of Social Science Faculty approach knowledge. They do it more questionable as the nominees of social scientist.

4. Results and Discussion

The results found out in this research which aims to evaluate the views of students on internet sources and the suggestions asserted through these results are pointed out below:

●The Internet, one of the main realities of the Information Age, has influenced the structures and representations of curricula in instruction process through education and school system just as it has influenced almost every area of life. The internet has not only cheapened and facilitated the way to reach the information but it also has made the knowledge independent of time and location. Apparently, it is no more a problem to reach the information. From this point, universities which are based only on the instruction phase have faced a gradual erosion

on their chance of leading status with this only mission. Furthermore, it seems that lecturers, against the internet, have lost their role as the only authority from the aspect of knowledge in class forever. In light of these circumstances, universities and lecturers are required to take on valid and effective positions against this recent information source.

● Internet is one of the ways which are frequently utilized to reach information in all instruction levels as well as higher education. However, this virtually-unlimited information source brings about a reliability problem. Nevertheless, according to the conclusion of this study, university students define their web sources as reliable and get each piece of information without questioning through these sources. This circumstance is likely to cause troubles on students' intellectual stimulation and their perceptions of science and reality. On this point, universities should take the necessary precautions in order to enable students to be competent at questioning, deciding and recognizing the correct information. For this purpose, new courses can be added into the curriculum or present course contents can be reconstructed if necessary. Moreover, informative activities can be arranged.

● Another result achieved in this study is that the purposes of students' internet use are as in the sequence of surfing, getting information and learning. The purpose of surfing on the internet should especially be converted into a learning objective. Thus, universities should encourage the students to use the internet for sharing, reinforcing, rewarding and extending the information they learn.

● It is concluded that the university students in this study consider the internet-based knowledge mostly as information. However, it is a suspicious fact whether this kind of an evaluation depends on an epistemological awareness according to the answers achieved in this study. From this point, extensive research is required to determine students' epistemological perceptions on internet-based information.

● Internet-based knowledge may bring out scientific and ethical problems. Universities, from this aspect, should carry out studies for developing scientific and ethical criteria on internet-based information.

13th International Educational Technology Conference

The follow up of the trainee from the training via internet by the Extension and Training Office of Kasetsart University during 2009 - 2012.

Churairat Intara-O-Sot[a155], Saroach Sopeerak[b]

[ab]*Educational Technology Department, Faculty of Education, Kasetsart University, Thailand.*

Abstract

When properly trained through training programs via the internet on webpage designing and eForm creating, members' organizations could be helpful for their work and carrier system. During 2009-2012 the Extension and Training Office of Kasetsart University has organized periodic editions of a training program for representatives of organizations. After four editions of this training program, a survey of the satisfaction, the utilization and the impact on follow up activities has been carried out.

A follow-up questionnaire has been developed. The sample comprised 123 sampling people who had taken part in the training program edition. The data were analyzed by descriptive statistics: percentage, mean and standard deviation.

For web designing, it was found that 56.70 percent of them used this knowledge gained in their work, and 36.70 percent used this knowledge gained to develop their work. Photoshop was the most useful topic. For eForm, most of them did not use it. The factors impacted on follow up activities on the training via the internet were computer accessories, communication infrastructure via internet net work. The difference between the utilization according to the impact factors were significant at 0.05

The trainees suggested that the duration of the course should be increase, the software should be update, should be emphasis on practical aspect, and should have more templates.

Keyword: trainee, training via internet

Introductions

Education one of the most important tool in developing human resource. Both government and non government organizations are focus on and interested in developing their personnel.Human resources policies and practices in Thailand have become the mainstream of national development, and has been listed in the National Economic and Social Development Plan No. 7 and No. 8 (Suchart: 2540).

Training is one of the strategies using in human resource development to increase individual knowledge, abilities, and skills. This is pinpoint to the better efficiency and effective of work .The final process of training is follow up. The follow up will reveal that the trainee applied the knowledge and skills they have got to their work appropriately, the problems of utilization. The results from this follow up can be used to improve and develop the training courses for more efficiently. As Suchart (2540:14) state that

... follow up is necessary and more necessary in the future for the professional human resource development training conductors. This is because of the competition in conducting the training course. It should be authentically prove that it can developed human resource, useful to the trainees, and direct to the objectives. And also showed the problems on training management, and how to make it more efficiently...

Kasetsart University, with various of research units, is one of educational institutions that focus on professional development and training. The university provides services and trainings by Extension and Training Office.

Objective

After four editions of this training program on wave, a survey of the satisfaction, the utilization and the impact on follow up activities has been carried out.

Methodology

A follow-up questionnaire has been developed. The sample comprised 123 sampling peoples who had taken part in the training program edition. The data were analyzed by descriptive statistics: percentage, mean and standard deviation.

Results

The study of this follow up is used to develop the curriculum of the training course. The training program were issued during the year 2009-2012 by Extension and Training Office of Kasetsart University. The purposes are to study the satisfaction, and the utilization of the trainees on two training courses: "Designing and building a website" and "Creating electronic form (e-Form)" and to study the impact factors to the follow up through the internet.

The study of the knowledge gained from the training adapted to the design and building professionals found that most of the trainees have the knowledge to good use. 56.70 percent was used in the development of most applications accounted for 36.70 percent of the knowledge in the course of designing and building a website. To deploy in occupations classified by topic, the results show that subjects who trained with knowledge in Photoshop to design the home page with the most benefit.

For the program to create an electronic form (e-Form), it was found that most of the trainees, 63.50 percent, did not use the knowledge and 36.50 percent used the knowledge after training. 25.40 percent used the knowledge to solve problems in their work. For the application of creating electronic form (eForm), classified by topic, found that most of the trainees create the form by using Adobe Acrobat 8.0 Pro program and print with highest average.

For web designing, it was found that 56.70 percent of them used this knowledge gained in their work, and 36.70 percent used this knowledge gained to develop their work. Photoshop was the most useful topic. For eform, most of them did not use it.

The factors impacted on follow up activities on the training via the internet were found that there were factors totally impact to follow up activities with high level (3. 94score). Those factors were computer accessories, communication infrastructure via internet net work. The difference between the utilization according to the impact factors were significant at 0.05

The trainees suggested that the duration of the course should be increase, the software should be update, should be emphasis on practical aspect, and should have more templates.

The Impact of Digital Mind Maps on Science Achievement among Sixth Grade Students in Saudi Arabia

Ibrahim. M. A. Jbeili[156]

Arab East College for Graduate Studies, Riyadh, Saudi Arabia

Abstract

The purpose of this study was to examine the impact of digital mind maps on science achievement among sixth grade students in Saudi Arabia. A total of female 44 students at the second-semester of the academic year 2012 /2013 participated in the study. The students were randomly assigned to two experimental groups to receive different treatments. The first group (DMM) utilized digital mind maps during their learning process, while the second group (PMM) utilized paper mind maps. The results revealed that using digital mind maps had a significant effect on students' science achievement. Based on the obtained results, it was concluded that the utilization of digital mind maps for Saudi sixth students could be helpful in improving their achievement.

Keywords: Digital mind maps; paper mind maps; science; achievement

1. Introduction

Instructional design has moved through a series of development phases. The move from behaviorism through cognitivism to constructivism represents shifts in emphasis away from an external view to an internal view of learning. To the behaviorist, the internal processing is of no interest; to the cognitivist, the internal processing is only of importance to the extent to which it explains how external reality is understood. In contrast, the constructivist views the student as a builder of her knowledge (Terhart, 2003). This turning point of learning processes asks for designing of instruction that deals with students as builders not receivers of knowledge, students who construct knowledge through interaction and connecting their experiences and their prior knowledge with the current situations, and students who have learning strategies to help in building their knowledge and understanding. Therefore, effective instruction emphasizes on the teaching of strategies that enable students to learn with understanding.

Based on a constructivist approach principles, the utilization of mind maps facilitates meaningful learning (Akinoglu & Yasar, 2007, Buzan, 1993, Erdogan, 2008). Researchers confirmed that visual presentation is an essential for students to understand new knowledge. One of the most powerful tools for visual presentation is mind map which is a "useful tool for helping younger students with the process of building conceptual understanding of content and promoting achievement" (Mona & Khalick, 2008, p. 298). Buzan (1993, p.59), defined the mind map as

E-mail address: dr_jobaili@hotmail.com

"an expression of Radiant Thinking and is therefore a function of the human mind. It is a powerful graphic technique which provides a universal key to unlocking the potential of the brain". The mind map has four essential characteristics: The subject attention is crystallized in a central image, the main themes of the subject radiate from the central image as branches, branches comprise a key image or key word printed on an associated line, and the braches form a connected nodal structure.

Learners who utilize mind maps are more likely able to learn effectively by organizing maps and add images and color to them (Nesbit & Adesope, 2006). Mind maps let learners to produce a visual image to enrich their learning (Budd, 2004). Farrand, Hussain, and Hennessy (2002) found that mind maps not only aided medical students in studying, but also encouraged a deeper level of learning, especially when paired with a problem-based learning curriculum. Mind maps have also been used as reflective tools that allow for broader associations to be made to the material (Budd, 2004). Moreover, utilizing mind maps aids teachers vary their teaching methods which may be more likely to reach diverse learners (Nesbit & Adesope, 2006). The utilization of mind maps can be assisted with "the adoption of colors, images, codes, and multidimensional approaches to help human memory, so that one could concentrate the mind on the central part, which is, the crucial subject" Chen, 2008, p.1034). Buzan (1993) stated that mind maps help learners to use graphic representation which may help in the brainstorming process. McGriff (2000) confirmed that relating images to concepts is a creative task which requires thinking instead of memorizing. Adam and Mowers (2007) found that learners who could express their learning with visual skills had a 40% higher retention rate than that of just verbal learners.

Although many research findings (Akinoglu & Yasar, 2007; Buzan, 1996; Chiou, 2008; Erdogan, 2008; Farrand et al. 2002; Riley & Ahlberg, 2004) have showed the effectiveness of employing the paper mind maps, paper mind maps have been considered by some writers not to be a useful skill. For example, sometimes it could be time consuming for the teacher to present and for the student to understand, especially if the student is inexperienced, or uncreative (Buzan, 1993). In the digital word and the age of ICT, writing anything out long hand is unfavorable, and therefore, paper mind maps creation seems to be time consuming and a huge step backward. However, it is valuable to benefit from computer to create mind maps, namely, digital mind maps.

By utilizing digital mind maps, students can move objects and concepts around simply by drag and drop them, in contrast, with paper mind maps, students need to erase and rewrite again and again (Erdogan, 2008).

Moreover, digital mind maps can be saved as files, the file can be shared among learners, and bits of it may be copied for other maps. Further digital mind maps enable students to include hyperlinks and email links to their maps. Students can also attach and view video clips, animated pictures, and images (Riley & Ahlberg, 2004).

1.1 Purpose of the study

To date, however, various research studies have been conducted to investigate the effect of paper mind maps on learning science. Research has provided relatively little insight into the role of digital mind maps on young learners' science achievement. Thus, the purpose of this study is to investigate the impact of digital mind maps on science achievement among sixth grade students. Particularly, the study was conducted to investigate if there were any statistically significant differences in science levels between students who were taught and learned by utilizing digital mind maps (DMM) and students who were taught and learned by utilizing paper mind maps (PMM).

1.2 Research Question and Hypotheses

This study seeks to answer the following research question:

Does the utilization of digital mind maps make more significant difference on students' achievement in learning science when compared to paper mind maps?

Based on the above research question the following hypothesis was formulated:

There is no statistical significant difference in science achievement between Students taught via the utilization of digital mind maps and students taught via the utilization of paper mind maps.

1.3 Significance of the Study

It is hoped that the findings of this study will contribute to further understanding of the role of digital mind maps in improving science academic achievement. If the utilization of digital mind maps proves its effectiveness in improving science academic achievement, teachers in Saudi Arabia will have additional instructional media that can be used to support students' learning with understanding. Moreover, this will help educators in Saudi Arabia in their search for an effective and efficient pedagogical strategy or model for improving learning with understanding.

2. Method

It is important to note that everyday classroom instructions and all reading materials used in the participating school are in the Arabic Language (except for classes focused on the teaching of English). Therefore, all the materials and instruments used in this study were in Arabic.

2.1 Population and Sample

The population of this study comprised of all female sixth grade students enrolled in the National Guard elementary schools in the capital city of Saudi Arabia –Riyadh- during the second semester for the academic year 2012 / 2013. The National Guard Office includes (15) female elementary schools that comprise (729) sixth grade students. Schools in Saudi Arabia are not coeducational.

In order to implement this study in a naturalistic school setting, existing intact classes were selected. One school from the (15th) elementary schools was randomly selected and two classes from the selected school were randomly selected. The sample consisted of (44) female students who were studying in two sixth-grade classrooms. The size of the classes was similar (22 and 22) and the mean age of the students was 11.6 years. Students in the selected classes were from approximately equivalent socioeconomic status as defined by the National Guard Office.

2.3 Experimental Conditions

The two groups were different from one another in terms of the mind map type. The DMM group was taught and learned by using the digital mind maps. The PMM group was taught and learned by using the paper mind maps. The followings are the details of each group:

DMM Group (N = 22)**:** In this group, the teacher and learners used digital mind maps two weeks before the formal experiment with practice lessons. In the present study, in each session, the teacher introduced and explained the new topic for about 10 minutes to the whole class by using and presenting digital mind maps. After the teacher's explanation, students worked individually using the digital mind maps that guided and supported students to achieve the learning objectives. In other words, students under this condition were instructed and reminded frequently to use the digital maps to facilitate their learning. During the learning process, the teacher monitored each student and intervened by guiding student to the usage of the digital mind maps if necessary. At the end of the session, the teacher asked student to turn off their computers and assessed and evaluated students' performance, discussed with the whole class to ensure that students carefully processed the effectiveness of their learning.

PMM Group (N = 22)**:** In this group, the teacher and learners followed the same method in the DMM group, except they utilized the paper mind maps instead of digital mind maps, and at the end of the each session, the teacher collected all paper mind maps.

After three weeks of implementing the study, namely in the last science session of this experiment (session 15), students in both groups were asked to complete the science achievement test.

2.4 Instructional Materials

In order to investigate the students' science achievement in a naturalistic setting of the classroom, the instructional materials that used in this study were based on the fifth unit from the science textbook (Matter) designed by the Ministry of Education for all fifth-grade students in Saudi Arabia, teacher's lesson plans, digital mind maps, and paper mind maps. Both types of mind maps were developed by the researcher and one of his graduate students who have B.Ed. major in science.

2.5 Measurement Instruments

To measure students' science achievement, a pre- test and a post-test were developed in this study. The pre-test and post-test questions were similar in content but their order and numbering were randomized. Two weeks before the beginning of this study, the pre-test was conducted; the results were collected and used as a covariate.

2.6 Test Validity and Reliability

Three experienced science teachers, two education science supervisors, and three science education university lecturers reviewed the test. Each viewed all question and rated their confidence in their response, using scale from 1 (very weak) to 5 (very strong). Only questions, which had received 4 or more scores from all evaluators, were selected as test questions. The evaluators' suggestions, feedback, and comments were taken into account until there were no discrepancies among them. Prior to the beginning of the study, a pilot test was carried out and the scores from the pilot study test were collected to determine the Cronbach's Alpha reliability coefficient. Cronbach's alpha reliability coefficient of the test was .91.

3. Results

Testing the study hypothesis: "There is no statistical significant difference in science achievement between Students taught via the utilization of digital mind maps and students taught via the utilization of paper mind maps".

Table 1 presents means and standard deviations of the pre-test and post-test by the group, DMM and PMM.

Table 1: <u>Means and standard deviations of the pre-test and post-test by the group, DMM and PMM</u>

Group	Pre-test			Post-test			
	N	**Mean**	**SD**	**N**	**Mean**	**SD**	**Adj.mean**
DMM	22	5.93	1.14	22	17.90	.97	17.90[a]
PMM	22	6.25	2.32	22	16.09	1.53	16.10[a]

Maximal Score: 20
   a.   Evaluated at covariate appeared in the model: pre-test = 6.0909

To examine if there was statistically significant differences in science achievement adjusted mean scores between the DMM and the PMM groups, while controlling the pre-test, analysis of covariance (ANCOVA) was conducted. Table 2 presents the results of ANCOVA.

Table 2
<u>ANCOVA Results</u>

Source	Sum of Squares	df	Mean Square	F	Sig
Pre-test	.468	1	.468	.279	.600
Group	35.35	1	35.35	21.11	.000
Error	68.66	41	1.67		
Total	12821.5	44			

The results of ANCOVA indicate that there is statistically significant difference between the groups (DMM and PMM). The *F* ratio was 21.11 (*p* = .000). This means that the instructional method had a main effect on science achievement. These results indicate that the DMM students (Mean = 17.9, SD = .97, Adj.mean = 17.9) significantly outperformed the PMM students (Mean = 16.1, SD = 1.5, Adj.mean = 16.1) with an adjusted mean difference of 1.8.

4. Discussion and conclusion

The results of the current study indicate that the digital mind maps improved students' science achievement more than the paper mind maps. The improved science achievement could be referred to the following reasons:

- Digital mind maps had a much more consistent appearance than paper mind maps, and had the potential to appear much cleaner.

- Hide and show features helped students to concentrate on a specific idea and to avoid visual clutter.

- Digital mind maps supported students to arrange information in expandable and collapsible topic trees. This enabled students to store much more information without overwhelming them.

- Students saved digital mind maps as files, shared files with colleagues, and easily retrieved them.

- Multimedia (videos, sounds, and animations) reinforced students to use different senses, and therefore to learn with understanding (Lih-Juan, 1997).

- Hyperlinks, email links, file attachments, and pictures are essential features that enabled students to achieve higher. Riley and Ahlberg (2004, p.253) indicate that "ICT capacity enables storage and revisiting of mapping and automatic functions, and creating concepts and vectors enable immediate linking and labeling that increase the ease and speed of mapping".

- Colored pictures and videos may assist students' learning motivation and attention (Lamberski, 1980), and accordingly influence their performance (van Schaik & Ling, 2001).

- The use of keyboard and mouse as input devices, enabled students to navigate through the digital mind maps easily and faster than the paper mind maps.

- Digital mind maps offered a dynamic, distributed learning environment which expanded the physical learning space and afforded students a means of developing, organizing and structuring their ideas using higher-order thinking skills and thereby enhanced their understanding (Novak & Cañas, 2006.p.15)

It can be concluded that the utilization of digital mind maps enhanced students' science achievement. When students actively employed the features of digital mind maps such as hyperlinks, hide and show, navigation, attachments, video, audio, animations, and file saving, they could achieve higher than employing the paper mind maps in science.

The Impact of PowerPoint on Undergraduates' Technical Communication Achievement

Yee Chiew Ling @ Vivian[a] [157], Low Loi Ming[b], Chong Seng Tong[a], Ng Yu Jin[a]

[a]Department of Languages and Communication, Universiti Tenaga Nasional, 43000 Kajang, Selangor, Malaysia.
[b]Department of Science, Mathematics and Computing, Universiti Tenaga Nasional, 43000 Kajang, Selangor, Malaysia.

Abstract

PowerPoint, one of the most well known ICT tools, plays a vital role in our society nowadays as it has been utilized widely and actively in facilitating the process of teaching and learning, especially in the educational domain. The study examined the effect of PowerPoint lecturing on undergraduates' Technical Communication final examination grade. The experimental group was taught in a PowerPoint lecture format while the control group in a traditional whiteboard lecture format. The results revealed that the experimental group grades were significantly higher than the control group at $p = 0.00$.

Keywords: Final examination grades, PowerPoint, Technical Communication

Introduction

The importance of ICTs in the education changes has been recognized by the Government of Malaysia by inaugurating Multimedia Super Corridor (MSC) status to higher learning institutions that use ICTs to produce and enhance their teaching and learning experiences. This award symbolizes "world-class service and achievement" (Multimedia Development Corporation, 1996-2012). In this context, the use of applications, such as PowerPoint, enriches the teaching and learning processes. PowerPoint application enriches teaching and learning experiences in a number of ways. First, it enables lectures to be delivered through a neat and organized presentation which eventually gets the students' attention (Holzl, 1997; Hashemi et al., 2012). Second, the uses of multimedia in the application enable the lectures to cater for different learning styles (Hashemi et al., 2012). In addition, the file format of PowerPoint is generally compatible to most systems, and thus, students can easily download the presentation slides and add more relevant information after or during lecture. Finally, PowerPoint presentation revolves around the most important points of the topic lectured.

Many studies have been carried out to examine the impacts of ICTs on teaching and learning but there are limited empirical studies of the effect of PowerPoint in learning. The European Higher Education Area (EHEA) is evolving their teaching and learning processes to provide better education experience. Valentín et al. (2013) reported that universities are transforming from a traditional controlled and directed instruction to autonomous learning, and hence, it is essential to focus on developing diverse competencies based instructions. ICTs play important roles in restructuring the educational setting, transforming it from teacher centered to students centered. In their study, Valentín et al (2013) proved that there were significant associations between the uses of different ICTs and 543 undergraduates' improved performance and satisfaction.

Gürbüz et al. (2010) explored the effect of PowerPoint as a learning tool. The sample for the study was a group of 109 freshman undergraduates taking a biology education program. They were assigned to two different groups: experimental group (n = 56) preparing and presenting with PowerPoint, and control group (n = 53) learning through traditional approach. To inquire the effect on academic achievement and attitude, two different tests were administered as pre- and post-tests, namely the Biology Achievement Test (BAT) and the Biology Attitude Scale (BAS). The results supported that using PowerPoint as learning tool may improve academic achievement and attitudes among undergraduates enrolling biology education program. This is due to the PowerPoint presentation

---

itself promotes auditory and visual information representations, reflecting the cognitive benefit of multimedia learning.

Szabo and Hastings (2000) conducted three studies to investigate the efficacy of PowerPoint lecturing on undergraduates' academic achievement and attitudes in different modules: Motor Learning, Strength, Power and Endurance in Sport and Exercise, Research Methods in Sports and Exercise, and Social Psychology of Sport and Exercise. In the first study, comparisons were made between (i) the students' attitudes towards PowerPoint lectures and traditional overhead or blackboard assisted lectures, and (ii) the effect of the lecture styles on students' test result. The students were found to have positive attitudes toward PowerPoint lectures because they felt that PowerPoint lectures were interesting, able to get their attention, and help them to have better understanding. However, this did not reflect their achievement; both lecture styles had no significant differences on the students' test result. In the second study, a series of mock tests was conducted on the three groups of students receiving three different lecture styles respectively (i) overhead or blackboard lectures, (ii) PowerPoint lectures, and (iii) PowerPoint lectures with distribution of lecture notes. The results indicated that students performed better with PowerPoint lecturing. In the third study, two groups of students were compared for their performance in two mock tests using counterbalanced research design (PowerPoint and overhead). Both groups obtained higher grades for Test 1 compared to Test 2 despite different lecture styles.

Susskind (2005) provides the latest account on PowerPoint lecturing. In this study, the effects of PowerPoint assisted instruction were examined on two sections of students in Introduction to Psychology college classes. Lectures for section one and section two were conducted by the same instructor using whiteboard and PowerPoint presentation software in two blocks of time. Lectures were conducted in counterbalanced order for the two sections. After each block of the two different lecture methods, a test was carried out. In total there were two tests. Both sections obtained higher grades for test one compared to test two despite the two different lecture methods.

Although these four studies in the last decade provide some emerging evidences on the benefits of PowerPoint lecturing, there has been no attempt to undertake an inquiry on language and communication classes to our knowledge. In order to address this, the aim of the present paper is to report a preliminary study on the efficacy of PowerPoint lecturing on undergraduates' academic achievement in Technical Communication classes.

Methodology

Participants

Participants were engineering undergraduates of College of Engineering at Universiti Tenaga Nasional (UNITEN). All participants were enrolled in two of 11 Technical Communication sections. Each section met two times a week for 60 minutes and 120 minutes each session. The first section was composed of 60 students and the second section was composed of 60 students also.

Research Design

Experiments were carried out on two different groups of participants. They were identified as sections one and two. Section one students received PowerPoint-assisted lectures in contrast to section two receiving traditional lectures. PowerPoint lectures were referred as "Lectures delivered with the aid of PowerPoint presentation software and with minimum uses of whiteboard." On the other hand, traditional lectures were referred as "Lectures delivered with the aid of whiteboard and with occasional uses of PowerPoint presentation software." Each class was conducted by different lecturer. The participants were tested after 14 weeks of classes.

Instrument

The only instrument used was the final examination questions developed by the Department of Languages and Communication in the university. This exam paper contained 20 multiple choice and two long answer questions. The multiple choice questions were about theories in writing experimental research report, business proposal, and information gathering processes. Each of the multiple choice questions was worth two marks. Meanwhile, the students were tested on the ability to review previous research studies and present research results on the other two long answer questions. This section was worth 60 marks. The total marks for the exam paper were 100 marks.

Procedure

The experiments were conducted for 14 weeks during the second semester of 2012-2013 academic year. All of the 120 students and two lecturers were given the same course outline which contained the scheme of work to be covered for the semester. The same lecturer provided the same lectures and notes to the same section of students.

All classes for section one students were lectured via PowerPoint slides prepared by the lecturer herself. The slides were displayed to the students on a screen in a lecture hall. After every main concept presented by the lecturer, students were given opportunity to ask questions and/or discuss short task assigned in groups. When needed occasionally, whiteboard was used by the lecturer to write down explanations for certain questions asked by the students. In contrast, all classes for section two were conducted by a different lecturer throughout the semester via traditional method by using mainly whiteboard, with PowerPoint presentation occasionally. The students were given in-class writing assignments to complete. Nevertheless, class discussions were encouraged as well in this section. After 14 weeks of lectures, all students took the final examination in week 15 in an exam hall at the same time.

Statistical Analysis

The final examination marks were analyzed using IBM SPSS Statistics Version 20. An independent-samples t-test was carried out to compare means, standard deviations and the level of significant differences at *p <0.05* between the experimental group and control group. The experimental group received PowerPoint lectures, but the control group received traditional lectures. Table 1 clarifies the data labeling used to key in data into the software.

Final examination marks	Grade awarded for the marks obtained	Value used to represent the grade
85 – 100	A	1
80 – 84	A-	2
75 – 79	B+	3
70 – 74	B	4
65 – 69	B-	5
60 – 64	C+	6
55 – 59	C	7
50 – 54	C-	8
45 – 49	D+	9
40 – 44	D	10
0 – 39	E	11

Table 1. Data labeling used in the study

Results and Discussion

The results of the analysis (Table 2) revealed that there was significant difference between section one and section two students' grades (*p*=0.00). Students in section one had better and higher grades (M = 3.95) for their final examination than students in section two (M = 6.28). The average grade obtained by section one students was *B+*, and section two scored *C+* at average.

	n	M	SD	*t*	*p*
Experimental group (section one)	60	3.95	1.44	-7.54	0.00
Control group (section two)	60	6.28	1.91		

Table 2. Means (M), standard deviation (SD), and t test scores of students' final examination marks or grades

These findings reinforce partially those of Szabo and Hastings (2000), who conducted a study on the effects of blackboard or overhead projector lecturing, PowerPoint lecturing and PowerPoint with lecture notes lecturing on students' academic achievement. It was found out that students performed better with PowerPoint lecturing. The current results imply that lecturing with PowerPoint has significant effect on students' academic achievement. As described by Susskind (2005) and Szabo and Hastings (2000), lecture delivered with PowerPoint presentation is more organized and systematic which might assist students to understand the content better. In other way, students

might be more attracted by the design of the slides, and hence, they would pay more attention during the lecture. Paying attention to lectures is important in the sense that this facilitates effective teaching and learning to take place. In fact, interesting and well-design slides with animation and variation of color could capture the students' attention better, leading to establishing of interaction between lecturer and students. Lecturers would have more control over the teaching and learning processes.

Conclusion

The current findings show that the uses of PowerPoint in lecturing could help technical communication undergraduates to perform better academically compared to traditional lecturing where whiteboard is used mainly in lecturing. Lectures for both control and experimental groups were conducted by two different instructors; this was seen as a limitation for the current study. Distinct teaching notes or experience could have play significant role in affecting the students' understanding and academic performance in addition to using PowerPoint slides and whiteboard as teaching aids. Researchers should examine the uses of PowerPoint slides and whiteboard as teaching aids by the same instructors to determine whether the PowerPoint-assisted lecturing establishes differences in students' academic achievement or not. This would also allow improvement in result reliability.

Abstract

A large number of literature on education of women clearly suggest that educating a woman is equal to educating a family and that woman are worth training more than their counterparts, men, in many respects. However, despite the fact that positive contribution of women education to the economy and society has long been known, education of women in many nations, particularly in developing countries, needs to attract more attention.

The education level of women is quite low in Muslim countries which are mostly developing countries. Increasing the level of education is dependent upon eliminating gender inequality in education. Muslim countries need to use all of their resources in order to reach their economic development targets. Women participation in economy is a major economic resource which is not frequently used in Muslim countries. A large amount of literature (Dollar and Gatti, 1999; Barro, 2001; Schultz, 2002; Klasen, 2002; and Knowles, 2002) suggests that, gender equality has a positive effect on economic growth. Taking Muslim countries into account, one can reasonably claim that the rate of the effect of gender equality on economic growth is higher in developing countries.

In this paper, the impact of gender inequality in education on economic growth for Turkey will be explored, using econometric techniques. The relationship between such variables as primary school graduation, high school graduation, vocational high school education and university graduation with economic growth will be discussed in detail. The paper will take into account of all variables for the period 1968-2005.

The contributions of educated women in an economy are threefold. First of which is that increasing the level of human capital, correspondingly, decreasing the fertility rate of the women. Second argument is that infant mortality rate might decline by virtue of decreasing the fertility rate of the women. Thirdly, increasing women education level may affect the education level of next generation positively.

Within this framework, co-integration approach will be applied in order to understand long run relationship between these variables which is gender inequality in education and economic growth. The empirical results indicate that there is a long-run relationship among these variables.

Although Turkey has the biggest national income among OIC countries according to 2011 data, she has not been successful in fully eliminating gender inequality. Furthermore, Turkey is an interesting case in terms of education level of women and position of women in labor force. For instance, women are represented in academic life with 38% in Turkey, while the rate of women in quite low in many other sectors. Similarly, it is quite interesting to note that the rate of university graduates among Turkish women are only 3.9%, the rate of women participation in Turkish labor force is 28% and the rate of schooling among women are 32%, while women representation in academic life in quite high. Another interesting and unique situation in Turkey is that half of the female workers are placed in agriculture sector. These facts reflect significance of our study and its contribution to the field.

Keywords: Gender inequality, education, economic growth, Turkey

Introduction

Education is considered to be one of the most important driving forces of economic and social development. The efficiency of education in economic development emerges depending on its level and distribution. For this reason, as well as increasing levels of education, training levels of women needs to be raised. Since, half of the qualified labor potential, which is one of the important components of competiton in economic life, formed by women, makes women's education important. The potential to increase a country's human capital significantly depends on raising the level of women's education.

Increase in the level of education of women provides their active participation in the economic life. An increased level of education is primarily an effect on women's participation rates to labor force. Women's labor force participation as an employer or as an employee provides, effective use of the labor factor, and consequently a higher level of production achievement. Increase in the level of women's education, increases productivity through education, which is considered as a form of human capital. Recognition of equal opportunities for women in economic and social life provides the rise of their level of education, such as increasing their participation in market activities and enables households to give better decisions. The inclusion of women in working life is effective on the current and future economic growth through the channels of income, consumption and expenditure. In addition, increase in the level of women's education, developes human capital by increasing the quality of child care and education. This is especially effective on the performance of future growth. On the other hand, elimination of gender inequality in economic and social life, lead to an increase in the levels of education of children and an increase in the women's labor force participation rate, as well as the feedback effect of these two developments help to ensure gender equality.

Education investments, provides positive returns both for the individual and for the society. Education, increases individuals personal gains, at the same time, creates positive externalities for society. When the personal and social returns provided by education are calculated according to gender, types of programs, education level and level of development of the countries, determining the priorities of education policies to be applied and increasing the achievements in practice will be possible.

The conclusion of the studies in order to calculate the returns of education are that the personal gains of education is higher than calculable social gains, and the education level that provides most personal and social gain is primary schoool. In addition, education provides higher returns to women than men. Personal and social gains of education in developing countries, is higher than developed countries.

According to these findings, personal and social gains to be obtained from women's education are higher than the gains that the men will get. In developing countries, gains provided by the education are higher than the developed countries. Therefore, in developing countries, women's education is more important than in other countries. Developing countries must remove the gender gap in education by giving more prominence to women's education, and must give priority to policies aimed at expanding primary education.

Women's education has significant gains except the market-oriented activities. Especially the time women spend on household chores such as cooking, cleaning and child care, is much more than men. Since these activities are not performed market-oriented, there may be some difficulties in identifying the exact equivalents in the market. However it is obvious that, considering the costs incurred when the works that, are carried out by women without expecting any fees, are met from the market, it provides a significant gain to the family budget. While, providing household chores such as cooking and cleaning from market has quite low alternative cost, especially providing childcare from market may have higher alternative cost since the child would be away from his mother. In addition, to increase the level of women's education by reducing their interest in household chores can positively affect the efficiency of home affairs. In economical literature, empirical evidences between women's education and the efficiency of housework are generally positive. While the studies within the framework of economics are in this direction, in some studies except the economics literature has negative effect. In non-economics literature the negative effects between the education of women and household chores are generally depends on their decreasing attention towards household chores and not satisfying them quite well. In studies investigating the economic size of the education, the number of findings concerning the gender inequality has negative effects on economic development is very high.

These effects are both emerge directly or indirectly and not simultaneous or not the same degree in each country. The researches examining the economic effects of education inequality, cannot fully measures many factors or ignores some of them. Despite these shortcomings, achieving gender equality in education can be considered as a strategy that allows their development for developing countries.

1. Relationship between Women's Education and Economic Development

The importance of women's education in the economic and social development is well known. Comparative studies between countries and evidences obtained from households' investigations a show that, educating women has contributed to the community in many ways. Development economists also emphasize the importance of girls' educational attainment in reaching out development goals. In developing regions, it is stated that the investment with the highest rate of return is investment in girls. Studies about positive relationship between national income and gender equality in education and/or positive contribution of women's education on national income and economic growth is substantially increased since the last ten years (Lewis and Lockheed, 2008: 2-3).

Impacts of the provision of women's education or gender equality in education, on the growth and development, occur in different channels. First of all, increase in the level of education of women, is being effective by enabling human capital form's development. At the same time, in parallel with an increase in levels of education, increasing the participation of women in economic life, thus manufacturer aspects become efficient. On the other hand, there is a significant association between women's educational level and population growth, fertility and infant mortality rates.

Despite the absence of sufficient empirical studies of education in terms of macro-economic externalities, it is generally agreed that education to children, by cutting the consumption of the current year, increase investments in the next period. Thus, positive externalities that the future generations will gain through education, are subsidized. According to empirical studies, raising maternal education increases the quality of children more than father's education for the reasons such as, good and healthy nutrition of children and well-education before and during school (Schults, 2002: 212). According to the findings of Thomas, the effect of the income earned by the mother on the child to live longer is 20 times more than the income derived by the father (Klasen, 1999: 8).

The low level of women's education causes negative consequences on growth, due to environmental influences. There are plenty of evidences that, environmental impacts are decisive factors in the success of children (Engin-Demir, 2009:27). In a study by Chen, it is indicated that, not being able to provide gender equality in education with the intellectual environment, by affecting adversely the abilities of children and the quality of students, caused negative effect on quality of labor, productivity, and therefore on growth. In this study, the second channel that is formed on the growth by gender inequality is, reducing the marginal product of capital by low quality of labor, through the household's life-long learning level, it does cause less investment and growth. In addition, employment gender inequality impresses on the growth by means of the quality of labor (Chen, 2004:31). In the studies about, raising the level of education of the women would be effective on growth through population increase, a right way relationship is determined between gender equality in education and growth. According to one of them, since increasing the women's level of primary education reduces the fertility, it may alert economic development indirectly (Barro, 2001: 38). According to a study of Lagerlöf by using a dynamic method, the initial gender gap in education causes continuation of the deficit by a later period, through the high fertility and low economic growth. This result constitutes an important reason to break the vicious circle of gender gap (Ghulam, 2005:8). In addition, the elimination of gender inequality in education reduces child mortality as well as fertility (Klasen, 1999: 23).

Whether male or female, enhancing the quality and number of employees with higher education levels, will reduce the income and technology diversity between the countries that has higher levels of education and produce new technologies, and the countries that are applying them (Kim and Lawrence, 1994: 235-6). Closing the gender gap in education will provide more efficient use of resources for developing countries, and will allow more easily to close their the difference between developing countries.

There is not a definitive answer to the question if, making lower levels of human capital investment in women in terms of education and health, can be considered as a market failure or not. However it is referred, reduction of gender inequality that causes an increase in the income level can be regarded as a market failure for the developing countries (Dollar and Gatti, 1999: 21-22). In addition, it is stated that with the development of the pension and social security system, to ensure their senility parents will reduce the investments in sons. Hence, with the increase in national income of the countries, market failures experienced in women's education is expected to decrease (Ghulam, 2005:5).

The theoretical basis of the researches examining the relationship between women's education and growth starts with the studies of Schutz and Denison, dating back to Solow, Roemer, Lucas, Barro's studies. Especially in studies using endogenous growth models, emphasizes the importance of human capital form on growth, which consists of investments in education and health care. In these studies, women's education is often considered as an element of the form of human capital, it is considered as a part of the educational factor. Studies' examining the effects of women's education on growth independently is fairly new.

Studies done by Dollar and Gatti (1999), Lagerlöf (1999), Schultz (2002), Klasen (2002), Knowles (2002), are the major studies that reveal the relationship between women's education and economic growth, and development in the last decade. In these studies, the nature of the relationship between women's education and growth are analyzed. Women's education, as measured by indicators such as women's enrollment rate, literacy rate, indicators which measures the inequality between women and men in education also used in. In studies, however measured the women's education is concluded to be effective on growth, albeit on different channels.

2. Impact of Gender Inequality in Education on Economic Growth

The work of Dollar-Gatti, significantly sheds light on the subject of macro-economic effects of Women's education. According to this study of Dollar-Gatti, there is a strong correlation between secondary education enrollment rates of women and per capita income. In this study, concluded that gender inequality in education leads to a negative impact on the growth, as well as economic reasons for women compared to men receiving a lower level of education, cultural elements and civil rights are also effective.

In a study by Chen, achieving gender equality in education on national income per capita, is explained by the demographic impact channels. According to this study, providing gender equality in education enables the rise of the level of women's education. Indeed, except for a limited number of countries, especially in developing countries, educational inequality is disadvantage of women. The most important demographic effect of the rise in women's level of education, reduce the number of children, by decreasing fertility. Reduction in the number of children ensures, reduces in the expenditures of children and thus provides increase in savings and therefore investments. Another effect of the decrease in the number of children, takes place in the form of increasing the relative size of the working age population. Reduction in the number of dependent children decreases the dependent population. Decline in the dependent population, increases the marginal efficiency of capital through investments, but also directly increases national income per capita (Chen, 2004:31).

Of the grounds for girls receiving a lower level of education, since boys seen as a tool of social security in old age, girls' education investments have lower returns, women's low-income from education and socio-cultural preferences are included. However, considering that, in the majority of developing countries, women return from education is more than men; it is not possible to say that the economic reason for the occurrence of low investment in women's education is available in all countries. Together with the economic reasons, it is more accurate to take into account socio-cultural structure and other conditions in the country (Ghulam, 2005: 3-4).

According to one of the studies that deal the economic size of the dimension of women's education, in the framework of macro-economic indicators, positive effect of women's education on economic development is statistically more clear than the effect provided by men. At the same time, the educational gap between men and women hinders economic development (Knowles,

2002: 143). According to a study by Klasen, education gap between women and men in East Asia, Sub-Saharan Africa, North Asia and in the Middle East, explains %0.4 and 0.9 of differences in the annual growth increase and this ratio shows the trend of increase. According to this study, a small gender gap in education affects a high growth rate decisively (Klasen, 2002: 367).

3. Econometric Methodology, Data Set and Implementation Results

In order to determine the effects of women education in Turkey on growth, the relationship between gender indicators in education and annual growth rates will be investigated.
Since population censuses are pentetric, it has not been able to reach an annual education indicator. Since 1996, annual training series are displayed. 12 years of data is not possible to make the econometric analysis. For this reason, for gender inequality in education covering the period 1968-2006, series of sex ratio will be used for, elementary school, middle school, high school, vocational and technical high school and university graduates.

3. 1 Econometric Methodology

The changes in political and economic life that occur at various times for various reasons, can be effective between relationships on the time series related to changes. When examining the relationship between the analyzed variables, not taken these changes into consideration, even in the lack of structural change taken into account, it causes to obtain incorrect results.
In this study, if there is a relationship between gender inequality in education and economic growth, and if this relationship exists in which years these changes have occured will be investigated, by cointegration test that does not allow the structural break as well as cointegration tests that allow single and double structural breaks. In this way, which events are effective in this relationship will be understood. In this context, firstly, at which level the variables that are conducted a survey have become stagnant will be investigated, then it will be investigated whether there is a long-term relationship between them.

3.2. Unit Root Tests

In order to understand whether are there long rung relationship between all variables, applying cointegration test, it should be checked that all variables at the same level stationary or not. If these series not stationary at level, it should be precede first deference to get stationary positions. When all series become stationary at the first difference level, it can use cointegration test. The Augmented Dickey-Fuller (ADF) and Phillips-Perron (PP)[159] Unit Root Tests are employed to test the integration level and the possible cointegration among the variables (Dickey and Fuller, 1981; Phillips and Perron, 1988). The ADF test is proceeded to check out whether the series are stationary or not and the ADF test is based on the following regressions:

$$\Delta y_t = \alpha_0 + \alpha_1 y_{t-1} + \sum_{i=1} \alpha_i \Delta y_{t-i} + \varepsilon_t \qquad (1)$$

Equation is consisting of lag of dependent variable. In the equation y is a time series, t is a linear time trend, Δ is the first difference operator, α_0 is a constant, n is the optimum number of lags on the dependent variable, and ε is the random error term. The main difference between Phillips-Perron (PP) Unit Root Tests and the ADF test, in the PP unit root tests in order remove autocorrelation it is adding lag of its and it is applying a nonparametric correction.

3.3. Cointegration Tests

3.3.1. Engle Granger Cointegration Test

Engle-Granger (1987) cointegration test is consist of two stages, first stage regression model is set up:

$$y_t = \alpha_0 + \alpha_1 x_t + u_t \qquad (2)$$

In the second phase, error terms that is acquired from the model is applied the Augmented Dickey-Fuller (ADF) Unit Root Tests.

$$\Delta u_t = \alpha_0 + \alpha_1 u_{t-1} + \sum_{i=1}^{n} \alpha_i \Delta u_{t-i} + e_t$$

At this point it should be considered that applied critical values are different from Augmented Dickey-Fuller (ADF) Unit Root Tests.

3.3.2. Gregory-Hansen Cointegration Test

In order to determine long-run relationship between the variables generally applied to cointegration tests, because of time series sometimes have some structural breaks it will not submit the correct results. Therefore instead of standard tests for cointegration

---

[159] PP approach allows for t he presence of unknown forms of autocorrelation with a structural break in the time series and conditional heteroscedasticity in the error term.

if the presences of structural breaks are time series, it has been applied tests that deal with structural break in the cointegrating relations.
Cointegration that is developed by Gregory and Hansen (1996) is considering possible structural breaks in the series. Gregory and Hansen developed tree different models that are considering changing in intercept or trend, through those models investigate is there any cointegration vector among the variables.

$$y_{1t} = \mu_1 + \mu_2 DU_t + \alpha_1 y_{2t} + e_t \qquad \text{(Model CC)} \quad (4)$$

In the model while μ1 represents constant term μ2 is changing in the represent constant term that time in the structural shift. Structural shift included in model by dummy variable that can be defined as here:

$$DU_t = \begin{cases} 0 & t \leq [n\tau] \ iken, \\ 1 & di\u011fer \ durumlarda \end{cases}$$

While n represents that number of observations, τ parameter show data that are between (0.15T and 0.85T).
When level shift with trend inclusion of a linear trend it would get model that regime shift where Intercept, slope coefficients and trend change (C/T).

$$y_{1t} = \mu_1 + \mu_2 DU_t + \mu_3 t \ \alpha_1 y_{2t} + e_t \qquad \text{(Model C/T)} \quad (5)$$

Before the structural change slope coefficient is α1 and after the shift occurred slope coefficients is represent with α2.
In the Gregory and Hansen test (1996), to determine breaking time, trough time period, all possible breaking point (τ) will be calculated by applying contiguous ELS methodology. The residuals from the calculations employed in Phillips-Perron (PP) Unit Root Tests and the ADF test by which to get minimum value to determine the breaking time.

$$\text{ADF}^* = \inf \text{ADF} (\tau)$$

It is known that standard tests for cointegration are biased towards non-rejection of no cointegration if the data is subjected to a structural break. Hence a researcher relying on standard cointegration tools may erroneously fail to reject the null of no cointegration if the presence of a structural break is not accounted for. In a response to this problem there have in recent years emerged a number of tests that deal with structural breaks in the cointegrating relations. If in the time series is there more than one endogenous break Gregory and Hansen (1996) test will not be fit for it. In this situation, we should apply the Hatemi-J cointegration test.

3.3.3 Hatemi-J Cointegration Test

The method that is developed by Gregory and Hansen (1996) is taking account just a breaking however, Hatemi-J (2008) cointegration test developed for two endogenous breaking. Hatemi-J (2008) model that is explain the effect of two structural shifts, has showed below.

$$y_t = \alpha_0 + \sum_{i=1}^{2}(\alpha_i D_{it} + \beta'_i D_{it} x_t) + \beta'_0 X_t + u_t \qquad (6)$$

In the equation α0 is constant term that is before the structural shifts, α1 is appear because of first structural break, α2 is second structural shift that is lead to change in the constant term. β0 is before the structural shift represent of slope parameter, β1 is effect of first structural shift on slope, β2 is represent that second structural shift in the model.
In the model the unknown parameters $\tau_1 \in (0, 1)$ and $\tau_2 \in (0, 1)$ signifying the relative timing of the regime change point and the bracket denotes the integer part. $D1t$ and $D2t$ are dummy variables defined as

$$D_{1t} = \begin{cases} 1 & t \leq [n\tau] \ iken, \\ 0 & t \leq [n\tau] \end{cases} \qquad\qquad D_{2t} = \begin{cases} 1 & t > [n\tau_2] \ iken, \\ 0 & t \leq [n\tau_2] \end{cases}$$

In order to test the fundamental hypothesis which shows a cointegration relationship among the variables, ADF* statistics are frequatly used. ADF* statistics are got out of applying unit root test statistics on the remainders of Model 2.
ADF test statistic does not standard normal distribution. The applicable test statistics are the smallest values of these three tests across all values for τ1 and τ2, with $\tau_1 \in T_1 = (0.15, 0.70)$ and $\tau_2 \in T_2 = (0.15+\tau_1, 0.85)$. The critical value of these test statistics are in the Hatemi-J (2008) table.

3.4. Data Gathering Methodology

In this study, the relationship between gender indicators in education and annual growth rates will be investigated, in order to determine the effects of women education in Turkey on growth. Gender in education is calculated through the rate of girls among all graduates from primary, secondary and high schools as well as university graduates. These variables are as follows:
lgrt: Logaritm of growth in Turkey by years

prm: rate of girls among all primary school graduates by years

hgh: rate of girls among all high school graduates by years

unv: rate of girls among all university graduates by years

As population census is carried out in each 5 years in Turkey, the researchers failed to get all annual education indicators. Therefore, for gender inequality profile, gender rate series among primary, high school and university graduates between 1968 and 2006 are used. Growth rates data used within the framework of this research have been taken from World Bank databanks and education data from Turkish National Statistics Institution.

1968-2006 data about above-mentioned variables are presented below in graphs. As a general outlook for these graphs, it seems to be that these series are not static. The rate of girls among primary school graduates were increased in 1997 when a law (Law Number 4306) about uniting primary and secondary schools and making education in these levels mandatory.

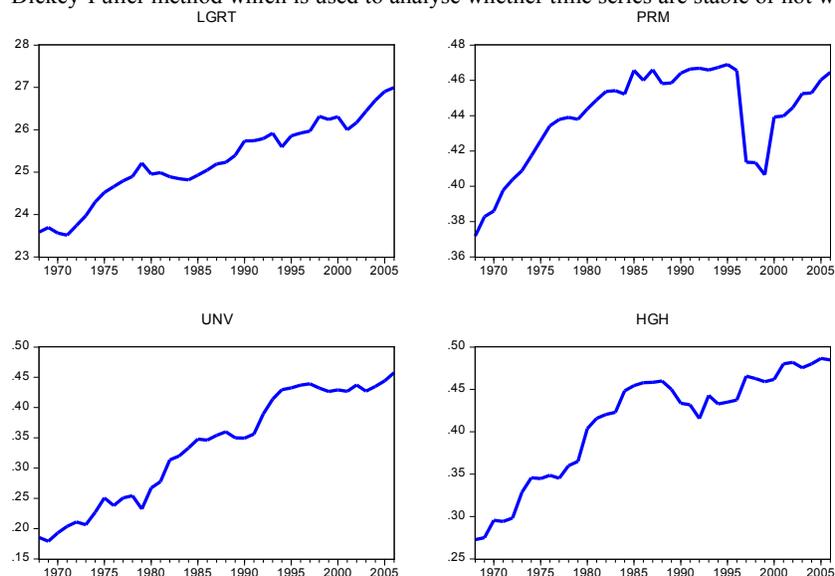
Dickey-Fuller method which is used to analyse whether time series are stable or not will also be used fort his research.


Figure 1: Time Series in Economic Growth and Gender Inequality in Education in Turkey

3.5. Empirical Results

Within the framework fort he research presented in this paper, the effect of gender inequality on long term economic growth is investigated, through using "cointegration analysis" econometric method. First of all, whether these series are integrated series I(1) and these series are cointegrated CI (1,1), in other words whether all series are stable when their differences are taken into account from the first level are investigated. In order to understand stability levels of the series, ADF and PP unit root tests have been carried out and the results of these tests are presented in Table 1.

Table 1: The Augmented Dickey-Fuller (ADF) and Phillips-Perron (PP)[160] Test Results

Variables	ADF-Level	ADF- First difference	PP –Level	PP- First difference
Lgrt	-0,4547	-5.9559**	-0,4547	-5,9559**
Prm	-2.5655	-5.7868**	-2.5754	-5.7828**
Hgh	-2.0907	-5.9645**	-2.1627	-5.9652**
Unv	-0.9654	-6.0124**	-0.9654	-6.0126**

Note: Lag length criteria is chosen with Schwarz information criteria. (**) Critical values at 1% levels.
* MacKinnon (1996) critical values for rejection of hypothesis of a unit root; %1 critical value -3.639407, %5 critical value -2.951125, %10 critical value -2.614300

As can be seen from the table above, when ADF and PP results are scrutinized, it is clearly seen that these series are not stable at their levels, in other words they include unit roots in their levels. When taken primary differences, series become stable in 1% significance level. Taking together results of both tests, it is seen that all series are I(1). Engle-Granger (1987) cointegration test which does not take structural breaking into account has been carried out in order to test whether there is a long term relationship between economic growth and gender rates among different education levels. The results are presented at Table 2 below.

---

[160] PP approach allows forthe presence of unknown forms of autocorrelation with a structural break in the time series and conditional heteroscedasticity in the error term.

Table 2: Engle-Granger Cointegration Test Results

Dependent Variable:	Engle-Granger Test Statistic	Prob[*]
LGRT	-2.835054	0.5273

Note: (*) MacKinnon (1996) p-values.

As can be seen from Table 2, results of the Engle-Granger test show that there is no long term relationship between the variables. The main reason why we feel that there is no relationship between the variables is that structural breaking is not allowed in this test. (Test statistics -2.8350 in 10% level is smaller than Mackinnon critical value 3.73).

In the next phase, Gragory Hansen cointegration test which allows a structural breaking in long term relationship has been used. As the result test statistics -6.1536 is greater than table value -6.00 in terms of absolute value, we consider thatrelationship between the variables. Lumsdaine ve Papell (1997) find out that more than one breaking would be possible when examining long term series and that the analyses which take only one structural breaking into account would cause incorrect results. Therefore, in this study, Hatemi-j cointegration test which allows two structural breaking is also used.

Table 3: Gregory Hansen and Hatemi-J Cointegration Test Results

| | | Cointegration Test Results | | | |
| | | Test Statistic | First Break Point 1 | First Break Point 2 | Lag Length |
		ADF	TB1	TB2	k
Engle Granger	Number of break=0	-2.835	-	-	2
Gregory Hansen	Number of break =1	-6.1536**	1979	-	0
Hatemi-J	Number of break =2	-7.1937**	1989	1991	0

Note: Engle-Granger critical value at %10: 3.73; Gregory Hansen critical value at %5: -6.00; Hatemi J critical value at %10: -7.118. As the results of this tests the gained test statistics -7.1937 in 10% level is greater than critical level of -7.118 in terms of absolute value, we can conclude that there is a long term relationship between variables in structural breakings which occurred in 1989 and 1991.

Table 4: Correlation Matrix between gender in education and economic growth

	LGRT	PRM	UNV	HGH
LGRT	1.0000			
PRM	0.6170	1.0000		
UNV	0.9308	0.6202	1.0000	
HGH	0.8869	0.7294	0.9205	1.0000

The indicator which has the greatest impact upon the level of growth is gender rate among university graduates. In deed, university graduates enter into business life sooner than people in other categories. Another interesting result is that increase in women rate among university graduates is much higher than other series.

CONCLUSION

Women's low level of education generates negative results on growth, due to its environmental impact. There are plenty of findings about environmental impacts' decisiveness on children's achievements. Not being able to obtain gender inequality in education effects intellectual environment, competences of children and students' quality negatively and leads negative effect on qualification of labor, productivity and thereby on growth. The second path that has occured on growth by gender inequality, by means of households' lifetime learning level, low labor qualification decreases marginal product of capital, and it leads less investment and growth. Besides, gender inequality in recruitment also causes negative effects on growth by means of qualification of labor

Ensuring gender equality in education brings with it, increasing women's education level. Yet, except limited number of countries, especially in developing countries, education inequality is against women. The most significant demographical effect of women's high educational level is, to reduce the children population by decrasing fertility rate. Reduction in the number of children causes less spending towards children and thus increases savings and investments. Another effect of reduction in the number of children is, realized as increasing the relative size of working-age population. Reduction in the number of dependent children decreases the dependent population decreases. Decline in the dependent population incresing the marginal efficiency of capital through investments, but also directly increases national income per capita.

According to the results of the econometric analysis, a long-term relationship is seen between the sex ratio of higher education, elementary and high school graduates and GDP (Gross Domestic Product) in Turkey. However, this relationship contains fractures especially in the periods before and after the 1980 military intervention. These periods that have breaks, were the times both have economical, social and legal significant impacts. So that, military rule which was effective in this period, sees a large segment of society as objectionable and guilty and, needed to intervene in every area of life. Military goverment's interventions to the right of education, both with constitutional regulation and the regulations within the framework of the trade union and the Higher Education Act, have been effective in the formation of these breaks. On the one hand with the prohibition of headscarves caused a further increase gender inequality in education, on the other hand large number of educators removed from the profession because of their proximity to the left ideologies. The indicator that has the highest influence on the rate of growth is sex ratio of higher education graduates. According to other levels of graduates, higher education graduates to participate in working life in a shorter time reinforce this findings' accuracy. At the same time the increase in sex ratio of graduates of higher education is much higher than other series.

Whether male or female, enhancing the number and the quality of highly educated employees will reduce the income and technology difference between the new technology producing countries and the countries that implement them. Increasing the level of women's education, both micro-and macro-economic point of view provides more benefits than men. Closing the gender gap in education, will allow more efficient use of resources in developing countries and their difference from developing countries will close more easily. A well-educated population is one of the most important sources of economic growth, but also a

key element to ensure the efficient use of other resources. As a result, education is the flower, as well as the seed, of economic development (Krueger, 2000: 44).

Abstract

To date, lots of research was carried out solely on the effectiveness of Authentic Learning principles in service learning. The results showed positive relationships between theories and practices because students had become relatively analytical thinkers, problem-solvers and collaborators. The uses of Authentic Learning and Facebook in service learning, however, are under research. Hence, this paper tends to investigate the effectiveness of Authentic Learning Principles and Facebook in promoting active learning among students in their service learning curriculum. These students are from Albukhary International University (AiU) whereby service-learning curriculum also known as Community Engagement Project (CEP) has been introduced to all undergraduate students across their 3-year curriculum. Purposive samplings were employed to find out the students' preferences in using Authentic Learning Principles together with Facebook as a social media tool in their service learning projects. Surveys which consisted of Likert-scale questions were administered to ninety-six (99) students from 20 different countries. Fifty-one percent (51%) of the students were males and the other forty-nine (49%) were females. The results have shown that Authentic Learning Principles and Facebook as a tool of communication have effectively enhanced students' learning experience in service learning.

Keywords: Authentic Learning Principles, Facebook, Service Learning / Community Engagement Project

1. INTRODUCTION

Albukhary International University (AiU) is established under the concept of "Waqf" – a charitable university which offers full-fledged scholarships to the underprivileged students during the duration of their studies. The ultimate goal of the concept aims at providing equal education opportunities to academically qualified students from disadvantaged, underprivileged and marginalized backgrounds. In line with the ultimate goal, the students are expected to possess good characters in terms of valuing discipline, being caring and generating contributions to the society upon their graduations. It is also a model university to the world characterized by high quality and relevant education and universal humanitarian values. In order to produce students who have good characters and experience in social activities, they are requested to participate in planned service learning projects during their course of studies. The service learning projects provide an authentic learning phenomenon in which they have to employ real-world and discovery-based problem solving skills to resolve the problems. They are expected to learn the passion to serve and the meaning of contribution for the betterment of the society. Previous research on the integration of authentic learning in service learning projects showed positive outcomes because they had become relatively analytical thinkers, problem-solvers and collaborators (Brown, 2002; Lombardi, 2007; Tan, Teo & Chy, 2009). Technological-based authentic learning also presents its significant role in creating and applying new knowledge by using higher thinking cognitive processes (Churchill, 2005). Hence, this paper tends to investigate the effectiveness of authentic learning and the use of Facebook as a social media tool in the process of students' active involvements in the service learning projects.

2. LITERATURE REVIEW

2.1 Authentic Learning in Service Learning Environment

---

[161] Corresponding author;
E-mail address: halawati@aiu.edu.my

Authentic learning (Herrington & Kervin, 2007), also known as experiential learning, has created a new paradigm shift for students because it dismisses rote learning. The principles of authentic learning promote learning knowledge and skills useful in real life (Collins, 1988), link the classroom theories with real world practices (Bennett, Agostinho & Lockyer, 2002; Borthwick, Bennett, Lefoe & Huber, 2007), develop problem solving skills and construct knowledge (Hui & Koplin, 2011) during the authentic activity learning process. Research has also shown the fact that students who have engaged in authentic learning activities tend to have the flexible competency such as "the judgment to distinguish reliable from unreliable information, the patience to follow longer arguments, the synthetic ability to recognize relevant patterns in unfamiliar contexts and the flexibility to work across discipline and cultural boundaries to generate innovative solutions" (Chang, Lee, Wang & Chen, 2010, p.1572). Lombardi (2007) further commented that authentic learning activities can go beyond the content of curriculum where students are exposed to different disciplines and cultures. Consequently, students can face and manage their problems easier because the higher order of thinking skills they possess give them strength to make the right decision in their future working atmosphere (Herrington & Kervin, 2007; Lombardi, 2007).

Service learning has become the curriculum in higher education institutions which aims to improve the quality of live especially to underprivileged and maginalised people on a voluntary basis. It gives authentic contexts to students to apply their knowledge and skills. Therefore, students are encouraged to be involved in service learning which provides authentic activities. Students can learn new experience by real experience and they can remember the content for a long time (Ammon, Furco, Chi, & Middaugh, 2002). Apart from this, the students learn about social responsibilities such as being empathic, ethical and helpful to needy people in their surroundings (Berham, 2006; Ikeda, 2005; Wigginton, 1985). Such learning experience also certainly enriches the life of learners in schools. Erlich (1996) and Furco (1996) had clearly stated that students best learned not by the printed materials but experiences. Jacoby (1999) further explained that service learning is the authentic activity which accommodates "human and community needs" besides being a popular activity and contextual relevant to culture and experiential learning (Settle & Smith, 2008). In addition, service learning requires participants to give up their time, comfort and finance (Perold & Omar, 1997) for the benefits of others. In this process, students have to be self-sacrificed to handle and solve the complicated problems externally and internally. Learners are given opportunities to strengthen their skills of thinking process as they freely explore, discuss, reflect, construct concepts from the project they are involved (Mims, 2003). Positive characters such as team-spirit, leadership, conflict resolution, communication, organization, and time management (Tucker, McCarthy, Hoxmeier, & Lenk, 1998) are inculcated when they are committed to service learning. A previous research (Campus Compact 2005) showed that 95 percent of interviewees recognized and accept the outcomes of positive character building through service learning. With the positive outcomes, the students are able to make use of their existing good characters, knowledge and skills in their real-life. They are the practicalities of authentic learning activities in service learning.

2.2 Authentic Learning in Facebook (Social Networking)

Because of the popularity and usefulness of social networking, teaching and learning from the traditional setting has now moved to the virtual world setting. Previous research in Malaysia mainly focused on interface design and interactive multimedia elements (Sivapalan & Wan Fatimah, 2010) which did not offer authentic learning contexts and activities for students to interact. The focus on authentic learning in social networking particularly in the use of Facebook is under research.

The invention of Facebook, a popular communication tool, has offered the virtual communities for students to communicate. Facebook has broken its records of active users from 350 million in 2010 (Facebook, 2010) to 526 million in 2012 (Facebook, 2012). The drastic increase of users has signified its existence not only as a communication tool but also an avenue for the people to share their leisure and lives. It is also a tool to befriend and simultaneously joins the connections and interactions from a physical setting into a virtual world (Wang, Chun, Yu & Wu, 2013). Shih (2013) has proven that the virtual world in Facebook is enticing because users are given the opportunities to "exchange, interact, collaborate and socialize" (p.52) with other people. Before its invention, multimedia technologies which lacked of interactive components were regarded as inhumane and the community felt bored to use them (Zaidieh, 2012). However, the introduction of Facebook with interactive advertisements, chatting tools, colourful pages, pictures and games has gained its fame among students and teachers. It encourages students to communicate with their teachers after school hours for their projects and most importantly, Facebook promotes learning through authentic contexts and activities. Students are given leverage to express their thoughts,

opinions and suggestions on Facebook. Simultaneously, they will receive comments, feedback and support from their teachers and peers. In this case, strong relationships in the culture of learning for both teachers and students are strengthened (Zaidieh, 2012).

Teachers and students gain the advantages of using Facebook as a tool to allow students to come together to discuss, co-ordinate, collaborate and resolve subject-related problems in the virtual platform (Salaway, Caruso, Nelson & Ellison, 2008). Besides, students using Facebook as an educational tool are encouraged to spend more efforts to work in teams for their academic activities (Kennedy, 2000). With the convenient features in Facebook, students and teachers can experience authentic learning environment when they share the resources, make the announcements, discuss the details of the projects and exchange ideas in groups. As a result, merging Facebook with teaching and learning breaks the four walls of classrooms and provides students more room to interact with the aim at enhancing effective learning. Students are now more able to improvise their thinking and communication skills which are beneficial to their work in the future. The skills go hand in hand with "engaging students in disciplinary practices of professional practitioners" (Land, Hannafin & Oliver, 2012, p. 11).

3. METHODOLOGY

AiU has tailored the Community Engagement Projects (CEP) as compulsory curriculum to all the undergraduate students during their 3-year studies. They are from 50 different countries and are expected to be the agents of change to their respective communities after their studies. CEP focuses on empowering underprivileged and disadvantaged students by transferring social entrepreneurship qualities, moving towards a non-conventional paradigm - social business mind set and ability to plan, implement, monitor, identify, scale up and evaluate a "holistic" development programme by taking into consideration social, economic and environmental dimensions.

Indeed, CEP promotes "learning from each other and taking action together" (Chamberlain, 1993, p. 31) in which learning has moved into real social contexts. He further observed that "it is not only what's being done that is impressive, but how – against the odds; and why – the motivation and the spirit that produces such a determination to succeed' in community development (Chamberlain, 1993, p. 32). Ideally, it is linked together with a common goal of combining activities and working together so as to build good relationships and sharing available resources in the communities or villages. It also goes further to encourage the AiU students with community members and other interest groups to be involved in learning by identifying the potential development, making the proposals and action plans based from the demographic findings and monitoring the progress of the development programme at the specified community areas.

A total of 232 undergraduate students had registered themselves in CEP. They were divided into 21 groups. Each group comprised 9 to 13 students. The names of the groups consisted of Enactus 1, Enactus 2, Heptanations, Global SLA and 7-Heaven. Students were able to choose their own group of 3 from different countries. Besides, each student had a Facebook account. AiU had made use of Facebook to make announcements on community service activities and academic matters. Students liked the flexibility of Facebook because it could update the communication in the community fast and also the ability to share multimedia contents. Hence, Dwyer, Hiltz and Passerini (2007) has advocated in the research that Facebook is an easier mean of communication with staff leaders and group members since most undergraduate students are online with Facebook daily.

As part of the preparation process in CEP, Facebook is used as the social media tool for communication. Facebook has become their source of interaction among the project leaders, student group leaders as well as among the group members. They needed to develop their own digital identities in order to become the community of professionals utilizing educational technology to the community. The Year 1 group leader would create a Facebook group at the beginning of the first semester. All group members were required to join the Facebook group. It was not public viewing Facebook groups. Only group members could access and view the groups' announcements, shared documents and online discussions. Figure 1 is an example of a Facebook group created by one of the groups. There were 13 members who came from various countries namely Somaliland, Myanmar, Bangladesh, Sri Lanka, Indonesia, Uzbekistan and Bhutan.

Figure 1: An Example of a Facebook Group

Facebook functioned as a social media tool does support the authentic learning via service-learning. It has also provided information and resources that help students in CEP. By engaging students in Facebook, they were able to flexibly communicate with each other and it was a cost-effective way of communication. Most importantly, Facebook also gave the opportunities to many university students to explore and manage their daily communication in a safe and ethical mode (Ahmedani, 2011).

Purposive samplings also known as random or probability samplings were used in this study. Purposive samplings are a "strategy in which precise settings, persons or events are selected purposely in order to gather important information that can't be obtained from other choices" (Pickard, Child and McLeod, 2007, p. 64). We chose selected CEP groups and they were required to complete 30 items in the Likert-scale survey form. In the survey form, the students were asked about the average time spent on Facebook and whether or not they liked the idea of using Facebook in their CEP.

4. RESULTS ANALYSIS

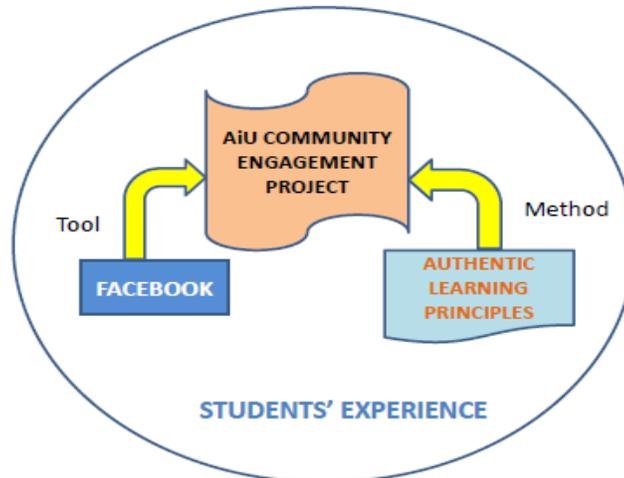
Out of 232 students, there were only 99 students involved in the survey. They consisted of 51 males and 48 females. Out of 99 students, 83 students used Facebook Group as a communication tool in the CEP. Using Facebook Group triggered the critical discussions and shared field trips experience among the group members. They could also upload and update the common group report to meet the objectives of respective tasks. It goes in line with the objective of this paper which tends to investigate the effectiveness of Authentic Learning Principles and Facebook in promoting active learning among students in their service learning curriculum.


Figure2: Conceptual framework of CEP in AiU

In this study, we integrated the ten authentic learning principles into the community engagement project activities as indicated in Figure 2. The students went on field trips to study the socio-economic environment of the rural local community. The activities included addressing means of living, strengthening the ability to cope and recovering from stress and shocks, incorporating relevant aspects of people's lives and livelihoods into development planning, implementation and evaluation, and the ability to be responsive to changes and people's needs and ensuring sustainable resources for today and tomorrow's generation.

The outcome of the finding is reflected in the Table 1. Students felt that using Facebook had helped them in achieving a successful outcome in their CEP. The students also agreed that the Facebook group provided a useful medium for them to share and display information and resources. Facebook was as if a noticeboard for any updates of their CEP activities. From this survey, 83% of the respondents had accessed to Facebook all the time and frequently visited the site every day. Only 12% of the respondents were not frequent Facebook users.

Besides, about 90% respondents agreed that Facebook had allowed them to communicate effectively and conveniently between group members and staff group leaders. They could communicate freely in texts for any discussions related to CEP. Facebook had also provided them an easy, cost-effective, safe and friendly environment to voice out their views and opinions.

Almost all the students (93%) agreed that Facebook had promoted authentic learning contexts and activities in CEP by learning the roles, delegating tasks among group members. This was done through Facebook groups and events. Facebook had allowed the students to articulate their views and opinions, discuss issues and process activities via status updates and comments. By uploading the related Youtube, videos and visual elements to Facebook, the experts of performance were able to identify how service learning was conducted as well as to explore more topics through external links.

Two thirds of respondents (66%) agreed that coaching and scaffolding were done through Facebook discussions and it had given the opportunity to instructors to observe the activities and comments made by the students. When students had made a comment or asked for a question, feedback could be given by the project leader or the group leader. Somehow, only 70% of the students agreed that the feedback had helped the students to reflect on what they had learnt during the CEP activities. The overall result of this study had implied that Facebook was a social media tool that could be used as platform to implement authentic learning principles in AiU CEP activities.

Table 1: The Students' Perceptions on Facebook and Authentic Learning Principles

Authentic Learning Principles	N	Mean	Std Dev
Principle 1: Authentic Context a. Facebook allows you to bring the real life learning experience into community engagement activities. b. Facebook provides you a place to display pictures, YouTube or visual elements about community engagement activities. c. Facebook is a tool to motivate you to learn more about the community engagement activities during the process.	99	2.4693 3.0202 2.4141	0.7587 0.7518 0.8042
Principle 2: Authentic Activities a. Facebook provides you a place to determine the roles of each team members in the community engagement activities. b. Facebook provides you a place to delegate the tasks of community engagement activities among the team members. c. Facebook provides you a place to connect with team members regardless of their locations about the community engagement activities easily.	99	2.616 2.889 3.071	0.7876 0.7899 0.7726
Principle 3: Expert Performance a. Facebook provides a place to project leaders to demonstrate the steps to begin and manage community engagement activities systematically. b. Facebook provides you a place to observe the communication skills of the project leaders to other students. c. Facebook allows easy and cost-effective communications among team members and project leaders.	99	2.745 2.633 3.072	0.7601 0.8130 0.7766
Principle 4: Multiple Roles and Perspectives a. Facebook provides you a place for different comments and opinions about community engagement activities. b. Facebook provides you a place to investigate the reliability of information about community engagement activities. c. Facebook provides you a place to update your group members about any news and discussions on community engagement activities.	99	2.990 2.663 3.265	0.7491 0.8800 0.6784
Principle 5: Reflection a. Facebook provides you a place to write reflections about your strengths and weaknesses in community engagement activities. b. Facebook provides you a place to record the incidents take place throughout the community engagement activities. c. Facebook is a place to express your feelings freely without being judged.	99	2.459 2.633 2.691	0.8227 0.8498 0.9235
Principle 6: Collaboration a. Facebook provides you to collaborate among members of the community engagement group. b. Facebook provides you as a medium to collaborate their work and ideas about community engagement activities. c. Facebook allows you to share the group reports about community engagement activities.	99	2.857 2.888 3.010	0.6999 0.6528 0.6308
Principle 7: Articulation a. Facebook provides you to discuss issues or processes of community engagement activities. b. Facebook provides you the opportunity to debate about the views on community engagement activities. c. Facebook is a tool to adopt a new learning method in community engagement activities.	99	2.816 2.724 2.546	0.7333 0.8053 0.8618
Principle 8: Coaching and Scaffolding a. Facebook provides project leaders to observe students, offering resources and providing feedback about community engagement activities. b. Facebook provides the opportunity to you on the skills and knowledge transfer from project leaders about community engagement activities. c. Facebook provides you an effective channel for the project leader's feedback and areas of improvements about community engagement activities.	99	2.691 2.670 2.753	0.7231 0.7828 0.6740
Principle 9: Integrated Authentic Assessment a. Facebook can capture rich information about student performance in community engagement activities. b. Facebook allows you to upload reports about community engagement activities for project leader's assessment. c. Facebook has the mechanism for you to continuously revise your reports based on project leaders' feedback about community engagement activities.	99	2.408 2.867 2.732	0.8186 0.7645 0.7253
Principle 10: Professional Learning a. Facebook allows students to keep informed about new technology developments in teaching and learning techniques related to community engagement activities. b. Facebook allows student to update information relevant to their future professional development. c. Facebook is a social media tool to learn about community engagement project in innovative, challenging and creative ways.	99	2.816 2.847 2.714	0.6903 0.7050 0.8081

5. CONCLUSION

There were some limitations in this study. Firstly, four groups had not adopted Facebook as a social network media tool in the CEP. The students felt that Facebook was merely for their social lives and it was not for academic activities. Some students found that the staff leaders did not extend their co-operation in assisting them to complete their activities and tasks related to CEP. It had affected the results for the principle in coaching and scaffolding.

Secondly, Facebook had a constraint of only accepting a certain type or format of document to be uploaded. Thus, it restricted the students and project leaders to share the resources among the group members.

Finally, students appreciated very much the flexibility of Facebook in terms of communication and sharing information and resources. Facebook has already been an integral part of undergraduate students' daily lives. Students could improve better through their CEP with the integration of Facebook as a social media tool and ten authentic learning principles. Hence, the study has shown that students favourably responded well to this framework.

The potential of Youtube for teaching and learning in the performing arts

Dorothy DeWitt[162], Norlidah Alias, Saedah Siraj, Mohd Yusaini Yaakub, Juhara Ayob & Rosman Ishak

Faculty of Education, University of Malaya, 50603 Kuala Lumpur, Malaysia

Abstract

Youtube, as a Web 2.0 tool, can be utilized for knowledge generation through observation and social interactions. However studies related to the use of Youtube in education have focused mainly on academic achievement, with very few studies are conducted in the instruction of the performing arts. In addition, there are very few studies done in the performing arts related to future studies. The objective of this study was to get consensus on the benefits of the use of Youtube as a tool for teaching and learning in the performing arts, and for maintaining students' interest and achievement in learning, as well as to determine the suitability of using Youtube as a tool for teaching the performing arts in future. In this study, the Fuzzy Delphi technique was used to get consensus among 20 experts who were instructors and lecturers in seven areas of specialization: music, creative writing, theater, television film, dance, animation and fine arts from the Academy of Arts, Culture and National Heritage (ASWARA). The findings show that Youtube the potential to be used as an instructional tool in the performing arts in line with current trends of collaboration and social networking in education

Keywords: Youtube; teaching; learning; performing arts

Introduction

Videos as social media

Learners remember and understand better when they see, hear and do. The level of a students' understanding of a subject when they see, hear and produce materials during instruction is higher (75%) compared to students who only see during instruction (20%), and see and hear only (40%) (Lindstorm, 1994). Learning with multimedia elements, such as videos, has been shown to be effective for learning activities (Krauskopf, Zahn & Hesse, 2012; Zahn, Pea, Hesse, & Rosen, 2010). Learners are able to see, hear and produce the required behaviors.

There is a variety of online media, including videos which enable these elements to be available. YouTube, TeacherTube and Vimeo are online video repositories in which videos are made available (Norlidah Alias, DeWitt, Saedah Siraj, 2013). Users are able to download, view and share video clips on an extensive variety of content which includes film clips, television shows, music and instructional videos, vlogs or videoblogs, as well as amateur video. The YouTube becomes social media when the videos are shared and comments and other forms of interaction occur on the site.

Social media has been shown to be effective for learning. Learners are able to develop higher level thinking skills such as decision making and problem solving, as well as communicate and collaborate using social media (Bunus, 2010; Greenhow and Robelia 2009). In addition, connections can be made to what they learnt in their classrooms (Greenhow and Robelia 2009) and learning becomes more engaging (Bunus, 2010). Hence, there is a potential for YouTube, as both a video with audio and visual elements, as well as a social media to be used for instruction.

The Performing Arts

The performing arts is sometimes considered unrelated to education and morality as glamorous lifestyles of some professional artists may indicate. However, there are many elements of values involved in performing arts. character-building, self-discipline, collective discipline and creativity.

Performing arts educates the public on the culture of the community: the values, beliefs, interaction and lifestyle (Schecner, 1988). These would include ways of obtaining their daily sustenance, hunting for food, worshiping and daily living (Torrez, 2010). Performing arts can address the formal, non-formal and informal aspect of education. Drawing on the Performance theory of Richard Schecner (1988) the function of performing arts in the educational context should be strengthened and "refreshed" in line with the current technology. Conventional teaching and learning methods need to be reviewed to keep pace with the rapid development of technology in the 21st century. The role of the teacher is important to make sure the teaching strategies and resources have a maximum impact on student learning. Learning is observed through changes in terms of skills, knowledge and attitudes of students after instruction (Noraini Idris, 2009).

ASWARA, or the Academy of Arts, Culture and National Heritage, is an institute of higher learning for the performing arts. ASWARA aims to produce highly skilled and competent artists and employees for the continuity of the national art heritage. Learning emphasizes practical work to ensure that students are skilled. ASWARA graduates are expected to fulfill the human capital requirement in the field of performing arts and music by producing songwriters, singers, actors, script writers, dancers, painters, directors and experts in other careers related to the creative arts industry. Specialized areas of study which include video film, dance, music, theater, creative writing, fine arts and animation makes ASWARA the premier higher education institution which functions as a parent for other institutions of education for culture, arts and heritage.

Videos for performing arts

Studies have shown that the use of multimedia, including videos are effective for learning. The use of multimedia in teaching and learning has been found to be effective for enhancing knowledge (Mohd Arif Ismail, Zamri Mahamood and Norizan Abdul Razak, 2000). In addition, videos in particular have been used for courses in Java computing, and have been shown to be effective for learning while minimizing time spent on lectures (Carlisle, 2010). Videos help in the cognitive and social development of students in problem solving tasks (Zahn, Pea, Hesse, & Rosen, 2010). When videos are shown at the appropriate phases in the teaching process, it aids the effectiveness of teaching (Hsu, 2013).

There have not been many studies in the use of Youtube in education. Studies have been done using YouTube for instruction in the academic fields such as medicine (Koya, 2012) and architecture (Ham and Schnabel, 2011). In Salman Khan's Flipped Classroom, videos are used for instruction out of the classroom in academic subjects, while face-to-face training with the instructor is done in the classroom (Webley (2012).

A Delphi study on the use of YouTube for instruction did show that experts concur that further research is required on the use of social media tool in 5 areas (Snelson, Rice & Wyzard, 2012). The social content was ranked first, followed by the teaching and learning category, social and political impact, video creativity and production and finally legal and ethical aspects. The potential for the use of YouTube in transforming education in the classroom was listed as an important area of research (Snelson, Rice & Wyzard, 2012).

However, the role of the teacher is still important in monitoring the access to social media sites (Troy & Kristen, 2011; Yong Zulina, Asma Ahmad and Mohd Sapiyan, 2000. In addition, the selection of videos on education on video repositories is limited, as more popular video is uploaded (Torres, Finamore, Kim, Mellia, Munafor and Rao, 2011).

The studies related to the use of Youtube have focused mainly on academic achievement (Koya, 2012, Ham and Schnabel, 2011) with very few studies conducted in the performing arts. Hence, there is a need for more studies on YouTube (Snelson, Rice & Wyzard, 2012) to determine if this form of social media can be taken advantage of and used for instruction in the performing arts.

The findings from this study will help the academics at ASWARA in developing new curriculum is important to determine the learning experiences that lecturers may need to attract students to learning the performing arts in future. In addition, schools and other institutes of higher learning can also benefit from this study as it will determine if innovative and creative ways for achieving academic performance can be implemented while the objectives of the performing arts is attained.

Research Objective

The objective of this study was to get consensus among experts on the use of Youtube in teaching and learning the performing arts at the Academy of Arts, Culture and Heritage (ASWARA). The research questions are as follows:

1. What are the benefits of the use of YouTube as a tool for teaching and learning in the performing arts?
2. Can students' interest and achievement be maintained in learning the performing arts using YouTube?
3. Is the YouTube suitable as a tool for teaching the performing arts in future?

Design of the Study

The design of the study employs the Fuzzy Delphi technique, which uses a combination of interview and survey to collect data among experts. The Delphi technique, a method for obtaining consensus among experts, was first introduced by Kaufman & Gupta (1988). It consists of several rounds of data collection and verification, making it reliable.

Interviews were conducted in the first phase. Interviews are invaluable in capturing the perception and understanding the meaning constructed by the respondent. In the semi-structured interview process, the questions were formulated in advance, but the sequence and modification of the questions were made based on the participants' reactions (Noraini Idris, 2010).

The data from the interviews would be used to develop a questionnaire which would be use for the Fuzzy Delphi technique for data collection among the experts.

Sample

The sample comprises of 20 lecturers and trainers from an institution specializing in performing arts. There were three lecturers each in the following specialist areas: theater, dance, music, fine arts, animation, and creative writing and an additional two from TV-movie production. The experts were chosen based on their credibility and experience in the field of performing arts. The choice of experts was justified based on their academic qualifications, and expertise in the field of performing arts with a minimum of five years teaching experience.

Instrument

The instruments in the study consist of the interview protocol, a list of structured interview questions; and a questionnaire, Potential Use of You Tube in Teaching and Learning Performing Arts, developed using the Fuzzy Delphi technique.

The questionnaire is divided into 2 parts. Firstly, data on the profile of the respondent (gender, age, academic qualification, experience and position in ASWARA) was collected; and secondly, the opinions and views of the experts on the use of Youtube for instruction.

The second part of the questionnaire was developed from the analysis of the transcripts of interview with the experts. The areas in which the opinions and views of the experts were collected are on the prospects of performing arts learning Malaysia, efficient teaching methods that can be used by lecturers in practical classes in the performing arts, the problems detected by these lecturers in teaching and learning the performing arts, the contribution of Youtube to teaching and learning, and student interest and achievement: whether the visual elements displayed in Youtube attracts the attention and interest of students.

Data collection and analysis procedure

Firstly, six experts with differing areas of expertise were interviewed to determine their views on the potential of using Youtube in the instruction of the performing arts. The interview was audio-recorded and observations on non-verbal features were noted during the interview. The transcripts of the interview were analyzed to facilitate the construction of the Potential Use of You Tube in Teaching and Learning Performing Arts questionnaire.

The questionnaire consists of 52 survey questions on the potential use of Youtube for instruction. A 5-point Likert scale was used as follows: 1- Strongly agree; 2- agree; 3 – unsure; 4 – disagree; 5 – strongly disagree.

The analysis of data was done using negative Triangular Fuzzy Number to produce a negative scale (similar to a Likert scale). In this study, the scale used to translate negative linguistic variables to fuzzy number.

	Strongly agree	Agree	Unsure	Disagree	Strongly disagree
Likert scale	1	2	3	4	5
Triangular Fuzzy Number	0.60, 0.80, 1.00	0.40, 0.60, 0.80	0.20, 0.40, 0.60	0.10, 0.20, 0.40	0.00, 0.10, 0.20

Two key points in the fuzzy rules are triangular fuzzy number and deffuzification process. For the triangular fuzzy number is used to produce a scale (similar to a Likert scale). This scale is used to translate the variables to the fuzzy number. For this study we use a scale of 5 for strongly agree (0.60, 0.80, 1.00), 4 for agree (0:40, 0.60, 0.80), 3 for unsure (0.2, 0.4, 0.6); 2 for disagree (0.1, 0.2, 0.4), and 1 strongly disagree (0.0, 0.1 and 0.2).

The deffuzification method for determining the position of each of the variables and sub variables is done using the formula $A_{max} = 1/3 * (a_1 + a_2 + a_m)$.

Findings and Discussion

23.1. Benefits of the use of Youtube as an educational tool in the performing arts.

The results show 8 themes emerged when the analysis of experts' opinions using Fuzzy Delphi was done (Table 3). The analysis shows that the experts agreed and ranked as being the most important: instructional messages for teaching and learning the performing arts can be effectively channelled through Youtube (Delphi deffuzication of 14.16 points). The experts also agree that Youtube is beneficial for providing information (13.16 points), as well as

for teaching and learning in the performing arts (13.1 points). In conclusion, the experts seem to agree that Youtube can contribute to the teaching and learning of performing arts.

Table 3: Contribution of Youtube in teaching and learning

Position	Question	Deffuzification Marks
1.	Instructional messages in performing arts can be channelled effectively through the Youtube application	14.16
	Youtube is not the main learning tool but a support tool for providing information on issues in performing arts.	13.16
	Youtube is beneficial to teaching and learning in the performing arts.	13.1
	Teachers play an important role as advisor in the process of teaching and learning in using Youtube	12.86
	The use of video in teaching and learning sessions are more effective compared to Youtube	11.4
	The use of Youtube in the performing arts does not develop an internal sense of producing works of fine art	10.1
	Youtube is suitable for the use of the introduction part of instruction in performing arts	9.13
	Youtube is not suitable to be used as an instructional aid	6.36

3. 2 Student interest and achievement using Youtube for instruction in the performing art

Novel methods and teaching resources can motivate students to continue learning to improve their performance. However, using Youtube is not a preferred method of teaching among specialists in this area of study as the experts agree that face-to-face instruction is more relevant than using Youtube (deffuzification score of 13.8) (Table 4).

Conventional methods were perceived to have more impact on the teaching and learning process as through the face-to-face training, problems can be identified and corrected immediately, thus improving the quality of instruction. However, experts agree that Youtube is motivating and can increase student achievement in the performing arts (ranked 9 position with a deffuzification score of 9.2).

Table 4: Student interest and achievement using Youtube for teaching and learning

Position	Question	Deffuzification Marks
2.	Face-to-face teaching methods is more relevant compared to using YouTube for instruction	13.8
	Youtube can be used as a platform for the promotion of performing arts among students.	12.9
	Visual elements are displayed through Youtube to attract the attention and interest of students	12.5
	Teaching and learning the performing arts is more efficient if coupled with Youtube applications	11.75
	Effectiveness in terms of student achievement cannot be measured using Youtube applications	11.5
	The use of Youtube in the teaching and learning of the performing arts can create two-way communication between lecturers and students	11.1
	Negative issues such as copyright of the work of performing arts will affect teaching and learning using Youtube	9.7
	Learning through the use of Youtube is less effective in terms of student motivation and achievement	9.2

3.3   Implications on using YouTube in performing arts education in the future

The experts agree that in the future, learners of the performing arts need to improve their information technology skills as this is related to globalization (Table 5). The experts realize that the use of YouTube in instruction cannot be used to acquire detailed techniques and skills in the performing arts. Furthermore, the experts also agree that learning the performing arts through YouTube requires complete supervision by lecturers. Nevertheless, the experts agree that YouTube does not negatively affect the learners.

Table 5: Implications on using YouTube in performing arts education in the future

Position	Question	Deffuzification Marks
3.	Lecturers in the Performing arts need to enhance skills related to information technology and be sensitive to globalization issues in the IT world	14:03
	Detailed accuracy of subject matter of performing arts cannot be acquired in detail in the presentation through the use of YouTube	13.06
	The lecturer needs to be control when using Youtube for teaching and learning in the performing arts lecturer	12.36
	You tube can be used for documenting results of work in the performing arts for future reference	12.33
	Creative and innovative approaches, appropriate to the subject of the performing arts should be applied in using Youtube for teaching	11.73
	Knowledge of the cultural identity of a society can be explored through the use YouTube	11.06
	Language is a key constraint in learning the performing arts using YouTube presentations	9.66
	The exclusiveness of learning the performing arts is eliminated using Youtube	8.93
	The openness of YouTube has a negative impact on students' acceptance and perception of issues in the performing arts.	8.76

4.   Conclusions and Recommendations

The findings of this study indicate the integration of information technology in learning and teaching the performing arts can be done using YouTube. In the context of teaching and learning, YouTube is used as a video repository to assist both lecturers and students. At the same, innovation and creativity among lecturers and students can be triggered.

The study found that the importance of using technology other than YouTube is also required and that lecturers needed to pay attention to this new shift in the performing arts education. Based on the experts' opinion, the performing arts can become a commodity for Malaysia to market.

Efficient teaching methods should be practiced to specifically deal with practice in the performing arts. Thus, lecturers must keep pace with the needs of the present generation of students but at the same time maintain the artistic value and originality. YouTube can be used to enhance the knowledge base in performing arts.

Policy planners and implementers of the performing arts curriculum should consider the integration of the subject with information technology and develop the information technology skills among lecturers and learners.

The limitation of this study is that the experts were from the same institution, ASWARA. It would be interesting to determine if experts in the performing arts in other institutions had the same opinions. In addition, it would also be useful to determine if there was a correlation in the age of the experts and their perception towards the use of technology for the performing arts. The implementation of this tool in instruction in the various specialized areas of performing arts can be also studies.

This study can be replicated to determine if the use of YouTube can be extended to other subject matter areas. In addition the effectiveness of YouTube can be studied to determine its strengths and weakeness in the priority areas in education (Snelson, Rice, and Wyzard, 2012).

In this day and age of information and digital technologies, more effective methods are being used to encourage innovation and creativity. Hence, it is even more necessary to encourage this elements in the performing arts to instil the appreciation of the arts and performance in the general while convincing society of the importance of the performing arts.

The Problem of Using Educational Technology in the Faculty of Technology

Cengiz Öner[a163],Osman Karahan[b], Bahadır Köksalan[c], Salih Akyıldız[d]

a.   *Doç. Dr. Fırat University, Technology Faculty, 23119, Elazığ, Türkiye.*
b.PhD Student, Fırat University, 23119, Elazığ, Türkiye

Abstract

Faculty of Technologies, which is incorporated to Turkish Educational System by modifying Faculty of Technical Education, carries the purpose of producing the needs of tecnolog defined as production engineer. During the recent years when the Turkish industury improves, it becomes very significant of Faculty of Technology to train technologs who have this vision. Training needed and well-qualified techno-technologs for our era depends on using educational technoloy during training besides, many variables. However, having crucial problems in this subject is a reality.

The purpose of this study is to identify the problem of using educational Technologies according to opinion of lectures and students. The data which is going to be collected by using Likert scale is going to be analysed according to arithmetic mean, Standard deviation, The results of analysis can be expected to identify the problems which come across while using technology in the Faculty of Technology and to make some suggestions.

At the beginning of the establishment of the Republic, which is very important given the services of Technical Education Schools (Alkan et al, 2001; Işıksoluğu, 1998), and later experienced serious difficulties due to various reasons. In time, many steps have been taken towards overcoming these problems. The first of these affiliated teaching continued for many years TEF, issued on 20 July 1982, by legislative decree No. 41 "Technical Education" (TEF) was restructured under the name transferred to the universities, the program was redesigned in terms of structure and management. After the transfer of the universities, it is a form of organization of schools and programs, significant changes have taken place. The differentiation of technical teacher training institutions and employers, employment, and planning has led to problems (Mahiroğlu, 1996). Exchange programs, more practical courses realized in the form of reduction and increase engineering courses. Need to reduce the practical courses, as well as a form of organization, the quality of graduates, and therefore, their negative impact on employment (Ulusoy, 2003; Sezgin, 1992). TEF graduates employment problems in time grow and has become chronic. TEF model have been raised as a result of this restructuring needs (Ozer, 2003), and finally in 2010 to change once again exposed TEF, published in the Official Gazette No. 27405 dated 13.11.2009 2009/15546 by the Council of Ministers No. (www.tmmob . org.tr) "Technology Schools" what transformed. This transformation, the graduates of the Faculty of Technology "engineer" has achieved the title that this is an important achievement. Because the students who graduated from a higher education institution with the name of the title, finding a job, the promotion of business success and an important factor that determines the degree of satisfaction (Karasar, 1981). Today in our country due to various colleges of education operates in 21 Faculty of Technology.

Faculty of Engineering and management of project engineers, having produced mainly different, the main aim of the Faculty of Technology, application oriented engineers (in a sense, production engineers) to train. This goal has long been directed to vocational and technical education "is mainly theoretical, not giving enough weight to the application that" criticism (Savaşır, 1999) becomes even more important considering. That this is the name of

E-mail address: mconer@firat.edu.tr

the faculties of technology, science, manufacturing, service, transportation and so on. areas of application problems. Educational technology in the teaching-learning process design, implementation, evaluation and improvement of the job (Alkan, 2009).

This mission, in accordance with the Faculties of Technology is expected that application oriented teaching process. The application of a weighted in the educational process, of course, require the use of educational technology intensive. At this point, two issues stand out. The first is about the lack of educational technology in the Faculty of Technology TEF'den convertions configured. Second, the use of educational technology competence of the instructors at these faculties are unknown.

These two problems are closely related to the original purpose of the Faculty of Technology, the employment of graduates in the medium term is the potential risk. Mainly because the application of efficient and effective education, and their effective use, but requires the presence of a sufficient amount of educational technology. These issues, the problems, the predictable negative effect on the quality of graduates. Who had been through the historical process, and many have been forced to prove his mettle repeatedly recruited TEF'den Faculty of Technology, can not tolerate a similar failure. Therefore, Faculty of Technology, to be available in the future, almost doomed to be successful in all respects. This conviction of the Faculty of Technology, in the teaching process requires extensive use of educational technology. The aim of the problems of educational technology Faculties of Technology, based on feedback from students, this study was to determine expected to contribute to the relevant literature.

2. Method
This study is a descriptive survey model is of quality. Screening model, the current state of the universe by sampling a model based on the description and explanation. **. (Arseven, 1994; Balcı, 1995; Karasar, 2005).**

2.1. Population and Sample
The universe of this study, Firat University, 2012-2013 academic year studying at the Faculty of Technology I. and II. Teaching students. In the sample, it can be the universe (who accepted the survey) created a total of 214 students.

2.2. Data Collection and Analysis
In this study, data were collected through a questionnaire. Questionnaire prepared by the researchers, in addition to the personal information, education, technology is about using the eight items on five-point Likert type. Likert-type items, 1 I strongly disagree (1.00-1.80), 2 Less agree (1.81-2.60), 3 moderately agree (2.61-3.40), 4 Very agree (3:41 to 4:20), and 5 Many agree (4:21 to 5:00), including in the form of five-point Likert rated. Faculty and students of faculty of technology in the preparation of the survey interviews created an item pool. These materials will be reviewed in accordance with the opinions of the teaching staff, the survey was finalized. In the study, the data obtained were analyzed by mean and standard deviation.

3. Results and Comments

3.1. The Evaluation of Educational Technology Faculty of Technology
Faculty of Technology students participated in the study, faculty views on the current state of technology in education is seen in table 1.

Table 1 Students of the Faculty of Technology, views on the current state of educational technology:

Mad.no	Student Feedback	$\overline{X}$	S
1	Please see section Learning educational technology.	2.89	1.27
2	Educational technology education section we have seen is not enough.	4.41	.64
3	Please see section features educational laboratories.	3.66	1.21
4	Please see section features educational technology education classrooms.	2.88	1.40
5	Education saw the episode, writing about the course in terms of resources and sufficient documentation.	2.50	1.26

6	Education saw the episode, in terms of information resources related to the course is sufficient.	3.34	1.06
7	Please see Education section features internet.	2.79	1.28
8	Education saw the episode, in terms of number of faculty members is sufficient.	3.60	1.28
9	Education saw the episode, workshop and laboratory expediting sufficient for use.	2.00	1.04

Table 1 is examined, Faculty of Technology students receive education educational technology section moderately passable ($\overline{X}$= 2.89), they understood. According to the students participating in the study, they study very adequate laboratory section ($\overline{X}$= 3.66), a high degree of educational technology classes ($\overline{X}$= 2.88) is sufficient. Students of the Faculty of Technology, sections of the written sources and documents related to the course ($\overline{X}$= 2.50) with the expediting ($\overline{X}$= 2.00) less; computing resources ($\overline{X}$= 3:34) and internet hardware 'intermediate' ($\overline{X}$= 2.79) were adequate, it is understood that the same table.
Of Human Resources, Faculty of Technology students, faculty members and the number of sections is very adequate ($\overline{X}$= 2.79) found.

These findings are evaluated collectively, Faculty of Technology, is moderately adequate in educational technology, while in the written sources and documents expediting not be said enough. Mission on behalf of the Faculty of Technology and are not suitable for this situation can lead to application-oriented engineers in raising the difficulty. Some of these problems any relevant financial and administrative problems, though, being a part of any relevant step of the restructuring of these faculties can not. Faculty of Technology to serve the purpose of effective and efficient service to continue their education, as well as classes and workshops and laboratories need to be equipped with educational technology.

3. Evaluation in terms of using education technology of Technology faculties

Opinions of Technology Faculty students participated in research related using of education technology is shown at table 2.

Table 2: Opinions of Technology Faculty students related using of education technology

İtem number	Student Opinions	$\overline{X}$	S
10	Instructors usually teach lectures by education technology support	2.59	1.29
11	Instructors teach lectures by conventional presentation strategy	3.72	1.11
12	Instructors make use of visual education technologies at lectures.	3.41	1.12
13	Instructors make use of auditory education technologies at lectures.	2.12	1.06
14	Instructors make use of visual-auditory education technologies at lectures.	3.54	1.03
15	Instructors generally make use of written source and documents at lectures.	3.70	1.16
16	Instructors generally make use of the real objects at lectures.	4.01	.83
17	Instructors make use of humanistic resources at lectures.	2.53	1.28
18	Instructors make use of internet resources at lectures.	3.34	1.07

According to table 2, included student opinions related using of education technology at Technology Faculties, students put forward that instructors teach lectures by conventional presentation($\overline{X}$=3.72) rather than education technology support($\overline{X}$=2.59).

This is an important inadequacy. Because, teaching materials motivate student and encourage them to study by providing accession to information and evaluation facility(Akkoyunlu, 2002). Furthermore, teaching materials, is an important element in increasing quality of education. (Şahin and Yıldırım (1999)) specified that some teaching materials prepared effectively can be substituded all activities(drawing attention, representing information, clue, participation, application and repetition, feedback, correction and evaluation) represented by instructor at teaching environment(Akt:Gündüz and Odabaşı, 2004). According to students, instructors generally make use of real objects($\overline{X}$=4.01), written sources($\overline{X}$=3.70),visual-auditory($\overline{X}$=3.54), ,visual($\overline{X}$=3.41),internet sources($\overline{X}$=3.34), auditory($\overline{X}$=2.12) technolgies respectively as education technology. This findings demonstrate that real objects generally used as education technology at lectures at Technology Faculties and conventional written sources followed this. At Technology faculties, given an application-oriented vocational and technical education, generally being used of real objects at lectures is an expected condition. But, being followed written sources this is engrossing, so that can be interpreted as that instructors still have pursued teaching process by using conventional methods. At Technology faculties, generally teaching lectures by visual-audio educational technology support can be evaluated as promising. At this subject, to be informed and convinced of instructors at using subject of education technology can be increased using ratio of education technology at Technology Faculties.

Results and Proposals

At this project, the objective is specified of student opinions regarding using of education technology at Technology faculties, reached results and advanced proposals based on this results are reported below:

● The main objective of Technology faculties configurated by reusing from TEF(Technical Educational Faculty), constituting a critical ring of vocational and technical education in Turkish education system is to train application-oriented engineers, need for industry. The subject of having education technolgy and using this effectively has critical importance for reaching this objective of Technology faculties. Accordingly, This subject should be considered when established Technology faculties.

●Education technology facilities, owned by Technology faculties are inadequate. This inadequacy can compromise in the medium term to the mission of this faculties. In this regard, existing capacity regarding education technology of workshop and laboratories at Technology faculties should be supported and if that has shortcomings, they should be fulfilled.

● Although Technology faculties have application-oriented education, theoretical lectures have great importance to reach objective of this faculties. In this regard, classes at this faculties mentioned, should be equipped in terms of education technology. Thus, effectiveness of teaching and consequently qualification of graduate students can be increased.

● Technology faculties should be supported in terms of internet substructure in accordance with the age , at the present time referred to the informartion age. Because, at the present time ,internet has a critical importance in terms of being informed regarding vocational improvements besides being the main means of transportation to information.

● However Science and Technology developed, instructors are still the most critical constituent within teaching process of Technology faculties as each level in. Thus, to be specified quality of an educational institution, qualification of instructors owned by this institution is accepted as an important factor . To be made use efficiently of instructors owned by Technology faculties, these instructors should be supported in terms of information and skills related using of education technology. For this reason, education activities should be organized and instructors should be persuaded in the matter of increasing their efficiency and productivity by education technology.

● To support information and skills related using of education technology of instructors at Technology faculties, should be provided them to see appilications at different universities in the country, abroad through various exchange programs.

The Quality Of Service Of The Distance Education

Tolga DURSUN[a164], Kader OSKAYBAŞ[a], Cansu GÖKMEN[a]

aMaltepe University, Faculty of Business Administration 34857, "Istanbul", Turkey

Abstract

The purpose of this paper is to measure the quality of service of the distance education that received from the educational institutions which are among the leading service enterprises, to find out students' expectations, to what extend students expectations are met and whether or not the acquired findings vary by demographical information of the students. In this paper, the data obtained from the questionnaire with 463 students is evaluated. The examination of partial SERVQUAL scores indicate that expectations are not met for all five dimensions effecting service quality in the universities providing e-MBA education.

Keywords: distance education, service quality, servqual;

Introduction

Our century seems to be an age to witness a lot of political, social and technological changes. Similar changes has been also undergone by previous centuries. But globalization appears to push these changes to expand and continue with an increasing efficiency. These developments and changes have significant impacts on life's, demands and needs of people, while affecting styles and approach of meeting those needs. Therefore these changes in this century have required a new way of understanding in education service.

Since, it intends to train those who are willing to join in professional life in the future, education service is one of the most critical service fields in the service sector. In this respect, increasing the quality of higher education in universities serves for the purpose of training people individually so that they provide society with maximum benefit in their own professional field. On the other hand, educational service quality is also a factor effecting university preferences of the youth. It is seen that students, applying for university entrance exam, place the name of the universities known for their qualified educational services on the top of the lists on the preference forms.

In the 21th century, it is obvious that all the societies has become in more need of education owing to an information explosion. In turn it has led to the development of new educational technologies and methods to have caused change in education by degree. Traditional educational institutions fall behind the increasing education demand. Resulting education deficit has been gradually growing day by day. This situation has urged people to search for alternative education to traditional one and the concept of "Distance Education" is an output of this search. The main driving force behind these developments is the effort of meeting educational demands of people as a result of rise in numbers of student, education demand of different student populations, former students, rise in jobs and working bringing with it a lifelong learning.

Education is a concept on which much stress is placed in the world. It is clear that those societies with high level of education feature fast development course and have caught competitive advantage in various areas. This potential could not be achieved by a common educational system. Here the importance of educational quality reveals. Education leading to development means quality education.

Quality is a relativistic concept which varies depending on personal needs. Also, goods quality and service quality are two separate concepts, because of their peculiar characteristics. Yet, it is possible to determine the expectations and perceptions of service receivers. Literature review shows that SERVQUAL is one of the common models for measuring service quality. This model is used to measure the service quality perceived based upon the

  E-mail address: tolgadursun@maltepe.edu.tr

gap between perceived and expected services. And in this study SERVQUAL model is used in order to measure quality of service of distance education.

1.1. Quality, Service and Service Quality

Turkish Language Society (Türkçe Sözlük, 2005, p.896) defines the "Service" as standing someone in good stead or performing work good for somebody. According to Mucuk (2004, p.299) service is the benefit bought by consumers, which has nothing to do with ownership; Kotler (2003, p.444) says that "A service is any act or performance that one party can offer to another that is essentially intangible and does not result in ownership of anything. Its production may or may not be tied to a physical product". Today, we live in a service economy in which relationships are much more important than physical products. Howsoever high the share of technology in a service offered may be, main component is human being. Hence, service, provided either by machine or human, is a whole of intangible activities oriented to meet demands of people. As for service organizations, they lie across a broad spectrum ranging from education, health and communication to banking, insurance business and tourism.

Concept of quality, according to Deming (1998, p.137), is "Judgement of consumer on product or service produced by a business firm" and is "Conformity degree of a product to requirements" for Crosby (1979), Turkish Standards Institute (TSE) defines quality as "Whole of the features of a product or a service, based on its capability to meet the given or possible needs".

According to American Society for Quality (ASQC) "Quality is the totality of features and characteristics of a product or service that bear on its ability to satisfy stated or implied needs."

Generally, all the quality definitions concern product quality, falling behind explaining service quality. Whereas the concept of service quality is defined by Parasuraman, Zeithaml & Berry (1988 p.45) as the direction and degree of the gap between expectations and perceived performance based on comparison made by customers between their expectations before receiving service and their real service experience.

In its broadest sense, service quality implies rendering great or perfect service to meet customers' expectations. According to Odabası (2004, p.93) it is an ability of a business firm to meet or go beyond expectations of customers as is seen, both definitions attach more importance to customer expectation than other quality determinants. So, the quality here is the one which is perceived by customer.

In terms of expectations and perceptions of customer, service quality can be defined by Parasuraman, Zeithaml and Berry (1985, p.42), as comparison between those expectations and perceptions. Perceiving many factors, customers interpret quality in his/her way and compare service rendered with service he/she perceived. What is important here is that customers should perceive high level of service. If a comparison gives a negative difference between expected and perceived qualities, it is obvious that customer interpreted negatively the service quality. If the result is a positive difference then it may be said that customer made a positive interpretation.

Thus, service quality can be described by Sekerkaya (1997, p.14) as "A measure of realization level of service by customer's expectations". Howsoever difficult to define service quality, business managements should know these two things: At first, quality is defined by customer not by producer. Second, service quality which has failed to satisfy customers' expectations is condemned not only to lose existing customers but also to fail to gain new customers in (Stanton, Etzel and Walker, 1997, p.524). Again the point is that quality determinant is the customer and so firms should give weight to demands of their customers.

2. Measuring Service Quality

Although many methods and equipment have been developed for measuring service quality by this time, questionnaire survey method has been combined with SERVQUAL as an assessment method while conducting the research project designed for measuring service quality of education service rendered with e-MBA programs in distance education.

2.1. Conceptual Model of Service Quality-Gap Analysis

This model developed by Parasuraman, Zeithaml and Berry (1985, pp. 48-49) prefer "Perceived service quality" instead of service quality. Perceived service is a result of comparison between customer's expectations before receiving service (i.e. expected service) and actual service experience of that customer. Expectations include demands and desires of customers related to given service. Relationships between expected and perceived services as follows:

If expected service is > perceived service, then perceived quality is far from satisfactory and implies an unacceptable quality level.

If expected service is = perceived service, then perceived quality will be satisfactory.

If expected service is < perceived service, then perceived quality will be quite over satisfactory level and reach the ideal quality level.

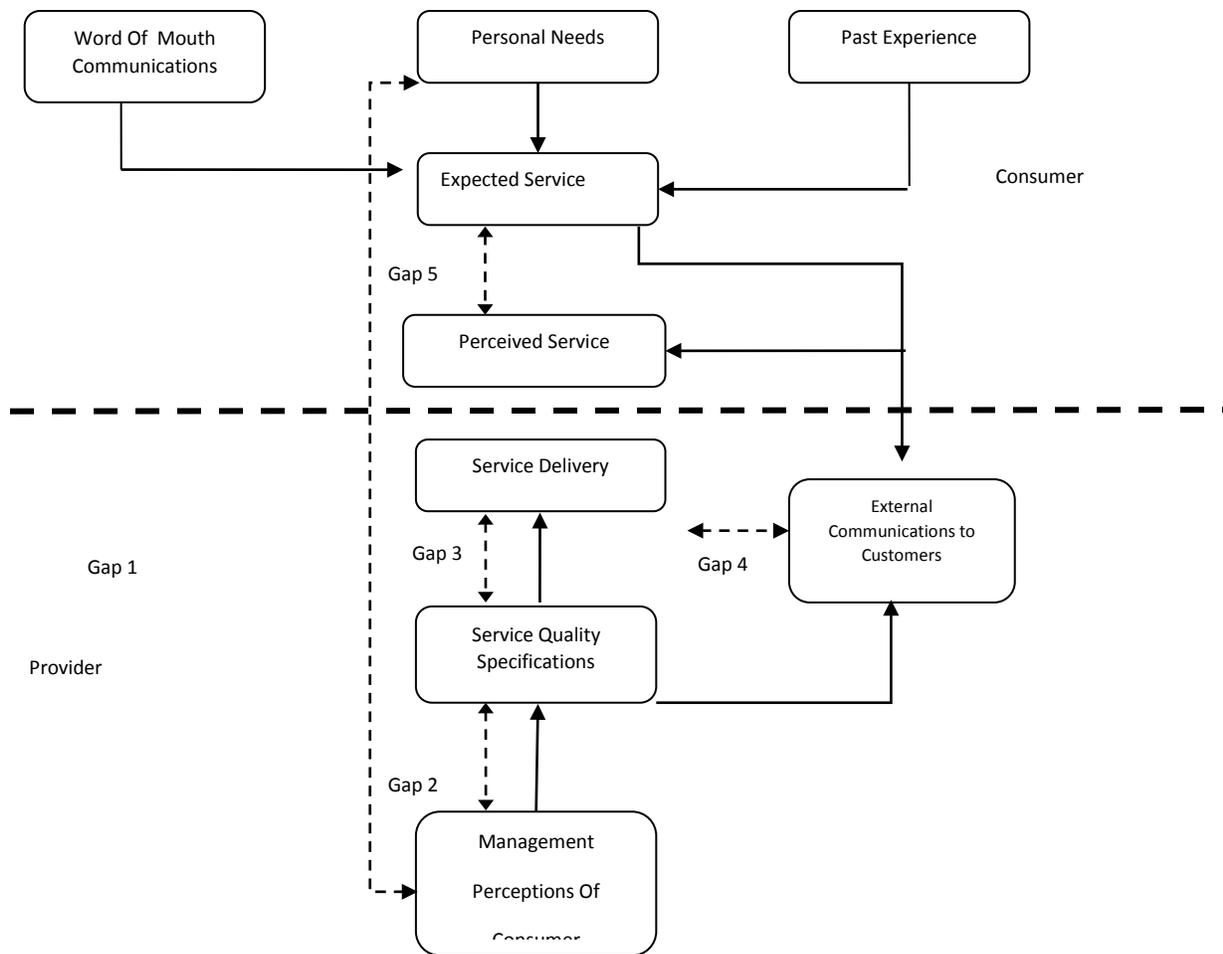
This model includes approach and implementations of the service firms along with gaps between expected and perceived service and source of these gaps. In this context five types of gap is shown in figure 1 (Parasuraman, Zeithaml & Berry, 1994, p.4).


Fig. 1. Conceptual Model of Service Quality

Zeithaml, Berry and Parasuraman (1990) revealed that 10 criteria used by consumers in evaluating service quality. These (dimensions) are reliability, responsiveness, competence, access, courtesy, communication,

credibility, security, empathy and tangibles. Having assessed surveys with factor analysis and reduced 10 dimensions determining service quality for 5 dimensions. Those five dimensions determining service quality as explained below:

- Tangibles: Physical facilities, equipment and appearance of personnel and communication instruments.
- Reliability: Performing the service based on principle of accuracy and honesty. In other words, organizations should fulfill their promise to customers.
- Responsiveness: Employees being ready and willing to perform service.
- Assurance (Contains competence, courtesy, credibility and security): Knowledge and kindness of employees and their ability to inspire trust and confidence.
- Empathy (Contains access, communication and understanding the customer): Making effort to know customer and learn his/her needs.

3. An Application Of The Quality Of Service Of The Distance Education

3.1. Purpose

The purpose of this paper is to measure the quality of service of distance education that received from the educational institutions which are among the leading service enterprises. It intends to evaluate what students expect from education service they receive, to what extend their expectations are met and whether or not the acquired findings vary by demographical information of students. Moreover, it is tried to determine whether or not there are any differences among similar higher education institutions implementing distant learning program in terms of their educational service quality. It is aimed at helping increase the quality of existing higher education services by evaluations based on the results of this comparative study.

3.2. Method

The survey which was conducted in this study was composed of four pages plus a briefing note addressing respondents. First two pages of the form includes 22 likert type questions, while last two pages includes questions related to demographical variables.

In the study it is to be determined at which level perceptions meet expectations by measuring expectations and perceptions of students as customers according to SERVQUAL methodology. SERVQUAL model suggests that perceived service quality is based on discrepancy/gap between customers' expectations from a service and the performance of the service firm rendering that service. Therefore, Zeithaml, Parasuraman and Berry's (1996, p. 23) model is composed of two main parts: Expectations which include 22 variables representing five dimensions (Reliability, responsiveness, assurance, empathy and tangibles), help understand customers' general expectations related to the service. These 22 variables were found out by investigating possible inherent features in a quality service in accordance with SERVQUAL criteria, i.e. the customer's value judgement (Degermen, 2006, p. 38).

Second part of the model, developed by Zeithaml, Berry and Parasuraman (1996, p.23), consists of perceptions. In this part all the 22 variables, which are to be used for measuring customers' judgements about a service firm, are compared. As a result, if a received service meets or is over expectations, service will be decided as a quality one. But received service is less than expected, dissatisfaction will occur. Thus, SERVQUAL is also called as "Gap analysis".

First part aims at measuring the students' expectations and the second part includes measurement of students' perceptions. However, in this study the respondents were subjected to a 5-point likert type scale (1=Strongly disagree, 5=Strongly agree) which is converted from the original 7 point type. This conversion was because of common usage, relatively easy assessment and answering of the 5 point type.

In Turkey, universities implement distance education including associate degree, undergraduate degree, degree completion, non-thesis master degree and master degree programs. In recent years, there has been a significant increase in the number of students taking distance education. Since they have seen this potential, many universities started to give weight to establish distance education programs. Today, there are 156 universities (54 of them are foundation universities) in Turkey (www.yok.gov.tr). Among those implementing distance education programs there are 21 universities with e-MBA program, including newly opened ones with no student yet. These include; Anadolu University, Ankara University, Ataturk University, Bahcesehir University, Beykent University, Cukurova University, Ege University, Fatih University, Gazi University, Gaziantep University, Isık University, Istanbul Aydın

University, Istanbul Bilgi University, Karabuk University, Karadeniz Technical University, Maltepe University, Mersin University, Ondokuz Mayis University, Sakarya University, Suleyman Demirel University and Zirve University.

Population is composed of students receiving education in the universities having e-MBA programs. Having identified those 21 universities with distant learning e-MBA programs in Turkey and considering difficulty of access to all and time limitation, the survey form prepared for this study was applied to only five universities selected by means of random sampling. Survey sample group is composed of all students of those five selected universities. Simple random sampling is a method by which samples from the population are chosen in such a way that every sample has an equal chance to be chosen. According to Gegez (2010, p.211); it is intended to make the units of the population equally likely to be selected. All the students taking distant learning e-MBA programs at those five selected universities are incorporated to the sampling. At the beginning students were informed about the study and asked to participate online. Each student with his/her assigned username and password was given right to participate online in the survey. In total, 463 students participated in the study.

3.3. Data Analysis and Methods

Data obtained in this survey were computerized in Microsoft Excel and SPSS 18.0 programs. Specific calculations and statistical analysis used in SERVQUAL model were made by SPSS system.

Generally, a survey is prepared having 22 questions related with five dimensions - reliability, responsiveness, credibility, empathy and tangibles- on SERVQUAL scale. According to the model, consumer have expectations about those five variables before receiving service and then compare these expectations with the service given. If service they receive meet their expectations it is concluded that the service is of quality. In other words, service quality is equals to discrepancy/gap between expected and perceived service.

In this study, 22 statements were put into each survey form with a view to determine expectations and perceptions in accordance with five dimensions standard SERVQUAL scale developed by Parasuraman, Zeithaml and Berry. Students were asked to state to what extent they agree with 22 statements at a scale of 1 to 5 at first for an ideal university having e-MBA program and next, their current universities. Agreement degrees were designed as 1-Strongly disagree, 2-Disagree, 3-Neutral, 4-Agree, 5-Strongly Agree. Next comes the scoring part for each dimension assessment on the scale of 100 to calculate importance weights of each quality dimension.

The other part includes questions directed to obtain students' demographic information, their satisfaction level with the e-MBA programs that they chosen, whether or not they faced with any problem during education and whether or not they find the solutions offered adequate, how they think about recommending the program they attended. 22 questions prepared for expectation and perception levels on the scale are distributed as follows and the statements composing dimensions are shown in Table 1.

Table 1. Statements Composing Service Quality Dimensions

Statement	PHYSICAL/TANGIBLE FEATURE
1	Distance Education Portal should always be accessible/usable
2	Sufficient number of most recent sources (Book, Journal, Article, Electronic Databases, etc...) in library should be accessible
3	Web page should have striking, clear, understandable and good view.
4	Safe environment should be ensured in the Distance Education Portal.
	RELIABILITY
5	Courses, in large part, should be practice-oriented (e.g. case study)
6	Students should be prompted to group works in practice oriented parts of courses
7	Students should be allowed to contend for prize such as degree, incentive etc...
8	Students should be in interaction with faculty members and other students
9	Program should offer elective courses to meet personal needs for career
	INTEREST-RESPONSIVENESS OF FACULTY MEMBERS AND ADMINISTRATIVE STAFF

10	Faculty members should help students in every matter for which they need counselling immediately.
11	Faculty members should be available at extracurricular times
12	Administrative staff should deal with each student one by one (registration procedures, course selection, etc...)
13	Library staff should meet demands and needs of students immediately
	CREDIBILITY
14	Lectures should be given by the faculty members who are expert in their fields
15	Course contents should be prepared in accordance with course schedule
16	Course content should be prepared conspicuously and given by faculty members
17	Faculty members should be fair in grading
18	Faculty members should be experienced
19	Coursed should be largely given by faculty members with Prof. title
	EMPATHY
20	Faculty members should help students and give advices on their career planning
21	Advisers should help students complete the program smoothly
22	Students should be provided with advisory service about employment opportunities offered by the diploma they are to get by this program

Service quality determinant is the gap/discrepancy between performance of and expectations for a given service as to its receiver. For the analysis, gap score calculation is made by subtracting the expectation score from the perception score for each item that e-MBA students give. This operation is open to two types of SERVQUAL scoring: Unweighted SERVQUAL Score and the Weighted SERVQUAL Score. First step is calculated without taking into account the importance weight rated for each quality dimension by students while the later takes accounts of the importance weight given by students.

Next step is the calculation of average SERVQUAL Score involving service quality dimensions. Two stages are followed for each dimension:

• Sum up the SERVQUAL scores for each of the statements (Perception-Expectation) and divide the sum by the number of the statements making up the dimension.
• Sum up the scores obtained per students in the first stage and divide the sum by the number of students.
• Resulting SERVQUAL Scores are averaged, that is, SERVQUAL score found out for each dimension are summed up and divided into five (number of dimensions) and so obtained value gives the Unweighted SERVQUAL Score.
• The Weighted SERVQUAL Score is calculates at four stages as follows:
• Average SERVQUAL Score is calculated for each student for each of five dimensions.
• Obtained score per each dimension for each student at the first stage is multiplied by the importance weight given to that dimension by each student. (Importance weight is obtained by dividing scores rated by customer to given dimension into 100)
• Resulting Weighted SERVQUAL Scores per student for five dimensions in the second stage are added up and thus a overall Weighted SERVQUAL Score is obtained.
• Calculated scores for overall customers of which number is represented by "N" at the third stage is summed up and divided into overall "N".

4. Research Findings and Comments

SERVQUAL scale applied here was analysed in terms of its reliability and its alpha coefficients are established in a view to determining its internal coexistency.

In these analyses, definitive statistics including frequency tables, crosstabulation tables and averages were used as well as t-test and anova in comparing service quality scores by participants' demographic aspects and universities. Anova analyses conducted in comparing service quality levels by demographic features and universities are accompanied by Levene test for homogeneity between groups and Tukey post hoc test for determining between

which groups discrepancies occur. But when Levene test results in inhomogeneity between groups Welch test is put into use not Anova. It is shown on statistic tables that which analysis was used. Survey findings were assessed by distinctive calculation method of SERVQUAL system and analysed by some statistical techniques.

4.1. Findings of Reliability Analysis

Reliability is a concept related with research findings. Gegez (2010, p.184) explained that basically reliability indicates whether or not the same results would be obtained when a research is repeated and whether respondents would give same answers in case of no change of their state. For reliability analysis of research Cronbach's alpha model was used. Cronbach's alpha model is the one used for measuring internal consistency, in the words of George and Mallery (2001, p. 209), it is an indicator of to what extent all the items in a scale can successfully measure any dimension.

Table 2. Reliability Coefficient

	Expectation	Perception
	Cronbach α	
Total scale	0,947	0,959
Tangibles	0,887	0,812
Reliability	0,791	0,873
Responsiveness	0,841	0,886
Credibility	0,857	0,873
Empathy	0,843	0,907

Reliability analysis comes to the front to gauge inter-closeness degree of questions when calculation is made by summating the values of answers to certain numbers of questions. This is also called as internal consistency. Most preferred method for reliability analysis is Cronbach Alpha model. This model calculates the coefficient alpha. Coefficient is obtained by comparing overall variations of question to general variation in a scale. Alpha is a standard change mean and varies between 0 and 1. In social researches, alpha value of 0,70 is accepted as adequate for reliability (Nakip,2006, p.146). For in this study reliability values of scales and sub-dimensions are at acceptable levels, t-tests, variation and SERVQUAL analyses were proceeded for testing research hypotheses.

4.2. Demographic Features

34,1% of total participants was female and 65,9% were male, while 50,5% participants were married and 40,5% single. Initially students from age group between 21-30 with 60,7% and then age group between 31-40 with 33,7% were enlisted. These two age groups (between 21-40) make up 94,4% of whole participation.

Table 3. Demographic Distribution

Gender Distribution			Age Distribution		
	Number	%		Number	%
Female	158	34,1	Under 20	1	0,2
Male	305	65,9	21-30	281	60,7
Total	463	100,0	31-40	156	33,7
			41-50	23	5,0
Distribution by Marital Status			51-60	1	0,2

	Number	%			
			61 and Over	1	0,2
Married	234	50,5	Total	463	100,0
Single	229	49,5			
Total	463	100,0			

Distribution of the professional sectors that e-MBA service quality measurement study participants work, is like this: 14,3% is in Banking , 8,4% in Health, 8% in Service, 7,3% in Informatics, 6,9% in Education, 5,6% in Construction while of them 27,6% serves as engineer, 16,4% as manager, 12,7% as banker, 6,3% as accountant.

Table 4. Professional Experience

Occupational Distribution			Distribution by Professional Field		
	Number	%		Number	%
Engineer	128	27,6	Other	169	36,5
Other	111	24,0	Banking	66	14,3
Manager	76	16,4	Health	39	8,4
Banker	59	12,7	Service	37	8,0
Accountant	29	6,3	Informatics	34	7,3
Teacher	20	4,3	Education	32	6,9
Self Employment	10	2,2	Construction	26	5,6
Economist	9	1,9	Food	18	3,9
Academician	7	1,5	Communication	18	3,9
Security officer	6	1,3	Logistics	11	2,4
Medical Doctor	5	1,1	Security	7	1,5
Architect	3	,6	Economy	6	1,3
Total	463	100,0	Total	463	100,0

Almost all of the participatory e-MBA students (96,8%) resides in Turkey. In this distribution striking point is that participation from Afghanistan with 1,3% was the highest one among the participation ratios from abroad. When participation by city is examined, it is seen that the most participation was from Istanbul with 50,5%, and then comes Bursa with 7,3%, Ankara with 6,3%, Kocaeli with 5,2%, Izmir with 4,3%, Sakarya with 3,7% and Balikesir with 1,7%.

Table 5. Distribution by Country of Residence

	NUMBER	%
AFGHANISTAN	6	1,3
GERMANY	3	,6
IRAQ	1	,2
SPAIN	1	,2
UZBEKISTAN	1	,2
RUSSIA	1	,2
TURKEY	448	96,8
UKRAIN	2	,4
TOTAL	463	100,0

SERVQUAL Scores Comparisons by Demographic Features

In order to determine whether or not the expectations of e-MBA students were met in terms of their demographic features, t-tests were used for comparison by gender and marital status and variance analyses for comparison by age and income status.

Table 6. Comparison Test for Service Quality Dimensions by Gender

	Gender	N	Mean	Std. Deviation	Std. Error Mean	t	p(sig.)
Tangibles	Female	158	-,172848	,2554850	,0203253	-2,298	,022*
	Male	305	-,121369	,1644927	,0094188		
Reliability	Female	158	-,178658	,2489990	,0198093	-,378	,706
	Male	305	-,168774	,2755989	,0157807		
Responsiveness	Female	158	-,186092	,2197352	,0174812	-,611	,542
	Male	305	-,171451	,2563722	,0146798		
Credibility	Female	158	-,167954	,2550665	,0202920	-2,108	,036
	Male	305	-,119978	,2193538	,0125602		
Empathy	Female	158	-,174072	,1881578	,0149690	-1,654	,099
	Male	305	-,142295	,1999835	,0114510		
SERVQUAL SCORE	Female	158	-,175925	,1658452	,0131939	-1,928	,055
	Male	305	-,144773	,1643642	,0094115		

Overall SERVQUAL scores do not differ by gender for e-MBA students. But, service quality score differs at sub-dimension of tangibles. Satisfaction level of female students from tangibles are less male students'. In other words, males are satisfied with their universities in terms of tangibles in comparison with females.

Table 7. Comparison Test for Service Quality Dimensions by Marital Status

	Marital Status	N	Mean	Std. Deviation	Std. Error Mean	t	p(sig.)
Tangibles	Married	234	-,136325	,1786907	,0116814	,282	0,778
	Single	229	-,141605	,2226850	,0147154		
Reliability	Married	234	-,188333	,2920399	,0190912	-1,322	0,187
	Single	229	-,155607	,2372965	,0156810		
Responsiveness	Married	234	-,164306	,2262274	,0147889	1,081	0,280
	Single	229	-,188854	,2614847	,0172794		
Credibility	Married	234	-,136467	,2345957	,0153360	-,011	0,991
	Single	229	-,136230	,2318680	,0153223		
Empathy	Married	234	-,142863	,1892568	,0123721	1,138	0,256
	Single	229	-,163639	,2033258	,0134361		
SERVQUAL SCORE	Married	234	-,153659	,1635900	,0106942	,229	0,819
	Single	229	-,157187	,1674767	,0110672		

Overall and sub-dimensional perceptions of service quality about universities having e-MBA programs differs by marital status of students. As for service quality scores comparison by age variance analyses were used.

Table 8.Payoff Table of Homogeneity Tests for Age Groups Variations

Levene Statistic	df1	df2	Sig.

Tangibles	,379	2	457	,685
Reliability	1,072	2	457	,343
Responsiveness	,126	2	457	,882
Credibility	2,581	2	457	,077
Empathy	,536	2	457	,586
Servqual	,573	2	457	,564

*Welch test is to be made

**One-way-Anova is to be made

According to the variance analysis hypotheses variances of groups to compare should be equal (Homogeneity). Homogeneity of age groups SERVQUAL scores variances were subjected to Levene tests. By means of one-way variance analysis it was found that total SERVQUAL scores and service quality score variances between age groups for each sub-dimension are homogeneous.

Table 9. Comparison Tests for Service Quality Scores by Age Groups

		Sum of Squares	df	Mean Square	F	Sig.
Tangibles	Between Groups	,071	5	,014	,350	,882
	Within Groups	18,678	457	,041		
	Total	18,749	462			
Reliability	Between Groups	,190	5	,038	,533	,751
	Within Groups	32,644	457	,071		
	Total	32,834	462			
Responsiveness	Between Groups	,090	5	,018	,301	,912
	Within Groups	27,493	457	,060		
	Total	27,584	462			
Credibility	Between Groups	,199	5	,040	,731	,601
	Within Groups	24,882	457	,054		
	Total	25,081	462			
Empathy	Between Groups	,082	5	,016	,422	,833
	Within Groups	17,739	457	,039		
	Total	17,821	462			
Servqual	Between Groups	,066	5	,013	,477	,793
	Within Groups	12,566	457	,027		
	Total	12,632	462			

*Significant at p=0,01 level

As a result of variance analyses, service quality perception from universities with e-MBA learning programs differs by age groups of students attending those universities. Variance analyses were also used in comparing service quality scores by income groups.

Table 10. Payoff Table of Homogeneity Tests for Income Groups Variations

	Levene Statistic	df 1	df2	Sig.
Tangibles	6,785	5	457	,000*

Reliability	1,305	5	457	,261**
Responsiveness	1,332	5	457	,249**
Credibility	1,079	5	457	,371**
Empathy	1,063	5	457	,380**
Servqual	1,307	5	457	,260**

*Welch test to be made
**One-way-anova to be made

According to the variance analysis hypotheses, group variances to compare should be equal to each other. Levene tests were conducted for testing homogeneity of SERVQUAL score variances by income groups. Having used one-way variance analyses, test results show that service quality score variances between age groups are homogeneous for sub-dimensions, except for total SERVQUAL scores and tangibles. Welch test was used in variance analysis for sub- dimension of tangibles because homogeneity hypothesis was not corresponded there.

Table 11. Investigation of Service Quality Scores Between Income Groups by Welch Test

Welch Test	Statistic[a]	df1	df2	Sig.
Tangibles	1,339	5	141,289	,251

Table 12. Comparison Tests for Service Quality Scores by Income Groups (One-way Variance Analysis)

		Sum of Squares	df	Mean Square	F	Sig.
Reliability	Between Groups	,557	5	,111	1,578	,165
	Within Groups	32,277	457	,071		
	Total	32,834	462			
Responsiveness	Between Groups	,233	5	,047	,779	,566
	Within Groups	27,351	457	,060		
	Total	27,584	462			
Credibility	Between Groups	,371	5	,074	1,372	,233
	Within Groups	24,710	457	,054		
	Total	25,081	462			
Empathy	Between Groups	,151	5	,030	,779	,566
	Within Groups	17,671	457	,039		
	Total	17,821	462			
Servqual	Between Groups	,169	5	,034	1,242	,288
	Within Groups	12,463	457	,027		
	Total	12,632	462			

*Significant at p=0,01 level

As a result of variance analyses it was understood that service quality perception from the universities having e-MBA learning programs do not differ by income status of students.

4.3. General SERVQUAL Scores and Its Assessment

Values which were obtained as a result of calculations made for realizing SERVQUAL analysis are shown in Table 13.
Without taking into account colleges at which students have education, it is seen that service quality score (SERVQUAL score=0,80456) of institutions rendering e-MBA service is subtractive.

Table 13. Expectation And Perception Averages Of All Participants And Expectation-Perception Gap Scores

| Dimension | Statement | Number | Perception | | Expectation | | Discrepancies of Averages | Sum of Factor Gap | Factor Gap Averages |
			Average	Standard Deviation	Average	Standard Deviation	Expectation-Perception		Total Gap./k
Tangibles	1	463	4,1512	1,0355	4,7603	,7092	-,6091		
	2	463	3,4233	1,1798	4,6091	,8168	-1,1857	-3,1037	-,7759

	4	463	4,0778	,9178	4,5961	,7722	-,5184		
Reliability	5	463	3,3499	1,1727	4,2527	,9574	-,9028		
	6	463	2,8877	1,2691	3,6307	1,1878	-,7430		
	7	463	2,8251	1,3050	3,5875	1,2381	-,7624	-4,0043	-,8009
	8	463	3,7797	1,0985	4,2981	,9008	-,5184		
	9	463	3,4795	1,2445	4,5572	,8247	-1,0778		
Responsiveness	10	463	3,4946	1,1046	4,4039	,8622	-,9093		
	11	463	3,4428	1,1864	4,3197	,8982	-,8769	-3,5594	-,8898
	12	463	3,4600	1,2388	4,3672	,8992	-,9071		
	13	463	3,3585	1,0756	4,2246	,9148	-,8661		
Credibility	14	463	3,8186	,9723	4,3758	,8908	-,5572		
	15	463	3,9503	,9303	4,5443	,7824	-,5940		
	16	463	3,7343	1,0489	4,5659	,7613	-,8315	-3,2246	-,5374
	17	463	3,8596	1,0339	4,6328	,7917	-,7732		
	18	463	4,0238	,9078	4,4492	,8611	-,4255		
	19	463	3,4255	1,1312	3,4687	1,1800	-,0432		
Empathy	20	463	3,3737	1,1644	4,3434	,8905	-,9698		
	21	463	3,6350	1,0904	4,5767	,7401	-,9417	-3,0562	-1,0187
	22	463	3,1814	1,2731	4,3261	,9302	-1,1447		
						SUM			-4,0228
						SUM/5=SERVQUAL SCORE			-0,80456

* k:Number of statements composing dimension

This state indicates that students are not satisfied with service quality of colleges from which they receive e-MBA education. Moreover, it is an evidence that SERVQUAL scores estimated for service quality dimensions, -tangibles, reliability, responsiveness, credibility and empathy- are also subtractive and expectations for none of them were met. SERVQUAL scores calculated in the Table above are the values estimated without considering importance weight given by students to service quality dimensions. Service quality SERVQUAL score including importance weights given by students to dimensions is calculated as follows:

SERVQUAL SCORE= (Reliability*importance of reliability + Empathy*importance of empathy +credibility*importance of credibility + tangibles*importance of tangibles + responsiveness*importance of responsiveness) / Number of dimension.

In this calculation importance weight is expressed as percentage of importance that student give to a dimension.

Table 14. Weighted SERVQUAL Scores Table

	N	Weightless Average Gaps	Weighted Average Gaps	T	p (Sig.)
Tangibles	463	-,7759	-,138936	-14,840	,000
Reliability	463	-,8009	-,172147	-13,895	,000
Responsiveness	463	-,8898	-,176447	-15,538	,000
Credibility	463	-,5374	-,136350	-12,592	,000
Empathy	463	-1,0187	-,153139	-16,777	,000
TOTAL GAPS		-4,0228	-0,77702		
SERVQUAL SCORE		-0,80456	-0,1554		

Before assessing dimension SERVQUAL scores it was examined that whether or not the discrepancy between perceived and desired service for each dimension is significant, that is, whether or not the discrepancies are statistically valid. For this examination hypothesis "H0: Gaps equal to "0" was tested throught the instrument of single sample t-test. As a result of t-tests it was found that gaps for all dimension were significant at level of p(sig.)= 0,000, that is discrepancies were non zero.

It was found that service quality scores estimated without regarding importance weights are = -0,80456, while servqual scores including importance weights are = =-0,1554. Here the striking point is that results of both estimation are subtractive, meaning that expected service was not met. Next assessments were realized on the basis of weighted SERVQUAL scores.

Absolute value of SERVQUAL score approximation to zero implies an increased service quality. When partial SERVQUAL scores are examined, although service expectations were not met for five dimensions effecting service quality in the universities rendering e-MBA education, most dissatisfied dimension was responsiveness, followed in order by reliability, empathy, tangibles and credibility.

5. Conclusion And Suggestions

Today education system is faced with many problems, including falling behind developments and technology, lacking equipment, personnel and resource, scarcity of scientific researches, personnel having no skill and quality demanded by the system, education programs under efficiency standards. It is important to have educational organizations restructured and operated according to contemporary understanding of quality in order to find solutions to these problems and make education organizations efficient.

Today, in a globalized world where competition has increased and quality has gained importance over other factors such as price for national development it is crucial to reorganize education system conforming the quality standards so as to train people in accordance with demands of competition environment. For ensuring development and advancement in a country education system should be carefully protected and improved by following the developing and changing conditions.

Information technologies leading a reorganization of all institutional procedures have become one of the integral parts of education sector over time. Today computers and communication technologies are the factors which provide training education services unlike in 90's when they were used as supportive devices in education service.

One of these education services is an Internet based distant learning model. This model basically is applied for two goals: First, to provide support service for traditional education programs and secondly, servicing education programs over the web. In this framework Internet based distance education is considered among the most efficient and the best instruments to meet today's educational needs.

Distance education enables people to receive various certificates as well as associate, bachelor's, postgraduate and doctoral diplomas from foreign universities whilst staying at their country.

In service quality measurement literature it is the SERVQUAL method emerged as marketing research instrument that is the most common, most valid in its dimension structure and most reliable in terms of its internal consistence. Thanks to the SERVQUAL method it can be calculated to what extend each dimension and general service quality to have been affected by structural innovations and changes in services realized by enterprises rendering service. And in the light of this calculations it can be decided on vital and costly issues such as whether or not full-scale innovation or change is feasible.

If results show a low grade in quality, it must be looked for which dimension is the crux of the problem and to what extent and then improvement should be initiated starting with statement of minimum quality level in that related dimension. To be able to make improvements based on that statement, a customer-oriented service approach should be adopted and the best effort should be made. So, rise in the perception statements scores would lead to a rise in perceived service quality.

Service quality of distance education applications in education sector was examined including five quality determinants, tangibles, reliability, responsiveness, credibility and empathy. For five dimensions determining service quality and total service quality, discrepancies between expectation and perceptions of students were analysed regardless universities that render distance education. Discrepancies among scores that students rated for perceived and expected service for each were found statistically significant for each dimension.

When partial SERVQUAL scores are examined, although service expectations were not met for every five dimension effecting service quality in the universities rendering e-MBA education, most dissatisfied dimension was responsiveness, followed in order by reliability, empathy, tangibles and credibility. It can be said that students' perceptions of services are under their expectations. As survey results show, averages of overall expectations are higher than perceptions. It was found that expectations of survey participants were not met, leading to a dissatisfaction. And it is remarkable that dissatisfaction become more glaring especially as for the variables of responsiveness. Therefore, it is obvious that general perception is under general expectation, resulting in a dissatisfaction.

When the customer oriented approach, which is important in terms of modern marketing, is adapted to education service marketing, focal point appears to be is educational expectations of students, parents and society. Education institutions marketing educational services should specify the marketing mix strategies.

Service quality measurement is an opportunity for enterprises to accurately define their goals and correctly perceive needs of their customers accordingly to reshape their services. Moreover, measuring service quality allow for productive usage of operating assets.

Enterprises operating in education sector should work on increasing service quality. Therefore, it is necessary to employ and to train quality faculty members as the backbone of education system. It is also significant to empathize with students in order to understand their educational problems and to ensure that courses made just in time in accordance with the curriculum by well-made organization. Besides, employees should have enough knowledge and experience to meet the expectations students. Universities, especially at the stage of planning and executing the services, should form administrative and academic cadres in pursuant of defined quality targets. As a result, these adjustments increase educational service quality and student satisfaction.

In the light of these results, general perspective is under general expectation and there comes a dissatisfaction. In this case to enhance service quality and thus increase student satisfaction, it is obvious that sensitivity should be shown primarily to responsiveness. In this sense responsiveness is followed in order by reliability, empathy, tangibles and credibility. So students' expectations can be met by making necessary regulations starting with statements under responsiveness dimension. Faculty members should be available for students and provide every kind of consultancy about university and education program. Administrative staff should deal with students one by one. Library staff should have competence to address the needs and demands of students. And then comes statements of reliability dimension to be treated. Courses should be heavily practice-oriented. A competitive environment should be provided for students. Students could find an educational climate with interactive relationships among themselves and with faculty members as well. Furthermore, elective courses should be included in programs. In order of importance statements of third dimension, empathy, should be examined to be used in career orientation by faculty members. Advisers should help students pursue education programs smoothly and inform them about job opportunities that program diploma/certificate would create. Tangibles, as fourth dimension, are a point on the basis of which distance education portal can be designed. Accordingly, distance education web pages should be attention-grabbing, clear and understandable and kept updated. Also, universities are to be responsible for safety of that distance education portal. Last dimension in order of importance is credibility. Examining statements under credibility dimension, necessary regulation should be made to meet students' expectations.

Demands and needs of students have critical place in designing and improvement of education systems. It would be one of the most important factors which higher education institutions would pay attention to in developing quality management system to determine students' expectations from higher education and measure the service quality by empathising with students. Related units of universities should examine thoroughly reasons and results of assessments made by students and accordingly produce solutions addressing negative assessments. These works

should be made regularly and it should be monitored to what extent solution proposals could be realized. If regularly and continuously applied this and such like studies could be used by universities as   important instruments in enhancing educational quality.

Abstract

The paper investigated the relationship among 153 tertiary level EFL students' Big Five personality traits, online learning motivation and online learning satisfaction in a digital English learning environment. Participants completed questionnaires regarding the Big Five personality traits, online learning motivation and satisfaction. Results revealed that personality traits were correlated with online satisfaction, and that extraversion and conscientiousness were the two important traits among the Big Five in predicting motivation and satisfaction. Also, motivation was a strong predictor of satisfaction. Five constructs of motivation, including escape, social contact, desire to learn, self-development and academic progress, were significantly related to satisfaction.

Keywords: Personality; online learning motivation; online learning satisfaction

1. INTRODUCTION

Application of online learning technology not only enhances teaching effectiveness but also makes up for the inadequacies of traditional education. In other words, online learning provides a facilitative environment where students could engage in learning. It allows students' repeated exposure to the learning activities at their own pace and learning sites are not limited to physical classrooms. Students can engage in their individual learning and their learning styles are changed from the passive acceptance to more active self-oriented learning. In colleges and universities across many countries, online courses continue to enhance their presence in the schedules of undergraduate and graduate students, and many studies have been conducted to evaluate students' online learning programs and satisfaction. While some of the online learning studies focused on the development of technology acceptance model (Jung, Loria, Mostaghel, & Saha, 2008; Masrom, 2007), others focused on online learning satisfaction, a key factor that determines the success or failure of online programs in this competitive global environment (Dziuban, Moskal, Brophy-Ellison, & Shea, 2007).

2. LITERATURE

2.1. Factors related to learners' online learning satisfaction

Studies have been conducted to investigate factors related to learners' online satisfaction. Based on 1,056 participants' responses, Muilenburg and Berge (2005) identified factors that explained student difficulties to online learning. It included barriers related to administrators and instructors control, obstacles to online learning caused by a lack of interaction, obstacles to online learning caused by a lack of academic skills, obstacles to online learning caused by a lack of technical skills, factors related to learner motivation, factors related to time and support for studies, factors related to cost and access to the Internet, obstacles caused by technical problems (Mulienburg & Berge 2005). Similarly, Sun, Tsai, Finger, Chen, and Yeh (2008) identified seven factors that influenced online learners' satisfaction based on 295 responses from students enrolled in 16 different online learning courses. They were computer anxiety, instructor attitude, course flexibility, course quality, perceived usefulness, perceived ease of use, and diversity of assessment.

Other scholars also have found that learners' on-line learning satisfaction was affected by factors like learners' technology acceptance behaviors, learners' experience in online learning, quality of institutional support, academic environment, and instructional interaction (Biner, Dean, Mellinger, 1994; Changchit, 2007; Chute, Thompson, & Hancock, 1999；Conrad, 2002; Fulford & Zhang, 1993; Palloff & Pratt, 2005; Song, Singleton, Hill, & Koh, 2004; Swan, 2003). For instance, learners who had more experiences in online learning were more likely to be satisfied with learning online, and were less likely to feel anxious about online learning (Arbaugh & Duray, 2002; Conrad, 2002). In addition, the issues of academic environment and instructional interaction also contributed to students' online learning acceptance and satisfaction in higher education online programs (Artino, 2009; Driver, 2002; Osman & Herring, 2007). However, these perspectives do not account sufficiently for the influence of individual differences in online satisfaction since motivation, a predictor of achievement in academic settings (Chute et al., 1999), and personality, the description of an individual's pattern of personality interaction with the environment to satisfy needs, both help in understanding why individuals process and respond to the same online learning situations differently. There have been fewer studies of online learning that account for the impact of personality and motivation differences on online learning satisfaction.

2.2 Personality traits

One person's values and preferences were often reflected in their personality traits. They could explain the occurrences of certain individual behaviors and were regarded as an individual's disposition to particular patterns, or as enduring dispositions that caused characteristic patterns of interaction with one's environment (Goldberg, 1993; Olver & Mooradian, 2003). Previous studies had different development and categorization of personality traits (Buss, 1991; Digman, 1990; Funder & Sneed, 1993; Goldberg, 1992; Hogan, 1996; McCrae & Costa, 1997; Sneed, 2002；Sneed, McCrae, & Funder, 1997). Among them, NEO-FFI, developed by Costa and McCrae (1992), consists of 60 items, 12 for the factors of Conscientiousness, Neuroticism, Extraversion, Agreeableness and Openness to

Experience. It was the most widely used measure of personality traits and has demonstrated good internal and external validity (Costa & McCrae ,1992).

2.3. The relationship among personality, satisfaction and motivation

In previous studies, most scholars investigated the relationship between personality and work satisfaction (Judge, Higgins, Thoresen, & Barrick, 1999; Organ & Lingl, 1995; Tsai, 2001) and they found individuals with high agreeableness were easy to get along and cooperated with others; when individuals with high agreeableness, they were satisfied with their work. It seemed to support that high agreeableness could predict work satisfaction. Among the few that studied the relationship among personality and learning satisfaction, Morahan-Martin and Schumacher (2003) found lonely people were more likely to be satisfied with their online interactions than were nonlonely people. Similarly, Chou (2002) reported that learners' learning satisfaction was affected by their personality; specifically Neutricism, Agreeableness, and Extraversion had significant influence on learning satisfaction. Personality influences learners' learning satisfaction.

In terms of the relationship between personality and motivation, many studies have been conducted to uncover the relationship among the big five and learners' motivation (Komarraju & Karau, 2005; Meera, Steven, & Karau, 2005; Meera, Steven, Karau, Ronald, & Schmeck, 2009). Personality had a significant influence on their learning motivation; learning motivation in turn had a significant effect on learning satisfaction (Chuang, 2008). For instance, Heaven (1989) reported that achievement motivation was positively correlated with extraversion, and negatively correlated with impulsiveness and psychoticism among high school students. Also, Busato, Prins, Elshout, and Hamaker (1999) reported that conscientious and extraverted students were more achievement oriented and preferred meaning, reproduction, and application directed learning styles. Individuals high in conscientiousness, extraversion, and openness showed the strongest learning goal orientation (Payne, Youngcourt, & Beaubien, 2007), whereas high neuroticism and low extraversion students were most likely to experience a fear of failure and pursued avoidance performance goals. Similarly, Chuang (2008) found undergraduates' personality had a significant influence on their learning motivation; learning motivation in turn had a significant effect on learning satisfaction.

For the relationship between motivation and online learning satisfaction, it is reported that motivation is an essential prerequisite for learners' learning in web-based environments (Hoskins & van Hooff, 2005; Song, Singleton, Hill, & Koh, 2004), and the relationship between learning motivation and on-line satisfaction were positively interrelated (Biner, Dean, Mellinger, & Tallman, 1994; Chute, Thompson, & Hancock, 1999; Lim, 2004). A review of these studies showed that there was conflicting findings related to the role of personality and learners' online satisfaction (Chou, 2002). For instance, Summers, Anderson, Hines, Gelder, and Dean (1996) reported no significant relationship between satisfaction and learners' personality. On the other hand, Biner, Bink, Huffman, and Dean (1995) investigated 16 personality variables in a web-based instruction and discovered strong relationship between satisfaction and participants' personality. In addition to the conflicting evidence in previous research, earlier studies focused on the technology dimension of a learning system while ignoring the influence of learners' affective factors (Jones & Issroff, 2005; Kreijns, Kirschner, & Jochems, 2003; Miltiadou & Savenye, 2003). In order to fill in the gap, the research investigated whether personality and motivation of tertiary level EFL college students were related to online satisfaction in a digital learning environment. The research questions were as follows: 1. What is the relationship among learners' Big Five personality traits and their on-line learning motivation? Among the Big five, which factors can predict their online learning motivation? 2. What is the relationship among learners' Big Five personality traits and their online learning satisfaction? Among the Big five, which factors can predict their online learning satisfaction? 3. What is the relationship between learners' motivation and their online learning satisfaction? Among the factors of motivation, which factors can predict their online learning satisfaction?

3. METHODOLOGY

3.1.Participants

To ensure the homogeneity of learners' background, all 153 (116 male and 37 female) tertiary level university freshmen recruited from three classes, participated in this study. College students are appropriate samples for

Internet study because they have Internet experience and access to the Internet on and off campus (e.g., Bonebrake, 2002). These students majored in engineering, aged from 18 to 19, and have learned English as a required subject for 10 years at school. Based on their performance of the Mock TOEIC test administered to the participants at the beginning of a semester, the participants scored around 412 on average. The data was collected during the years of 2009 to 2010.

3.2. Instruments

The instruments employed in this study included NEO-FFI personality questionnaire developed by Costa and McCrae (1992), the on-line learning motivation questionnaire by Huang (1985), and online learning satisfaction questionnaire developed by Wu (2003) and Yu (2004). The personality traits were measured by NEO-FFI, developed by Costa and McCrae (1992). NEO-FFI is the most widely used measure of personality traits. This inventory has been proved to reliably assess the Big five personality variables and has demonstrated good internal and external validity (Costa & McCrae, 1992). Participants indicated their degree of agreement with each statement using a 6-point Likert scale ranging from strongly disagree (1) to strongly agree (6). In terms of the reliability of the test, the Cronbach's α value of the questionnaire was 0.88.

Based on Huang (1985), the 27-item on-line learning motivation questionnaire was developed to evaluate participants' online motivation in the factors of escape or stimulation, social contact, desire to learn, self-growth, and academic progress. Participants indicated their degree of agreement with each statement using a 6-point Likert scale ranging from strongly disagree (1) to strongly agree (6). With regard to the reliability of the test, the Cronbach's α values of the five constructs were 0.91, 0.88, 0.85, 0.84, and 0.94 respectively. This confirms that the questionnaire had high reliability.

Adopting the online satisfaction inventory of Wu (2003) and Yu (2005), we measured participants' online satisfaction in four dimensions: course content, learning outcomes, learning environment and relationship. Participants indicated their levels of agreement with 25 statements on a 6-point Likert scale (1 = strongly disagree, 6= strongly agree). The reliability of each factor in the questionnaire of online learning satisfaction was 0.86, 0.85, 0.82 and 0.92 respectively.

3.3. Data analysis

To address the research questions, the collected data were analyzed by applying a few statistical measures run by the Statistical Package for Social Sciences (SPSS) 15.0. First, the Pearson product-moment correlation analyses were performed to see the relationship among the three variables –big five personality traits, online learning motivation and online learning satisfaction. As a rule of thumb, correlations were less than 0.3 were deemed low or weak. Those in the range of 0.4 to 0.6 were moderate, and those were greater than 0.7 as being strong or high (Bryman & Cramer, 2004). Next, the data were subjected to regression analyses to determine the predictive power of each variable.

4. RESULTS AND DISCUSSION

4.1. Personality and learning motivation

Research question 1: What is the relationship among learners' Big Five personality traits and their on-line learning motivation? Among the Big five, which factors can predict their online learning motivation?

Pearson's product-moment correlation analyses showed that the personality and motivation had low but significant relationships(r= .206, p<.05). Linear regression was conducted to explore the contribution of big five in predicting online learning motivation. The amount of contribution of big five personality traits can account for 12.7% of the variance in motivation (R^2 =.155, adjusted R^2 change= 0.086, $p < .01$).

R^2 change indicates the amount of the contribution of each of the variables to the percentage of the explained variance. Specifically, as shown in Table 1, extraversion (R^2 change= 0.086, p<.01) contributed most variance to

motivation. This was followed by conscientiousness (R^2 change= 0.006, p < .01), which accounted for an additional 0.6 percent of the variable. On the other hand, Openness to Experience (R^2 change=.003, p > .01), Agreeableness (R^2 change=.001, p > .01), and Neuroticism (R^2 change=.0001, p > .01) did not have any significant contribution to motivation. Therefore, compared with other big five personality traits, extraversion and conscientiousness seemed to better predict students' motivation.

Table 1. Multiple regression of motivation by big five personality

Variable	R^2 change	p value
Extraversion	.086	.000***
Openness to Experience	.003	.470
Neuroticism	.000	.840
Conscientiousness	.006	.043*
Agreeableness	.001	.775

Note:*** p<.001

The results showed that extraversion and conscientiousness affected positively on learners' online learning motivation. People who were in extraversion were more active and willing to receive new learning style; so they had higher online learning motivation. Similarity, people who were classified into conscientiousness were achievement oriented and were willing to receive different learning ways to strengthen their professional ability; so online learning can activate their learning motivation. The results were in agreement with previous studies (Busato, Prins, Elshout, & Hamaker, 1999) which reported that conscientious and extraverted students were more achievement oriented, and individuals high in extraversion and conscientiousness had the strongest learning goal orientation (Payne, Youngcourt, & Beaubien, 2007).

4.2. Personality and learning satisfaction

Research Question 2: What is the relationship among learners' Big Five personality traits and their online learning satisfaction? Among the Big five, which factors can predict their online learning satisfaction?

To explore the relationship between learners' Big Five personality traits and their online learning satisfaction, Pearson product-moment correlation analyses were conducted. Although Big Five personality traits significantly correlated with online learning satisfaction, the strength of association was weak(r = .205, p < .01). Linear regression was conducted to explore the contribution of big five in predicting online learning satisfaction. The amount of contribution of Big Five personality traits can account for 12.2% of the variance in online satisfaction (R^2 =.151, adjusted R^2 change= .122, estimated standard error p < .001). Specifically, as shown in Table 2, Extraversion (R^2 change= .093, p < .01) significantly contributed most variance to motivation (9 per cent). This was followed by Conscientiousness (R^2 change=.072, p < .01), which accounted for an additional 7 per cent of the variable. However, the amount of contribution for Neuroticism (R^2 change=.008, p > .01), Openness to Experience (R^2 change=.001, p > .01), and Agreeableness (R^2 change=.0001, p > .01) were low and insignificant. It seemed to imply that Extraversion and Conscientiousness were the two more important traits among the Big Five in predicting online learning motivation. The results corresponded to the studies of Chou (2002) and Tsai (2001) in which they reported that Extraversion and Conscientiousness were positively correlated with satisfaction.

Variable	R^2 change	p value
Extraversion	.093	.000***
Openness to Experience	.001	.718

regression of satisfaction by big	Neuroticism	.008	.276
	Conscientiousness	.072	.001**
	Agreeableness	.000	.923

Table 2. Multiple online learning five personality

Note:*** *p*<.001

4.3. Online motivation and learning satisfaction

Research question 3: What is the relationship between learners' motivation and their online learning satisfaction? Among the factors of motivation, which factors can predict their online learning satisfaction?

Results showed that motivation had significantly high relationship with online learning satisfaction(r=.747, p<.01). Also, all of the five constructs of motivation, including escape, social contact, desire to learn, self-development and academic progress, were significantly highly related to four constructs of online learning satisfaction. The results were in agreement with Chuang (2008), who found learning motivation had a significant effect on learning satisfaction.

A follow up linear regression was conducted to explore each factor's contribution to online learning satisfaction. The amount of overall contribution of motivation can account for 57.4% of the variance in online satisfaction(R=767, R^2 =.588; adjusted R^2 = .574; Standard Error=10.65953; R^2 change=.588; F change=41.897, p < .001). Specifically, as shown in Table 3, self-development (R^2 change=.498, p < .001) significantly contributed most variance to online learning satisfaction. This was followed by social contact (R^2 change=.482, p < .001), desire to learn (R^2 change=.381, p < .001), academic progress (R^2 change=.334, p < .001) and escape or stimulation (R^2 change=.287, p < .001) which accounted for an additional 28.7 per cent of the variable. It proved that self-development and social contact were the two more important constructs among motivation in predicting online learning satisfaction. The findings correspond with the study of Blumenfeld, Kempler, & Krajcik(2006), who indicated that students' motivation was a crucial factor for their academic performance and learning satisfaction.

Table 3. Multiple regression of online learning satisfaction by motivation

Variable	R^2 change	p value
Academic progress	.334	.000***
Escape or stimulation	.287	.000***
Social contact	.482	.000***
Desire to learn	.381	.000***
Self-development	.498	.000***

Note:*** *p*<.001

5. CONCLUSION AND SUGGESTIONS

The findings of this study extend our knowledge of the influence of learners' big five personality traits and online learning motivation on leaning satisfaction. It also provides valuable information about the amount of contribution of these variables in online satisfaction. For this study, we know that extraversion and conscientiousness were the two important traits among the Big Five in predicting motivation and satisfaction. Compared with personality, motivation seemed to be a stronger predictor of satisfaction. Therefore, in order to increase EFL learners' online learning satisfaction, instructors and online program designers should design more interactive courses based on learners' personality traits and provide more interesting activities to motivate their learners in online learning.

Although the present study has yielded findings that have pedagogical implications, it has some limitations. First, there were only 153 participants in this study and the number of males and females involved in this study was not equal. For future studies, it would be beneficial to include more female students, and replicate this study on larger

and different populations. Furthermore, this research focused on the variables of personality traits, motivation on learners' online learning satisfaction. Investigating other potential variables across different learning systems is needed for future studies.

13th International Educational Technology Conference

The Role of Educators in Introduce Technology In Early Childhood Through Science Activities

Sri Sumarni, Dr. M.Pd.[166]

Lecturer at FKIP Unsri

Abstract

Advances in technology closely related to science, with the development of science, the technology will also be growing rapidly. Therefore science is a great way to introduce technology to children. Technology is the application of scientific concepts. With the various concepts of science, man can create a useful technology to facilitate people in solving everyday problems. Indirectly when parents and teachers (educators) introduced the concept of science, is to introduce technology to children. Early childhood had a curiosity that is very high on the phenomena that occur in the environment. especially on the technology that is around children. But the child's curiosity about this technology is sometimes not appropriately stimulated both parents and teachers. During these educators had erred in introducing the technology on children. They tend to introduce sophisticated electronic equipment such as computers, laptops, tablets, gadsget, smartphones, and other. By way of introducing the technology through electronic device, can stimulate children to become users. Indirectly inhibit the children to think creatively in finding a technology. Should be able to make a child happy in finding a technology, not just users only. The process of finding a child in technology can be stimulated through simple science activities. This positive impact on aspects of child development and scientific attitude. Expected in the future, these kids are going to make a big change in the world through technology invented.

Keywords: Activity Science, Technology, early childhood

Background

During this time parents and teachers with the technology to introduce advanced electronic devices such as laptops, tablets, smart phones, gadgets, and more. Indeed, these children look very modern and follow the times. Moreover, the sophisticated electronic devices have own prestige for owners and users. Behind the fame of existing electronic devices, stored real negative thing when children use them constantly. This makes children and kids addicted to using it more as a user are not alone.

Though parents and teachers should be introduced to the concept of technology is not the technology results in the form of an electronic device. With children recognize the concept of technology children will be motivated to create a technology. When someone creates a technology professional, of course, when childhood, he must know in advance the technology and enjoys. In order for a child enjoys the concept of technology, parents and teachers should introduce the concept of technology in a fun activity, namely through science activities.   .

Greatly affect the progress of science technology, with the development of science, the technology will also be growing rapidly. Therefore science is a great way to introduce technology to children. Technology is the application of scientific concepts. With the concept of science, can create a useful technology to facilitate people in solving everyday problems. So is the case with the children. When children do science activities, as well as children are finding a technology, though simple.

Science activities will have a positive impact on the children, not just on the introduction of technology, it can stimulate children to think creatively in finding a technology, it does not directly stimulate adult child later became a scientist. Direct positive impact on aspects of child development and scientific attitude. Later in the future, these kids are going to make a big change in the world through technology he created.

Based on the above explanation, that parents and teachers play an important role in introducing the technology in early childhood. The introduction of technology on children to the concept of technology, compared to the results of the technology. The introduction of technology can be provided with a fun activity that is through science activities.

B. Theory of the Study

1. Role of Parents and Teachers in Introduce Technology

Parents and teachers play an important role in introducing the technology on children. Not only as modeling for children, parents and teachers are a main gate that determines the child's first impression of the technology. Because with a good first impression, make children motivated to megenal more deeply about the technology.

The term technology cited by Badarudin (2006:122) mentions that the technology means the study (the Greek: logos, which means conversation, speech, word) systematic about skill (techne, meaning art, craft, or skill). Three centuries later, the notion of widespread technology, in addition to the mean machine, the definition also includes the way technology, processes, and ideas. In the twentieth century, technology is broadly defined as "ways or activities that allow humans alter or tamper with the environment (natural, human, and all creation)". By that definition, he has covered everything possible be done to improve human life. Parents and teachers how to introduce technology to children is to introduce

the benefits of the technology. That technology is a means used by humans to solve everyday problems that it faces.   .

This is supported by the National Science Teacher Association in Martin (2001:12) "Children should construct understanding of science concepts and processes, see aplications of science and technology to everyday life". This means that children must construct their own understanding of the concepts and processes of science and technology, to observe the application of science and technology on everyday life. In other words, in addition to its benefits, parents and teachers also have to introduce the concept and process technology that is very close to the child's environment, for the child will more easily find a way to solve simple problems in daily life through science concepts.

Engineering Technology". Reinforced by Kumar (2000:10-12) which states that "Basic Science Abstract Applied Science Based on this, it is clear that a technology created by the foundation of science. For the science very big influence on a technology. By teaching science to children as well as teach children to learn the concept and the process of finding a technology. So the role of parents and teachers in introducing technology in early childhood is to introduce the benefits, concepts, and processes simply from a technology through science activities.

2. Science Activity

Science is a systematic knowledge about the various things that are around us that can be verified. Science activities at school, very rarely involve children actively. Schools are more likely to give evidence in theoretical. Whereas in science learning children are expected to be actively involved in the process of finding the problem, determine the provisional hypothesis or conjecture, to what is the most appropriate way to handle it. The rights of children to actively participate during this constrained because the parents and teachers who do not understand what essence contained in a child's active involvement in the activities of science.   .

The National Science Teacher Association (NSTA) is extremely active in the reform of science education at all levels in Martin (2001:12) argues, the NSTA says that elementary science should emphasize learning science concepts and process through the use of activities that children involve; manipulating materials and thinking about the activity curricula should be organized around conceptual themes and should provide opportunities for children to study real-life, personal, and social problems related to science and technology.

Means NSTA is a very active association in the reform of science education at all levels. NSTA said that science should emphasize learning basic science concepts and processes through the use of activities that engage children in manipulating materials and thinking about activities in the curriculum should be organized on the theme of conceptual and should provide opportunities for children to learn about real life, personal, and social issues related to science and technology. NSTA based on active involvement of children in science activities is highly recommended. Both in the manipulation of material to think that eventually the child will have many opportunities to learn to surrounding environment.

Surely there are many positive benefits when children are active in science activities. In line with that expressed Lawson (2008:1) that,

Students develop scientific literacy trough active inquiry, problem solving, and decision making. With each activity program, student are encouraged to explore, investigate, and ask questions as a means of heightening their own curiosity about the world around them. Students solve problems through firsthand experiences, and by observing and examining objects within their environment. In order for young students to develop scientific literacy, concrete experience is of utmost importance-in fact, it is a essential.

This means that in developing the scientific literacy of a child can be done through the activity of an active investigation, problem solving, and decision making. With each program of activities, children are encouraged to explore, investigate, and ask questions as a means of enhancing their own curiosity about the world around them. Children solve problems through direct experience, and by observing and examining objects in their environment. So that preschoolers can develop science literacy, the real experience is very important and in fact, it is the most important. In other words that there are many positive effects and benefits when children are actively involved in running the activity of science. Where the real experience is the cornerstone of this activity.

Furthermore, Martin (2001:32) reveals "The six basic processes of science. They are as follows: "the basic processes in the implementation of science activities will provide many opportunities for children to engage actively and positively impact the child's ability to recognize and resolve simple concept that is simple problem around the environment in everyday life.   .
1. Observing, observing the child's activity in the objects, all the events, even the phenomena through the five senses.   .
2. Classifying, children in group activities, classify objects, events, and phenomena that children encounter in everyday life environments of children.   .
3. Communicating, child's activity in communicating a variety of objects, events, and phenomena encountered in the child's daily life with the child's own language. Obviously with simple language, both verbal and nonverbal.   .
4. Measuring, measuring the activity of the child in the extent to which objects, events, and phenomena observed child. Children were able to observe changes in the physical and concrete through the senses.
5. Predicting, in predicting a child's activity or making hypotheses or conjectures will be changes to objects, events, and phenomena that children observe through the five senses.
6. Inferring, concluding activity of the child in the child the facts observed through the proofs by using a simple experimental process. As well as comparing the predictions with the fact that going from a simple proof.

(McCormack & Yager, 1989; Padilla, nd) in Martin (2001:33) states "these 6 processes, Referred to as the" basic ". Process are fundamental to all scientific investigation. Each process you are asked to develop an activity of your own dealing with the process you can use in early childhood science classroom. "In other words, the above six processes, a fundamental process in all science activities. Any process can be developed on science activities for early childhood level, of course, with a much simpler process.

Science activities for young children is a simple science activities. Where children were introduced the concept and were actively involved in the process. This was disclosed by Tim Doctorrabit (2005:3) argues that science is the basis of various knowledge. Appropriate science learning will provide

the ability to think conceptually and develop students' logic. Thus, it is important to instill understanding to children from an early age that learning science is fun and very beneficial to their lives.

Science learning activities are divided into the paper, experiments, and games 1. Activities with paper, to teach children to understand the concept of science with various activities including: cutting, folding, and pasting paper, connect, classify, sort, and coloring. 2. Experiments, intended to make children familiar with the concept of science is not only a theory but as children thought to express the question of what, why, and how so that children get their own answers through experimentation activities they do.

3. Game intended to facilitate the understanding of concepts through a variety of fun games. to impact science learning will positively to the development of scientific attitude and child. Surely the five aspects of the development include: moral-religious, physical, cognitive, language, and socio emotion. Scientific attitude of a child involves, as expressed by Salandanan (2002:17-20) that,

Scientific attitudes is a way of thinking and reacting in an orderly, systematic and Methodical Manner. Commonly exhibited is an Analytic approach and a conscious effort to find clues or Evidences that may serve as instant guides in choosing a course of actions. Simple inquisitiveness can easily be Considered scientific as opposed to habitual, unaffected, easy acceptance of strange Happenings. An objective way of interpreting occurrences rather than a wiki way likewise reveals a scientific mind. The attributes of a scientific mind (critical-mindedness, persistence, creativity, responsibility, open-mindedness, curiosity, Objectivity, humility)   .

Means scientific attitude is a way of thinking and reacting in an orderly, systematic and methodical. Commonly exhibited an analytical approach and have a high curiosity to find clues or evidence that can serve as an instant guide in choosing a program of action or actions. Simple curiosity can be considered scientific as opposed to habit, is not affected, receptive and open to the strange happenings. How to interpret objective events rather than subjective manner and also revealed to the scientific mind; critical-thinking, perseverance, creativity, responsibility, open-mindedness, curiosity, objectivity, humility. By providing a stimulating science, will give children the opportunity to develop a scientific attitude.

So based on the above opinion, the science activities are activities of children in observing, classifying, communicating, measuring, predicting up to conclude the facts, objects events and phenomena in the environment through the five senses as a form of introduction to the concepts and the active involvement of children in activities that will positively affect aspects of child development and scientific attitude.

3. Linkages between Technology and Science

Science is the basis of a technology. Impact on the advancement of science an technology advancement. Such opinions expressed Kumar (2000:11) that the conventional wisdom about the relationship between science and technology is represented as a tree. If the roots are watered, the science, the fruit, in the form of technology that will automatically grow. In this case the technology is the result of the application of science. Which is when the science is well developed, it will be manifested on the

technological advances that good anyway.   .

Lowson further argues (2008:1) in view of the relationship between program hands-on science and technology (1) To relate science and technology to society and the environment, (2) To develop the skills, strategies, and habits of mind required for scientific inquiry and technological problem solving, (3) To understand the basic concepts of science and technology. This means that program hand-on science and technology that aims to link science and technology to society and the environment, (2) To develop the skills, strategies, and habits of mind required for scientific inquiry and problem solving in technology, (3) To understand the basic concepts of science and technology.

Gonzales (2005:10) He has 5 different models proposed for considerations, roommates take into account the views that have been more Influential in the relations between science and technology. In this he proposes 5 different models for consideration, in view of the relationship between science and technology.

1. Technology is reducible to science (ie, ontologically technology depends on science), roommates means that either it is applied science or is an application of science
.
2. Science is reducible to technology (ie, science depends on technology ontologically) 'roommates can be seen as an instrumentalist position insofar as science Appears as an instrument to dominate nature trough technology (a view held by some Philosophies focused on praxis, such as different version of pragmatism, Marxism ... or even nihilism)   .
3. There is an identify of science and technology. This thesis is a way of understanding "techno science", but is so strong that even its supporters-mainly contructivitist -try to emphasize the identity in methodological terms-as a common process-rather than in ontological terms (as being the same entity)
4. Science and technology are both ontologically and causally independent. It is a parallelist view: they move According to the same rhythm but without interaction   .
5. There is an ontological independence between science and technology, but they are in a causal interaction.

This means that (1) can be reduced to a science technology (ie, depending on the ontological technology of science), which means that the technology is applied science or a science applications, (2) Science is relegated to technology (ie science depends on technology ontological) 'which can be seen as an instrumentalist position as far as the instrument of science appear to dominate nature through technology (a view held by some philosophy focused on the practical, such as different versions of pragmatism, Marxism ... or even nihilism), (3) There identifying science and technology. This thesis is a way to understand the "techno science", but so powerful that even the supporters-especially contructivitist-try to emphasize the methodological identity in general terms-as a process-rather than in terms of ontological (as the same entity), (4) Science and technology independent both ontologically and causally or causation. This is the view parallelist: they move with the same rhythm but without interaction, (5) There is an ontological independence between science and technology, but they are in a causal interactions. 5 models of the relationship between science and technology to prove that they have a relationship and influence between each other.

Powered by Kilmer & Hofman opinion Brewer argues in "Science as the more speci" knowledge about specific phenomena, the processes used to collect and evaluated information ... and as a recently added aspect, (technology when defined as) the application of science to problems of human adaptation to the environment. Science means specifically as "knowledge about a particular phenomenon, a process used to gather and evaluate information and a new aspect was added, (defined as current technology) the application of science to problems of human adaptation to the environment". In this case again touted the technology as the application of science. And science is the basis for the development of a technology.

So the relationship between science and technology have clearly illustrated the various opinions of various experts from the above, science and technology have a relation to one another. Science a positive impact on technology, nor is the container application science technology. With children too young to know the science means to know technology   .

4. Early Childhood

Early Childhood is the young man who created God with all unique personalities, behavior, and appearance. Division called the age range of early childhood is children aged 0 to 8 years old. This statement is in line with Bredekamp: NAEYC in Deiner (2010:574) states "Developmentally Appropriate practice in early childhood programs serving children from birth through age 8". This means the DAP in early childhood programs serving children from birth through age 8 years. "In other words, children who are under 8 years of covering baby, toddler, toddlers, preschoolers and early school children referred to as early childhood   .

But the Indonesian government split into baby's early childhood up to 6 years. It is listed in the Ministerial Regulation No.58 (2009:1) that "In the process, the public has shown concern for the problems of education, parenting, and early childhood protection for 0 to 6 years with various types of services in accordance with the conditions and capabilities of existing , both formal and non-formal. "In other words, the Indonesian government established that the said younger children in Indonesia are children aged 0 to 6 years include: infant, toddler, toddlers, and preschoolers. Supported by the opinion of the reviewing Sheridan range of early childhood through the stages of play. Sheridan (2002:2) states that "It provides a detailed description of children's play from birth to 6 years, Including an outline of elements of spontaneous play in roommates most engage children during the early years of their lives." Opinions above means that provide a detailed description of play that carried the children from birth to 6 years. Broadly speaking, the elements of spontaneity play, performed most of the children involved during the early years of their lives. That is Sheridan believes that the process of spontaneous play is felt only on infants to preschool children. For the early childhood learning for the right done playing. Same play activities provide a fun activity for children is one of them with science activities.

Associated with providing science activities for young children. According to Tim Doctorrabit (2005:3) states that science is the basis of various knowledge. Appropriate science learning will provide the ability to think conceptually and develop students' logic. Thus, it is important to instill understanding to children from an early age that learning science is fun and very beneficial to their lives. In other words, science is given to early childhood, is a fun activity for the benefit of those in the future.

Based on the above theory, it can be concluded that early childhood conceptual thinking skills and develop logic through stimulation in the form of a fun science activities.

C. Conclusion

Parents and teachers have an important role in introducing the technology in early childhood. Stimulated the introduction of this technology through science activities. science activities are activities children in observing, classifying, communicating, measuring, predicting up to conclude the facts, objects events and phenomena in the environment through the five senses to solve everyday problems. This is done as a form of introduction to the concepts and the active involvement of children in science activities that will positively affect aspects of child development and scientific attitude. Indirectly to make children happy and motivated in finding a technology, not only to the user only. Later in the future, these kids are going to make a big change in the world through technology he created.

The State of Technology and the Arts - Interactive Multimedia in Enhancing Culturally Responsive Pedagogy

Siti Zuraida Maaruf[167], Saedah Siraj (PhD.)

Faculty of Education, , Faculty of Education, University of Malaya, 50603 Kuala Lumpur, MALAYSIA

Abstract

The awareness in the diversity of using arts as a medium to infuse culturally responsive arts education classroom is on the rise. Despite gaining interests globally, it has yet to be introduced in Malaysian schools. This paper will use interactive multimedia as teaching tools and materials in enhancing culturally responsive pedagogical module. Using developmental research design, the study takes up samples consisting of sixty secondary school students of cross ethnicity and two arts education teachers. Findings from this study show that by 're-purposing' the technology and by including teachers as co-designers in the development of modules and teaching materials assist in creating cultural awareness and increases the knowledge regarding cultural diversity. Subsequently, the findings demonstrate that teachers are more culturally tolerant and students become more engaged in the learning process. There is yet to be any research performed in this area in the Malaysia setting.

Keywords: culturally responsive pedagogy; traditional craft

1.0 Introduction

The aim of this research is to develop a Culturally Responsive Pedagogical Module for Visual Art Education at the secondary school level. A culturally responsive pedagogy is a teaching and learning approach developed based on the knowledge of culture, and extant experiences that student from multi-ethnic backgrounds possess, built upon references and the performance styles of these multiracial students so as to make the learning process more relevant and effective to them. Rasool and Curtis (2000) as well as Gollnick and Chinn (2009) conclude and assert that a culturally responsive pedagogical approach is an important fundamental component for a multicultural education. At the international level, research in the field of a culturally responsive pedagogical approach is not new. Although researches and critical writings on the approach of a culturally responsive pedagogy are many, they are more oriented toward theoretical analyses and researches in the field of language literacy and special education.

Research into a culturally responsive pedagogical approach in arts education is still lacking and is in need of more in depth studies. Consequently, the lack of research references in the approach of a culturally responsive pedagogy in arts education at the global level as well as the lack of research at the local level has paved the way for the need to conduct a more comprehensive study in the field. Hence, these researchers feel that it is most appropriate for a study on the development of a culturally responsive Visual Art Education module at the secondary level be conducted in order to aid teachers to integrate and to implement a multicultural education in the teaching and learning practices at schools with the aim of enhancing students' knowledge and awareness regarding the elements of art and culture inherited by each race that makes up the multiracial society in Malaysia. It is also hoped that with the existence of this culturally responsive pedagogical module for the Education of Visual Art at secondary level, there will be an improvement in students' interest and academic achievements and that they will become more responsive towards their own culture and those of others.

1.1 The Development of Interactive Multimedia Teaching Material

According to Norasiah Abdullah, Nor Risah Mat Zain and Rosnah Ahmad Zain (2009), education technology fulfils the role as a teaching aid material which constitutes an important component to teachers. Classroom activities require interesting and creative teaching materials in order to inspire students to learn. In developing the teaching aid materials for this culturally responsive pedagogical module for traditional craft in Visual

---

[167] Corresponding author.
E-mail address: aidasam79@yahoo.com

Art Education for secondary schools, these researchers have chosen to develop an interactive multimedia teaching material in the form of a *Microsoft Power Point'* slide presentation so as to make the process of teaching to be more effective.

These researchers used the *'Microsoft Power Point 2010'* software as the main authoring tool for the interactive multimedia teaching material. This software was chosen due to its advantage as being universal software that is easily accessible to all computer users. This software also has the capability to operate at multiple levels of usage consisting of multimedia authoring software, graphics software and animations as well as object-oriented programming that are uncomplicated and effective.

The choice of Microsoft Power Point 2010 software as the main authoring tool was also based on the suggestion of Koehler and Mishra (2005) in their research that encourages us to make use of existing technology or to *'re-purpose the technology'*. Bearing in mind this suggestion of Koehler and Mishra (2005), these researchers feel the usage of Microsoft Power Point 2010 software to develop the interactive multimedia teaching material for a culturally responsive pedagogical module for traditional craft in Visual Art Education for secondary schools will enable teachers to be directly involved as co-designers in the improvement process whereby teachers may gain access to the interactive multimedia teaching material that has been developed and to allow them to add new information from time to time. This suggestion corresponds with the proposals presented by Brown and Duguid (2000) and Fischer and Giaccardi (2006).

2.0 Background of the Research

Multicultural education has long been an issue at the global level. Researches and critical writings in the field of multicultural education were first mooted after the break of the Second World War Banks (2010) elucidated that the outbreak of the Civil Rights Movement was responsible for the introduction of the Multicultural Education in the United States in the 1960s. Among the better known researchers who are still actively pursuing the study and critical writing of multicultural education until today are Banks (1989), Nieto (1992), Banks and Banks (1993), and Grant and Sleeter (1993). To date, the research of multicultural education that broaches into the field of specific curriculum such as language and arts education is gaining momentum throughout the world that it produces new researchers such as Jacobs (2002), Hatton (2003), Glazier and Seo (2005), Anita Malhotra (2006), Bastos (2006), Gina Martin (2006), Graham (2009) and a host of others.

In Malaysia, the study of multicultural education is also receiving more attention from academicians. However, a majority of the researches conducted are set towards theoretical analyses and general perspective either at the school level or at the level of institution of higher learning. These local researches include those conducted by Najeemah (2005:2008), Raihanah (2009a:2009b), Malakolunthu, Saedah and Rengasamy (2010), Malakolunthu (2011) as well as Abdul Razaq, Norhasni, Zalizan and Anisa (2011). In his research, Samsudin (2010) used comics as a teaching aid material in Malay language subject which saw the integration of a multicultural education element. Likewise with the research performed by Ahmad Ali, Zahara and Abdul Razaq (2010) pertaining to the effectiveness of a multicultural approach in the national integration of history subject. Badrul Isa (2006) had included to consider the issue of multicultural education within the the context of Visual Art education in Malaysia but once again, the consideration that he put forth was limited to theoretical analysis and general perspective only. These researchers feel that the time is ripe to venture into the need to focus and establish a research in the application of theory in P&P practices in schools.

As such, the research in the development of a Culturally Responsive Pedagogical Module for Visual Art Education for secondary school is not only important but meets current requirements. This pedagogical module will provide the opportunity for a diversity of cultures to be exposed to students by improving and purifying the Visual Art Education curriculum. Through this culturally responsive teaching, teachers are able to teach Visual Art Education while incorporating elements of culture or art from the Indian or Chinese communities in a Malay handicraft lesson, for example. This way, students indirectly learn art in a comprehensive manner as it encompasses every race from the context of history, medium or motive employed by certain races. This classroom process may be able to inculcate sensitivity and tolerance among students of different backgrounds and cultures.

3.0 Research Problem

UNESCO (2010) advocates a school curriculum that is based on the principle of equality and to ensure that student's combat discrimination and stereotyping involved in the development of multicultural education in a learning environment. Current researches in the field of multicultural education show that multicultural curriculum strategy that emphasizes a holistic approach encourages students to achieve better (Bank & Bank,2004; Pang, 2003). The research conducted by Najeemah (2005) showed that the practice of multicultural education among teachers in Malaysia is below the desirable level. The teachers involved in the research adduced four reasons for their lack in

practising multicultural education in schools. Firstly, teachers do not know or do not understand as to what constitutes a multicultural education. Secondly, teachers lack the knowledge in applying the pedagogical approach relating to an effective multicultural education. Thirdly, teachers do not receive any encouragement to learn about a pedagogical approach that leads to multicultural education. Fourthly, teachers lack the awareness of their full responsibility as educators to prompt them to utilize a pedagogical approach relating to an effective multicultural education. The research carried out by Abdul Razaq, Norhasni, Zalizan and Anisa (2011) also suggested that the Ministry of Education Malaysia (PKM) seeks a mechanism to improve on the degree of acceptance toward the issue of diversity in schools among teachers in order to ensure that the quality of education is one that is free from any form of prejudice toward any race in Malaysia. Malakolunthu (2011) is of the opinion that to successfully implement and achieve the aim of an effective multicultural education, emphasis should be placed on several critical actions which include the aspect of developing the professional teacher, the development of the curriculum framework, the pedagogy strategy, teaching materials and textbooks as well as the evaluation process.

It is evident here that we need to introduce a multicultural responsive pedagogical approach system that provides more room to the element of knowledge and awareness of the diversity of culture to assist teachers in the matter. In addition, this module will create the opportunity for the sharing of knowledge to students for them to become more sensitive to the practice of culture of the society around them. This is in tandem with what was proposed by Mitchell (2009) who suggested that specific exercises will help teachers to generate understanding regarding the diversity of culture in the minds of students. Subsequently, students need to be exposed not only to the recognition of various cultures, but also to look for similarities that exist in their respective diverse cultures. This will prevent them from being culture-illiterate or turning into an ethno-centric group. One of the aspects that need to be given attention to is the art that the multiracial society in Malaysia possesses and which is shaped through the practice of their culture. Gina Martin (2006) stressed that art plays a major role in a multicultural education as it inherently exists in the context of any culture. Hence, it is imperative for the young generation to have an awareness of the cultures of Malaysian society with a high degree of aesthetic value, as well as to possess imaginative, critical, innovative and creative minds. Art can be one of the ways or tools to build and strengthen a harmonious and integrated society that is culturally responsive.

There are constraints from the aspect of reference materials such as books and articles that touch on the culture of Malaysian society particularly on other than the Malay society like the Chinese, Indian and Indigenous groups as well as the various tribes from Sabah and Sarawak with regard to their culture and heritage arts have resulted in the lack of knowledge and awareness of their customs. This makes learning and understanding the essence of these groups' customs and community arts difficult for every strata of society. It is possible that these materials are written in that particular society's languages like the Chinese or Indian language and that these materials are not published for public reference. It is of utmost importance for all of us to own these reference materials on the subject matter of customs and community arts for the sake of teaching and learning especially for the young generation in order to empower them with knowledge about their own community and others so that they will not be counted as a generation that is ignorant of their own culture as stated by Moncrief (2007) whereby this condition may give rise to certain segment of society to be 'blind' to the effects of culture when there exists a dominant culture in a society as what happened to the dominant Euro-Americans.

4.0 Research Objective

The aim of this research is to explore the experiences of teachers during the conduct of a culturally responsive pedagogical module for Visual Art Education for secondary schools and to apply the multimedia interactive teaching aid material that has been developed.

5.0 Methodology

This research applies the Design and Development of Research approach (Richey & Klein, 2007) that focuses on the processes of developing a Culturally Responsive Pedagogical Module through the subject of Visual Art Education at secondary schools. In line with the research aim, this research has three phases that contain specific procedures following the sequences outlined in the ADDIE Model. Phase 1: (Analysis), Phase 2 (Design and Development Process) and phase 3 (Implementation and Evaluation Process). Every procedure differs according to its specific phase in the development of the module. For the purpose of this presentation, these researches will discuss the research findings for Phase 3: (Implementation and Evaluation).

5.1 Interview

To identify the benefits and effectiveness as well as the weaknesses of the module, in addition to understanding the experience of the teachers conducting the teaching and learning process by using the Culturally Responsive Pedagogical Module for Traditional Craft in Visual Art Education for secondary schools and the interactive multimedia teaching material that has been developed for improvement purposes, these researchers have elected to use interview as the approach for the research. For the purpose of accumulating data, researchers will carry out an in-depth interview on teachers who use the pedagogical module that thus has been developed. The rationale behind the choice of interview as the approach for the research by taking into account several aspects and characteristics of qualitative research as stated by McMillan (2008) and Creswell (2009).

5.2 Research Participants

Research participants for Phase 3: Implementation and Evaluation will be selected using the Purposive Sampling approach in view of the fact that the research participants are teachers and students who are undergoing the process of teaching and learning applying the culturally responsive pedagogical module for Visual Art Education in secondary schools and the interactive multimedia teaching material. In this research, the participants chosen were two experienced teachers of Visual Art Education subject in a national secondary school. The selection of research participants were also motivated by several factors which include:

  i.   Background of the subject taught
 ii.   Teachers' experience in teaching PSV subject
iii.   Teachers' experience in using a culturally responsive pedagogical module for Visual Art Education in Secondary schools.

5.3 Data Analysis

For Phase 3: Implementation and Evaluation, narrative analysis was be used for data obtained from interview sessions conducted on two teachers who taught using the module and the interactive multimedia teaching material.

6.0 Findings

Views and experience of teachers toward the culturally responsive pedagogical module for traditional craft in Visual Art Education for secondary schools and the presentation of the interactive multimedia teaching material.

The research findings discussed in this section was based on the analysis of the interview transcription conducted on both the Visual Art Education teachers chosen through the purposive sampling approach whereby these Visual Art Education teachers were involved in the teaching of the culturally responsive pedagogical module for traditional craft in Visual Art Education for secondary schools developed by researchers. For a more in-depth discussion regarding the teachers' perception on the culturally responsive pedagogical module for traditional craft in Visual Art Education for secondary schools that has been developed, researchers will make the analysis based on the following themes:

- New experience and knowledge
- High potential for module to be integrated in the current curriculum
- New pedagogical approach that is responsive to the current multicultural education Visual Art Education

a.   New experience and knowledge

Overall, both teachers gave highly positive responses regarding their experience in handling a culturally responsive pedagogical module for traditional craft in Visual Art Education for secondary schools and the presentation of the interactive multimedia teaching material. This is evident from what was stated by one of the teachers:

Cikgu Adi stated that:

As for me puan …so enjoyable lah …..my experience aaa….. teaching the module is a new experience because the subject aaaa…….I have never taught this subject before except *tekat*. Aaaa I mean those Chinese and Indian craft activities that I myself had not learned before this ….. If like ah…… observe what is Indian embroidery …..aaaa…… and that lantern, never before whether at school during practicum a long

time ago or in the art and art design programs at the Education Faculty before .... as for me …..aaaaa……..
(L31-37:Respondent 1:22 Oct 2012)

He added:
even as a teacher I myself was excited…..when teaching this module I myself had fun learning how to make a lantern with Indian embroidery .... further ... I learned many new facts like its history ....to me, when there is a module like this teachers will automatically become more responsive and aware of the cultures among students ……*(L171-175:Respondent 1:22 Oct 2012)*

Further, Cikgu Raiha said:
even for me myself ...... more homework on Chinese and Indian cultures before teaching this module ... afraid that students will not understand ... so I myself must be fully familiar with the craft to be taught ..... then I realized ..... actually there are much that we do not know about the customs of other people or races ... so, as teachers ... we should learn more about crafts ... other races' culture ... because we are ignorant of all these ....I think we can become closer with our students ..... that sounds fun ..... when we can share with our students ... I noticed when I talked about the crafts of other races .... students become more comfortable to interact with me .... as if they are not shy or intimidated by us ... it gives them the impression that we are more sensitive and concerned about their culture .. not just the culture of the Malays only ….*(L176-187:Respondentt 2:22 Oct 2012)*

b.   *High potential of module to be integrated into the current curriculum*
Both teachers asserted that this culturally responsive pedagogical module for traditonal craft in Visual Art Education for secondary schools that has been developed is extremely suitable to be integrated into the Visual Art Education curriculum since the existing curriculum only emphasizes on the crafts of the Malays only. Below are the statements from both teachers:

Cikgu Adi stated that:
it is a good approach because it exposes urm what do you call it ... the diversity of culture of the Malaysian Malay, Chinese and Indian and also the Bumiputra to be learned together in the context of the given module lah ... aaaa….further ….. actually students also don't know about the crafts of other races….lah *(L37-42:Respondentt 1:22 Oct 2012)*

Further, Cikgu Raiha stated:
my opinion ah…… like this ah……..this Culturally Responsive Craft module is actually very suitable for schools because we know even in schools there are a diversity of Malay Chinese Indian cultures so..aaaaa……. mostly if we look at the art education syllabus um……. much is emphasized on the Malay traditional craft all like us um…… like this module there is *tekat* um……. and then handicrafts ah…… Chines Indian so from there we ah….. indirectly learn ah….. very ah……. interesting ah…….. the activities are very interesting lah. I think puan ... it is time ... our psv .aaa…..has ….new things like this module …..then only students become more interested to learn *(L44-53:Respondent 2:22 Oct 2012)*

She added:
This module is very suitable for PSV curriculum ….. in my opinion we and Malaysia have diverse cultures ... they will learn the cultural crafts of every ethnicity la …...*(L390-392:Respondent 2:22 Oct 2012)*

c.   *New pedagogical approach that is responsive to multicultural education*
Both teachers opined that this culturally responsive pedagogical module for traditional craft in Visual Art Education for secondary schools that has been developed is a novel teaching approach that can assist teachers in the integration of the elements of multicultural education over the existing curriculum in tandem with the aspiration of 1Malaysia. According to them:

Cikgu Raiha stated:
this module is timely .... aren't we now embracing the concept of 1Malaysia….. by right all these students have already learned or we must expose about the traditional craft of all races ….. *(L145-148:Respondent 2:22 Oct 2012)*

Cikgu Adi explained:

> As a teacher I myself was excited..... when teaching this module I myself had fun learning how to make a lantern using Indian embroidery ... furthermore .... I learn many new facts, for example its history.... to me when there is a module like this teachers will automatically be more responsive and sensitive to the cultures that exist among the students ….*(L171-175:Respondent 1:22 Oct 2012)*

Cikgu Adi added:

> The learning outcome from this module is effective on the students because.... now there is the 1Malaysia concept it's like we are strengthening that concept of 1Malaysia lah. Meaning the education transformation happens indirectly ….., based on culture….. I totally agree if this module can be integrated into the existing PSV curriculum today .... Really ….this culturally responsive modue is ......one……product-based teaching and learning process that is considered ... this is really a culture ….*(L354-360:Respondent 1:22 Oct 2012)*

The strengths and advantages of a culturally responsive pedagogical module for traditional craft in Visual Art Education for secondary schools and the presentation of the interactive multimedia teaching material.

To discuss the research findings in this section obtained from the analysis of the interview transcriptions conducted on both the Visual Art Education teachers who were involved as the teaching staff in the culturally responsive pedagogical module for traditional craft in Visual Art Education for secondary schools that the researchers developed, the researchers will make a thorough analysis based on three themes which are; improves two-way communication, effective tools and teaching aid materials enhance IT skills, module has high potential to be integrated into current curriculum.

a.   Improves two-way communication.

Both the Visual Art Education teachers who conducted the teaching and learning process based on the module developed by the researchers agreed that a culturally responsive pedagogical module of traditional craft in Visual Art Education for secondary schools have the features for an effective communication and two-way interaction.

Explained Cikgu Raiha:

> …..interactions do exist ... and to me indirectly when teachers are supplied with a module complete with an interactive multimedia teaching aid material like this …..*(L124-126:Respondent 2:22 Oct 2012)*

Cikgu Adi added:

> In terms of two-way communication and interactions between teachers and students, it is obvious that they exist …..because the students gave such positive responses during P&P….many asked all kinds of questions ... when I gave the students chance to give more comments ... they would comment .... some commented about motives, …aaaa….colour … all kinds lah …..*(L130-133:Respondent 1:22 Oct 2012)*

b.   Effective tools and teaching aid material enhance IT skills

Based on the analysis of the interview with both Visual Art Education teachers who used the module developed by the researchers, on a very positive note they stated that the tools and teaching aid material provided together with the module are highly effective and their IT skills improved after using the culturally responsive pedagogical module for traditonal craft in Visual Art Education for secondary schools.

Cikgu Adi stressed that:

> one thing that I think is good when using this module …ar….Because the approach is by way of multimedia and it is student-centered and teacher-centered means students can give their attention from the attraction of its audio, music, videa and visual and as the likes. So students could get attracted ……could get attracted by what was presented by the multimedia. From another angle, maybe ..... maybe ah ... to the teacher handling the module will find it easy to use the multimedia. Just click it ……. information comes out…..I really like a multimedia presentation that only used power point because it is easy to use as I think everybody already has the basic …..to me, it is easy to add any new information ….no need for teachers to take the trouble to learn a new software …not like there is a courseware that is not user friendly …like using a director ....aaaaa.... or flash….because not all computers have those and …sometimes it is too

heavy….cannot even support it …. in the end, teachers are reluctant to use it …......*(L100-113:Respondent 1:22 Oct 2012)*

Cikgu Raiha stated:

that is true …. when there are tools and teaching aid material as complete as this module then I think it is no longer difficult to teach ….Because we know nowadays technology ah…..is widely used in schools but not all schools ……. so from the aspect of multimedia technology it attracts students to learn because if we are used to anything, chalk and board so it is rather effective for students to learn from whiteboards. So multimedia is even more attractive to students …..*(L114-119:Respondent 2:22 Oct 2012)*

She added:

Teachers can also enhance their ICT skills ….because of the interactive multimedia teaching aid material…. this can be improved by teachers …in case they have new materials ….…..*(L127-129:Respondent 2:22 Oct 2012)*

Cikgu Adi also commented on the tools and teaching aid material found in the module:

The use of all those teaching materials was very helpful lah ….haaa…..(laugh)…. plenty of object-based learning material there …… to make P&P more interesting and effective …aaaa… because students can touch can see …aaaaa…….. can feel. *(L330-333:Respondent 1:22 Oct 2012)*

He added:

Actually ABM – teaching aid tool like …this OBL…… only one but it can be used in many classes. Meaning it's not burdensome and they can make a collection for teaching. *(L331-338:Respondent 1:22 Oct 2012)*

Cikgu Raiha's reaction :

Furthermore……. that powerpoint is already in the module set ….. teachers only need to add information if necessary……the OBL …. by right the school needs allocation ….. as teaching material and tool …..let it be a collection in the art room….all art teachers can share them ……like what Adi said….*(L334-338:Respondent 2:22 Oct 2012)*

Cikgu Adi added more:

So, when there is a module like this it facilitates teachers to …..what's that, teaching material lah …..so …..we need to guide properly lah….because all information is already in the module we only need to deliver the lesson ….*(L369-371:Respondent 1:22 Oct 2012)*

7.0 Conclusion

Results in this study prove that teaching tools and materials used in the Culturally Responsive Traditional Crafts Pedagogical Module for Visual Art Education at the secondary school level is very effective and succeeds in increasing the teachers' IT knowledge and skills. Additionally, the findings corroborate with the findings by Kampouropoulou, Fokiali, Athanasjadis and Stefos (2011) that multimedia technology is very supportive in the production of an art piece among school students. Moreover, the results give light that the Culturally Responsive Traditional Crafts Pedagogical Module for Visual Art Education improves teachers' level of dedication and responsiveness. Subsequently, the module used in this study is timely and corresponds to the claims highlighted by teachers in Najeemah (2005) and Malakolunthu et. al. (2010) on matters such as teachers must be equipped with relevant sources, trainings, and exposures to culturally responsive teaching.

The Malaysia Ministry of Education is able to provide teachers with the knowledge, preparation and exposures needed for art teachers in the form of training in service (LADAP) to empower teachers who are culturally responsive. Therefore, findings from this research also prove that in developing the application of interactive multimedia the Department of Education Technology needs to raise the awareness for teachers to utilize 'repurposing the technology' technique as suggested by Koehler and Mishra (2005) based on knowledge, skills and aptitude of the teachers without overloading them with the current teaching loads.

The results also prove that the Culturally Responsive Traditional Crafts Pedagogical Module for Visual Art Education improves teachers IT skills and accelerates teaching and learning. It is also encouraged that teachers to be given encouragement and be permitted to be co-designers in developing and reconstructing the module and designing teaching materials. Teachers may contribute in designing the presentation of interactive multimedia in which they will have access to information and upgrade the materials which they co-designed aligned

With the findings and suggestions listed above, it proves that teachers are more dedicated in performing their duties and are more culturally responsive through co-designing. Subsequently, they improve in developing their Technological Pedagogical Content Knowledge (TPCK) as proposed by Koehler and Mishra (2005). Based on the study, experiences through workshops and courses are not effective in instilling and developing in depth understanding to assist teachers to use new technology in performing their jobs.

Abstract

There is great importance of accounting lessons on the professional careers of students that studied economics at universities. Most of the lessons includes theme of accounting, finance, tax, and law. In this context, the success or failure of students in accounting lessons affect both the students' professional careers and undergraduate education period.

The success and the failure of the students at accounting lessons depend on several factors. As an example of these factors, educator factor: the ability of imparting the theoretic information to the practical, physical feasibility: the laboratories besides classes, etude, working, and counseling services etc.

This study, at the first part, has a sample of two similar universities. Accordingly, this study aims to assert a comparison of the students which studies at similar cities, universities, and departments, failure or success of accounting lessons.

At the second part of the study, a model have been suggested which has prevented the factors that causes the failure of accounting lessons. On the other hand, the model also have been mentioned that success should be an organizational culture which has based on the life-long education.

Keywords: Accounting Education, Entrepreneurs, Accounting Information System

1. Introduction

Knowledge, which is one of the most important capital factor in today's competitive environment, should be exact, proper for need, understandable, significant, reliable, objective, right, comparable and presented in time during the decision process for current and future.

Accounting, which is assistant function of business, provides financial and non-financial information that management needs to take routine and strategic decision (AAA[169], 2013). It also helps current and potential investors to or not to invest with financial data (AICPA[170], 2013). To advance accounting effectively and efficiently while it stands those important functions in the business, accounting education that combines theory and practice is needed.

Uçma and Beycan (2009) define accounting education as "inform students about determining, gathering, measuring, processing, saving, checking validity of information that is useful for business decisions, summarizing as reports in an easily understand way, using the result of examination of information and develop skills to use that information." According to AICPA (2013), the objective of accounting education is to give high-level of accounting education for preparing students to the business and make them graduate. While concept and objective is examined

---

in this respect, it is understood that the harmony of theory and practice is significant for effective and efficient accounting education. Korukoğlu (1998) organize the objectives of accounting education as follows;

- To constitute business record system in accordance with generally accepted accounting principles,
- To reach business goals rapidly and effectively by educate people toward basic concepts of accounting,
- To create and develop accounting standards,
- To teach accounting applications and reporting techniques, to transfer right and reliable information to the management,
- To enhance knowledge and skill of accounting, to raise the quality of personnel,
- To follow current developments and changes related to accounting applications,
- To represent technological developments into the accounting applications,
- To inform personnel about legal regulations by following changes and developments,
- To follow developments on managerial accounting section,
- To minimize errors and raise productivity,
- To educate beginners, to provide an understanding at working personnel about what the company's structure and conditions of accounting system,
- To provide communication and coordination among branches by informing other executives (technical staff etc.) about accounting
- To provide teaching professional ethics codes oriented at application.

The objective and significance of this study arise at this point. Faculty of Economics and Administrative Science students' qualified accounting education is an important factor for students' both university and professional life's success or failure. Hence, a model is going to be constituted.

2. Literature Review

In this section, results gained from academic studies about accounting education will be reviewed and presented.

Sayın, Yeğinboy and Tektüfekçi (2005) make a research about evaluation and measurement of effectiveness of accounting and finance education for students from Faculties of Economics and Administrative Science. It is revealed from the study that students should be informed about qualities, opportunities and process of accounting profession, training opportunities should be created for students during their university education because of the fact that accounting education comprise of both theoretical knowledge and implementation and, financial means should be enhanced in order to prevent the negative effect of crowded classroom.

Nouri and Shaid (2008) examine students' learning and attitudes to Powerpoint presentations' effect, while Green, Reinstein and Mc Williams (2000) research the performance differences between students have education with conventional teaching methods and students have education with computer supported education methods. It is founded that information technologies supported learning methods different from conventional increase the learning efficiency at accounting education. Usage of information technologies also provides combining theory and practice by using more visual image and having effective time management.

Özcan, Ünal and Helhel (2009) state that female students are more satisfied about accounting program rather than male students and female students think that accounting program enables students to find better jobs at the study with title of "The Relationship Between The Gender and Formation of Accounting Program Students and Their Attitudes Towards Accounting Careers."

Harwood (1999) investigate classroom assessment techniques (CAT) in accounting education in his study. Differences occurred on student's learning feature while teacher uses one CAT or more than one CATs is observed in the study. In consequence of this study, it is reached that evaluation of student's success or failure with single criteria creates scarce and wrong results, hence it should be evaluated with multiple criteria.

Çelenk, Atmaca and Horasan (2010) who make a research about assessment of students' perspective toward accounting profession examine the impact of teacher factor on students' tendency to accounting profession. It is found that teacher factor is effective on choosing accounting profession. Study also states that high rate of job placement in accounting profession is an important factor for students to choose accounting profession and students who follow developments at accounting profession are being more satisfied with accounting profession.

Kealey, Holland and Watson (2005) examined that whether critical perspective to accounting principles have impact on students' performance. As a result of the study, it is reached that basic accounting principles need to have critical thinking feature.

Demir and Çam (2006) reached that insufficient use of accounting application during accounting education and ignorance of student's satisfaction are the reason of failure at the study where they examine negative factors that affect accounting department students during accounting education. The other findings of their study are as follows;

- Students want to work accounting related departments,
- While students are pleased to study at accounting department, their tendency to choose accounting department again is low,
- Lack of interest of students to the profession and again lack of future goals are important factors that affect success.

Chiang (2008) investigate the impact of teachers' use of case studies on student performance which are performed from real accounting professionals at managerial accounting courses. Collecting, saving and reporting of financial transactions' documents are not only routine operations, but also acquired information is historical fact. Managerial accounting is in use to make future oriented decisions. In this respect, it is reached that in addition to historical facts, transferring and analyzing real cases to managerial accounting to minimize risks and uncertainties raise students develop a lifelong learning philosophy and have a mission.

Gençtürk (2007) aimed to measure vocational school students' success at accounting-finance lectures in comparison with their high school graduation and education style. He stated that students who took accounting and finance lesson at high school level are more successful at general accounting lectures.

Baker and Logan (2006) investigate in-class activities at learning methods. The study revealed that besides conventional learning, in-class activities where students participate actively increase students' learning efficiency and adopted as a professional role. It is reached that these cases provide students' exploration of his/her own skills, increasing and adoption of his/her interest about accounting profession.

Bekçi, Titiz and Ömürbek (2006) stated that students consider that they can use software programs which they learn during the accounting lectures in different areas. Another significant finding is the fact that while the computer laboratory is open for student use after lectures increase the students' success. In this research, they suggest making computerized accounting course compulsory lessons in faculties and vocational schools as computerized accounting courses provide implementation of accounting knowledge and gain to use this knowledge after school.

When studies about teaching methods investigated, it is seen that Bashir (2000) study open learning, Bremser and White (2000) deal with learning by trying, Nikolai (2006) research active learning and Norman et al. (2004) explain learning with collaboration.

Otlu, Durmuş and Solak (2012) mention vocational schools' mission of educating intermediate staff. They stated that bringing new responsibilities to accounting executives in parallel with new developments that new Turkish Trade Act brings. Another highlighted point is with these new responsibilities, there will inevitable work load. With this respect, the study suggests to close accounting and tax departments of vocational schools and constitute faculty departments.

3. Research

- *3.1. Extent and Method*

The extent of the study is students from Aksaray University (ASU) ile Karamanoğlu Mehmetbey University's (KMU) faculty of economics and administrative sciences. There are Business Administration, Economics and Public Administration departments at related faculties.

Constraints of the study are as follows;

- Since there is not sufficient accounting education in Public Administration departments, students from this department exempt from the research.
- Due to the fact that there are no third and fourth year students at ASU Economics department, students from this department exempt from the research. Same restriction is made for KMU Economics department to be able to make comparative analysis.
- Research conducted on Business Administration department third and fourth year students since it is considered that they had sufficient accounting education.

The data of the research is collected from ASU and KMU Business Administration students. Total 3rd and 4th year students of ASU, Faculty of Economics and Administrative Sciences, Business Administration department is 465 and 147 of them respond the survey. Likewise, Total 3rd and 4th year students of KMU, Faculty of Economics and Administrative Sciences, Business Administration department is 600 and 197 of them respond the survey. Total 3rd

and 4th year students of both universities are 1.065 and 344 of them participate the study. 5-point Likert scale was used during the developing statements and data is analyzed with SPSS 20 software program. In the beginning, it is thought that comparative analysis would be meaningful between two university students. However, there were no significant result found after conducting comparative analysis, that is why analysis is made after colliding two datasets from two different universities. Reliability analysis has been made by Cronbach Alpha method and the coefficient is seen on the table below.

Table-1 Reliability Coefficient

Number of Survey	344	*Number of Statement*	38	*Alpha Coefficient*	0.736

When all statements added to analysis, reliability coefficient is found 0.736. The value of coefficient shows that reliability of the survey is at desired level.

- *3.2. Objective*

The objective of the research is to create a model by presenting the factors influencing ASU and KMU students' success or failure on accounting education

- *3.3. Findings and Analysis*

Total number of respondents is 344 and 147 of them are male students and 197 of them are female students. Demographic data of respondents is given at Table 2.

Table-2 Demographic Findings of the Respondents

	Frequency	Percentage (%)
Gender		
Male	147	42.7
Female	197	57.3
Age		
17-20	8	2.3
21-24	303	88.1
25-30	28	8.1
31 and more	5	1.5
Type of Graduated High School		
Trade Vocational High School	56	16.2
Vocational High School	48	14
Science High School	26	7.6
High Schools gives Social Sciences Education	214	62.2
The Reason of Choosing The Faculty		
Professional Career	96	27.9
Legal Obligation	41	11.9
Family Related Choices	30	8.7
Personal Choices	177	51.5
Intended Area of Profession		
Banking and Finance	104	31
Public Accountant	27	8.1
Self-Employment	14	4.2
Public Sector	138	41.2
Marketing	18	5.4
Entrepreneurship	28	8.4
Others	15	4.3

The most salient demographic finding according to Table 2 is 62,2% of respondents (n=214) are graduated from High Schools gives Social Sciences Education, 16,2% of them(n=56) from Trade Vocational High School, 14% of them (n=48) from vocational high school and 7,6% of them (n=26) from Science High School.

Table-3 Frequency, Percentage, Mean and Standard Deviation Values of the Impact of Accounting Lectures on Career and Personality

The Impact Of Accounting Lectures On Career And Personality	Certainly Important-Important		Neutral		Certainly Unimportant-Unimportant		n:344	
	f	%	f	%	f	%	$\overline{x}$	s
It revealed my leading skill.	159	46.2	89	25.9	96	28	2.85	1.131
I had the skill of analyzing professional theory and practice together.	210	61.1	68	19.8	66	19.2	2.51	1.559
It provided that I have social responsibility.	216	62.8	58	16.9	70	20.3	2.41	1.152
It improved my analytic thinking skill.	229	66.5	66	19.2	49	14.2	2.29	1.084
I had perpetual learning understanding.	190	55.2	97	28.2	57	16.6	2.48	1.093

When Table-3 is examined, it is seen that accounting lectures improve students' analytic thinking skills, as a result of that they can have a critical perspective; it provides students to have social responsibility; it gives perpetual learning skill and students are able to use this in their daily lives; finally it also provides the skill of analyzing professional theory and practice together.

Table-4 Frequency, Percentage, Mean and Standard Deviation Values of Productivity Level of Accounting Lessons

Productivity Level Of Accounting Lessons	Certainly Important-Important		Neutral		Certainly Unimportant-Unimportant		n:344	
	f	%	f	%	f	%	$\overline{x}$	s
General Accounting I-II	234	68	20	5.8	70	26.2	2.44	1.232
Inventory Balance Sheet	204	59.3	31	9	109	31.7	2.66	1.220
Corporate Accounting	270	78.4	26	7.6	48	13.9	2.05	1.121
Cost Accounting I-II	232	67.4	44	12.8	68	19.8	2.22	1.261
Computerized Accounting	85	24.7	173	50.3	86	25	3.03	1,098
Managerial Accounting	86	25	195	56.7	63	18.3	2.97	0.979
Accounting Audition	70	20.3	213	61.9	61	17.7	3	0.905
Financial Statement Analysis	112	32.5	179	52	53	15.4	2.76	1.044

According to Table-4, students consider Corporate Accounting, General Accounting, Cost Accounting and Inventory Balance Sheet lessons are efficient. It could be said that since students take general accounting lesson efficiently and effectively, they have a solid background of accounting and that is why they will not struggle so much on other accounting lessons.

Table-5 Frequency, Percentage, Mean and Standard Deviation Values of Factors that Effective on Accounting Lessons' Productivity

Factors That Effective On Accounting Lessons' Productivity	Certainly Important-Important		Neutral		Certainly Unimportant-Unimportant		n:344	
	f	%	f	%	f	%	$\overline{x}$	s
My personal knowledge, interest and skill	249	72.3	48	141	47	13.6	2.17	1.030
High rate of general success level of the class	132	38.4	84	24.4	106	37.2	3.02	1.097
Lecturer's effective and productive teaching	273	79.3	36	10.5	35	10.2	1.90	1.998
Physical facilities of school (Library, internet connection, etc.)	123	35.7	65	18.9	156	45.4	3.15	1.288
Supporting theoretical education with practice	186	54	60	17.4	98	28.4	2.61	1.389

According to Table-5, the main reason of lesson productivity is lecturer's effective and productive teaching and second reason is students' personal knowledge, interest and skill. It is seen from the table that another important factor that is effective on accounting lessons' productivity is supporting theoretical education with practice. With this respect, it is hard to say physical facilities of school have impact on accounting lessons' productivity.

Table-6 Frequency, Percentage, Mean and Standard Deviation Values of Students' Learning Techniques of Accounting Lessons

Students' Learning Techniques Of Accounting Lessons	Certainly Important-Important		Neutral		Certainly Unimportant-Unimportant		n:344	
	f	%	f	%	f	%	$\overline{x}$	s
I learn the lesson while lecturer is giving.	281	81.6	37	10.8	26	7.5	1.82	1.064
I learn when I study by myself.	304	88.4	25	7.3	15	4.4	1.80	0.811
I learn when a friend of mine tells me.	217	63	56	16.3	71	20.6	2.48	1.153
I learn when I study with a group of my friends.	180	52.4	57	16.6	107	21.1	2.76	1.302

When Table-6 is examined, it is seen that students learn when they study by themselves and while lecturer is giving. Thus, it might the stated that students less adopt collaborative and interactive learning techniques.

Table-7 Frequency, Percentage, Mean and Standard Deviation Values of Students' Reasons of Failure

Students' Reasons Of Failure	Certainly Important-Important		Neutral		Certainly Unimportant-Unimportant		n:344	
	f	%	f	%	f	%	$\bar{x}$	s
It is because I don't like the lecturer.	124	36	62	18	158	46	3.14	1.370
It is because lecturer can't have my attention to the lesson.	170	49.4	47	13.7	127	36.9	2.80	1.314
It is because I don't like issues of lesson.	144	41.8	75	21.8	127	50.3	2.91	1.250
I struggle to understand the content of the course.	180	52.4	56	16.3	108	31.4	2.78	1.580
It is because of lack of my previous learning.	204	59.3	57	16.6	83	24.2	2.49	1.289
It is because the content is numerical	106	31.1	62	18	179	50.9	3.28	1.329
It is because examination system and difficulty of questions	196	57	58	16.9	90	26.2	2.55	1.304
I don't make an effort to succeed.	128	37.2	55	16	161	46.8	3.15	1.380
It is because I don't have enough support from my family.	53	15.4	34	9.9	257	74.7	3.95	1.223
It is because of inappropriate teaching methods.	163	49.4	73	21.2	108	31.3	2.82	1.463
Lack of course material which make me understand the lesson	147	42.7	68	19.8	129	47.5	3.17	4.608
It is because I don't want to work in this profession in the future.	127	46.9	79	23	138	40.1	3.03	1.327
Lack of support from lecturer both in and out of class	146	42.4	75	21.8	123	35.8	2.92	1.272
It is because I don't think I am talented at accounting lessons.	119	34.5	73	21.2	152	44.2	3.17	1.283
It is because I am not informed enough about what I gain from accounting lessons.	160	46.6	72	20.9	112	32.5	2.81	1.270
It is because of insufficiency of success measurement tools used in lessons.	157	45.6	56	16.3	131	38.1	2.90	1.292

When Table-7 is examined, it is seen that respondents mostly choose "neutral" and "unimportant" answers for reasons of failure statements. Thus, it might be stated that students influenced from all the reasons but they are indecisive about which factor affect them most. As is seen from Table-7, first five reason of failures according to students are; "It is because of lack of my previous learning", "It is because examination system and difficulty of questions", "I struggle to understand the content of the course", "It is because lecturer can't have my attention to the lesson" and "It is because of inappropriate teaching methods".

It has been asked to respondents that if their expectations for education have been met or not. Group means were compared in order to check if respondents' answers have an impact on students' career and personality. Hypothesis according to these factors are as follows;

H_0= *There is no significant difference between students that their expectations have been met and those haven't been met.*

H_1= *There is significant difference between students that their expectations have been met and those haven't been met.*

Hypothesis are analyzed with Independent samples t Test.

Table-8 t Test Result in Terms of Level of Meeting Expectations ($p^* < 0.05$)

Meeting Expectations	n	Mean	Standart Deviation	t	df	p^*
Yes	139	2.3065	0.67343	-4.610	298	0.000
No	161	2.7503	0.94685			

According to Table-8 values, the mean of students that their expectations have been met is 2.3065 and the mean of students that their expectations haven't been met is 2.7503. The mean of students that their expectations haven't been met is higher. The difference between the groups seems to be meaningful.

To measure perception levels of students' reasons of failure, 3 (neutral) value is accepted as reference. This value is also midpoint of 5-point Liker scale. The reason to use the reference values as 3 (neutral) is to measure whether students have idea about their success and failure reason. Hypothesis according to these factors are as follows;

H_2= *The average of perception levels of students' reasons of failure is 3 (neutral).*

H_3= *The average of perception levels of students' reasons of failure is not 3 (neutral).*

The results of one sample t Test is as follows.

Table-9 t Test Results in Terms of Perception Levels of Students' Reasons of Failure

Test Value=3	t	df	Sig.(2-tailed)
The average reasons of failure statements	-0.159	343	0.874

When Table-9 is examined, due to the fact that Sig. (2 tailed) value is $P < 0.05$ H_3 is declined and H_2 is accepted. According to this result, it is seen that students do not have any idea why they have failure on accounting lessons.

4. Result and Recommendations

To determine success and failure reasons of Business Administration department students in accounting lessons, 344 survey forms were collected and following results are stated.

- 16.2% of students state that they are graduated from trade vocational high school. The fact that rest of the students did not take accounting education during their high school can be counted as one of the reasons of failure in accounting lessons. High mean and rate of "It is because of lack of my previous learning" statement in reasons of failure part of support this finding, also.
- Another high rated statements in reasons of failure part are; "It is because lecturer can't have my attention to the lesson" and "It is because of inappropriate teaching methods". This shows the importance of "teacher" factor. Teacher's utilization of class assessment techniques and use of learning techniques (active learning, open learning, etc.) effectively will cause positive influences on student's learning action. In this respect, supporting lecturers with pedagogical education will cause an increase on students learning.
- Another factor of students' failure in accounting lessons is students do not understand the content of lessons. It is seen that when students do not understand the content, they cannot see the whole picture of course. Students diverge from their objectives and targets and this circumstance cause that they become suspicious on the benefit of course. Lecturer should make students to comprehend the content, objective and target of the course and teach how students can use the beneficial knowledge gained from lessons in educational and professional times of their lives.
- When students' learning techniques for accounting lessons are examined, it is seen that they do not adopt interactive and collaborative learning methods and understand the lesson when lecturer tells or when they study by themselves. Thus, efficient and productive use of educatory learning methods should be used to influence students' learning, positively.
- It is seen that students whose expectations have been met in terms of education in Faculty of Economics and Administrative Sciences are better career and personality scores. Hence, it might be stated that students gain critical perspective by having analytic thinking skill.

Conventional accounting education methods are generally occurs as giving lecture and solving problems. Lecturers who use this method determine the content of the course, course material and measurement techniques and generally lesson are performed by lecturer tells the issues and chapters. However, lecturers who choose modern education techniques in accounting education should pay attention the factor below (Bonwell and Eison, 1991);

- Delivering course content via course material that consist visual communication,
- Use of strategies that encourage students to write during giving lecture,
- Giving computer-supported education,
- Use of case studies,
- Accustoming students to group studies with collaborative learning methods.

As a conclusion, non-realization or struggle of realization of course content and subjects in accounting education is important in terms of accounting education. The solution of the problem is use of modern accounting techniques by lecturer. Group studies, combining theory and practical education, computer-supported education use of visual tools are factors that lecturers should gravitate to more. It could be said that students' accounting learning will increase by doing this.

5. Model Proposal

When the result of survey conducted on ASU and KMU Faculty of Economics and Administrative Science, Business Administration students, a model that raise the quality of education should have steps mentioned below.

First Step: Students who deserve to enroll Faculty of Economics and Administrative Science, Business Administration department should participate "Basic Skill Survey" which tries to determine students' professional skills. .

Second step: Giving basic business administration courses to students.

Third step: According to results of basic business administration courses and basic skill survey, students will be able to take lessons for specialization in the 2nd and 3rd year. With this step, due the fact that an education is provided which is appropriate for students' wants and able to present their skills a factor that increase students motivation will be created.

Fourth step: In this step, students will take lesson (in 4th year) in which they can transfer theory to practice. These lessons will be practical, able to help students to plan their career and, make them gain experience.

During the actualization of these steps, there are some important factors that needed to consider. These factors are as follows;

- To provide students not having so much course load, taking the basic courses and bend to specialization,
- To make accounting education an active learning where lecturers are guiding,
- To develop software programs to transfer accounting education theory to practice, to establish professional laboratories and to make case studies,
- To provide an understanding of lifelong learning philosophy both for students and lecturers as an organizational culture,
- To constitute interactive education surface that makes out-of-class learning effective
- To provide physical infrastructure that is needed for student success, to organize social and cultural activities.

Abstract

Technological developments in ubiquitous computing and wireless communication together with the adoption of mobile multimedia devices and applications have translated into huge opportunities for English as a foreign language (EFL). Operating systems like Google's open source Android, Apple's iOS, and Microsoft's Windows 7 are getting more sophisticated and now have the potential to dramatically change this field. These handheld devices support individual and collaborative learning and offer the opportunity to develop technology that will assist students to learn anytime and anywhere and a large amount of applications for mobile phones, tablets and i-pod players has already been widely employed in EFL.

Mobile learning (m-learning) refers to the use of mobile technologies for educational purposes. These devices can offer learning opportunities that are: spontaneous, informal, contextual, portable, ubiquitous, pervasive, and personal (Kukulska-Hulme *et al*, 2011). Thus, as Pilling-Cormick and Garrison (2007) explained, learners take primary responsibility and control of their learning process, including setting goals and evaluating outcomes. They are no longer the passive recipients of education, but consumers making choices in the learning market.

However, although the stimuli from multi-channels (sound, image, interaction, etc.) may be very advantageous for the learner, mobile technologies also require the thoughtful integration of EFL pedagogy. In this paper, we intend to examine both the qualities and limitations of some mobile applications available by assessing their features from a pedagogic and technical point of view with the aid of a quality rubric. The results here presented are the starting point for the development of MALL (Mobile Assisted Language Learning) applications for EFL teaching/learning as part of the work carried out by linguists and IT engineers within the context of the SO-CALL-ME project in Spain.

Keywords: MALL; EFL; m-learning

Introduction

MALL is a teaching and learning methodology that uses mobile phones or other handheld devices with some form of wireless connectivity, such as phones, PDAs and tablets, among others. O'Malley *et al.* (2003: 6) defined it as ''any sort of learning that happens when the learner is not in a fixed, predetermined location, or learning that happens when the learner takes advantage of the learning opportunities offered by mobile technologies". It is considered a booming future trend, thanks to its ubiquity, which facilitates education anywhere and anytime, and the ever-increasing interest among the growing number of users of smart-phones and portable devices.

The world is changing at high speed, we are moving from an industrial economy to one that is media-driven and based on information. As the world that surrounds us is becoming smaller and communication and media are becoming more global and diffuse, the nature of society, and of ourselves as human beings, is being defined quickly on the basis of our ability to be consumers but also producers of knowledge. The nature of knowledge - how and who creates it-, as well as the spaces where it is possible to find it are evolving rapidly (Kress, 2003). In the 21st century, the need for inserting the principles of *lifelong learning* in education and in broader development policies seems to be more urgent than ever before. These principles, if implemented systematically, will contribute to the establishment of more just and equitable societies. *Lifelong learning* comprises learning at all ages and forms:

E-mail address: prodriguez@flog.uned.es

formal, non-formal and informal. Two UNESCO reports, which constitute real milestones in learning throughout life (Faure *et al.*, 1972; Delors report, 1996), articulated its fundamental principles (UNESCO, 2013).

   MALL is without any doubt the next step in the evolution of educational technology, reflecting the digital convergence of mobile technology and e-learning in response to a more dynamic society that seeks a personalized, lifelong and universal education (Romero *et al.*, 2010). It is, therefore, the educational technology of the new century, as it can provide frequent and comprehensive access to systems and applications that support formal and informal learning. It gives the learner the opportunity to control and to take advantage of the free time that most people have during a typical day: while travelling to and from work, having a lunch break, or waiting to see somebody. Learning spaces have departed from the traditional classroom and have expanded their horizons: it is now possible to learn at home connected to a virtual space, or even walking down the street with a virtual application that provides information added to the place that you are visiting, or to an object that you are looking at in real time. MALL also presents a number of very attractive features that prove very useful for universities and educational institutions and rewarding for the students, such as: ubiquity of access to information, resources, materials and educational content; flexibility which promotes independent and collaborative learning; interactivity, usability and efficiency which enhance the learning environment, develop professional skills and encourage learning.

   MALL took off in the 1980s, when Xerox Palo Alto Research Center (PARC) developed the *Dynabook*, a device very similar to what it is now known as a tablet. In the 90s, it continued to develop in universities in Europe and Asia, where the possibilities of m-learning were evaluated. Since the year 2000, the European Commission has financed large domestic companies in the creation of contents development projects. Thus, there have been several projects of the European Union related to MALL in the last decade:

4. *MOBIlearn*, a research and development of technologies project for mobile learning which included several universities from Australia, America and Europe between 2002 and 2005.
5. Mobile learning took its first steps in the *M-Learning program* for the Learning Skills Development Agency (LSDA) designing educational products. In 2001, it started with the M-Learning project that presented different portable devices programmed with games and educational materials. 250 young people from Sweden, Great Britain and Italy aged between 16 and 24 had to interact with them. At the end of this study, 80% of the participants considered that these applications could help them improve their reading and spelling skills.
6. The *eMapps* project (Motivating Active Participation of Primary Schoolchildren) which focused on demonstrating how games and mobile technologies could be combined to provide motivating experiences on schoolchildren from 9 to 12 years of age. Its main objectives were to support creativity in the classroom and to contribute to practice for developing new teaching methodologies based on learning games, such as problem solving, memory and physical activity exercises.
7. There has also been a rising number of references to MALL at well-known international conferences. *IADIS International Conference* and *Online Educa Berlin*, the largest global conference on technology, provide forums for the presentation and discussion of m-learning research which sketches the developments in the field.

   In this light, the ATLAS research group (*Artificial Intelligent Techniques for Linguistic ApplicationS),* (reference no. 87H31), started its latest project, SO-CALL-ME (*Social Ontology-based Cognitively Augmented Language Learning Mobile Environment),* (reference no. FFI2011-29829), in Spain with funding from the Spanish Ministry of Science and Innovation. The project's aim is twofold: firstly, to design and develop a theoretical framework for a new model of EFL computer-assisted learning carried out from mobile devices with permanent access to the Internet to enhance a very flexible, adaptive, interactive and dynamic form of learning. Secondly, to design and develop a linguistic ontology of audiovisual learning objects that allows the enhancement of EFL avoiding the inherent problems in the standard teaching materials, which are largely static and de-contextualized from daily socio-cultural contexts.

   In order to develop our own apps and seeing the large number of those already available on the market, it was considered very important to review some of the existing ones. This study was carried out in several phases: a first one focusing not on technical details but on the educational objectives of such applications; and a second one – the object of this paper – which analysed the technical and pedagogical values of some of those apps.

First phase of the evaluation of EFL apps

The potential of audiovisual materials is already well known as they present a combination of sound, image and creative elements that allow the learners to interact with them (Squire, 2002). This type of stimuli is ideal for learning, as Glasser (2000) remarked that humans retain 10% of what they read, 20% of what they hear, 30% of what they see and 50% of what they see and hear. Nevertheless, there are over 28,000 apps for educational purposes available on the market at present[172], and it would be difficult to conclude that all of them are designed with a sound theoretical approach to teaching or the necessary cognitive scaffolding mechanisms to be of real value for the learners. Scaffolding is based on Vygotsky's (1978) concept of the zone of proximal development (ZPD), which he defined as the distance between the "actual developmental level as determined by independent problem solving and the level of potential development as determined through problem solving under adult guidance or in collaboration with more capable peers" (p. 86).

In a first evaluation phase for our project (Arús, Rodríguez-Arancón and Calle, in press), the aim was to analyze some of these apps in order to gain knowledge and insights into the features that are effective and suitable for learners using MALL. This original assessment phase did not focus on the technical specifications of the apps, but rather on their pedagogic goals, in a most general sense. No in-depth methodological analysis of any particular app was therefore intended at that stage. In order to carry out this evaluation process, two templates were created, and shared through Google Drive: the first was a table with two columns and an extendible number of rows where each of the three evaluators could indicate the app assessed and their URL to avoid any possible repetitions. The second template consisted of a rubric created by the authors of this paper for this purpose, with three criteria and a scale from one to five. The intention was to keep the rubric simple and in line with our project's specific needs. The purpose was to assess as many apps as possible within a relatively short space of time and guarantee the homogeneity of the process. The three criteria considered were: 1) the apps cognitive value; 2) similarity of the app with the pedagogic aims of the SO-CALL-ME project; and 3) the app´s complementarity with the project. Each rubric was also accompanied by a brief description of the app and a final evaluative remark.

This process concluded with 67 assessed EFL apps through a combination of the study of the information available on websites that described them and, whenever possible, the testing of how they work on a mobile device. Each evaluator assessed different apps, which has the advantage of providing information about a larger number of them but also the potential disadvantage of less reliable assessments. However, the comparison of the rubrics in the only two cases in which two evaluators accidentally assessed the same app proved to show rather similar criteria of analysis.

There were interesting conclusions at the end of this first phase, as the study had put forward several aspects to take into consideration for the following stages. There was a high number of apps that presented technical problems at the time of downloading or when starting them. In fact, more than one third of the apps downloaded by the evaluators proved not to work properly or not to work at all. Concerning software, the vast majority of apps assessed were available for Apple devices –*iPhone*, *iPad* and, sometimes, *iPod Touch* – and around one in four were also available for *Android*; very few were *only* available for the latter. Other operating systems such as *BlackBerry OS*, *Bada* or *Ovi* do not seem to be targeted by app developers to the same extent. A few of them could also be directly run from the Internet on a conventional computer.

Another interesting observation regarded prices, as three marketing approaches were defined: expensive apps, which are in fact mobile versions of traditional dictionaries, textbooks, vocabulary or grammar tests, etc. have prices as high as 30 euros. A second group are downloadable for a small amount (1 to 3 euros) such as Cambridge's *English Monstruo*, or have an initial free sample and the possibility to download further packs as, for instance, the British Council's *LearnEnglish Grammar*. A third group is represented by English courses such as *Busuu* or EF's *EnglishTown*, in which the price depends on the needs of the user and/or seasonal offers.

The apps were also categorised in several groups according to their contents: a) Games, very often aimed at children, e.g. the apps available from Cambridge English Online; b) app versions of dictionaries, handbooks and textbooks, e.g. Cambridge's EFL methods, dictionaries, etc.; c) apps providing vocabulary, grammar and/or pronunciation practice, such as *My Word Book, Johnny Grammar's Quiz Master, 60 Second Word Challenge* or *Sounds Right*; d) the adaptation of online courses such as *Busuu* and EF's *EnglishTown* to mobile devices; e) most closely related to the interests and goals of the SO-CALL-ME project are those apps exploiting the use of language

---

[172] http://www.eduapps.es

in context and presented in a variety of ways, such as podcasts –e.g. *Learn English, Talking Business English*– videos –e.g. *Learn English Audio & Video, Conversation English*– films –e.g. *English Attack*– and cartoons –e.g. *Big City Small World*.

A last conclusion resulting from the assessment and which will be very relevant for the future development of our own apps concerns those features found which differentiated some apps from the rest and provided and added value. Features such as "drag-and-drop" available in *Learn English Grammar*; the possibility to draw with your finger, as in *Premier Skills*; connectivity with social networks, as offered by *Language City, Learn English, 60 Second Word Challenge* and *Tongue Mystery English*; or the inclusion of an Avatar, as in Cambridge's *Quiz up* which could be particularly appealing from a pedagogical point of view.

A quality guide and rubric for the evaluation of educational apps

In the second evaluation phase here described, a guide was created containing the quality criteria for the evaluation and creation of educational apps. This guide, based on the one created by Fernández-Pampillón *et al.* (2012) for the creation of Learning Objects, has the purpose of guiding app assessors and creators when carrying out their tasks, specifying those aspects, or criteria, that should be taken into account to identify or create quality apps and spelling out the specific points to be considered within each criterion so as to try to reduce subjectivity to a minimum.

The app quality guide takes the ten criteria used by Fernández-Pampillón *et al.* and adapts them to the characteristics and goals of educational apps. Table 1 shows the ten original quality criteria for Learning Objects and our adaptation for educational apps. An important aspect of this guide is that it combines pedagogical criteria (1-5) with technical ones (6-10). This avoids the risk of evaluating apps only from a technical point of view, which, as stated by Balance (2013) "is to discuss little more than mobile-enabled CALL" (2013: 44) but also reflects the fact that apps are very much dependant on technology and should therefore not be evaluated from an exclusively pedagogical perspective.

Table 1. Quality criteria. From Learning Objects to educational applications.

Quality criteria in Fernández-Pampillón *et al.* (2012)	Adaptation to Educational Applications
1. Goals and pedagogic coherence	1. Cognitive value and pedagogic coherence
2. Content quality	2. Content quality
3. Capacity to generate reflection, critical thinking and innovation	3. Capacity to generate learning
4. Interactivity and adaptability	4. Interactivity and adaptability
5. Motivation	5. Motivation
6. Format and layout	6. Format and layout
7. Usability	7. Usability
8. Accessibility	8. Accessibility
9. Reusability	9. Visibility
10. Interoperability	10. Compatibility

As we can see in table 1, changes concern criteria 1, 3, 9 and 10. The change in criterion 1 can be simply considered a nomenclature one, seeking to widen the assessment's scope, as under 'cognitive value' we can include not only the application's goals but also the specification of its target users and skills to be developed (see table 2, below). Conversely, the change in criterion 3, also chiefly terminological, tries to simplify matters, as the allusion to 'reflection' and 'critical thinking' as found in the original Learning Objects guide does not seem to go hand in hand with something as transient as an app (see Stockwell 2012 about apps and transience). In addition, 'capacity to generate learning' allows a neat contrast with the 'cognitive value' in the first criterion, which refers to the potential, whereas criterion 3 has to do with the actual achievement of the promised goals. 'Reusability' in the original criterion 9 is a key feature in Learning Objects, as their modular nature precisely seeks to make different parts of them reusable. When dealing with mobile applications, however, the reusability of their different parts is not something essential to the quality of the app, even if it is always convenient for app designers to be able to reuse

already created materials. When speaking of mobile apps, a key concept is 'visibility', and that is why this has substituted for 'reusability' in our guide. Finally, 'Interoperability' in 10 has been replaced with 'Compatibility' as the former may sound too much of a buzzword for those outside the specialized IT jargon, where it is usually employed to refer to the capacity of two products or systems to work with each other. Since this reciprocity involves looking at both ends, i.e. the app and the mobile device, and we are here focusing on the former, we found that the more widely known 'compatibility' served our purposes better.

Space constraints bar us from showing the whole guide here, yet, to give an idea of what the quality guide looks like, we show the complete specification of criterion 1 in table 2. It must be noted that the sub-criteria within each criterion have also been adapted to meet the needs of educational applications. For instance, one of the points within this first criterion for the evaluation of Learning Objects refers to the existence of a metadata file specifying goals, skills, etc. Since this kind of files are specific to Learning Objects but irrelevant to apps, the mention of metadata files has disappeared from our quality guide.

Table 2. Criterion 1 and its sub-criteria in the quality guide for the evaluation and creation of educational applications.

1. Cognitive value and pedagogic coherence This criterion assesses if the teaching aim(s), the target users and the skills to be developed are clearly set from the beginning. In particular, it must be assessed whether: a. The app's download page, or the app itself, includes a description or a demo clearly specifying and/or showing the pedagogic aims, the skills to be developed and the users' type/level/needs. b. There is coherence between the aims, the skills, and the target users. c. There is coherence between the aims/users/skills and the app's contents, resulting in a potential high cognitive value.

Based on this guide, a new rubric was designed to facilitate the app evaluation process. As seen in table 3, which illustrates the first row in the rubric, the information in the cells is based on the specifications made in the quality guide. The way in which we proceeded was to first fill in the cell corresponding to the maximum punctuation, i.e. 5, with the fulfillment of all the sub-criteria and gradually slacken such fulfillment as we move down the scale until the minimum punctuation, i.e. 1, is reached, where none of the sub-criteria is fulfilled.

Table 3. Criterion 1 in the educational app evaluation rubric.

	1	2	3	4	5
1. Cognitive value and pedagogic coherence	Not very clear learning goals and/or target users; contents are hard to justify	There is coherence between skills and target users but the learning goals are unclear	Clear learning goals but lack of coherence between these goals and skills and target users; contents are not well-suited to the goals, skills and target users	Clear learning goals but lack of coherence between these goals and skills and target users OR contents are not well-suited to the goals, skills and target users	Clear learning goals; coherence between these goals and skills and target users; contents are well-suited to the goals, skills and target users

This is by no means the first rubric for the evaluation of educational apps in the field of MALL. For instance, Toni Vincent's rubric (Vincent online), drawing in turn on Walker 2010, spotlights the following five criteria: relevance, customization, feedback, thinking skills, engagement and sharing. While this rubric is highly practical by virtue of its simplicity, we find that, by the same token, its scope is somewhat limited. For instance, the fact that, as said above, our rubric –the same as the original quality guide in Fernández-Pampillón *et al*.– includes a number of technical criteria, makes it more complete, with these technical aspects complementing the pedagogical ones. Additionally, the accompanying quality guide provides an important back up to the use of the rubric.

8. Results and discussion

In this paper we have reported on the work carried out in order to develop the necessary tools to evaluate and create educational apps within the context of the SO-CALL-ME research project. A quality guide and a rubric were the results of such work, as seen in the previous section. Before tackling the quantitative evaluation of educational apps with the use of our rubric, as well as using it as a guide in the creation of apps within our project, a first step was taken to test the reliability of the rubric. To that end, two of the authors of this paper undertook the evaluation of four EFL apps so as to get their impressions on the use of the rubric and to check whether the rubric allowed a rather objective evaluation (in addition, of course, to obtaining information about the evaluated apps). In the next few paragraphs, we show and discuss the preliminary results obtained.

Out of the 63 EFL apps previously evaluated with a simpler rubric, as reported in Arús, Rodríguez-Arancón and Calle (in press), four of those obtaining the highest punctuation, i.e. with the highest potential to serve as sources of inspiration for the apps to be developed, were chosen for this preliminary evaluation. The four apps were: *Englishfeed, SpeakingPal English Tutor, Clear Speech* and *Learn English Audio and Video*. Table 4 summarizes the results of the evaluations and compares the punctuations given by both evaluators.

Table 4. Evaluation results (Ev.1= evaluator 1; Ev.2= evaluator 2).

	Evaluation							
	Englishfeed		SpeakingPal		Clear Speech		Audio&Video	
	Ev.1	Ev.2	Ev.1	Ev.2	Ev.1	Ev.2	Ev.1	Ev.2
1. Cognitive value and pedagogic coherence	5	3	4	5	5	5	4	4
2. Content quality	5	3	5	5	3	3	5	5
3. Capacity to generate learning	4	4	5	5	3	3	4	3
4. Interactivity and adaptability	4	2	4	4	2	3	3	4
5. Motivation	5	4	5	5	3	2	4	3
6. Format and layout	5	3	5	5	2	2	5	5
7. Usability	5	4	5	5	3	3	5	5
8. Accessibility	5	5	4	5	4	4	4	4
9. Visibility	3	5	4	4	4	4	4	4
10. Compatibility	4	4	4	3	3	3	4	4

Although the number of apps so far evaluated is still too small to statistically measure the evaluators' agreement, the results shown in table 4 do seem to show consistency between the two evaluators and therefore allow us to be optimistic as to the usability of the rubric. An interesting point that stands out is that criterion 4 –Interactivity and adaptability– seems to be the weakest one in the apps evaluated. If a wider-scale evaluation confirms this, it will mean this is the aspect on which special emphasis must be made when developing new educational apps. In fact, it comes as no surprise that this should be the weakest point in educational apps. A look at table 5, which shows the specification for this criterion in our quality guide, reveals that these are the essential requisites for successful Foreign Language teaching, and precisely the ones with which teaching methods in general have traditionally found it the hardest to comply.

Table 5. *Interactivity and adaptability* in our quality guide.

The *interactivity* criterion is related to the fact that the presentation of the content is not static but that it depends on the use by the learner. It must be taken into account if:
a. The content presented to the users is related to the questions, answers or actions that they have previously carried out.
b. The content presented depends on the previous knowledge of the learners or on their needs.
c. Users feel that they really control and manage their learning process.
d. Conditioned content presentation is automatic, through programming, or manual, through the apps' instructions for use.
The *adaptability* criterion is related to the ease with which the app adapts to the different types of users. It must be taken into account if:
e. The app proposes different contents/activities for different competence levels.
f. The app can be used independently of specific teaching or learning methods.

The discussion in this section has highlighted the educational affordances of the rubric here presented, with the back-up provided by our quality guide, both for the evaluation of educational apps and for the design of new ones. Pending tasks are the extension of the evaluation to a higher number of apps and, most important for the goals of the SO-CALL-ME research project, the actual implementation of the quality criteria for the development of EFL mobile applications that successfully combine technical prowess (criteria 6-10) and a sound pedagogy (criteria 1-5).

The Use of ICT Among Administrative Staff in an Open University: The University of the Philippines Open University Experience

Emely M Amoloza[173]

Faculty of Information and Communication Studies
University of the Philippines Open University
Los Baños, Laguna, Philippines 4031

Abstract

Nowadays, the information and communications technology (ICT) plays a vital role in every university most specially those universities who are offering distance education. The University of the Philippines Open University (UPOU), being the Philippine's pioneer in online teaching is no exception to this. The UPOU personnel, including its administrative staff are making use of all available ICTs to be able to accomplish their functions well.

This paper presents the importance of ICT among the administrative staff of UPOU. Specifically, this study will enumerate all the ICTs used in UPOU and rank all these according to use and importance.

Keywords: ICT; distance education

In this day and age, the information and communications technology (ICT) plays a vital role in every university most specially those universities who are offering distance education.

The University of the Philippines Open University (UPOU) being one of those universities that offers distance education makes use of ICT. A pioneer in online teaching and learning, the UPOU was established on February 23, 1995. It continues to lead the practice of open learning and distance education in the Philippines.

Being the nation's most comprehensive education institution, the UPOU offers two undergraduate programs, nine post-baccalaureate certificate and diploma programs, eleven master's programs, two doctoral programs and nine non-formal degrees.

UPOU Staff Profile (by Class). Based on the records of the Human Resources and Development Office (as of April 2013), the UPOU has a total of one hundred eleven (111) staff, classified into four categories, namely: administrative, research and extension professional staff (REPS), faculty and temporary second appointment. As shown in the table below, majority (56.76%) of the staff are the administrative staff while there are twenty-eight (25.23%) faculty, eighteen (16.22%) REPS and two (1.80%) Temporary Second Appointment. Table 1 and Figure 1 present the UPOU staff Profile by class.

Class	Count	Percentage
Administrative	63	56.76
REPS	18	16.22
Faculty	28	25.23
Temporary Second Appointment	2	1.80
TOTAL	**111**	**100.00**

Table 1. UPOU Staff Profile by Class

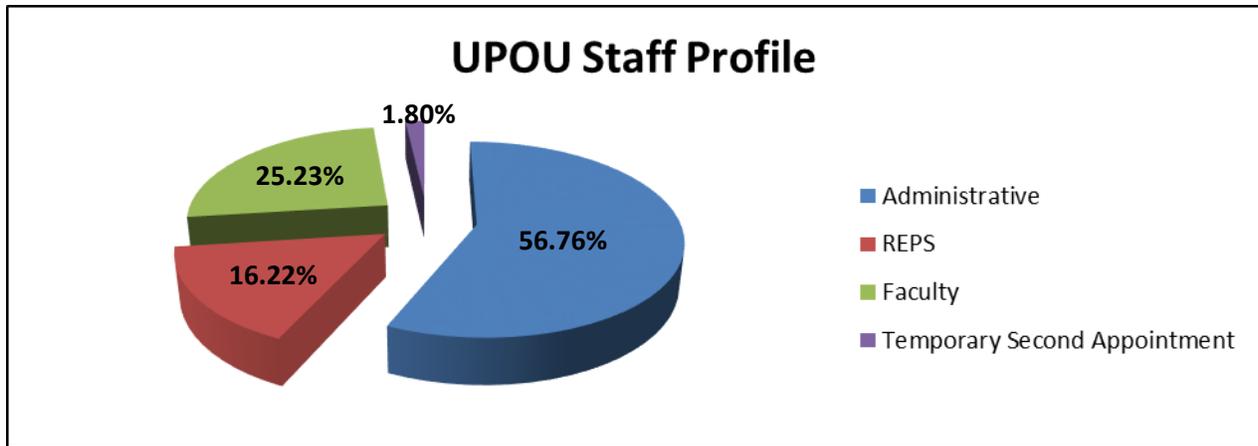
* Amoloza, Emely M. Tel.:+6349 5366001 to 06 loc. 841; fax: +6349 5366009.
E-mail address: emely.amoloza@upou.edu.ph


Figure 1. UPOU Staff Profile by Class

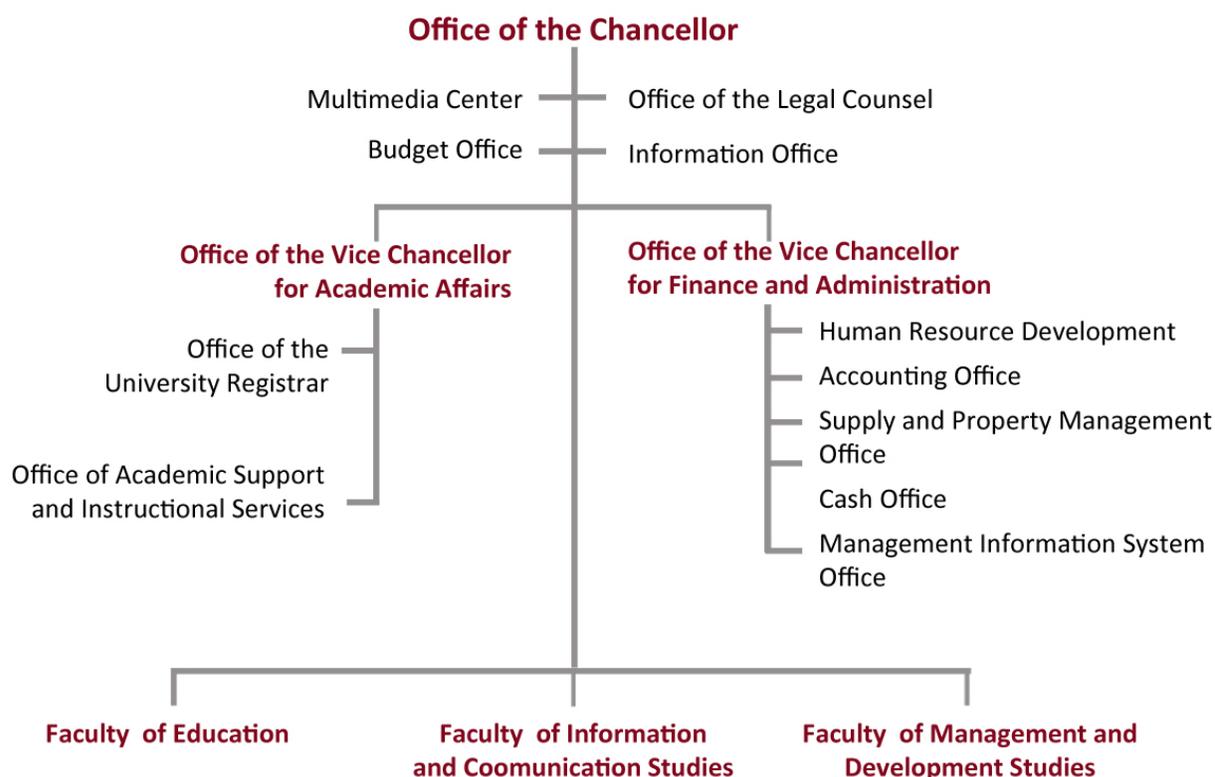
Composed of various offices, each office at UPOU is assigned administrative staff to provide essential support and ensure the smooth operations of each office. Delegated with a wide range of duties and responsibilities, the administrative staff serves as support to the UPOU system. Figure 2 shows the Organizational Chart of UPOU.


Figure 2. The Organizational Chart of UPOU

Having the most number of staff, this study considered the administrative staff as the respondents. With the aim to present the importance of ICT among the administrative staff of UPOU, this study enumerates all the ICTs used in UPOU and rank all these according to use and importance. A survey was used to gather data and the following were the results of the study.

Personnel/Group that Administrative Staff communicate with. Results showed that all the administrative staff communicate with their supervisors and other administrative staff. Some of them communicate with the officials, REPS, faculty and affiliate faculty. Table 2 and Figure 3 present the personnel/group with whom the UPOU administrative staff usually communicate with.

Personnel/ Group	Yes	No
Supervisor	16	0
Officials	11	5
Faculty	9	6
REPS	11	5
Administrative Staff	16	0
Affiliate Faculty	3	13
Students	3	13
Other Government Agencies	1	15

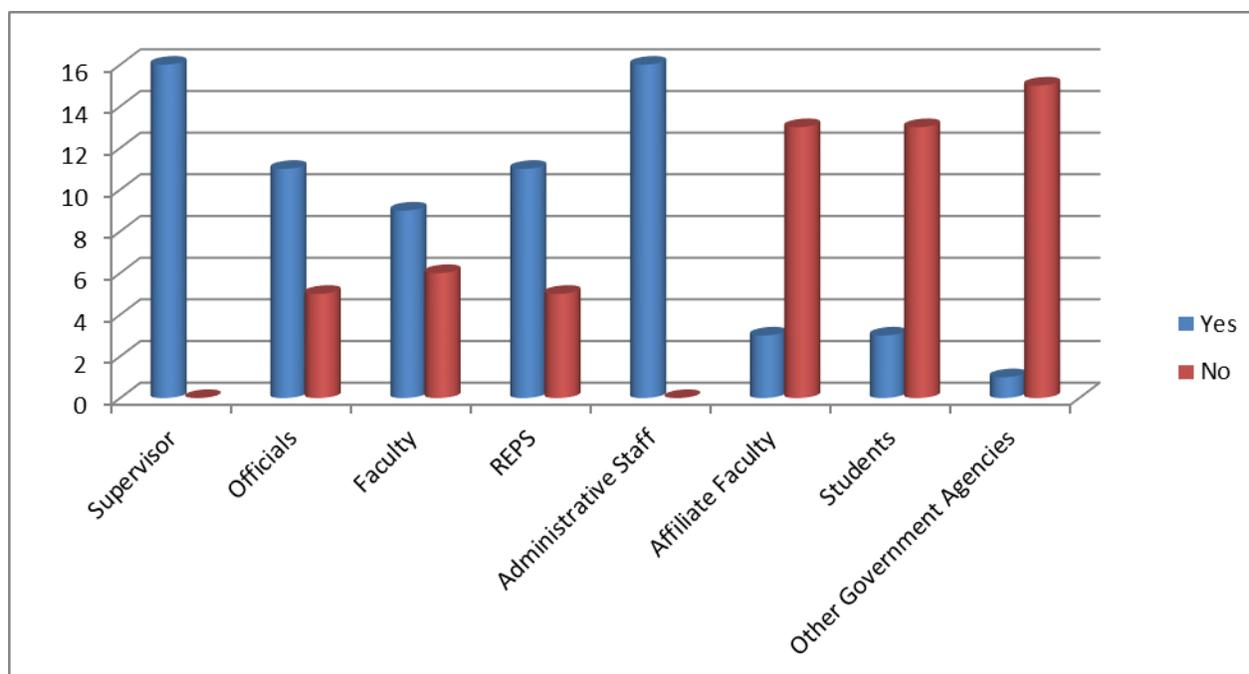
Table 2. Personnel/ Group that Admin Staff communicate with


Figure 3. Personnel/ Group that Admin Staff communicate with

For this study, the following are considered as the Information and Communication Technology (ICT): telephone, cellular phone and internet. Specifically, call and text messaging were individually considered under the cellular phone while e-mail, yahoo messenger and skype were counted under the internet.

Rank of ICTs According to Use. The respondents were asked to rank the ICTs according to use. The results indicate that six (37.5%) of the respondents ranked telephone as first while five (31.25%) of the respondents ranked internet using e-mail as first. Sixteen or 100% of the respondents ranked internet using skype as last. Table 3 and Figure 4 detailed the ranking of ICTs according to use.

ICTs	1st	2nd	3rd	4th	5th	6th
Telephone	6	6	2	2	0	0
Cell Phone (Call)	1	0	0	4	11	0
Cell Phone (Text Messaging)	3	1	6	5	1	0
Internet (e-mail)	5	2	1	5	3	0
Internet (yahoo messenger)	1	7	7	0	1	0
Internet (skype)	0	0	0	0	0	16

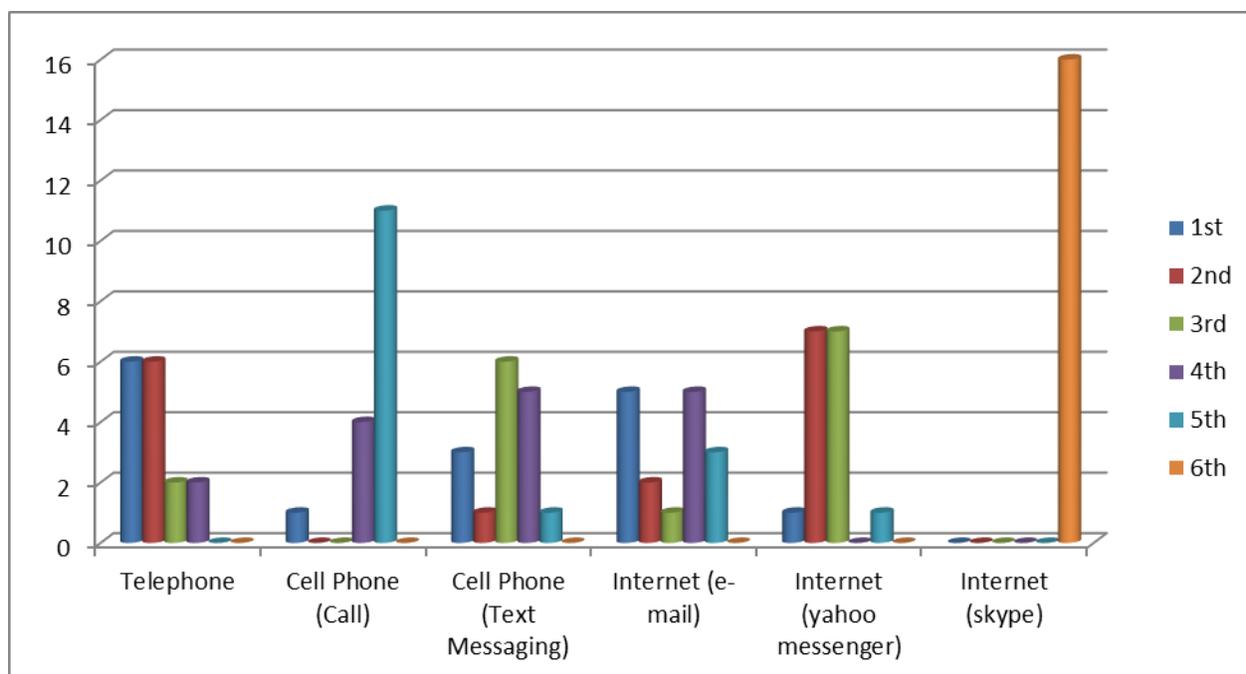
Table 3. Rank of ICTs According to Use


Figure 4. Ranking of ICTs According to Use

Considerations in Using ICT. When asked what their considerations are in using ICT, all the respondents pointed out the need for immediate feedback. While ten (62.5%) answered the cost as their considerations in using ICT. Thirteen (81.25%) confirmed that they consider the availability of ICT. Table 4 and Figure 5 detailed the respondents' considerations in using the ICT.

Reasons	Yes	No
Need for Immediate Feedback	16	0
Cost	10	6
Availability	13	3

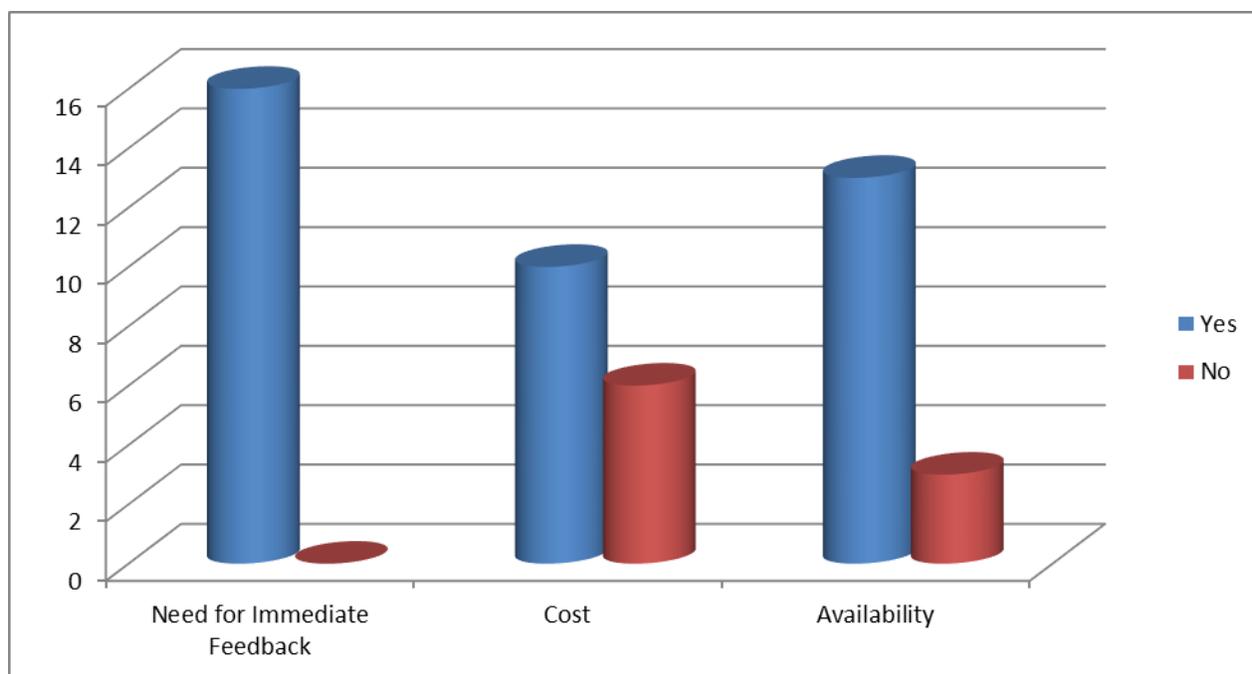
Table 4. Considerations in Using ICT


Figure 5. Considerations in Using ICT

Importance of Using ICTs. The respondents considered the telephone (81.25%) and the internet using yahoo messenger (75%) as very important. While 37.5% of the respondents considered the internet using skype as not important. Table 5 and Figure 6 present the level of importance of using the different ICTs.

ICTs	Very Important	Important	Not So Important	Not Important
Telephone	13	3	0	0
Cell Phone (Call)	4	8	4	0
Cell Phone (Text Messaging)	10	4	1	1
Internet (e-mail)	10	5	1	0
Internet (yahoo messenger)	12	4	0	0
Internet (skype)	2	3	5	6

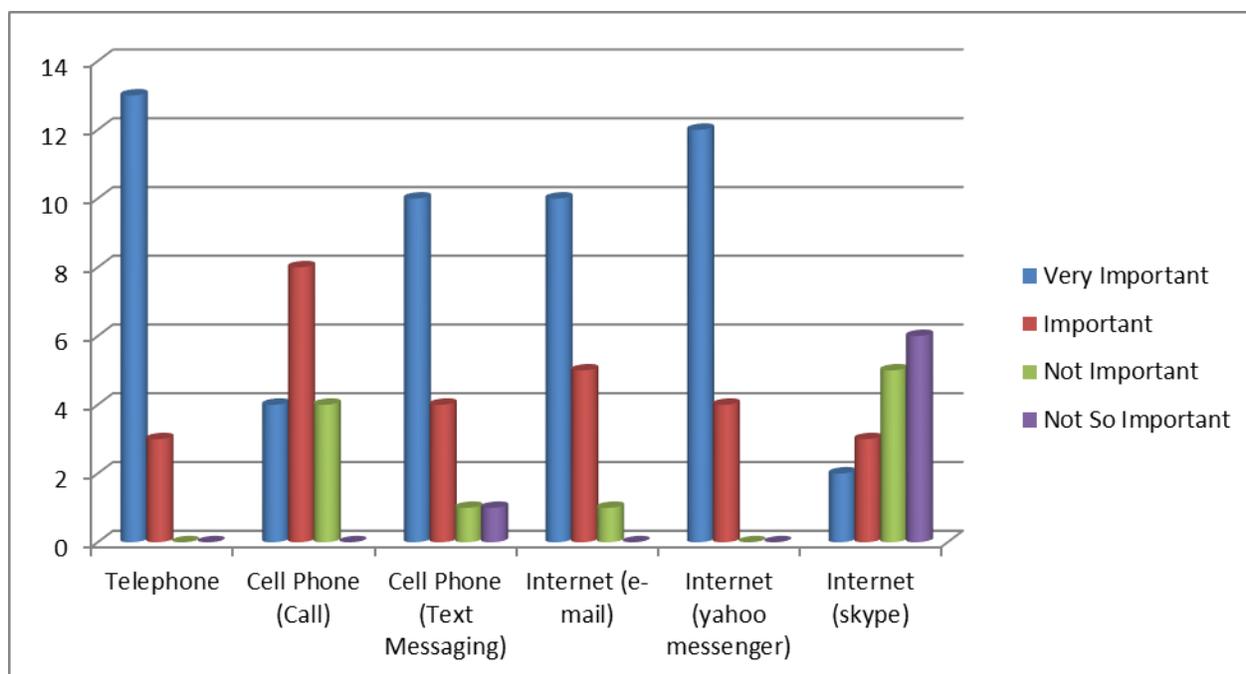
Table 5. Importance of Using ICTs


Figure 6. Importance of Using ICTs

Purpose for Using ICT. The purpose of using ICT among the UPOU administrative staff includes: setting a meeting; coordination of activities; communicating with scholars, faculty, staff, officials, REPS and affiliate faculty; verification of information, payroll concerns and online remittance; submission of reports, and information dissemination.

Problems in Using ICT. Among the UPOU Administrative staff, the problems encountered in using ICT are: unstable or intermittent internet connection, hacking of account, failure of communication devices, power interruption, weak signal for cellular phones, and accidental distribution of confidential information.

Looking at the results, the majority of the UPOU Administrative staff ranked the telephone either as first or second in the list and consider it as either very important or important. While all the respondents ranked the internet using skype as the last. This is due to the reason that the respondents consider the importance of immediate feedback. The use of skype is not being practiced by the UPOU administrative staff at the moment as this technology has not yet been introduced to them. Within the university, skype is currently being used for meetings that involve two or more locations: UPOU Headquarters, Diliman and Manila.

If the university administration would like to consider cutting the cost on its communication and travel expense, using of skype should be introduced to everybody specially those who have constant contacts with other staff based on another locations.

13th International Educational Technology Conference

The use of social media technologies among Malaysian youth

Farrah Dina YUSOP[a174], Melati SUMARI[b]

Faculty of Education, University of Malaya, Kuala Lumpur 50603, Malaysia
Faculty of Education, University of Malaya, Kuala Lumpur 50603, Malaysia

Abstract

This exploratory study report findings on the profile of Malaysian young adults age 20 to 24, also known as the Generation Y and/or the Millennial generation, with special regard to their use of Internet and social media technologies. Data were collected from 379 youth from a public Malaysian university across six schools of studies in a Malaysian public research-based university: the Academy of Islamic Studies, School of Economics and Administration, School of Engineering, School of Education, School of Business and Accountancy, and School of Arts and Social Sciences. Findings indicate that the most preferred activities are online communication and socialization, followed on researching on specific information for the purpose of completing assignments, "how-to" and "do-it-yourself" information. The least preferred activity is buying things such as books and clothing online. Additionally the Academy of Islamic Studies students are more active in discussing political issues online compared to their peers from other schools. Data from this study will allow social researchers to utilize Internet and social media technologies for the teaching and learning activities.

Keywords: social media; youth; technology

INTRODUCTION

Mobile technologies, Internet and social media have become social phenomenon especially among young adults age 18 to 29 or also known as the Millennial generation (Lenhart, Purcell, Smith, & Zickuhr, 2010). Among others, their findings indicated that the use of social networking sites American teenagers and young adults has risen significantly since 2006. They are found to be more engaged in many social relation activities such as sending daily messages to friends, sending bulletins, group messages and private messages on these sites.

This paper intends to investigate the Malaysian youth online activities within the various social networking sites (SNS). This study is designed to answer three main questions:

- what are the general characteristics of Malaysian young adults with reference to their access to telecommunication technologies and Internet across these six schools?
- what are the online activities Malaysian young adults are engaged in across these six schools?
- what are the social media activities Malaysian young adults are engaged in across these six schools?

Social networking and online activities

Social networking is a technology that allows two-way communication and interaction between specific individuals and/or organizations in an online environment. Many of these social networking sites (SNS) such as Facebook and Twitter are built with microblogging technology that supports blogging activity with smaller size of word posts (Chin & Yusop, 2011).

The user-friendly feature of SNS invites its wide usage among youth and adults. The Pew Internet and American Life Project (2010) has identified several activities carried out by these two groups of people using SNS. The activities include:

- sharing content like photos, videos and stories with others
- remixing online content such as music and videos together to make "artistic creations" (p.23)
- blogging and commenting on others' blogs
- building websites
- posting comments to news group, website, blog or photo sites
- information searching on topics like health, news and political news, and
- online purchasing.

Except for blogging, all of these activities are reported to be either steadily maintained or increased since 2006.

Methodology

A survey on online social media activities are distributed to a sample of 379 young adults in the age of 20 to 24 years old (referred to as young adults throughout this paper) across six (6) main faculties in a Malaysian public research-based university. These schools are Academy of Islamic Studies, School of Economics and Administration, School of Engineering, School of Education, School of Business and Accountancy, and School of Arts and Social Sciences.

73% of the respondents are female, thus, the ratio female to male is 2.7. For ethnicity, 53% of the respondents are Malay and 37% are Chinese which is aligned with Malaysia's population in 2010 (Department of Statistics Malaysia, 2010). The number of respondents surveyed is representative of the Malaysian population, and the gender and ethnic distribution in Malaysian higher education institutions. Table 1 presents the background of the respondents based on their schools, gender and ethnicity.

9. Table 1. Background information on survey respondents: schools, gender and ethnicity.

Background information	Frequency (n)	Percentage (%)
Schools		
Academy of Islamic Studies	49	13%
School of Economics & Administration	60	16%
School of Engineering	73	19%
School of Education	99	26%
School of Business and Accountancy	57	15%
School of Arts and Social Sciences	41	11%
Totals	**379**	**100%**
Gender		
Male	103	27%

Female	276	73%
Totals	**379**	**100%**
Ethnicity		
Malay	201	53%
Chinese	140	37%
India	14	4%
Others	24	6%
Totals	**379**	**100%**

Findings

Data from this study reveal several interesting findings on students' access to technologies and their activities both online and on social media. Findings are presented by the three main research questions of this study.

Malaysian young adults access to telecommunication technologies and Internet

Table 2 indicates that more than 90% of the respondents own various types of handheld telecommunication devices such as cell phones and smart phones, and close to 100% of the students own computers. All of them have access to the Internet and most utilize the Internet to check, send and receive emails. This finding confirms the initial assumption that the surveyed groups are technology-savvy and do utilize their technological devices for communication purposes.

10. Table 2. Access to telecommunication devices, computers and Internet to send and receive emails.

Schools	Have telecommunication devices (%)	Use computer (%)	Use Internet (%)	Send and receive emails (%)
Academy of Islamic Studies	98%	96%	98%	98%
School of Economics & Administration	98%	98%	100%	100%
School of Engineering	93%	95%	100%	99%
School of Education	91%	97%	100%	98%
School of Business and Accountancy	95%	100%	100%	100%
School of Arts and Social Sciences	95%	98%	100%	100%
Totals	**94%**	**97%**	**100%**	**99%**

However, as displayed in Table 3, it is interesting to note that majority (90%) of the respondents access the Internet on campus compared to from home (73%). This finding suggests that majority of their times are spent on the university's campus for academic purposes such as attending lectures, having group discussions and completing assignments. It also suggests that the students rely heavily on the free Internet access provided by the university due to high costs of subscribing to commercial telecommunication providers.

11. Table 3. Access to Internet based on locations.

Schools	From home (%)	From campus (%)	From other places (%)
Academy of Islamic Studies	51%	94%	45%
School of Economics & Administration	77%	90%	53%
School of Engineering	82%	89%	56%
School of Education	70%	92%	52%

School of Business and Accountancy	89%	88%	56%
School of Arts and Social Sciences	61%	83%	34%
Totals	**73%**	**90%**	**51%**

Online activities Malaysian young adults are engaged in

To understand the online activities Malaysian young adults are engaged in, a crosstab analysis on the online activities across five activities was conducted. The activities are:

- *reading* personal, political and social issues online and on blogs;
- *share* comments, photos and videos related to political and social issues in social media, blogs and websites;
- *searching for information* online including information to complete assignments, do-it-yourself (DIY) and self-improvement information;
- *online shopping* such as buying flight tickets, reserve for hotel rooms and/or services; and
- *socializing* and sharing latest updates using various social media sites such as MySpace, Facebook, LinkedIn.

Results, shown in Table 4, indicate that, on daily basis, socializing via various social media sites is the most popular online activities among majority of the students across schools (88%). This result is similar to of other reports that young adults socialize and interact with one another via social media very frequently compared to adults beyond 25 year old (Lenhart, Purcell, Smith, & Zickuhr, 2010). This activity is followed by information searching activities (65%), reading (28%) and sharing information (23%). The least popular online activity across schools is online shopping (12%).

12. Table 4. Online activities across schools.

Schools	Reading (%)	Sharing (%)	Information Searching (%)	Online Shopping (%)	Socializing (%)
Academy of Islamic Studies	41%	25%	71%	14%	90%
School of Economics & Administration	26%	24%	68%	20%	92%
School of Engineering	23%	23%	60%	10%	88%
School of Education	31%	24%	64%	9%	88%
School of Business and Accountancy	16%	22%	67%	19%	89%
School of Arts and Social Sciences	29%	18%	66%	2%	80%
Total	**28%**	**23%**	**65%**	**12%**	**88%**

Social media activities Malaysian young adults are engaged in

Zooming into Malaysian young adults' social media activities, we categorized respondents' activities into 4 categories. They are:

- discussions on political issues;
- social sharing;
- click "Like" to show preferences and supports towards comments and/or organizations; and
- sharing both positive and negative comments.

As shown in Table 5, it is found that preference of "Like" clicks has the highest weights (67%). Among schools, both students of the Engineering, and Business and Accountancy schools have relatively low percentage (59% and 54%) of being involved in this activity. It may due to the fact that they are much more burdened with academic life

and thus spend less time on social behavior of clicking "Like". Additionally the Academy of Islamic Studies students (56%) are more likely to involve in online political discussions compared to students of other schools. This finding aligns with the current situation in the country where students of Islamic Studies are among the most active group of young adults interested and engaged in both on-campus elections and national political discussions.

13. Table 5. Social media activities across schools.

Faculty	Political Purpose	Social Sharing	Click "Like"	Opinions Sharing
Academy of Islamic Studies	56%	63%	74%	35%
School of Economics & Administration	49%	70%	68%	37%
School of Engineering	43%	58%	59%	26%
School of Education	42%	59%	70%	24%
School of Business and Accountancy	42%	56%	54%	26%
School of Arts and Social Sciences	43%	66%	78%	27%
Total	**45%**	**61%**	**67%**	**28%**

Conclusion

14. In conclusion, we noted that there are different behavior patterns between students from each school who participated in this study although they are all in the categorized as Generation Y (Gen Y). It is mainly due to other factors such as their backgrounds, the courses they are pursuing, peers' influences, and access to technologies. However, this group of young adults does share some characteristics. They are actively engaged in the social media sites both for sharing information and for educational purposes. This shows they are comfortable in using technology for teaching and learning process, and are aware of and interested in political and social issues around them. From academic point of view, findings from this study reveal that academics of higher educational institutions should utilize the technologies in communicating with this young generation of students and design their teaching and learning tasks to encourage them in social activism tasks relevant to their academic programs.

The web as a channel to connect the current and traditional cultural consumptions

Mariangela Giusti[175]

University of Milano Bicocca, Departement of Human Science for Education "R.Massa", Piazza dell'Ateneo Nuovo, 1   20126 Milano- Italy

Abstract

The presence in the new media and internet of the Second Generation of immigrants in Italy enriches the cultural offering of the web. Many young immigrants started websites of sharing, training and dialogue in order to maintain their culture of origin. The paper reports some results of a research conducted with in-depth interviews to thirty young immigrants Chinese, Arabs, Romanians, Albanians. Research shows that the offering and consumption of cultural arguments through the web is a way to encourage young migrants in the development of an attitude of double belonging in order to positively overcome the task of constructing identity.

Keywords: Web, cultural consumptions, training, identity, Second Generations immigrants

1. New media and second generation immigrants in Italy

The use of internet has increased the possibility of exchanging remote informations on a global scale: the cultural consumption through the web involves people distant united by interests curiosity and similar problems. It is a way to establish links which exceed the virtual field, affects on the change of habits of the subjects, their communicative languages on interpersonal relationships. Teachers and educators should try to get closer to the cultural consumption of the second generations, so they should try to approach what young immigrants themselves process and make it accessible to everyone with the ways at their disposal.

The web for young people is a powerful medium of offering and cultural consumption, stimulates the curiosity of the users and can be an alternative to the rigidity of the cultural offer provided by the schools. Thanks to its autopoietic nature (because active processes of creation) and deconstructed, the web stimulates the action of individual actors, makes users responsible for their own learning process. The young natives and migrants make a wide use of new technologies in the educational process of offering and cultural consumption. From the interviews conducted for a qualitative research in the north of Italy in 2011, the references to the use of the internet were quite frequent. The strengths seem to be at least two: a) the web is used to transmit traditional contents of different cultures; b) the web is used a lot for keeping in contact with the ethnic community and for references to current events.

The research (conducted through semi-structured interviews) showed that more and more users experiment and share new codes of communication on the web (Giusti, 2011). This is especially true for young second-generation Chinese immigrants in Italy: they are grown up watching Italian and Chinese television, they attended all grades of the Italian school, they absorbed habits and customs Western/Italian but, at the same time, they not want to lose the characteristics of the community they come from, where they lived and to which they feel they belong. They listen to the stories from adult people of the community of traditions and fragmentary details of their roots.

E-mail address: mariangela.giusti@unimib.it

The swing of identity, from one community to another, means that these girls and boys are not seen as entirely Italian in the eyes of the natives and are not seen as completely Chinese in the eyes of their families. Use the channels of the web means have innumerable possibilities to confront on subjects shared, on feelings that, if experienced firsthand, can be understood. The web becomes communication, information, comfort and support.

From several interviews collected during the research we encountered several references to some online portals where the second generation of Chinese immigrants, Albanians, Romanians are the protagonists. An example is in the testimony of a girl, Sun Wang, in Italy from fourteen years from China:

...We use internet very much ... me and also all my friends ... the people I know ... For a population very busy with little free time, internet is a major form of entertainment. A separate discussion is about the Chinese in Italy: the web and instant messaging programs provide users an incredible capacity , that is the possibility to find and meet other Chinese in Italy, an important form of communication, socialization, often in the labyrinth of servers we found countrymen or even former neighbors in China ... The main function of the web for young Chinese is socialization (Sun Wang, 23, from China)

The second generation of Chinese people in Italy are the protagonists in several portals: www.secondegenerazioni.it, www.qqinternational.it, www.associna.it are instruments of life and culture that also italian teachers in the schools should know, schoud use in teaching perspective.

2. Collect culture and transmit culture: the case of the site www.associna.it

Associna is an association that operates on the Italian territory with a number of initiatives in major cities where there are people of Chinese origin: Milan, Prato, Rome, Padua, Genoa, Turin, Bologna, Florence. Associna has the merit of opening and spreading the debate on the second generation of Chinese origin between the institutions, the Italian organizations and the Chinese associations. Associna represents a point of reference not only for the Italian-Chinese second generation, but for all those who want to know more about Chinese culture and multiculturalism of guys who grew up in Italy looking east. The portal www.associna.it has been created by the sons of Chinese immigrants and dedicated to themselves. Almost all of the site's members possess an account of QQ, the most popular instant messaging program in China, with a graphical interface with many functions. These young people have created with their imagination a virtual and real community, a diasporic public sphere, a shared memory, the result of memories and reworkings of those who take part: there are articles written by users, chat, forums, discussions, meetings . Through a participatory and cultural use of the internet, the everyday reality emerges and affects young members of the community.

The second-generation immigrants develop and recreate a new form of cultural consumption and put it in circulation through the web. It has created a sort of updated tradition: the site collects tales, stories, anecdotes heard from parents and grandparents; reconstructs events and symbols that are not experienced first hand. We understand the desire to forge a third identity, not Chinese and not Italian but Italian and Chinese. It is a path from the past to the present, from a tradition rebuilt and reworked a current condition they are in doubt about the identity light questions on problems relating to the inclusion in the Italian community, about being Chinese and Italian. The real find in the virtual space and vice versa, in a sort of circularity that moves constantly thinking between reality and fiction.

2.1 The purpose of Associna.it

The portal Associna was founded in 2005 by a meeting on the internet of a group of boys and girls of the second generations born and raised in Italy. The purpose of Associna is to create a bridge (virtual and not only) among the Chinese community and the Italian one, between the past (which usually it has been lived in China in the first person by the parents, not by the kids), the present and the future. The portal tends to perform certain functions:

* Support a project of opening of the Chinese community towards the host society and greater cohesion within the Italian society;

* Give voice to the second generations by providing informations, views, insights on various topics (news, politics, events) that can complement those transmitted by the media;

* Build a virtual meeting place, where people can communicate, discuss issues of tradition and current.

The site is organized in **different sections**: some reserved for registered users (chat and forum), other free. The topics **covered** are many, they are presented in the form of articles written by members of the community. We find biographies, culture, curiosity, economy, parties, events, opinions, politics, stories. Any registered user of the site can contribute to the presentation of the issues by providing comments, suggestions, fueling debates connected with it.

The popularity of the internet, among young Chinese makes this media very powerful , capable of spreading cultural consumption and to disseminate like wildfire thoughts and ideas. In fact, the site gives examples of how you can pass on notions related symbolic codes, traditional cultural elements, known in the first person by the guys that run the site, which are the children of immigrants born or raised in Italy. For example, several post in the forum can be found on the symbols meanings in Chinese décor. The epistemology of intercultural education aims attention to the symbols as they create points of contact between distant universes of reference. Symbols allow you to get closer to another culture, they have features that are transmitted with knowledge and education.

The symbols allow young Chinese, born and lived outside of China, to find in their lives some traces of an identity distant but present. Similarly Italians are in contact with symbolic Chinese decorations or of Chinese origin more than we can think, many of them have come in the course of history also as a part of the decorative universe that is considered Italian. In particular, teachers often do not know the meaning of the symbols used in the decorations and know it can be a value the intangible items (historical and cultural) that belong to the family estate of the students. For example, in a post on Associna can be found complex explanations of the symbols of the Horse, Dragon, Lion how to provide elements of cultural education, information, details, explanations for Italians possibly intrigued by the Chinese symbolism and for the Chinese who may have heard of these symbolic elements in the stories of their parents, but without having **knowledge**. The text seems to use various contaminations, **indirect restorations**, **historical**, **economic**, **cultural traits not** related to a particular culture, but to a third reality: cultural, historical, informative at the same time. A sort of symbolic handbook that can be used by anyone who wants or has curiosity.

2.2 Some subjects, some topics

The site deals with many subjects: events, stories from adult people and presentations. The users are in contact with particular visions of history, tradition, modernity; arguments that the imagination and the curiosity of young Chinese brings to light. Associna is a real reservoir of cultural references, presented by those who, like the Italians, they have not lived in the first person, but that may have them absorbed in part by the tales and the stories of family and friends. The cultural offer of Associna includes episodes and characters extracts of the decorative universe history, culture or literary of China. For example, are presented and summarized some of the pillars of Chinese literature, one of which is *The Dream of the Red Chamber* (*Hong Lou Meng*) with a trace of the plot, the context, the extent of the value of the novel.

These are cultural basic indications for those who do not already possess them (in fact it is probable that the Chinese who live far from China, do not know this literary work). This is one of the tasks that the virtual community Associna has given itself: to create a bridge between the present and a past that needs to be rebuilt, not with regard to the individual sphere, but as regards the traditional culture, which for young immigrants can not follow the usual route transmission of knowledge (from parents and institutions to children) but takes many forms and accomplishes different paths.

Another important figure of the Chinese cultural world, of which the second-generation youth may have heard the stories by parents, is Wu Chengen, became famous all over the world thanks to numerous television series and the cartoon *Dragonball*. The figure of the little monkey is the protagonist of the novel *Xiyou Ji* or *The journey to the West*, inspired by an ancient cycle of folk tales, one of the most popular in China and abroad. The novel, composed

by Wu Chengen probably between 1570 and 1580, is allegorical: the monk Xuanzang can be construed as a man in search of enlightenment; the horse that carries him as his will; the pig as the symbol of physical strength and inclinations; the monkey as a symbol of the heart and mind.

The user Quifeng begins his long post on Associna about the myth of Sun Wukong:

«*If you were to ask a child or teenager who is Son Goku, entered in the Western imagination through comics Hakira Toriyama Dragonball, would answer but maybe not everyone knows that Goku is inspired by a Chinese legendary monkey....*».

The words with which the user introduces readers to the mythological story can be compared to those of a parent who describes his son a myth of his childhood, a character who a guy could hear without knowing it and without knowing what role did the figure in the memories of adults and countrymen. These actions on the site are meant to tell what is usually taught in Chinese schools. The stories posted on the site by the young of Associna serve as the glue between one community and another, between the present and a past not lived in full (or at least not seen as peers in China).

Another figure that is part of the Chinese legendary and must be included in the cultural background of those who are from China is Mulan. The user Kai Asuma writes in his post abouto Hua Mulan, the legend of an intrepid orchidea: «The first praises to Mulan are in an anonymous epic poem of the period the Northern Dynasties (386/581). Later storytellers and playwrights have given her a name (Hua) and have enriched her adventures with many details...».

In other post are described China's traditional celebrations, events of Chinese culture that the Chinese can not miss. Immigrants in Italy, especially on festive occasions, they can feel even more the weight of the distance from home and believe that it is essential to transmit the knowledge of these occurrences to their children in order to safeguard the tradition: the Lantern Festival, the festival of five May, the feast of the moon...

It 's a kind of guide to traditional Chinese festivals for those who have not had the chance to experience them directly. The precision and the attention to details that characterizes the descriptions of events in the portal www.assoocina.it is felt to be necessary because those descriptions will become part of the cultural background of young immigrants or born in Italy. It is understandable that those who write about Associna you need to rebuild and imagine what happens in the streets and homes in China on feast days, even to understand the strong attachment that their countrymen may feel toward those customs. Probably by even a superficial knowledge of these cultural traditions of second-generation immigrants may diminish the generational and cultural gap that separates them from their parents and try to savor, even with the story and the images, the atmosphere and the habits to which fathers and mothers exhibit melancholy. The authors who have put these interventions on the site have accompanied the texts with images that bring very effective real places or fanciful elements with which the young second-generation immigrants have never had to do either directly or, if not, whose contact is happened a long time before turning into distant memory, more and more nebulous. Internet helps to fill a void and to share words and stories, images and visual elements suitable to rebuild something that you are not able to experience it firsthand. The measures collected in the portal www.associna.it not only affect the reconstruction of everything that is considered traditional but also cultural events and anniversaries that can touch up close and daily Chinese youth in Italy, for example: the celebrations in various cities of Italy on the occasion of Chinese New Year of 2011. In a post signed with two initials, a user describes the Chinese New Year along an ideal trip to China to discover the customs and practices that the children of immigrants have never lived in the first person, but they definitely some notions thanks to the reports of family members. It emerges that a party or an typical event Chinese traits can take new and original in the land of welcome and that the same situation is experienced differently by parents and children.

The topics in the portal are not unique to the field of history and culture, but also the contemporary. In the post below (almost a chronicle/story) a user woman who signed Shaoyan highlights what traits of change can take Chinese traditions, such as marriage, in the context of the host society:

«*No gifts but money. And the bride toasts with everyone. Voices, music, dragees, fireworks. We are in Via Giannone in Milan, in front of a Chinese restaurant in Chinatown. In a Sunday covered with clouds a couple of young Chinese decided to pray to the heavens and the earth. Which, in the Chinese tradition, it means marry*».

From the distant past, focusing on the symbolism, of literary and mythological figures and legends, handed down the path of identity of young immigrants led to the discovery of the traditional Chinese holidays and customs to changes that may be in the contexts of migration. If the glimpses of the past and of ancient Chinese cultural elements typically may appear frosty unknown to the boys, everything about the contemporary experience of migration appears to be very close and heard. The children of Chinese immigrants in Italy can speak in the first person begin to feel like your memory and identity, not just the result of a meticulous reconstruction and imagination. The stories that young second-generation Chinese publish on the portal are also experiences in the first person by those who have taken the path of migration, in which many children of immigrants can identify with. For example, Shaoyan writes:

«The dream of the Chinese is to become Lao Ban. Lao Ban means "to be masters." It 's important owning a business, even if small. I tell you three stories from the triangle Brescia-Bergamo-Milan. It 's the dream of all Chinese people to be called Lao Ban (masters). Owners of restaurants, shops, hawker stalls of clothing and various chinoiserie. And the Lao Ban in Italy increased, moving from side to side to increase the turnover and win an indispensable economic stability».

The glimpse of this is offered in the site also touches issues that affect the daily lives of Chinese young people, often in contact with uncomfortable questions or situations of confrontation between the original and the indigenous community. For example, there are debates about the importance of the attribution of a name in China (in order to give an analytical tool to those which are asked the meaning of his name in the host society); discussions and exchanges of views on articles published on the major Italian newspapers, such as occurs on the doubts related to the burial of corpses in Chinese culture or the fact that Chinese young people in Italy are spies for the Chinese government. Are ways to give answers to prejudices and stereotypes that often characterize the relationship between the Chinese community and the Italian and immigrant youth may hear directly weigh on their shoulders in the contexts of daily socialization.

The comparison between the two worlds may also include simple comparisons between different light on issues habits of life of the society of origin and the host. The discussion can also be imprinted on the ways in which the media (web, television, newspapers, advertising, radio) talk about the Chinese world. Often the messages conveyed can be captured in different ways according to the interlocutors and what the eyes of an Italian can arouse curiosity or irony, can be perceived as offensive or stereotyped by an immigrant. In addition to the session that contains articles published by users, the portal provides young people with different opportunities for discussion and venting, as well as a valuable tool for mutual aid. Those registered to Associna can communicate via chat and participate in forums that touch on various themes: Italian news, sports events, issues related to integration in the host society, international politics, issues of study, work, relationships. The relationship between the users of the portal can cross the boundaries between virtual and real communities, thanks to numerous opportunities to meet the association gives life. There have been two meetings in Prato, are organized football tournaments, meetings dedicated to the cinema, mixed groups of conversation, during which events to exchange views about the political world and the issues that are common to the second-generation immigrants. And 'interesting is the ability for users to converse in Chinese section of the portal "Chatting in Chinese!", "Let's talk in Chinese! ". Not to lose confidence with the language of origin, which, over time, is likely to be stifled by the gradual familiarity that children acquire the Italian.

Shared memory and built by the children of Chinese immigrants appears to be a new reality, not due to any alleged criterion of objectivity of interpretation, nor purely cultural canons in Chinese or Italian. The site analysis has allowed us to bring out the desire of the boys to share culture and experience, re-weave, thanks to the contribution of so many people feel similar to his own experiences, the plot of a past that migration is not allowed to know directly. The tradition handed down to second-generation Chinese immigrants, it becomes a tradition developed, not received, the positive counterpart of this lack is that, in search of the roots, the role of young people is more active, you can implement with non-traditional means such as the Internet and virtual communities.

The role that the web has to creating the identity handed down does not replace that of the people of flesh and blood (parents, grandparents, aunts, uncles), real possible transmitters of knowledge and experiences. The portal is a cultural offer that is at the same time, searching for the roots and the design of the future for young second-generation immigrants. With the web, you create an imagined community and diasporic, a bridge between past and

present, between Chinese and Italian companies, including the world of adults and one of the youngest. The identity handed down is not something static, absorbed in a passive way: it is a continuous process of research and selection of cultural consumption, construction and interpretation

The migration process has strong repercussions on the balance and stability of the society of emigration and the host community, especially the family and the individual. The breakup of the landmarks of cultural and social turns out to be even more pronounced in the case of a teenager who immigrated as a child or who are foreign born. In the new context of the family emigrated to life seems to no longer be able to provide its members with a valid support in coping with the difficult integration into host communities. Each original shall develop a strategy to overcome these shortcomings, with results that vary from subject to subject, difficult to define.

In the contemporary world the impact of the means of mass communication, especially the web, has a strong effect on how young people create (and change process) to the tradition and identity. Looking at the site yields a conception of identity absolutely no statuary, no fixed or sent by osmosis. The reality that surrounds each individual is subject to forces that change, it is not possible to give a universal definition of identity, nor think that will be built in the same way in different situations. We must recognize the power of change that characterizes the phenomenon of identity. In the face of today's dynamic, it makes no sense to talk about definitions of ethnicity, nation, culture or community. You must bring the original elaborations that individuals develop in different contexts depending on the variety of situations, thanks to the action of the imagination. In the example that is shown emerges one of many possibilities through which second-generation immigrants, through a medium of mass communication (internet) try to create a tradition that is not only passed, but created by them stess, and an identity that takes on the traits of a real active process. This, however, is not a substitute cultural ties, social and relational, which are woven into the daily reality: it is a significant part.

3.Websites born multi-ethnic and managed by the second generations

In the collected interviews the witnesses contacted for research have referred many examples of websites that are born multi-ethnic and that are managed by the second generations of boys and girls or children of immigrant families. In Italy, the experience very significant (now closed for lack of funds) is that of Crossing Tv (www.crossingtv.it) a web tv designed by a team composed of intercultural boys aged between sixteen and twenty five years. The experience started in February 2008 in Bologna (with funding from the Ministry of Social Solidarity of the Italian Gouvernement) and ended in 2012. The communicative intent of Crossing Tv was to give visibility and voice to teenagers and young people who are not represented by the mainstream media, trying to undermine the prejudices and counteract the stereotypes that young people see themselves and suffer daily.

Through this medium communication, the boys try to act to build new images of young children of immigrants to understand and comply with all the differences in each person, a sort of *Yalla Italia* the web. Then, Internet is a tool used by the second generations, in that it gives the possibility to obtain (in addition to providing) information in a more democratic thanks to its characteristics of an interactive medium. Several young people can have their own blogs and use social networks with the intent to express themselves freely and seek alternative opportunities to exchange ideas. They also represent an instrument of solidarity and sharing since, as said Stella, a young second-generation: «networks do not make you feel lonely, I'll just say that there are people that have the same trouble, that's when you feel more optimistic and see things from another point of view, often for the better. Through dialogue, the exchange of ideas, everything becomes a little lighter.»

3.1 About Muslim word

Over the last few years, were born several internet sites with the intention of giving space to questions about various issues concerning the Muslim world; an example can be given by www.islamonline.it that caters to Muslims and Muslim Italian Italian speakers living in Italy or have Italy as an important reference and is a tool of information, analysis utilities. It is a online magazine through which we discuss marriage, sex, use of the beauty products halal (permitted) haram (forbidden), they share recipes religious songs. It is "sites that help to present Islam in a more

clear and concrete, away from the deformation produced by the media or fanatical interpretations, which are far away from the essence of faith .. Internet is seen as an area in which every citizen is well received, is perceived as a space that transcends national borders by being «above the parties and becoming accessible to all. By islam-online other sites You can express their views freely, feeding processes of criticism and self-criticism: «The communication of self is not real but it is mostly virtual and my peers Moroccans have well understood and have started their silent revolution precisely this way. So it is true, no one is a prophet in his homeland, but we are all prophets on the internet».

Internet makes it possible to bring together the various Islamic communities scattered throughout the West, so they were born Palestian initiatives such as the Youth Network www.palyouth.org, a site designed to allow communication between of Palestinian origin, aged between 18 and 35 years old, living in different parts of the world. The aim is to build a town that is not in order to keep alive the stories that the G2 have heard the voices of their grandparents and increase awareness of themselves trying to stay together regardless of language, culture, religion residence. It is 'necessary for us, and not second-generation youth, go on the pitch we strive to create an alternative system to that of barriers and boundaries. We begin to feel ourselves members a people without a land, a land of many peoples. It is at that point, we will be able to fly on every border.

Other interesting experiences born thanks to the use of internet you can find on the site and the network Altmuslim www.altmuslim.com Cedar www.altmuslim.com. Through the first trying to "influence, producing information, three areas of interest the traditional media and the government the mainstream Islamic organizations. This website arises intent of politically motivated showing sensitivity towards the issues of contemporary forms of the Cedar network has social objectives: to propose the development of "European Muslims model" sustaining promoting their visibility, wants to be a network of interchange intellectual and professional .

Another interesting initiative proposed by the Cedar is the Emwi www.cedaremwi.com (European Muslim Women of Influence), time to honor and reward European Muslim women, giving them a positive image for their capacity to play "a vital role in a wide range that includes the spheres cultural, economic, professional and social.

3.2. Toward the cultures of Eastern Europe

Equally interesting in terms of training and cultural exchange sites are centered themes go cultures of the countries of Eastern Europe, aimed at users undifferentiated. The landscape is vast. They are sites monographs on individual artists in the country of origin: an example is the site designed and maintained by Sabrina Arpini about the artistic life of Gheorghe Iancu, star of the ballet, as a tribute to the great artist. The site is setup properly cultural/encyclopedic (http://www.gheorghe-iancu.com) contains all the information in a detailed and comprehensive career past and present G. Iancu.

There are also sites with a broader offering current topics, debates and opportunities. In this second category belongs the site of the 'Observatory Balkans and the Caucasus (OBC), a project of the Foundation Peace Bell in the middle between an electronic medium, a study center a service center that explores the social and political transformations in the south-east Europe, Turkey and the Caucasus. The Observatory website Balkans the Caucasus, http://www.balcanicaucaso.org, exploits the potential of multimedia, using open source technology and is present on the main social networks.

It includes a very wide range social and cultural issues: environment, gangs, human rights, economy, European Union, media, migration, politics, civil society, governance, customs, tourism and travel, peace, conflict, justice, art and culture, news, religions. Through the interaction between a working group with headquarters in Rovereto (Trento province) and a network of correspondents and collaborators over forty local produces and provides information and analysis that are posted on the web. The portal Observatory weaves information, research and stimulation of international cooperation, is visited by over a hundred thousand readers per month teachers and researchers journalists, students diplomats and officials of local authorities, regional and national policy makers and volunteers and professionals international solidarity and economic operators; citizens of diasporas in South-east Europe and the Caucasus tourist, travelers and visitors.

Another significant site as an example of supply and consumption of cultural products was carried out by the Centro Culturale Italo-Romanian Dacia by the Association of Milan and Livorno, a bilingual portal, which seeks to raise awareness of the cultural values of Romanians in Italy, highlighting also, as much as possible, cultural relations existed between Italy and Romania through time. The portal, http://www.culturaromena.it, was the brainchild a group of young students, researchers, professors, men and women of culture, Italian and Romanian, engaged in cultural and artistic research and some Romanian journalists that for several years living in Italy to be a medium of intercultural communication between the Romanian community living in Italy and the Italian, through literature, art, theater, music, etc. ..

The curators www.culturaromena.it in an attempt to bring the portal as a small mirror of Romanian culture in Italy as a diffuser its values in the world, following the meetings of major cultural Romanian and activate dialogue with the most important personalities who have for many years held a rich activity in this area in Italy. The portal supports and promotes in its pages groups, associations, institutions that operate in the 'sphere of culture. It is 'a project open and evolving with these subject areas History (to know the elements of Romanian history and cultural relations Romania through time) Publications (to present the books written by Romanian authors, or relate to Romania , written by Italian authors)

Events (to present cultural events, conferences, debates, organizing exhibitions, book presentations etc.). Spirituality (to acquaint readers with some spiritual values of the Romanian Orthodox Church) Articles and studies (to present the studies and articles that dealing with items of common interest, cultural interference Romanian) personality (to raise awareness of important personalities of Romanian culture history) Community (to present the personality Romanian living in Italy know even more, their artistic activity) photo and video galleries covering various cultural events.

There is another important site that is worth mentioning for knowledge of Romanian culture http://firiweb.wordpress.com, the site of the Forum of Romanian intellectuals of Italy (FIRI) who was born at the beginning of November 2007. The main purpose of FIRI is to conduct and promote activities to foster intercultural dialogue, understanding, mutual respect and friendship between individuals, communities and peoples.

The supply and consumption of cultural products through the web seems to be a way to promote encourage the young people who live migration the development of an attitude of dual membership, which can enable them to overcome the positive task of constructing one's own identity. Thanks also to the possibility of cultural training these guys could be introduced into the host society while remaining true to themselves, keeping that part of himself that refers to another culture. Even cultural consumption through the web should facilitate the integration, understanding it as the outcome of the choice of keeping their origins along with an opening towards the new construction.

Analyze the cultural offerings found on websites used as a benchmark allows you to guess the young Italian immigrants in the development of a sort of dual ethnicity, through which those who habitually frequents these sites feel they belong both worlds reference: the company host community and the society of origin. This small window of opportunity that opened on cultural consumption conveyed through the web should be useful to teachers and educators to fortify the point of view of intercultural pedagogy, that is able to harmonize the values and recognize the positives and negatives of both the other's sphere of influence, while maintaining the overall balance of the alternating biculturalism that allows you to move freely from one culture to another, from time to time responding to requests from different stakeholders and different situations.

Time perception in children with developmental dyscalculia

Monica Pellerone[176]

"Kore" University of Enna, Faculty of Human and Social Science, Via Cittadella Universitaria, Enna, 94100, Italia

Abstract

The present work evaluates time perception in children with dyscalculia (DD) to verify whether DD can interfere with timing tasks. Sample includes: 12 DD subjects (M=9.5 years) and 12 healthy subjects (M=9.2 years). Two studies are carried out: a time comparison task (to judge whether an interval was longer or shorter than a reference interval) and a time reproduction task. The ANOVA shows the effect of factor GROUP on temporal relationship and errors on temporal comparison. In sub-second duration timing task, DD children are less accurate than healthy children; boys seem to have a lower level of performance than girls.

Keywords: Learning disability; Dyscalculia; Temporal comparison; Temporal reproduction

1. INTRODUCTION

The quality and quantity of learning in school age requires optimum efficiency of cognitive functions: perception, memory, information processing abilities, and associative capacity, and functions requiring multiple data processing, as for example reading with the comprehension of a text. So, during school period, the cognitive disorder (underestimated or not relevant disorders) can became Learning Specific Disability.

The learning specific disabilities are classified in three subtypes: reading learning (RLD), written learning (WLD) and mathematic learning disability (MLD).

Developmental Dyscalculia (DD) is a congenital and specific learning difficulty of the calculation; it is a primary cognitive disorder of childhood affecting the disability of an otherwise intelligence and healthy child to learn arithmetic (the understanding of numerical concepts and arithmetical information).

A classification of developmental dyscalculia divides this disorder to (Badian, 1983): a) Alexia and agraphia for number; b) Spatial dyscalculia; c) Anarithmetia; d) Attentional sequential dyscalculia; e) Myxed type.

Although poor teaching, environmental deprivation, and lack of intelligence are involved in the etiology of developmental dyscalculia, current data indicate that this learning disability is a brain-based disorder with a familiar-genetic predisposition. Developmental dyscalculia is a common cognitive handicap; its prevalence in the school population is 5-6%, a frequency similar to developmental dyslexia and attention deficit hyperactivity disorder (Barberesi, Katusic, Colligan, Weaver, & Jacobsen, 2005).

Developmental dyscalculia is the most frequently encountered in neurologic disorders (fragile X carriers, epilepsy and Turner's syndrome) and developmental disorders of childhood such as attention deficit hyperactivity disorder and developmental language disorder (Jordan, Hanich, & Kaplan, 2003; Pellerone, Schimmenti, & Collura, 2012; Shalev & Gross-Tsur, 2001). Whereas isolated learning disabilities other than developmental dyscalculia are more common in boys, developmental dyscalculia is more prevalent in girls with epilepsy and in female carriers of fragile X (with a combination of low arithmetic, digit span and block design subtest scores).

Recent literature shows the presence of some measures as indicators of potential Mathematical Disorder in kindergartners, that is (Gersten, Beckmann, Clarke, Foegen, Marsh, Star, & Witzel, 2009): a) magnitude comparison (i.e., knowing which digit in a pair is larger); b) sophistication of counting strategies; c) fluent identification of numbers; d) working memory (as evidenced by reverse digit span).

Among the possible errors in comprehension and production systems there are: a) lexical errors, or errors concerning the production or comprehension of single figures; b) syntactic errors, since child is able to encode the single digits but he cannot establish the relationship between them in a correct syntactical structure.

The development of mathematical competence originates from the activation of the frontal and parietal areas of the brain. The execution of timing tasks for shorter periods than a second shows a cluster of activation in the right inferior parietal lobe (IPL). Many recent imaging studies have revealed the involvement of the frontal cortex, particularly the dorsolateral prefrontal cortex, in the processing of brief (< 1 sec) intervals (Tregellas, Davalos, & Rojas, 2006), and in the right hemispheric prefrontal cortex with sub and supra-second intervals (Koch, Oliveri, Carlesimo, & Caltagirone, 2002). This evidence confirms what electrophysiological investigations have already indicated regarding the role of the frontal lobe in the coding of temporal information.

Recent evidences (Frassinetti, Magnani, & Oliveri, 2009; Vicario, Caltagirone & Oliveri, 2007; Vicario & Martino, 2010) documents the disposition to spatial coding from left to right of the intervals timing respectively from shorter to longer ones in healthy children; from these results we could deduce that a trend toward the left (along the mental number line) is supposed to be responsible for the underestimation of time in children with dyscalculia.

Time, space and numbers are closely linked in the world of the psyche, however, the effects exerted by the space and other variables on the time estimation processes remain poorly investigated.

A recent study (Vicario , Caltagirone, Turriziani, Koch, & Oliveri, 2008) shows that the feedback of the duration of visual stimuli can be influenced by their location (left vs. right) along the space, as well as from information related to the number's magnitude. Several groups of healthy subjects have executed tasks of temporal evaluations about various types of visual stimuli. In the first two experiments, the visual stimuli consisted of decimal numbers, presented at the center of the screen or on the right and left of the space. In a third experiment, visual stimuli were constituted by circles blacks. The duration of the reference stimuli was set at 300 msec: the subjects had to indicate the relative duration of the test stimulus compared with the reference one. The main results showed that the duration of the stimuli presented in the left hemisphere is underestimated, and the duration of the stimuli presented in the right hemisphere is overestimated. On the other hand, in the median position, the feedback of the duration is affected by the number's magnitude of the stimulus presented, with a time underestimation of the test whether its dimension is smaller than the reference stimulus and vice versa an overestimation of the test if the number's magnitude is higher than the reference stimulus.

A further investigation (Oliveri, Caltagirone, Turriziani, *et al.*, 2008) shows a similar trend of results: in a first experiment, a group of healthy subjects was subjected to a time estimate task, requiring to assess whether the duration of the test stimulus was longer or shorter than a previous reference stimulus. The main results show that the perception of time was influenced by the digit's magnitude: for the lower numbers (for example: 1) the underestimation prevails whilst as regards higher decimal numbers (for example, 9) dominates the overestimation of duration. These findings confirm a functional interaction between time and numbers in the cognitive system.

1.2 METHOD

1.2.1 Objectives and research hypothesis

The present work aims to measure the perception of time in children with dyscalculia. The aim of the study has been to examine whether a deficit in calculation ability could influence with a time comparison task and a time reproduction task in sub-second and supra-second intervals.

In accordance with the literature (Vicario *et al.*, 2008) it is assumed that there is no gender difference in sub- and supra second timing tasks.

The group dimension is also assumed (healthy subjects and subjects with dyscalculia) to have an influence on the factor of temporal relationship and on percentage error in time comparison in sub- and supra second intervals, according to the literature (Oliveri, Vicario, Salerno, Koch, Turriziani, Mangano, Chillemi, & Caltagirone, 2008; Vicario, 2011).

1.2.2 Participants

The sample is formed by 24 students of primary school in Sicily: the first group is composed of 12 subjects (a experimental group), including 7 males and 5 females ($M = 9.5$ years; SD = 0.57), with pure dyscalculia (that is a form of dyscalculia in which is excluded any other form of co-morbidities); the second group of 12 healthy subjects (control group), including 7 males and 5 females ($M = 9.2$ years, SD = 0.50).

1.2.3 Procedure: Study one (Time comparison task)

The task was earlier described to participants; afterward they have been requested to perform a series of practical tests to verify whether participants had understood the progress of the test. The subjects were placed in front of monitor of a laptop.

The purpose of the experiment was to determine whether a test stimulus (a black circle) was presented for a time interval longer or shorter than the duration of a standard stimulus (a red circle).

For each session, there were two separate and consecutive blocks, the first one including sub-second intervals and the second one the supra-second intervals.

In the block of sub-second intervals, the duration of the standard stimuli was 400 milliseconds in each test. This block consisted of 18 trials including subjects, estimating 6 sub-second intervals (300, 440, 500 ms), each of which was submitted for 6 times in random order, but immediately after the stimuli reference. The standard stimuli were presented immediately before the test stimuli in each of the 18 tests.

In the block of supra-second intervals, the duration of stimuli reference was of 1400 milliseconds in every test. This block consisted of 18 trials, including subjects estimated 3 supra-second intervals (1200, 1440, 1520 ms), presented in random order for 6 times. The standard stimulus was presented immediately before the test stimulus in each of the 18 trials.

In both blocks, thus, 9 trials contained stimuli tests major than standard stimulus, and 9 trials contained test stimuli lower than standard stimulus. Each interval between the trials was 2000 msec. The order of presentation of the sub-second blocks and supra-second blocks was counterbalanced between subjects in each group.

The performance of each subject was analyzed by calculating the average percentage of wrong answers (errors) on 9 sub-second trials and 9 supra-second trials.

1.2.4 Procedure: Study two(Time Reproduction task)

The subjects were positioned in front of the monitor to a laptop. Each of them completed two tasks in a random order for the production of time intervals: in the first task, the way of production was independent (Self Time Production - STP), in the second task the way of production was given by the computer (Computer Time Production - CTP), according to indications Van Der Meer, Marzocchi and DeMeo (2005), who had applied this methodology in subjects with ADHD.

The two tasks were presented in a counterbalanced way. The execution of the task was preceded by a training phase in which (through the use of a stopwatch) the experimenter showed the real length of each interval. The data were collected in the form of response time expressed in milliseconds.

In the first task, the way of production was independent; it is consisted of a block of 18 trials in which subjects estimated 3 independent intervals presented in random order, each of which was submitted for 6 times; alia block consisted of 50 trials in which subjects estimated 3 sub-second intervals (300, 400, 500 ms), presented in random order for 6 reps too.

1.2.5 Measures

Instruments used are: *AC-MT* Test for evaluation of calculus disorders (Cornoldi, Lucangeli & Bellina, 2002) and Weschler III for QI evaluation (Wechsler, 1991).
● The test AC-MT was born as a response to the need to have an instrument to assess the numerical and calculation skills, in children from 6 to 11 years.

The tool serves to determine the detail of calculation (baseline assessment) and the difficulties of calculation (diagnosis of the first level), through six specific indices: the first two indices refer to the "accuracy" variable, the third index refers to the speed of calculation, provides an individual administration; the fourth index regard the presence of basic elements, related to the ability to lexical comprehend and produce, syntactic and semantic number; the other two indexes refer to written operations and solving mathematic problems.
● The WISC-III (Wechsler Intelligence Scale for Children; Wechsler, 1991) is a clinical tool for the diagnosis and evaluation of intellectual abilities of children aged from 6 to 16 years and 11 months; it is constituted by it 13 subtests divided into two groups: verbal subtest and subtest performance. Verbal subtests are oral questions without time limits except for Arithmetic; performance subtests are nonverbal problems, all of which are timed and some of which allow bonus points for extra fast work. The subtest select different mental abilities which will together contribute to the overall intellectual ability (IQ).

The verbal subtests measure: Information, Similarities, Arithmetic (Numerical Reasoning), Vocabulary, Comprehension, Digit Span. The Performance subtests are: Picture Completion, Coding, Picture Arrangement, Block Design, Object Assembly, Symbol Search, Mazes.

The ability of the child is synthesized through three different scores: Verbal IQ, Performance IQ, and Total IQ, (a combination of subtest scores for verbal and performance).

1.3 DATA ANALYSIS

The Univariate Analysis of Variance tree way (ANOVA) is used to measure the percentage of errors in temporal comparison task; in particular the Anova between subjects is used in the experimental group (child with dyscalculia) and in the control group (healthy child); The Anova within subjects is used to measure the dimension of BLOCK (sub and supra-second intervals) and the dimension of TEMPORAL REPORT between the test and standard stimulus (test stimulus longer than the reference test, against shorter than the reference stimulus).

Student's t test for independent samples was used for the inter-group and intra-group comparison.

1.4 RESULTS: PRELIMINARY ANALYSIS

A preliminary analysis is made in order to measure the level of IQ in both groups (subjects with dyscalculia and healthy subjects). The WISC III test shows that all participants have an IQ in the standard.

Another preliminary analysis is done to confirm the absence of symptoms of dyscalculia in the group of healthy children. The test AC MT- indicates that the 12 healthy child reported a normative score.

The Univariate Analysis of Variance to verify the influence of gender variable on performance tests emphasises the following:
● the significant effect of gender on time comparison task in sub-second block ($F_{(1,11)} = 5.16$, $p < .05$) and supra-second block ($F_{(1,11)} = 13.78$, $p < .01$): specifically boys obtain higher average score than girls in sub and supra-second intervals than girls;
● the effect of the variable of gender on temporal relationship in supra-second intervals ($F_{(1,11)} = 9.76$, $p < .05$): boys show a highest average score than girls in time relationship task with supra-second intervals.

1.4.1 Temporal Comparison

The three-way ANOVA for repeated measures shows the influence of the factor GROUP on temporal relationship ($F (1,11) = 7.34$, $p < .05$), and on the percentage of error in temporal comparison ($F (1, 11) = 5.42$, $p > .05$), but also a significant effect of the within-subjects factor BLOCK ($F (1,11) = 6.92$, $p < .05$).

The factor REPORT TIME has a main effect ($F (1,11) = 5.48$, $p < .05$) on the percentage of errors in the work of the temporal comparison.

Comparing the average scores, data show that: there is no difference between the two groups in the percentage of errors for the block supra-second intervals; while in sub-second test, children with dyscalculia are significantly less accurate than healthy children.

In children with DD, the temporal relationship is broader compared with healthy children but only in tasks of sub-second timing.

The interaction GROUP * BLOCK * REPORT TIME proves statistically significant ($p < .05$).

1.4.2 Temporal Reproduction
Student's T for independent samples shows a significant difference between experimental and control group in sub-second intervals ($F = 5.31$; $p < .05$).

The two-way ANOVA for repeated measures shows a main effect of factor BLOCK ($F (1,11) = 64.2$, $p < .01$), while there was found no main effect of the factor GROUP ($F (1, 11) = 1.35$, $p = .275$).

1.5 DISCUSSION

The present study is designed to assess the ability of children with DD to compare and reproduce time intervals. Compared to the tasks of temporal comparison, the research has shown that there are differences due to gender variables: in particular in the group of children with dyscalculia, boys seem to have a lower level of performance than girls. This result confirms some studies that show an increased incidence of disorder on girls than boys, because dyscalculia is associated to dysfunction in both hemispheres brain with a significant contribution of right hemisphere. As the girls are probably more dependent on verbal cognitive processes are higher than boys in this cognitive function they may be more phone to learning disabilities that depend of right hemisphere (Badian, 1983).

Disconfirming the initial hypothesis, there isn't difference between children with dyscalculia and healthy children as regards to the percentage of errors demonstrated in the resolution of the task.

Furthermore, confirming the research hypothesis, the factor Temporal Relation has a major effect on the percentage of errors: in detail, the interaction Block * Temporal Relation is also found to be significant as the Group * Block.

In reference to this interaction, the difference between the two groups concerns only the sub-second intervals, that is to say children with dyscalculia were significantly less accurate than the control group in the timing test of sub-second durations, because they manifest more errors in over timing comparison task, giving a judgment of underestimation compared to the standard stimulus.

Moreover, the post hoc analysis showed that the dyscalculia group significantly underestimates the duration of visual stimuli compared to the control group, whereas it was reported no difference between the subjects for the supra-second block.

In the task of reproduction time, the only significant value concerns the temporal factor BLOCK in the sub-second intervals: in fact children with DD give a judgment of underestimation compared to the standard stimulus, that is to say children with dyscalculia reproduce the test stimulus for a shorter duration than the standard stimulus.

The research shows that participants with dyscalculia did not differ from control group in comparison of supra-second intervals, but only in sub-second intervals. This temporal abnormality of child with DD is confirmed by the literature, that shows the presence of parietal and frontal activation during performance of works similar to ours.

The execution of timing tasks for sub second periods shows a cluster of activation in the right inferior parietal lobe (IPL) for perceptual and motion timing works.

1.6 CONCLUSION

The examination of neuroimaging studies (TMS - Transcranial Magnetic Stimulation) allows us to explain the temporal abnormalities in our group with dyscalculia, but it remains to explain why children with DD underestimate the time.

According to some recent evidence documenting a spatial encoding from left to right of the time intervals respectively from shorter to longer ones (Frassinetti *et al.*, 2009; Vicario *et al.*, 2008) one might assume that a trend toward the left along the mental number line may be responsible for the underestimation of time.

The results of a recent work document the presence of a pseudo-neglect (ie an attentional bias to the left) higher in the DD group compared with the control group, when they are asked to perform a task bisection of mental number

line (Ashkenazi & Henik, 2010). In particular, these authors showed that the group whit dyscalculia tends to identify the center of a segment leftmost of the control group. This study is the first to highlight the difficulty of spatial attention in children with DD (Corbetta & Shulman, 2002).

Knops and colleagues (Knops, Thirion, Hubbard, Michel & Dehaene, 2009), has further highlights the presence of a pattern of involuntary eye movements to left or to right, during the execution of arithmetic operations (subtraction vs. Addition, respectively) in association with activation of posterior parietal cortex.

On the basis of this evidence, it is assumed that an attentional bias to the left like the one recently reported by Ashkenazi and Henik (2010), may reflect the phenomenon of underestimation highlighted in children with DD, as predicted by the Time line model (Vicario et *al*., 2007) which proposes a similar orientation from left to right also for time intervals as well as for the numbers (Dehaene, Bossini & Giraux, 1993).

It was recently proposed a possible association between poor math skills and visual deficits in the temporal processing, considering the performance of DD in exploration tasks of sensitivity to visual motion (Sigmundsson, Anholt & Talcott, 2010). This study provides the first direct evidence on changes in the processing capacity of the explicit time in children with DD in absence of comorbidities. These deficts seem to be selective for sub second intervals.

The results of this study corroborate the hypothesis of a recent Mental Time Line (Vicario, Caltagirone, Pecoraro, et *al*., 2008;. Oliveri et *al.*, 2008) in which the representation of the inferior duration is positioned in the left side of a mental space, while the representation of a longer duration is positioned in the right side of the same mental space.

1.7 IMPLICATIONS FOR PRACTICE

Research in literature should be conducted in order to test the impact of arithmetic training sessions, which have been recognized to be able to improve the dyscalculia deficiency, changing the activation of both parietal and frontal circuits (see Ansari, 2008, for a comprehensive review), the ability to perform time estimate tasks.

There are four type of treatment to increase the math abilities:
● early intervention with children with difficulties in reading and writing;
● global training on the difficulties of numerical processing and calculation;
● training on transcoding numbers;
● training on specific components of numbers and calculation with the use of compensatory instruments.

In the first arithmetic tasks (such as sets, perceptual and manipulative activities), these children haven't particular difficulties because these activities do not provide abilities that are really difficult for them.

The first treatment is focused about the recovery of lexical labels (to read and write numbers, to count backwards, for multiplication tables), the working memory (to read and write numbers, to count); the ability to automate procedures (for calculating written and counting). Skills that would be favored with this type of intervention are: a) Increased efficiency in the number line, with exercises ascending and descending count, games such as the identification of the following or preceding number; b) The identification of the semantic aspects of numbers, such us their arrangement and placement on the number line, the mental calculation, the addition and subtraction.

The second model of treatment promotes: a good control of the processes of transcoding number; good executive skills and control measures relating to the calculation in children who started the second cycle of elementary school. Among the most frequent difficulties, together with those in arithmetic facts, there are the tasks of numerical transcoding and serial backward counting. A good ability in the use of the number line helps in the performance of any activity with numbers and calculations.

The training of numerical transcoding is intensive and of short duration; this is made during the last years of primary and secondary schools; it rests mainly on exercise of transcoding numbers, but also draws from some activities related to the number line. This treatment promotes a more efficient reading and writing of numbers in terms of speed and accuracy.

At the last, training on specific components of numbers influences: the specific components of numerical and calculation abilities; the promote awareness and the use of compensatory measures (using timing and mode of intervention shorter). During this treatment, you can teach, depending on requirements, to: a) use the calculator and the multiplication table; b) monitor the written calculation; c) to learn strategies to simplify mental calculations.

University Malaya. 50603 Kuala Lumpur, Malaysia
[b] Department of Education, Ilmu Khas Teacher Training Institution, 56000 Kuala Lumpur, Malaysia

Abstract

Teacher's behavior has a significant role in influencing the truanting behaviors among the students. The objective of this study is to identify the characteristics of teachers' behavior which impact on truancy among secondary school students. The sample consisted of 472 truants who have routinely skipped school from 10 to more than 40 days per year. Information about the samples' truancy was provided by the school administration. The findings indicated that there were 15 types of teachers' behaviors which affect truant behaviors of students. The characteristics of 'teacher serious in teaching' has the highest mean and 'teachers are biased toward male students' has the lowest mean. Further analysis showed that there were significant differences in mean in the construct of teacher's behavior based on gender and type of school.

*Keyword*s: Teacher's behaviors; truancy; gender; type of school

1. Introduction

School is a significant setting in the process of development for every individual in the country when public education is made compulsory. School is considered as the extended home for individuals as a lot of time is spent in school. Thus, the members in the school setting especially the teachers have a vital role to play in many aspects of students' attitude and motivation. Truancy is a type of behavior displayed by students that has drawn the concerns of parents, educators, society and the Ministry of Education. Truancy is defined as habitual engagement in unexcused absence from school (Zhang et al., 2010).

According to the Ministry of Education records, in 2010, out of 111, 484 discipline problem cases, 19, 545 cases involved truancy. In 2011, from the 108, 650 discipline problem cases, 18, 550 involved truanting behavior. Truancy is the beginning point to many lifelong problems (Garry, 1996). Literature review has reported that truanting behavior among the students is an early sign to many social problems. Truancy is related to dropout from schools (Baker et al., 2001, Balfanz et al., 2008; Furgusson et al. 1995; Hibbett et al. 1990), low academic performance (Chang & Romero, 2008; Nauer et al., 2008; Seeley, 2008a; Wilson et al., 2008), problems in academic (Balfanz et al., 2008; Heilbrunn, 2007), delinquency (Wang et al., 2005), and substance abuse (Heilbrunn, 2007; Herny & Thornberry, 2010; McAra, 2004; Seeley, 2008a).

The Ministry of Education has introduced the system of warning letters in deterring truancy. The school administration is given the authority to assign three types of warning letter to students who play truant. Warning letter type one will be given to students who are absent from school unexcused for more than ten days. Students who skip school unexcused for more than twenty days will receive warning letter type two. Warning letter type three will be issued to students deemed truant for more than forty days. Students will be expelled from school if they continue to truant. However, parents and guardians can appeal for the students to be re-registered into the school system.

Burley and Harding (1998) reported that school policies, rules, curriculum and teachers' characteristics can result in significant impacts on students' attitudes and attendance in school. Research has shown that teachers as the closest social agent to students in school have contributed to truanting behavior among students. Teachers' characteristics and attitudes can contribute to truancy (Baker et al. 2001; National Centre for School Engagement, 2005). Teachers who show lack of respect for students and disregard the different needs among the students can make students attempt to truant (National Centre for School Engagement, 2005).

Bartholomew (2009) stated that truants like to use "dislike teachers' teaching methods" as the most common excuse for playing truant. Truants favor interaction with teachers and students besides being granted autonomy in the learning process (Bartholomew, 2009). Bartholomew (2009) further asserted that positive teacher-student interaction can encourage students' attendance in class. Teachers' characteristics such as rude, sarcastic, unfair, insult and embarrass students can influence truanting behavior though the impact is rather small (Bartholomew, 2009). Aligned with Bartholomew (2009), Britten (2002) reported that teachers' unpleasantness and hatred toward certain students can contribute to students' truanting behavior. Besides that, students are also inclined to skip school when they feel that teachers and schools do not care for them (Van Breda, 2006) or teachers apply authoritarian teaching methods (Wiles, 2000).

In the Malaysian context, Azizi Yahaya et al. (2007) revealed that the aspect of teachers has the highest mean among all the predictors for truancy. Pursuing this further, Azizi Yahaya et al. (2007) point out that teachers who like to assign a lot of homework to students, are always late to class and fail to perform effective teaching will discourage students from staying in school. Findings of Mohamed Sharif and Hazni (2010) and Johari and Nik Selma (2011) support the role of teachers in influencing students to become truant. Muhammed Sharif and Suria (2012) reported that teacher's attitude can cause students' unexcused absence from schools. In their findings, 59.4% of the truants feel that their discipline teacher is unfair in punishing students, thus keeping students away from school. Furthermore teachers who are very strict, serious and mean can make students skip school. Bartholomew (2009) stressed that high expectations of teachers on students' performance outside and inside the classroom produce positive impacts on students' truanting behavior.

The major objective of this study is to determine the role of teachers in the problem of truancy among secondary school students. It is aimed at identifying the types of teachers' behaviors that will influence secondary school students to involve themselves in truancy. Besides that, this study also intends to identify the mean differences of teachers' behaviors based on gender and type of school.

2. Methodology

Respondents for this study were 472 students consisting of 322 males and 150 females from public schools which have been identified as schools with a high rate of truancy by the Ministry of Education in Malaysia. The respondents are 346 Malay, 64 Chinese and 62 Indian students aged between 13 to 16 years. Some 236 of the sample have been given warning letter one, 183 have been given warning letter two and 53 have been given warning letter three by the school administration.

Samples were obtained using purposive and random sampling procedures. We randomly selected 15 schools of high rate in truancy from the list given by the Ministry of Education of Malaysia. Selected schools have to prepare a name list of all the students who have been given warning letters of three types. All the students in the name lists are classified as sample. Data were obtained via survey using a self-administrated questionnaire. Samples were gathered and given 30 minutes to answer the questionnaire. The questionnaire has been developed by the researchers based on educational theory and literature review. The questionnaire consists of two parts, part A elicits the respondents' demographic data whereas part B is about teachers' characteristics. There are twenty-five items in the questionnaire. The instrument has undergone pilot study for validation.

3. Results of Research

The reliability of the instrument was assessed using estimates of internal consistency (Cronbach alpha). The cut-off value for Cronbach alpha is .70 and above (Hinton et al., 2004). Data of the study were analyzed based on SPSS (Statistical Package for the Social Sciences) to generate the descriptive and inferential statistics of the respondents and to achieve the objectives of this study. The Cronbach alpha value for the instrument is .79 which means the instrument has reached acceptable reliability (Hinton et al., 2004).

Table 1 reveals the mean and standard deviation of items on teacher's behavior. The means of all items were within the range of 2.34 and 3.49. Item 'teachers are serious in their teaching' has the highest mean ($M = 3.49$, $SD = 1.06$) whereas item 'teachers are gender biased, favor male students' has the lowest mean ($M = 2.34$, $SD = 1.08$). Items with mean within the range of 3.40 and 3.17 are 'teachers are serious in their interaction with students' ($M = 3.40$, $SD = 1.06$), 'teachers are biased, attention is given to students with high academic achievement' ($M = 3.32$, $SD = 1.24$), 'teachers emphasize on academic only' ($M = 3.31$, $SD = 1.12$), 'teachers are fierce' ($M = 3.29$, $SD = 1.21$), 'teachers like to scold and nag at students' ($M = 3.27$, $SD = 1.33$), 'teachers are biased, attention is given to students who contribute to school such as prefects, librarians' ($M = 3.17$, $SD = 1.29$) and 'teachers are not concerned about my problem' ($M = 3.17$, $SD = 1.23$). Items with mean within the range of 2.72 and 2. 2.34 are 'teachers rarely enter

class to teach' ($M = 2.72$, $SD = 1.23$), 'teachers are not pretty/ handsome' ($M = 2.70$, $SD = 1.33$), 'teachers have no initiative to teach' ($M = 2.65$, $SD = 1.19$), 'teachers understand my feeling', ($M = 2.58$, $SD = 1.24$), 'teachers are gender biased, favor female students' ($M = 2.54$, $SD =1.17$), 'teachers never check/ mark my homework' ($M = 2.53$, $SD = 1.19$) and 'teachers are gender biased, favor male students' ($M = 2.34$, $SD =1.08$).

The report further illustrates that 77.1% of the respondents do not agree that their teachers understand their feeling, 53.6% of the respondents agree that their teachers are too serious in the teaching and learning process, 47.7% of the respondents feel that their teachers are serious when interacting with students. 44.3% of the respondents find that their teachers are biased as they give more attention to good academic achievers because 43.2% of the respondents find that their teachers are very academic orientated. Besides that, the findings also show that 41.7% of the respondents agree that their teachers are fierce, 43.9% feel that their teachers like to nag and scold students and 42.2% of the respondents find teachers are biased as they give more appreciation to students who can contribute to schools such as prefects and librarians.

Table 1: Mean and standard deviation of items on teacher's behavior

	Item	SD (%)	D (%)	SA (%)	A (%)	SA (%)	Mean	Standard deviation
E1.	Teachers are fierce	9.5	14	34.7	21.4	20.3	3.29	1.21
E2.	Teachers are biased, attention is given to students with high academic achievement	7.8	19.7	28.2	21.6	22.7	3.32	1.24
E3.	Teachers are gender biased, favor male students	25.4	31.4	32.2	5.7	5.3	2.34	1,08
E4.	Teachers are gender biased, favor female students	22.0	27.8	32.8	8.9	8.5	2.54	1.17
E5.	Teachers are biased, attention is given to students who contribute to school such as prefects, librarians	10.8	23.7	23.1	22.9	19.5	3.17	1.29
E6.	Teachers are serious in their teaching	5.3	11.0	30.1	36.9	16.7	3.49	1.06
E7.	Teachers are serious in their interaction with students	5.5	12.1	34.7	32.4	15.3	3.40	1.06
E8.	Teachers emphasize on academic only	7.0	14.8	35.0	26.9	16.3	3.31	1.12
E9.	Teachers rarely enter class to teach	18.6	26.7	29.0	14.8	10.8	2.72	1.23
E10.	Teachers understand my feeling	25.8	21.0	30.3	15.3	7.6	2.58	1.24
E11.	Teachers are not pretty/ handsome	22.9	24.2	28.8	8.3	15.9	2.70	1.33

Table 2 shows the comparison of mean for teachers' behavior based on gender. Independent-sample *t*-test is used to determine if the mean differences is significant at the .05 level. As indicated in Table 2, the analysis yield a *t*-value of 3.67 which is significant at the specified level ($p = .000$). This implies teachers' behavior can produce difference effect on male and female students' truanting behavior. Further analysis displayed that the mean of teachers' behavior for male is higher than female students. Teachers' behavior results greater impact on influencing male students than female students to commit themselves in truancy.

Table 2: Comparison of teachers' behavior between male and female students

Construct	Mean	Standard deviation	*t*- value	*p*
Gender				
Male	45.00	8.76	3.67*	.000
Female	42.26	9.31		

Table 3 displays the comparison for mean of teachers' behavior based on types of school namely urban, rural, Felda and island. One-way ANOVA is used to determine if the mean differences are significant at the .05 level. As reported in Table 3, the analysis yielded a significant result with *F*-ratio of 6.54 which is significant at the specified level ($p = .000$). This denotes that teachers' behavior can produce difference impacts on truancy among students from urban, rural, Felda and island schools. The mean of students from Felda schools is the highest whereas the mean of students from rural schools is the lowest.

Post hoc test was conducted using Scheffe correction for multiple comparisons as shown in Table 4. The mean differences of teacher's behavior on truancy between urban schools and rural schools and between rural and Felda schools are 3.329 and 6.649 respectively and they are both significant at .05 with the value of *p* being .028 and .000 respectively. However the mean differences of teachers' behavior on truancy between urban and the Felda and the island schools are 3.162 and 1.079 respectively and they are not significant at the .05 level. Moreover, the mean differences between island and rural and Felda schools are 2.249 and 4.241 correspondingly are also not significant at the 0.05 level.

Table 3: Comparison of teachers' behavior One-way ANOVA based on types of schools

	Mean	Standard deviation	*F*- value	*p*
Types of school				
Urban	44.71	9.13	6.545***	.000
Rural	41.38	7.50		
Felda	47.87	9.58		
Island	43.63	8.72		

Table 4: Teachers' behavior on truancy differences among the schools

	Mean differences	P
Types of school		
Urban and rural	3.329*	.028
Urban and Felda	-3.162	.920
Urban and island	1.079	.947
Rural and Felda	-6.649*	.000
Rural and island	-2.249	.728
Felda and island	4.241	.235

4. Discussion

The findings of the study reveal that teachers' behavior plays a vital role in effecting the truanting behavior among the secondary school student as supported by Burley and Harding (1998), National Center for School Engagement (2005), Bartholomew (2009), Baker et al. (2001) and Azizi Yahaya et al. (2007). One of the most noteworthy findings of this study is more than two-third of the truants feel that their teachers do not understand their feeling and this input need to be considered seriously by the Ministry of Education particularly the teachers themselves. Most of the truants in this study feel that their teachers are too serious when they deliver their teaching in class therefore make learning process very boring. This is agreed by Bartholomew (2009) as the findings reported that truants always used 'dislike teacher's teaching method' as the reason for skipping class. According to Bartholomew (2009), truants prefer lessons where students are given a lot of opportunities to interact with the teacher and other students besides liking to attend classes where they have the autonomy to channel their opinions of things happening in class. Applying authoritarian teaching pedagogy will influence truancy among students. Teachers who like to use lecturing in class and assign many tasks for students to work on their own will discourage students from attending class. This is supported by the findings of Azizi Yahaya et al. (2007).

Teachers who like to practice seriousness when interacting with students affect truancy as truants state that they will skip class if they are discouraged from interacting with the teachers as reported by Bartholomew (2009). Teachers who treat students unfairly will stimulate students' truanting behavior. Teachers have to provide equal attention to all students though truants usually cannot perform well in academic and others aspects in school. Lack of attention from the teachers will increase the tendency of students to commit in truanting behavior. Furthermore, teachers should not focus on the academic aspect only in educating students as each student has different potential that can be developed as stated in Gardner's multiple intelligence theory. Learning settings that are academic oriented will demotivate students who cannot excel in academic aspect and lead them to truancy.

Teachers who are fierce, rude, sarcastic and unfair are not favored, thus they will discourage students from attending class (Bartholomew, 2009; Britten, 2002; Muhammed Sharif Mustaffa & Suria Abdul Jamil, 2012). According to Van Breda (2000), students will be tempted to involve in truancy if they cannot feel cared for by the school and teachers especially. At the same time, the findings of this study also confirmed that students who like to truant express that their teachers are not concerned and do not care about their problem. This will make students face loneliness and helplessness in solving their problems; consequently they will turn to peers where the feeling of

togetherness can be fulfilled. Teachers who like to scold and nag have proven to be one of the factors that influence truanting behavior among the students. Teachers' scolding and nagging has demotivated students from attending classes because they feel that learning is an unpleasant process injurious to their self-esteem.

Further analysis demonstrates that teachers' behavior can result in different impacts on the truanting behavior among the male and female students. Male students are more likely to play truant as a result of teachers' behavior. This may because most of the teachers are female. Additionally, the findings also reveal the teachers' behavior can influence the students of urban, rural, Felda and island schools to commit truancy differently. Students of Felda School most probably will skip school because of teachers' behavior followed by students from urban and island schools. In contrast, students from rural schools are least affected by teachers' behavior to become truants.

The findings of this study have revealed that teachers play a very crucial role in resolving the problem of truancy. Teachers themselves should have the awareness that they can contribute a lot of effort in helping truants to stay in school. It is essential that teachers have the initiative and capability to create a conducive and enjoyable learning process for the students to motivate them to keep coming to school. Learning activities should be student- centered and hand-on activities which focus on students' involvement should be emphasized. Besides that, teachers should prepare learning activities and create a learning environment that fulfills students' multiple intelligences. Developing a sense of belonging among students in the school system will attract them into continued attendance.

As for the psychological aspect, teachers have to foster good and close interaction with students whereby students' opinions and suggestions on the teaching and learning process and the school setting can be shared. Two-way communication ought to be practiced between the teacher and students to facilitate good relationship thus encouraging students to stay in school. Teachers with friendly and caring personality can prompt students to attend school as all students like to be taught by teachers who are very approachable and concerned about their students. It is of upmost importance for teachers to convey the message that they do care and understand how students feel. Teachers need to be aware that their characters can produce different influences on truancy based on the students gender and the school type.

Abstract

Today's managers are facing the problem of turnover intentions due to lack of skilled workers. Most of the organizations are using rewards, recognition to retain them but, how POS and organizational commitment helps them to retain key employees still need to explore. A total of 412 respondents participated in questionnaire based survey conducted in Malaysian banks. Results of the study revealed that POS positively affect on AC and NC while negatively on turnover intentions. Furthermore, AC and NC perform the role of mediator between POS and turnover intentions. Limitations and implications are also discussed.

Keywords: Perceived organizational support (POS), Affective commitment, Normative commitment, Turnover intentions;

Introduction

Leaders are of the view that committed and skilled employees are the only source of competitive advantage for organizations. In addition to this, skilled employees are of much importance for the organization's effectiveness, therefore it has become essential for employees to retain such employees (Mayfield and Mayfield, 2008). This issue has realized the importance of commitment to employers because committed employees are more adaptable to change, learn efficiently, work efficiently and less likely to leave the organization (Mowday, 1998). As a result HR managers are paying more attention in recruitment and retention of skilled employees. Management's policies which support their employees also play a vital role in enhancing their commitment and retention (Perryer et al., 2010).

Retention of employees with positive attitudes and skills has become difficult in the Malaysian context because of skills shortage. The breadth of the skill shortage was of major national concern in manufacturing, engineering, health service, IT and banking. This issue has created huge problem for the HR managers regarding high cost of employee's retention. Organizations are trying to retain its employees through promotions, rewards and incentives (Perryer et al., 2010), while some are providing them learning environment (Islam et al., 2013; Islam et al., 2012). One of the positive organizational aspects is perceived organizational support (Mowday, 1998). This aspect has strong impact on employee's organizational commitment and turnover intentions.

POS can be defined as "the overall extent to which employees believe that their organization values their contribution and cares about their well-being" (Eisenberger et al., 1986). Organizational support theory proposed by Eisenberger and colleagues was the base behind the concept of POS. researchers in the field of management and organizational behavior has identified POS as antecedent of employees organizational commitment and turnover intentions (Kim & Chang, 2012; Su, Baird and Blair, 2009; Yi & Lee, 2012). Organizational commitment can be defined generally as the relative strength of an individual's identification with, and involvement in, an organization (Mowday, Steers & Porter, 1979). Organizational commitment is an important factor of organizational outcomes and performance. Committed employees are more likely to engage in productive behaviors and less likely to leave the organization (Meyer, Allen & Smith, 1993). Organizational commitment is considered as multidimensional

---

[178] Talat Islam. Tel.: +60-14-9828964
E-mail address: talatislam@yahoo.com

construct i.e. affective, normative and continuance commitment (Allen and Meyer, 1990). *Affective commitment* is the employees emotional attachment with the organization, *Normative commitment* is the obligation to remain with the organization while *Normative commitment* is related to the cost associated with leaving the organization (Allen and Meyer, 1990). Researchers in the past have identified that employees who are emotionally attached, or thing obligation to be with the organization are less likely to leave organizations (Hsu, 2009, Meyer et al., 2002).

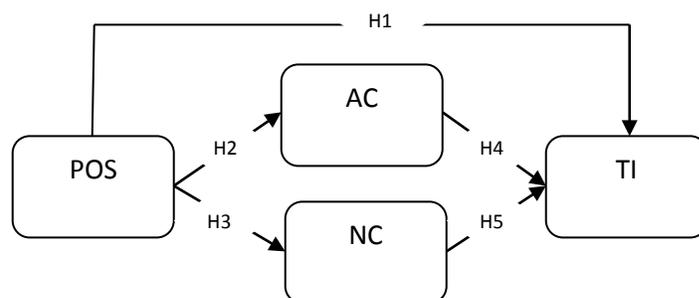
The current study is aimed to investigate the mediating effect of affective and normative organizational commitment between POS and employees turnover intentions among the employees of Malaysian banking sector to explore the social exchange relations in a new way. In addition to the direct relations the present study is also aimed to see how affective and normative commitment performs the role of mediator between POS and turnover intentions. Because Recently Galletta et. al., (2011) while exploring the relationship between POS and TI proposed to investigate the mediating role of organizational commitment between POS and turnover intentions.


Figure 1: Hypothesized model

Methodology

Sample and procedure

A questionnaire based research was employed using 412 employees working in Malaysian Banking sector, chosen on the basis of simple random sampling technique. A total of 600 questionnaires were distributed after getting permission from the branch managers with the response rate of 68%. Respondents were asked to be realistic regarding questionnaire and were assured that their information would be used only for research purpose. Out of total 78% of the respondents were female, 69% were having master's degree and 54% of them were having more than 5 years working experience with the same institutions.

Instrumentation

All the respondents were judged on the basis of five points Likert scale ranging from 1 = strongly agree to 5 = strongly disagree. To measure employee's turnover intentions 3 items scale was used from the study of Lichtenstein et al. (2004) who reported its reliability 0.83. Meyer and Allen (1990) introduced 16 items scale for affective and normative commitment. In a recent study Gellatly, Meyer, and Luchak, (2006) reduced this scale up to 6 items and reported that it is better than original scale. The same 6 items scale was used in the present study containing 3 items for each dimension. Researchers have continusly reduced Eisenberger's 36 items scale regarding POS. Recently Paillé, Bourdeau, and Isabelle, (2010) used 3 items scale and reported 0.89, 0.88 and 0.89 as factor loading with 0.92 reliability. The same three items scale was used in the present study.

Data Analysis

Table 1 shows the mean, standard deviation, reliabilities and correlation among all the variables. Mean score of the variables (POS, AC, NC and TI) are near to neutral (M= 3.61, 3.57, 3.68 and 3.29 respectively). POS was found to be positively associated with affective and normative commitment (i.e. $r = 0.65$ and 0.47 respectively) but negatively related to employees intentions to leave the organization ($r = -0.54$). On the other hand affective and normative organizational commitment were also found to be negatively related with employee's turnover intentions ($r = -0.53$ and -0.46 respectively). All measures demonstrated adequate levels of reliability (0.79–0.88).

Table 1. Descriptive, Statistics and Reliabilities

Variables	Mean	S.D	1	2	3	4
1.POS	3.61	0.39	(0.88)			
2.AC	3.57	0.58	0.65**	(0.79)		
3.NC	3.68	0.71	0.47**	0.68**	(0.81)	
4.TI	3.29	0.65	-0.54**	- 0.53**	- 0.46**	(0.83)

Note: Mean, Standard Deviation, Pearson correlations and Reliability. **$p < 0.01$; $n = 412$.

3.1   Structure equation model assessment:

Diamantopoulos and Siguaw (2000) demonstrated that the main objective behind SMA is to determine whether data support the conceptual explanation or not. Figure 2 shows the strength of the relationship with path coefficients and model fit. The hypothesized model indicated a good fit in all indices i.e. $p < 0.01$, nonnormed fit index (NNFI) =. 94, root mean square of approximation (RMSEA) = 0.063, standardized root mean square residual (SRMR) = 0.052 and comparative fit index (CFI) = 0.96, All the hypothesis were significant.

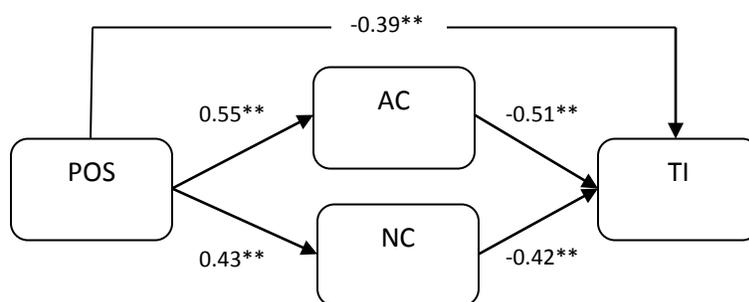
In addition to this another alternative model was tested. This model turned two paths i.e. POS to turnover intentions and NC to turnover intentions as non-significant. This model exhibit almost identical fit to the model except CFI. The results from alternative model were $p < 0.01$, CFI = 0.95, NNFI = 0.94, RMSEA = 0.063, SRMR = 0.052.


Figure 2: Hypothesized Model with Path coefficients

Both model fit almost gave the same results the difference was found in alternative model which showed two insignificant paths. In addition hypothesized model is good in parsimony. So, hypothesized model was accepted and the alternative model was rejected. Thus Affective and Normative commitment mediate the relationship between POS and employee's turnover intentions.

Discussion and Implications

The present study was aimed to find how employee's perceptions of organizational support help them in enhancing their commitment level with the organization and change their intentions to leave the organization. Firstly, POS was found to influence affective and normative commitment positively and turnover intentions negatively. This shows that when employees feel support from organizations they reciprocate it by showing more commitment and changing their intentions to leave the organization. These results are in accordance with the basic motive behind Eisenberger's (1986) theory of organizational support. Following the same theory some other researchers have also found the same results (e.g. Hsu, 2009; Kim & Chang, 2012; Su, Baird and Blair, 2009; Yi & Lee, 2012). Secondly, both AC and NC were found to be negatively related with employee's turnover intentions. These results are in accordance with Meyer et al., (2002) that highly committed employees are less likely to leave the organizations. Thirdly, SEM was applied to find the mediating role of AC and NC between POS and turnover intentions considering the call of Galletta et. al., (2011). Results revealed that AC and NC perform the role of mediator between both constructs. This means that, to reduce turnover intentions both POS and commitment are necessary.

The present study also has lots of implications for managers. As it was said earlier that now managers are facing problem in retaining their key employees so, they should implement those policies in organization which support employees this will not only enhance employee's organizational commitment but also reduce employee's intentions to leave the organization. on the other hand while making decisions they should consider the opinion of their

employees this will not only encourage them but also enhance their working capacity which ultimately affect on organizational effectiveness.

Limitation and future direction:

The present study was not free from limitations. Firstly, the study was conducted at one point in time future researchers should conduct longitudinal studies. Secondly, respondents of the present study were well educated this might turn the results in the favor of researchers, in future data should be conducted from different educationalists. Thirdly, most of the respondents in the present study were female which might raise a question on gender biasness. As this was the first study to determine the mediation role of AC and NC between POS and turnover intentions future researchers should explore the same in different geographical areas to make the results more generalize. Furthermore, future researchers should also focus on CC as mediator although this is related to the cost associated with leaving the organization but practically may employees are there who leave the organizations due to lack of support.

Conclusion:

The current study was aimed to resolve the issue of employee's turnover intentions among the employees working in Malaysian banking sector. For this, two aspects i.e. POS and organizational commitment were chosen. Results of the study revealed that POS helps employees to enhance their affective and normative commitment which ultimately reduces their intentions to leave the organization. SEM has confirmed that affective and normative commitment performs the role of mediator between POS and turnover intentions.

Twitter Sosyal Ağ Sitesinin Eğitim-Öğretim Sürecinde Kullanılmasının Etkileri

Barış ÇUKURBAŞI[a][179]

ᵃBartın University, Faculty of Education,74100, "Bartın", Turkey

Özet

Twitter, kullanıcılarına "tweet" adı verilen 140 karakterlik metinler yazma imkanı veren bir sosyal ağ sitesidir. Twitter kullanıcıları, ilgilendikleri kişilerin, grup veya toplulukların en güncel hikayelerini, düşüncelerini, haberlerini, fikirlerini anlık olarak öğrenebilmektedirler. Twitter, çoklu ortam paylaşımına ve bu paylaşımlara yorum yapılmasına olanak tanımaktadır. Ayrıca fikirlerin, bilgilerin, son dakika haberlerinin, kişisel deneyimlerin, çalışma yaşamının, toplumsal olayların paylaşılabileceği samimi bir sosyal ortam ve çok iyi bir zihin okuma ve zihni açma aracı olan bir Web 2.0 teknolojisidir (O'Reilly & Milstein, 2011). Henüz 6-7 yıllık bir geçmişe sahip olmasına rağmen dünya genelinde 600 milyon civarında Twitter kullanıcısı bulunmaktadır. Bu özellikleri ile Twitter kısa sürede eğitim-öğretim sürecinde kullanılmaya başlanmıştır. Bu araştırmada, konu ile ilgili yapılan literatür taraması ışığında, dünya genelinde yaygın olarak kullanılan Twitter sosyal ağ sitesinin eğitim-öğretim sürecinde kullanılmasının etkileri tartışılmıştır.

Anahtar Kelimeler: twitter, web 2.0, eğitim, tweet, sosyal ağ.

Abstract

Twitter a social networking site that allowing the users to write 140-character text. This text is called "tweet". Twitter users interested people, groups or communities can learn instantly most recent stories, thoughts, news, and ideas. Twitter allows sharing multimedia and commenting these shares. Furthermore ideas, information, individuals experiences, working life, social events can be shared in a friendly social environment and a very good mind reading and illumination are a Web 2.0 technology tools (O'Reilly & Milstein, 2011). Twitter has approximately 600 million users worldwide, just in spite of having a history of 6-7 years. With these features, Twitter has been used in the process of education and training. İn this research, within the framework of the review of the literature, widely used around the world use twitter social networking site effects are discussed in the process of education and training.

Keywords: twitter, web 2.0, education, tweet, social network.

Giriş

Bilgisayar ve internet teknolojileri giderek gelişmekte, yaygınlaşmakta ve hemen hemen her alanda bu teknolojiler kullanılmaktadır. Türkiye İstatistik Kurumu Başkanlığı'nın 2012 yılı Nisan ayında gerçekleştirdiği "Hanehalkı Bilişim Teknolojileri Kullanım Araştırması" sonuçlarına göre, 16-74 yaş arasındaki bireylerde bilgisayar kullanım oranı %48,7; İnternet kullanım oranı ise %47,4 olarak verilmiştir. Bu oranlar 2011 yılında sırasıyla %46,4 ve %45 olarak bulunmuştur. Ayrıca, Türkiye genelinde evden İnternete erişim imkânına sahip olan kişilerin oranı 2011 yılında %42,9 iken, bu oran 2012 yılında %47,2'ye yükselmiştir (Türkiye İstatistik Kurumu Başkanlığı, 2012). Bilgisayar ve internet kullanım oranları göz önüne alındığında kişisel bilgisayarlar ve internetin okul, ev ve iş ortamlarında günlük yaşamın bir parçası haline geldiği görülmektedir. Bilgisayar teknolojisinin gelişmesiyle birlikte birçok yeni araç ve ürün ortaya çıkarken; internet teknolojisinin gelişmesiyle bireylerin artan ihtiyaçlarına daha etkili bir şekilde yanıt veren teknolojiler ortaya çıkmıştır. Başlangıçta var olan, yalnızca statik metinlerden oluşan ve kullanıcılar tarafından içeriğe herhangi bir müdahalede bulunulamayan sitelerden oluşan internet teknolojileri gelişerek yerini kullanıcıların internet sitelerini daha etkileşimli bir şekilde kullanmalarına imkan veren, kişiselleştirilebilen internet teknolojilerine yani Web 2.0 teknolojilerine bırakmıştır.

Web 2.0, kullanıcı katılımı sağlandığı bir ortam oluşturmaya yarayan sistemler ve içerisinde birçok uygulamayı gerçekleştirmeyi sağlayan araçlar bulunduran teknolojilerdir (Horzum, 2010). Web 2.0 uygulamalarının temel amacı, kullanıcıların rahatlıkla paylaşımlarda bulunmalarını ve internetin sağladığı sosyal etkileşim olanaklarından yararlanmalarını sağlamaktır (Ata, 2011). Web 2.0, teknolojileri günümüzde yaygın olarak kullandığımız internet teknolojilerinden biridir. (Çekinmez, 2009). Twitter sosyal ağ sitesi de Web 2.0 teknolojileri ile geliştirilmiş ve günümüzde yaygın olarak kullanılan internet teknolojilerinden biridir.

Twitter

Twitter, gerçek zamanlı bir bilgi ağıdır (Twitter, 2012). Kullanıcılarına tweet adı verilen 140 karakterlik metinler yazma imkânı veren Twitter, 2006 yılında geliştirilen ve çeşitli araçlarla daha etkin kullanılabilen bir yeni nesil iletişim aracıdır (Webrazzi, 2012). Twitter kullanıcıları ilgilendikleri kişilerin, grup veya toplulukların en güncel hikayelerini, düşüncelerini, haberlerini, fikirlerini öğrenebilmektedirler. Bunun için ilgili Twitter hesabını bulup takip etmeleri (Follow) yeterli olmaktadır. www.twitter.com adresi üzerinden erişilebilen Twitter'a aynı zamanda mobil araçlarla veya Twitter'a erişebilme özelliği olan cep telefonu servis sağlayıcılarının sunduğu kısa mesaj hizmeti ile de erişilebilmektedir.

Çeşitli özellikleri sayesinde Twitter kullanıcılarına birçok iletişim olanağı sağlamaktadır. Bağlan (@kullanıcıadları-@mentioned) özelliği, kullanıcıların istedikleri kullanıcılar ile doğrudan iletişim kurmasını sağlamaktadır ve kendi aralarında sohbet devam ettirilebilmektedir. Ayrıca, Keşfet (# etiketleri) özelliği ile # işaretinden sonra yazılan (örneğin; #ders) ifade ile özel olarak düzenlenmiş kullanışlı ve eğlenceli bir bilgi akışı sağlanabilmektedir. Bu şekilde yapılan paylaşımlar bir arada toplanıp bir bütün halinde gösterilebilmektedir. Böylece ortak bir konu hakkındaki tüm paylaşımlar bir arada görüntülenebilmektedir.

Henüz 2006 yılında kurulmasına rağmen Twitter, gün geçtikçe yaygınlaşarak günümüzde çok fazla kullanıcı kitlesine ulaşmakta ve hala da kullanıcı sayısı artmaktadır. Yapılan araştırmaya göre 2012 Ocak ayında 383 milyon Twitter kullanıcı hesabı; 2012 Temmuz ayı itibariyle ise dünya genelinde 517 milyon Twitter kullanıcı hesabı bulunmaktadır (Geolocation analysis of Twitter accounts by Semiocast, 2012). Bu kullanıcıların büyük bir çoğunluğunu (%73,7) 15-25 yaş arasındaki bireyler oluşturmaktadır. Türkiye her iki araştırma sonucuna göre de dünyada 11. Sırada yer almaktadır. Yine aynı araştırmaya göre, Twitter'da 2012 Ocak ayında yaklaşık 6 milyon Türkiye kullanıcısı bulunurken; 2012 Temmuz ayında yaklaşık 9 milyon Türkiye kullanıcısına ulaşılmıştır. Yapılan başka bir araştırmaya göre de 2012 Mart ayında 7.2 milyon Türkçe içerik üreten Twitter kullanıcısı olduğu sonucuna ulaşılmıştır (Türkiye'nin Twitter Profili, 2012). Twitter kullanıcılarının sayısının çok olması sebebiyle Twitter üzerinden birçok konuyla ilgili olarak paylaşımlar/tartışmalar yapılmaktadır. Teknoloji, sanat, eğlence, aile ve eğitim dünya genelinde en çok paylaşım yapılan konular arasında bulunmaktadır (An Exhaustive Study of Twitter Users Across The World, 2012). Özellikle eğitim alanındaki paylaşımların yüksek oranda (dünya genelinde 5. Sırada) olması, Twitter'ın eğitim-öğretim sürecinde kullanılabilir bir sosyal ağ sitesi olması hususunda önem arz etmektedir. Bu bağlamda araştırmada konu ile ilgili yapılan literatür taraması ışığında, dünya genelinde yaygın olarak kullanılan Twitter sosyal ağ sitesinin eğitim-öğretim sürecinde kullanılmasının etkileri tartışılmıştır.

Eğitim-Öğretim Sürecinde Twitter Kullanımı

Web 2.0 teknolojileri birçok konuda bilgi paylaşmak, ilişkiler kurmak ve keşfetmek amacıyla oluşturulmuş; anlamlı ve değerli arkadaşlıkları, ilgiyi ve aktiviteleri temel alarak kullanılmakta olan internet siteleridir (Kwon & Wen, 2010). Samimi bir ortam olması, multimedya paylaşımına ve bu paylaşımlara yorum yapılmasına olanak tanıması, fikirlerin, bilgilerin, son dakika haberlerinin, kişisel deneyimlerin, çalışma yaşamının ve toplumsal olayların paylaşılabilmesi ve çok iyi bir zihin okuma ve zihni açma aracı olması açısından Twitter mükemmel bir Web 2.0 teknolojisidir (O'Reilly & Milstein, 2011). Bu özellikleri ile Twitter da eğitim-öğretim sürecine dahil olduğu söylenebilir. Literatürde Twitter üzerinden gerçekleşen birçok eğitim-öğretim aktivitesi bulunmaktadır (Liu, Li, ve Guo, 2012; McPherson, Huotari, Humphrey, Cheshire, Cheng, ve Brooks, 2012; Chang, 2011; Cheng, 2012; Lalonde, 2011; Maxwell, 2012; Orman, 2010; Kanter ve Fine, 2010; Kassens-Noor, 2012; Veletsianos, 2011; Wright, 2010).

Twitter kullanılarak gerçekleştirilecek eğitim-öğretim aktivitelerinde Twitter'ın öğrencilere sunduğu paylaşım özellikleri ve paylaşımlara istedikleri zaman ulaşabilme olanakları olması sayesinde, öğrenciler rahat bir bilgi paylaşım ortamına sahip olmaktadır. Ayrıca, Twitter ile okul dışı etkinlikler düzenlenerek sınıf öğrenmeleri desteklenebilmektedir (Maddin, 2012). Örneğin, Twitter üzerinde kullanıcıların paylaşımlarıyla hikaye yazma etkinlikleri düzenlenebilmektedir. Bu etkinliklerden biri 2008 yılında Twitter üzerinden bir öğretmen küresel düzeyde bir işbirlikli çalışma sonucunda ilköğretim ve lise öğrencileriyle gerçekleştirmişlerdir (@manyvoices, 2008). @manyvoices olarak adlandırılan bu çalışma ile altı farklı bölgedeki 140 öğrenci ile gerçekleştirilen aktivitede tüm öğrenciler aynı Twitter hesabına bir kez giriş yapıp hikayeyi oluşturacak bir tweet göndermişlerdir. Böylece, 140. öğrenci giriş yapıp paylaşımını yaptıktan sonra hikaye tamamlanmıştır.

Dünya genelinde birçok eğitim-öğretim kurumu, grup, kulüp ve bireysel çalışmalar için açılmış hesaplar (e-topluluklar) bulunmaktadır. Bu hesaplar, ilkokul düzeyinden itibaren yükseköğretim seviyesine kadar olmakla birlikte uzaktan eğitim ve özel eğitim amaçlı da olabilmektedir. TheHomeSchoolMom (MaryAnnKelley), ABCTeach (Abcteach), Classroom 2.0 (classroom20), Education World (education_world), Science Blog (ScienceBlogTwit), Extreme Biology (extremebiology), YourDictionary.com Foreign Language Dictionaries (YourDictionary), Dictionary.com (dictionarycom) ve GlobalScholar (GlobalScholar) bu hesaplardan bazılarıdır (Riley, 2011). Bu ve benzeri hesaplar ile hemen hemen her alanda ve hemen hemen her kesme hitap eden paylaşımlar yapılmakta, bu paylaşımlar üzerinden yapılan yorumlar, tartışmalar ile de ilgili konu ile ilgili daha derinlemesine bilgiler edinilebilmektedir.

Tartışma

Web 2.0 teknolojilerinin eğitim-öğretim sürecinde kullanılması ile yükseköğretim düzeyindeki sınıf içi öğretme ve öğrenme faaliyetleri, zenginleşmesi ve desteklenmesi bağlamında çok büyük bir potansiyele sahip olduğu görülmektedir (Ajjan & Hartshorne, 2008). Bu bağlamda Web 2.0 teknolojileri kullanılarak sınıf içi öğrenmeleri destekleyici/tamamlayıcı etkinlikler düzenlenebilir. Ayrıca, Web 2.0 teknolojileri okulların gelişimine ve kaynakların paylaşılmasına katkılar sağlamaktadır (Muijs, West, & Ainscow, 2010).

Literatürde Web 2.0 teknolojilerinin eğitim-öğretim sürecinde kullanılması ile ilgili olarak yapılmış birçok çalışmaya rastlanılmaktadır (Baran, Çukurbaşı, Çolak, ve Doğusoy, 2012; Ata, 2011; Çekinmez, 2009; Durusoy, 2011; McLoughlin ve Lee, 2007; Horzum, 2010; Bezir, Çukurbaşı ve Baran, 2011; Keskin, 2011; Atıcı ve Yıldırım, 2010; Harris ve Rea, 2009; Karal ve Kokoç, 2010). Bu çalışmalarda genel olarak Web 2.0 teknolojilerinin lehine sonuçlar alınmış ve yapılan eğitim-öğretim aktiviteleri kapsamında öğrencilerin gelişimlerine katkılar sağladığı görülmüştür. Bu araştırmalardan McLoughlin ve Lee (2007) tarafından yapılan araştırmada Web 2.0 teknolojilerinin eğitim-öğretim sürecindeki sağlayacağı muhtemel yararları şöyle sıralamıştır:

- Bağlanılabilirlik ve sosyal uyum sağlaması
- İşbirlikçi bir şekilde bilgiyi keşfetme ve paylaşma olanağı
- Var olan içeriğe bağlı olmak yerine yeni içerik oluşturulması
- Bilgi, haber toplama ve içerik güncelleme fırsatı

Web 2.0 teknolojilerinden biri olan Twitter, öğrenciler arasında bir arka kanal, teşvik edici, sohbet aracı ve hayal etmek için bir yer olarak kullanılabilir (Ferriter, 2011). Öğrenciler, çalışma sırasında fikirlerini paylaşmak ve diğer kişilerin görüşlerini almak için Twitter üzerinden paylaşımlar yapmaktan hoşlanabilir. Twitter gibi sosyal ağ siteleri ile belirli konular arasında gruplaşan; iletişimi açık ve sürekli bir yansıtma süreci sayesinde temelini oluşturduğu akran ve bireysel öğrenmenin özelliklerine benzeyen e-topluluklar oluşturulabilmektedir (Özmen, Aküzüm, Sünkür, & Baysal, 2012). Twitter kullanımı ile öğrencilerin yaratıcılıklarını artırmakta, eğlenmelerini ve sınıf ortamının

içinde ve dışında anlamlı öğrenme aktiviteleriyle meşgul olmaları sağlanabilmektedir (Bull & Adams, 2012). Böylece Twitter'ı kullanan ve Twitter ortamında paylaşımlar yapıp, yapılan paylaşımları takip etmekten hoşlanan yani bir bakıma Twitter sosyal sitesini benimseyen öğrenciler için Twitter aracılığıyla gerçekleştirilecek olan eğitim-öğretim faaliyetlerinin verimli geçecektir. Öğrenci zaten ortamda vakit geçirdiğinden dolayı eğitim-öğretim faaliyetleri için ekstra bir zaman ayırmasına gerek kalmayacak ya da öğrencinin boş vakitlerinin verimli geçmesi sağlanmış olacaktır. Böylece öğrenci hem istediği sosyal ortamda vakit geçirecek hem de ilgili eğitim-öğretim faaliyetini gerçekleştirmiş olacaktır. Üstelik bu etkinlikler genellikle dersi destekleyici özellikte etkinlikler olarak tasarlandığından, dersin hedef ve davranışlarına ulaşılması hususunda da Twitter vasıtasıyla önemli katkılar sağlanacağına inanılmaktadır.

Twitter sosyal ağ sitesini daha önce kullanmamış öğrenciler için Twitter ortamı hakkında bilgilendirme yapılıp, ortamı kullanmalarının kendilerine sağlayacağı yararları, olası zararları belirtilip, siteyi nasıl kullanacaklarına dair bir anlatım yapılarak öğrenciler Twitter ortamını kullanmaya teşvik edilebilir. Böylece öğrencilerin Twitter ortamını benimsemeleri sağlanabilir ve bu ortamda gerçekleştirilecek olan eğitim-öğretim faaliyetlerine katılmaları sağlanabilir. Bu hususta Rogers tarafından geliştirilen Yeniliklerin Yayılması Kuramının (Diffusion of Innovation) eğiticilere yardımcı olacağı düşünülmektedir.

Twitter kullanıcılarına diğer kullanıcılarla daha iyi etkileşime girebilmeleri için birçok seçenek sunmaktadır. Kullanıcıların yaptıkları paylaşımlar (Tweet), tüm Twitter kullanıcıları tarafından görülebilmektedir. Ancak isteğe bağlı olarak sadece kendisini takip eden kullanıcıların görebileceği şekilde sınırlandırma getirilebilmektedir. Ayrıca kullanıcılar, takip ettikleri ve kendilerini takip eden kullanıcıları; bu kullanıcıların takip ettikleri ve takip edildikleri kullanıcıları görebilmektedirler. Ayrıca, Keşfet (# etiketleri) özelliği ile # işaretinden sonra yazılan (örneğin; #ders) ifade ile özel olarak düzenlenmiş kullanışlı ve eğlenceli bir bilgi akışı sağlanabilmektedir. Bu şekilde yapılan paylaşımlar bir arada toplanıp bir bütün halinde gösterilebilmektedir. Böylece ortak bir konu hakkındaki tüm paylaşımlar bir arada görüntülenebilmektedir. Twitter ortamı üzerindeki etkileşim özelliklerini fazla olması, bu ortamda bir çok öğretim yöntem ve tekniklerinin kullanılabilmesine olanak sağlamaktadır. Altı şapkalı düşünme tekniği, rol oynama tekniği, beyin fırtınası ve benzeri teknikler Twitter üzerinden uygulanabilir.

Twitter ortamında eğitim ile ilgili yapılan paylaşımların büyük oranda olması, bu ortamın eğitim-öğretim ortamlarına adapte edilebilen bir internet teknolojisi olduğu sonucuna ulaştırabilir. Bu bağlamda yapılacak doğru bir öğretim tasarımı ile Twitter aracılığıyla verimli ve etkili bir öğrenme aktivitesi gerçekleştirilebilecektir. Ayrıca çok geniş kullanıcı kitlesine sahip olması ve hemen hemen her alanla ilgili paylaşımlar yapılması Twitter'da tasarlanacak öğretim aktivitelerinin etkililiğini arttıracağına inanılmaktadır.

Türkiye'de özellikle Milli Eğitim Bakanlığı (MEB) tarafından geliştirilen FATİH (Fırsatları Artırma Teknolojiyi İyileştirme Hareketi) Projesi doğrultusunda Twitter ortamında faydalanılarak öğrenme aktiviteleri yapılabilir. Proje kapsamında her öğretmene ve her öğrenciye Tablet bilgisayar verilmesi; her ilkokul ve ortaokul sınıfına da etkileşimli tahta bağlanması ve internet erişim olanağı verilmesi planlanmaktadır. Proje kapsamında verilen ve Twitter ortamını kullanabilmeleri için uygun cihazlardan biri olan Tablet Bilgisayar her öğretmen ve her öğrencide sürekli olarak kalacaktır. Yani her zaman her yerde istedikleri zaman kullanabileceklerdir. FATİH Projesi'nin sağladığı bu imkanlar doğrultusunda öğretmenler Twitter gibi Web 2.0 teknolojilerini derslerine entegre ederek kullanabilme olanağına sahip olacaklardır. Hemen hemen her ders için dersi destekleyici öğretim aktiviteleri Tablet Bilgisayarlar ve Twitter aracılığıyla gerçekleştirilebilecektir. Bu şekilde gerçekleştirilen bir öğretim aktivitesinden sonra öğretmen derste etkileşimli tahtayı kullanarak Twitter ortamında gerçekleşen aktiviteyi gösterebilir ve derste ek çalışmalar yapabilir. Bu noktada önemli olan öğretmenin Twitter üzerinden gerçekleştireceği aktivitelere yönelik öğretim tasarımını doğru bir şekilde yapmasıdır. Ayrıca yapılacak öğretim tasarımına ek olarak öğrencilerin Twitter ortamını benimsemelerini ve bu ortamda öğretim aktiviteleri gerçekleştirmeye yönelik güdülenmelerinin sağlanması gerekmektedir. Bunlara ek olarak öğretmenin Tablet Bilgisayar ve Twitter kullanımı konusunda yeterli bilgiye sahip olması ve öğrencilere etkili rehberlik etmesi de önemli bir diğer noktadır.

13th International Educational Technology Conference

Understanding the two sides of online counseling and their ethical and legal ramifications

Poh Li,Lau, Rafidah Aga Mohd Jaladin[180], Haslee Sharil Abdullah,

University of Malaya
Faculty of Education
Department of Educational Psychology & Counseling
Kuala Lumpur, Malaysia 50603

Abstract

The rise of the Internet has drastically changed the means by which people obtain information and communicate in the Malaysian society. The Internet has become possibly the most popular medium to connect with others particularly through social networking tools, like Facebook, Twitter and other. For the field of counseling, the Internet offers a new way to reach, facilitate and communicate with individuals who need help from all over the world. Little is known, however, about the implications of interacting with clients online. The purpose of this writing, therefore, is to address the possible advantages and disadvantages of online counseling, as well as ethical and legal considerations in the use of online counseling by summarizing the past research. Additionally, suggestions for better practice are also discussed so that counselors and therapists are able to have a better preparation before practicing online counseling. Overall, this writing has several important implications for counseling practitioners in Malaysia and beyond. It contributes to a better understanding of the role of the Internet in counseling practice in an increasingly electronic world.

Introduction

As the number of Internet users across the globe continues to rise, more and more resources are becoming accessible online. The possibilities of services that can be offered on the Internet are endless. Today, anybody can receive professional mental health services such as counseling online rather than through a traditional face-to-face counseling service. To date, numbers of professional individuals as well as organizations have commenced offering online counseling services to various populations of clients. This development marks the integration of technology use in the provision of mental health services. Therefore, this paper aims at discussing the possibilities and limitations of using online counseling as a modality to help needy individuals in the Malaysian context.

Online counseling by asynchronous e-mail is a primary focus, given that it is the most frequently used method of online counseling provided by counselors and therapists (Chester & Glass, 2006). There are other methods of online communication, such as private chat, text messaging and video conferencing, are famous as well as its have been used simultaneously with asynchronous e-mail. However, online counseling is a relatively new service. Hence, the long-term implications of such an experience are little known.

There are many concerned with the ethical dilemmas associated with online counseling. It is essential to identify the probable advantages and disadvantages of online counseling. Hence, this paper summarizes the existing research with respect to online counseling. Then, it outlines suggestions for conducting online counseling in a manner that maximizes its benefits and minimizes its risks. The goal is to provide information for helping professions concerning the benefaction of online counseling to clients of all ages and populations, where available.

Online Counseling

Online counseling is the transmission of therapeutic interventions in World Wide Web in which the computer-mediated communication technologies is facilitated as a medium of communication between a trained professional counselor and client. There are several terms used for online counseling including online or Internet therapy, e-counseling, e-therapy, cyber therapy, e-mail therapy, web counseling , Internet counseling, cyber counseling, synchronous single-session counseling, and therapy-e-mail.

Above all, synchronous (chat and video conferencing) and more popularly asynchronous (e-mail) communication have been used by clients. Additionally, online counseling has been provided as a stand-alone service and as an adjunct to other services. Virtual reality environments have also been used to conduct counseling whereby it's allowing both synchronous and asynchronous communication (Bambling, King, Reid, & Wegner, 2008).

Defining the term online counseling often invites controversies and sometimes becomes a continued source of debate. There are numerous definitions of online counseling which have been proposed in literature. These definitions suggest that online counseling can take many forms. For instance, Bloom (1998) describes online counseling as "the practice of professional counseling that occurs when client and counselor are in separate or remote locations and utilize electronic means to communicate with each other

Next, Mallen and Vogel (2005) provides a comprehensive definition of online counseling, "any delivery of mental and behavioral health services, including but not limited to therapy, consultation, and psych education, by a licensed practitioner to a client in a non-face-to-face setting through distance communication technologies such as the telephone, asynchronous e-mail, synchronous chat, and videoconferencing".

It has been argued that online counseling is an inversion of face-to-face counseling online, with technologies facilitating the therapeutic communication and impacting the process with their related advantages and limitations (Castelnuovo, Gaggioli, Mantovani & Riva, 2003). From this perspective, online counseling is not seeming as anew and discrete way of likable therapeutically with clients. Therefore, it is not seen as obliging a different theoretical framework from face-to-face counseling.

On the contrary, it is argued that online counseling should be considered a new type of therapeutic intervention which characterized by basically unique features (Fenichel et al., 2002). This perspective views online counseling as an adaptable and flexible resource with the potential to complement and support other types of interventions and definitely not a substitute to face-to-face interventions.

Advantages and Disadvantages of Online Counseling

No doubt, online counseling has both probable advantages and disadvantages. One of the primary advantages of online counseling is its potential for increased accessibility mental health services. This means online counseling may become the solution for potential clients with constraints to access mental health services such as those who are residing in in geographically remote areas (Sussman, 2004), and also those who are having difficulties to leave their home due to certain illness, physical limitations, transportation difficulties or family commitments (Maples & Han, 2008).

In particular, online counseling may also be a constructive and therapeutic modality for those clients who have socially phobic. This include persons who are fearful to seek for a face-to-face counseling therapy due to anxiety or stigmatization (Lange, Van de Ven & Schrieken, 2003), or who are hesitant and cautious about the in-person counseling process (Barnett, 2005). Moreover, family therapists may be able to engage absent family members in family therapy with the use of computer-mediated communication (King, Engi & Poulos, 1998). Economically, online counseling services are more affordable by clients because private therapists usually offer online-services at lesser cost than the regular cost of a face-to-face counseling session (Griffiths, 2001).

On the other hand, online counseling is also a convenient service whereby it can be provided at any time of the day and clients can send messages whenever they feel most in need of or interested in therapy (Bailey, Yager, & Jensen, 2002). Essentially, online counseling is accessible from any corner of the world as long as there is Internet access (Maples & Han, 2008).

Subsequently, it also lets individuals to access therapists comfortably from their home or even office (Manhal-Baugus, 2001). Therefore, therapists have more flexibility in their work schedules as the hassles and difficulties in having to schedule a specific appointment time is lessened as the therapist and client may not have to be sitting at their respective computers at the same time (Suler, 2000). Thus, it increases a therapist's accessibility, especially for those clients with inconsistent as well as demanding personal schedules (Peterson & Beck, 2003).

Although time delay is regarded as a disadvantage of e-mail counseling as it is integral in asynchronous communications, it can also being seen as advantages. Time delay allows both counselor and client to have sufficient time to compose a thought or question that precisely reflects their concern and issue – both presenting and real issues (Tate & Zabinski, 2004). Hence, the client can reply when he or she is ready to reply in detail as there are no pressures to think hastily (Suler, 2000).

Online counseling is also able to provide a lasting and concrete record of counseling sessions whereby it can provides many benefits to both clients and therapists as a reminder of things they had expressed previously (Barak, 1999). For instance, clients are able to re-read e-mails to evaluate the methods they have used in previous issues as well as to review positive and encouraging comments that their therapist has made about them (Murphy & Mitchell, 1998). Furthermore, both the client and the therapist can fully reflect on issues discussed in previous sessions or communications (Manhal-Baugus, 2001) as well as to explore the client's progress at various stages in the course of treatment (Oravec, 2000).

Finfgeld (1999) emphasized the higher standards of accountability that can hold clients and therapists by the recordkeeping provided by online counseling. Later, a permanent record also has the potential of as a tool for both supervision and consultation (Murphy and Mitchell, 1998).

Walker (2007) underlined that the act of writing itself can be therapeutic. Writing has been viewed as a facilitative method of self-disclosure, externalization of problems and conflicts, ventilation, and essentially it can promote self-awareness (Barak, 1999). Besides that, writing may also lessen the emotional burden on individuals by allowing them to say of any kind they want to say (Yager, 2001). It was suggested that some individuals are more honest and more expressive in writing compares to face-to-face counseling sessions.

The anonymity of online counseling may also be beneficial because being an "invisible" client can help individuals to reduce or eliminate the stigma related in seeking mental health services (Suler, 2000). This is especially important for clients with issues of shame and also for individuals who are scared of being judged. When certain social markers such as age, gender and ethnicity are removed, it may be easier for individuals to disclose information about themselves (Tate & Zabinski, 2004). Thus, clients may become more honest and sincere when they cannot see the therapist as they feel less defensive and vulnerable (Maples & Han, 2008), and feel more ease on the plausibly embarrassing and stigmatizing disclosure of behaviors and thoughts (Manhal-Baugus, 2001).

Online counseling can potentially enhance individuals' autonomy in the therapeutic relationship as clients are able to say whatever they want to say and to initiate contact. Therefore, it can reduce the power discrepancy between client and therapist (Yager, 2001). For instance, e-mail therapy may empower clients to convey their unique ideas without interruption by the therapist's premature phenomenology and it is particularly beneficial for clients who have been frustrated by therapists' lack of sensitivity to their uniqueness (Finfgeld, 1999).

Some of the study revealed that online therapy can be viewed as a way to enhance traditional treatments whereby it can be used as an extended support of the clinical process such as follow up and an expansion of face-to-face counseling sessions during the central and final parts of therapeutic sessions (Castelnuovo, Gaggioli, Mantovani, & Riva, 2003).

On the other hand, chat and instant messaging can assist more direct and immediate communication in which like e-mail therapy, they also provide for constant and instant feedback in two ways. Rees and Stone (2005) emphasized that the use of

videoconferencing can increase the access of mental health services to isolated and demoted populations including rural populations, disadvantaged populations, as well as individuals with disabilities.

To summarize, there are many advantages of online counseling and these include more accessibility, lesser cost, and wider clientele market. However, there are always two sides of a coin. This means that using online counseling is also subjected to several disadvantages. The following paragraphs discuss some of these disadvantages.

Initially, computers simply do not offer the human interaction that is crucial in the counselor's office (Maples & Han, 2008). Hence, the lack of physical presence within human communication may decrease the sense of intimacy, trust, and commitment in the therapeutic relationship. Consequently, it may weaken the development of a therapeutic foundation between the counselor and the client. The absence of visual and vocal cues, such as facial expressions, body language and voice tone can result in a greater potential for miscommunication.

Peterson and Beck (2003) asserted that some crucial emotions such as sighs, frustrated emotions, terseness, irritation, to name a few, may be lost in the process of the e-mail transaction. Without sufficient presence of visual and vocal cues, therapists and clients may face difficulty, or even inability to establish a strong therapeutic relationship foundation. It would be difficult for clinicians and therapists to correctly assess and diagnose disorders without enough access to non-verbal behavior. In most face-to-face counseling, therapists heavily rely on non-verbal cues in order to explore what clients feeling or thinking (Maples & Han, 2008).

Text-based communication is also seeming to be stark and cold. It is because typed text may feel or look more formal with lacking of supportive and empathic tone (Suler, 2000). Consequently, some words may perceived and come across as sounding harsher than anticipated. On the other hand, greater potential for misinterpretation will happen as different individuals can also have difference understanding of text messages as compared to verbal exchanges (Ybarra & Eaton, 2005). In addition, misinterpret aspects of e-mail communications might happen on hypersensitive individuals who are prone to alteration of facts and events (Yager, 2003).

During face-to-face session, counselors and clients communicate mostly with facial expressions, posture, eye contact and so forth. Needless to say, reading nonverbal is an essential element of counseling. If one is being counseled online, these nonverbal signs are unobservable and their absence can be disadvantageous to the counseling process. For instance, nonverbal signs which cannot be observed during an online session are nervous behaviors, whether eye contact is maintained or not, angle and distance of body in relationship to the counselor, to name a few.

Also, a client may be typing content which appears to be enriching, but at the same time he or she may be crying. Conversely, a client may be typing distraught messages but may be laughing while doing so. These inconsistencies in feeling, thinking and behavior are significant cues and can be a good indicator of possible mental diagnoses.

Internet access was previously noted as an advantage of online counseling, yet it can also be viewed as a limitation. It said that in online counseling, it is only available to clients who have access to a computer and the Internet. Hence, therapists who have the utmost desire to serve particularly those in traditionally underserved populations may have the least access to the desirable technologies (Barnett, 2005).

In order to fully utilize the Internet and the chosen method for example by e-mail or chat efficiently in online counseling, clients and counselors are required to have necessary skills and must be fairly good readers and writers (Abbott, Klein & Ciechomski, 2008).

In asynchronous communication, time delay is a seeming natural result. However, it is also caused from technological failure. Time delay can become an advantage in online counseling but it can also change the flow of the counseling process (Rochlen, Zack, & Speyer, 2004). Nonetheless, time delay can lead to uncertainty that may result in self-questioning or self-doubt and also frustration of the client (Maples & Han, 2008). As for time delay caused by technological failure, it may delay and interfere d the services. Subsequently, feelings of isolation and alienation may arise if a client is cut off with no means of reconnection.

Ethical and Legal Considerations in Online Counseling

In any practice of counseling be it face-to-face or online, professionals must always make rooms for ethical and legal ramifications of such practice. Therefore, the following are potential ethical and legal issues associated with providing online counseling services that counselors and therapists must take into consideration.

Substantially, threats to confidentiality occur at two levels in which during transmission and at the end of the session. Prior, what's under concern is that e-mails may be misinterpret by typos in the "to" field or hacked by computer hackers (Recupero & Rainey, 2005). Later, things that must take into account are the possibility where other persons may have access to the client's e-mail, such as employers or family members and at the same time, client e-mail may be accessible to the therapist's

office staffs. Other than that, the storage of transcripts of online counseling sessions by either the therapist or the client might bring up confidentiality issues (Mallen, Vogel & Rochlen, 2005).

As the era changed, the range of the Internet spreads beyond state and even international boundaries. When this happen, there will be an unclear application of laws as the client resides in a different jurisdiction than the therapist (Kanani & Regehr, 2003). Which one to be used –the jurisdiction in which the therapist is providing the counseling services or the client resides? The issue of jurisdiction also applies to the rights of clients to recompense complaints and not only to the legitimacy of the activity.

On the other hand, if the counselors and therapists are practicing outside of their jurisdiction whereby their experiences are inadequate within a given culture or a language barrier exists in the helping process it can result competence issues. Counselors may oversight some important signs without the aids of non-verbal cues and they might make incorrect presumptions regarding the client's cultural identity. Therefore, lack of knowledge about client's cultural issues may limit counselor credibility and eventually will lead to inappropriate counseling interventions (Sampson, Kolodinsky & Greeno, 1997).

Peterson and Beck (2003) assert that clients may perceive the accessibility of e-mail to mean that the counselor's door is always open. In addition, there is an expectation that whoever, include therapists with an e-mail address is instantly available and responsive as well as reachable all the time. By that, some of the clients may continue to send the therapist e-mails although they have terminated the session or some clients may even harassing and stalking their former therapists by using the Internet. Misunderstanding regarding the nature of the relationship between counselor and client may arise as e-mail appears to encourage familiarity and spontaneity (Bailey, Yager, & Jenson, 2002).

Codes of ethics in helping profession oblige counselors and therapists to be competent in their chosen practice and have sufficient education to declare their expertise so that clients' welfare are protected as well as free from professional misconduct (Kanani & Regehr, 2003). Some therapists may not have high level of technological knowledge of computers that is requisite for online counseling. For instance, some practitioners may not have had specific training in text-based psychotherapeutic.

It is an ethical duty for therapists of various disciplines to warn or protect if clients present a danger to either themselves or others. However, it is harder to access and to intervene in an emergency via online counseling. This is because when therapy is conducted face-to-face, therapists are on hand to evaluate and manage psychological crises (Carlbring & Andersson, 2006).

Contrarily, Internet communication does not always allow or limit counselors to access the violence signs or potential of a client (Kanani & Regehr, 2003). Hence, there are possibilities that counselors failed to perceive and responded appropriately to existing communications problems. Then, as anyone can lie about their information such as age, gender, and situation, identity authentication can be an issue when working online (Ragusea & VandenCreek, 2003).

Therefore, online counseling services can provide challenges regarding to client identification (Fisher & Fried, 2003). Counselors and therapists may be facing difficulties to determine whether the client holds an appropriate mental capacity to consent because there is no pre-existing relationship between therapist and client beforehand. For instance, it is common for youth to use Internet and thus there is a likelihood whereby underage youth is using online counseling services without getting the consent from their parents or caregivers.

Essentially, instead of getting informed consent from the client it is also crucial for the client to understand the possible risks and probable benefits of a suggested intervention. However, to date the benefits of various forms of online counseling are still being examined and debated in the literature and thus it can be a difficult task to mental health and helping professions.

Barak (1999) pointed out those professionals without sufficient credentials tend to offer online counseling services as it is easy to access. Therefore, scam is much easier to constrain in the anonymous online world. Other than that, individuals whom seek for online counseling and to make an accurate decisions about which services are good and which are not good may also be difficult as there is a long list on this services at the time being.

Suggestions for Better Practice

Suggestions for a better practice based on the relevant research findings are discussed next after addressing numbers of disadvantages and ethical concern identified in online counseling. The following paragraphs discuss some of these summarized suggestions in respect of the identified disadvantages and ethical concern.

Initially, it is crucial for counselors to inform clients of the standard limits to confidentiality for example child abuse and suicidal ideation, and the threats to confidentiality regarding to transmission of information through electronic, as well as the procedures being used to protect confidentiality (Fisher & Fried, 2003). On the other hand, clients should also be informed of their own confidentiality affliction whereby they should be advised to do their online counseling in a room with privacy where they wouldn't get intruded by anyone (Ragusea & VandeCreek, 2003). Essentially, the risk of records keeping of online therapy

sessions should also be informed to the clients which includes the methods and the time period of online sessions records are being retained (Kanani & Regehr, 2003). For some practicing novice counselors and therapists, there will be supervision sessions and thus clients should be made aware of the access to the records of online sessions (Oravec, 2000).

Concerning to jurisdiction issues, Zack (2008) emphasizes online counselors should be familiar with the licensure restrictions and exemptions in their jurisdiction as well as the jurisdictions in which they clients are reside. Hence, counselors and therapists shall only provide their services in jurisdictions in which they are licensed. Online therapists should also provide links to websites of all relevant certification and licensing boards. Besides, sensitivities to the diverse cultures shall develop by counselors as well. For instance, counselors must be alert in making assumptions about things such as names and expressions and familiar with clients' local cultural norms and local events.

Intake form basically contains certain information regarding to the ethnic and cultural background of the client. However, for some culture and populations, this may seem as bias part of the counselor and therapist. Therefore, Sampson Jr., Kolodinsky, and Greeno (1997) suggests if the therapist is happening to come across this unexpected situation, therapist should proceed slowly and clarifying to the client about their perceptions of thoughts, feelings, and behaviors

In online counseling, vague relationship between counselors and clients might happen. Hence, steps must be taken by the counselor in order to avoid encouraging unnecessary excessive dependence. Kanani and Regehr (2003) suggest counselors can establish a time frame for responses to maintain boundaries rather than immediate responses expected by clients. Thus, counselors and clients shall establish appropriate rules with regard to suitable use of e-mail communication.

As online counseling is different from face-to-face counseling session, tone and language might perceived wrongly by the clients. Therefore, the tone of e-mails should always be professional in which avoid anger, annoyance and other unprofessional tones. Inappropriate jokes, unprofessional social or self-disclosing statements should be avoided and counselors should use professional tone and language that is usually used in the office. It is important to note that for clients who are suffering from severe boundary problems, e-mail should not be used.

Concerning the competency of online counseling services, counselors should seek out necessary training (Zack, 2008) which cover technology, theory, applications and ethics, as well as licensing laws. Online training should also take account of skills in text-based communication and protecting client's welfare and information online. Thus, counselor shall only use online software that is within their capabilities or if new software is used to expand their competencies.

Concerning the language used in online counseling, counselors may need to develop an ability to understand the style and interpret the content of e-mails written by the client particularly youth as they have developed their own language on the Internet. This includes language that is characterized by abbreviations, spelling phonetically, and the absence of many of the rules of grammar (Fenichel et al., 2002).

Counselors can use emotional bracketing and descriptive immediacy in online counseling (Murphy & Mitchell, 1998). Emotional bracketing includes bracketing the emotional context behind the typed words in order to allow the client to hear the intended vocal tone in the words whereby descriptive immediacy includes providing the client with images for better understanding the counselor's words.

Counselors can also use spacing and pacing techniques to exercise a higher degree of control over the online counseling process. Variety of emotional nuances and facial expression can conveyed by using "smileys", emoticons and other commonly used symbols. With that, clients and counselors can develop a set of standardized emoticons and acronyms in the session. In order to prevent misinterpretations and to make sure the client understands what the counselor is saying and that the counselors understands what the client is saying, the counselor should check with the client continuously (Stofle, 1997).

It is important to note that online counseling is not suitable for individuals who are having psychosis problems. Therefore, counselors should aware about not taking on clients who are suffering from psychiatric disorders for online counseling and needing immediate attention, clients who are significantly depressed (Carlbring & Andersson, 2006), individuals who might give danger to themselves or others, such as serious substance abusers and those who presenting psychotic or actively suicidal ideation. Besides, counselors should not take on individuals who are highly reactive and potentially dangerous, such as those with borderline personality disorder, paranoia or dissociative disorders.

Concerning on crisis situations, it require quick responses and should not be addressed online whereby clients who are experiencing such situations should be encouraged to seek face- to-face counseling. Moreover, online counseling websites should disclose topics that are not appropriate for online counseling, such as sexual abuse and violent relationships. Lastly, online counseling websites should have notices for individuals who have suicidal ideation with information about hotlines, crisis centers and emergency departments of hospitals (Manhal-Baugus, 2001).

Conclusion

Overall, online counseling has both advantages and disadvantages and a number of legal and ethical considerations surrounding its offering and provision. Research in the area of Internet therapy or online counseling focuses primarily on self-help interventions with little therapist involvement and there is limited certain empirical evidence with respect to the efficacy of online counseling between therapist and client.

Online counseling is a great responsibility as is counseling an individual face to face. Both face-to-face and virtual relationship should be treated with the highest ethical professionalism. It is important to note that whenever an online client is communicating in a virtual world, his or her problems are still very much real.

Usability and User Satisfaction of Hardware-Software Interfacing Visualization Kit for Novice Learning Programming

Ahmad Zamzuri MOHAMAD ALI[181], Siti Rosminah MD DERUS

Faculty of Art, Computing and Creative Industry, Universiti Pendidikan Sultan Idris, Tanjong Malim, 35900, Perak, Malaysia

Abstract

Com port is the interface of choice for most of the projects that require communication between a computer and external device or peripherals. This study has developed an experimental tool that serves as a practical hands-on learning kit for novices in exploring and mastering hardware-software interfacing in visual environment. After exploring the developed experimental tools, learners could understand the use of computer to configure, control and connect external devices via com port in visual environment. Based on the questionnaire feedback, the developed tool seems very useful and helpful for beginners, which have minimum skills in electrical and electronic engineering in understanding hardware-software interfacing programming better. 15.

Keywords: hardware-software interfacing; programming; visualization

1. Introduction

The ICT is a bustling new industry with programming, database, software engineering, project management, networking and creative multimedia appears to be the most-wanted skills (Ungku Harun Al'Rashid, 2004). Research findings show that industries' requirements for software engineers are high, and this indicated that programming personals are critical needs for industries nowadays (Ahmad Rizal, Nurliana & Yahya, 2008). However, the programming skills needed by the industries were lacking in most of the local graduates, which forces industries to hire software engineers from abroad to fulfil their requirement (Knowledge Worker Exchange, 2004). Due to these, institutes of higher learning strive to plan, design and develop or revise programming courses in their curriculum to fulfil the current industries' needs. Question arises, were the students really being prepared to meet the needs, especially in hardware-software interfacing programming areas? Basically, university's aims are mainly to produce graduates with highly-developed intellectual, rather than practical capabilities (Moreira, 2004). The lectures in university were very theoretical and even weekly laboratory sessions were very textbook-based (Moreira, 2004). It is also found that only two to four percent preferred hands-on programming, while the majority preferred to do technical writing, software analysis and design (Moreira, 2004). Unavailability of adequate teaching and learning aids for students to experience proper practical skills might be among the reason contributing to these drawbacks. Therefore, efforts are needed to develop tools specifically designed to fulfil the requirements of beginner programmers (Pears et al., 2007).

2. Research Objective

The objective of this study is to design and develop program visualization and test its effectiveness among novice learners. The initial phase of this study was only focused on design and development of the program visualization kit for hardware software interfacing programming, specifically for beginners. The study was focused on hardware software interfacing, since most of the previous studies found on program or algorithm visualization were mainly emphasized on software and very rare or almost none on hardware software interfacing programming, specifically for beginners. Research findings have shown; educational aids developed without considering the educational principles may and may not work well. It is unarguable on the existence of abundance of hardware-software interfacing teaching aids in the commercial market. However, most of these kits were not grounded on

E-mail address: zamzuri@fskik.upsi.edu.my

educational research outcomes. Furthermore, most of the kits emphasized more on microcontroller technology, which is unsuitable for novice programmers in mastering hardware-software interfacing fields.

3. Development Methodology

The designing, developing and testing of hardware-software interfacing kit (ComPort V1.0) process was mainly grounded on ADDIE Instructional Design framework, which consists of the analysis, design, development, implementation and evaluation phases.

3.1 Analysis

The big picture of the complete instructional design process was established during this phase as follows:

3.1.1 Identify the content

A first step in exploring hardware software interfacing is learning how to get most from a port with the everyday application and peripherals, which include find, configure and handle (Axelson, 2000). Computer ports are mainly differentiated into two categories that are parallel communication ports and serial communication ports. Fundamentally, a port is a set of signal lines that microprocessor uses to transmit and receive data with other components. Most computer ports are digital, where each signal or bit is 0 or 1. Parallel port transfers multiple bits concurrently, while serial port transfers a bit at a time. Most personal computers come with one parallel port and a number of serial ports. On newer personal computers and laptops, parallel port is mostly not included, since nearly all the newer peripherals use serial port. Therefore, the serial port appears to be the port of choice in this study.

There are many types of serial ports available, ranging from the ubiquitous RS-232 port to a newer RS-485, USB, IEEE-1394 and IrDA interfaces (Axelson, 2000). Almost all the computers have at least one RS-232 port. This interface is useful when the computer, and the peripherals need to be connected are physically far apart. RS-232 links are slow. Along with each byte, the transmitting devices normally add a start and stop bit. Even at 115 200 bits per second, which is a typical maximum rate for a serial port, the data transfer rate with one start and stop per byte is just 11 520 bytes per second. RS-485 is another serial communication choice in computers, which can use cables as long as 4000 feet and allows up to 32 devices to connect to a single pair of wires. Other interfaces similar to RS-232 and RS-485 are RS-422 and RS-423. A better option for serial interfacing is Universal Serial Bus (USB), a project of a group that includes Intel and Microsoft (Axelson, 2000). A single USB port can have up to 127 devices communicating at either 1.5 Megabits per second or 12 Megabits per second over a 4-wire cable. The USB standard also describes both the hardware interface, and software protocols. Newer computers may have numerous USB port built-in that can be used without any added hardware and software drivers. The IEEE-1394 high-performance serial bus, also known as Firewire, is another serial interface of choice. It allows up to 63 devices to connect with a computer, with transmission rates of up to 400 Megabits per second. The 6 wire cables can be as long as 15 feet, with daisy chains extending to over 200 feet. The interface is popular for connecting digital audios and video devices. The Infrared Data Association (IrDA) interface is a wireless serial communication over distances of 3 to 6 feet. The link transmits an infrared signals at up to 115 200 bits per second. It is intended for short-range communication where cabled interface is inconvenient. Newer computers and peripherals now have IrDA interfaces built-in. In conclusion, USB is the serial interfacing of choice in this study, based upon its ability, speed and availability in most of the computer system nowadays.

Notably, serial port is harder to interface than the parallel port for parallel communication. Any peripherals connected to the serial port need the serial transmission converted to parallel for parallel interfacing. This can be done using UART. On the software side, there are many more registers need to be attended to than on a Standard Parallel Port (SPP). This study intended to develop the serial to parallel conversion hardware and the software compatible to it. Since the kit is for novice, the conversion circuit and program were not the main concern to be introduced to the learners. The main concern would be on ways to access the hardware in software. In conclusion, the main objective of this study is to develop a hardware interface to facilitate hardware visualization and software interface to facilitate program and algorithm visualization.

3.1.2 Identify the target learners

Programming tools were generally developed to meet professional preference's requirement; they often have extensive sets of concepts and features that are problematic for novices. For that reason, efforts are needed to develop tools specifically designed to fulfil the requirements of beginner programmers. Thus, the target learners of the kit developed would mainly be secondary and tertiary level students who have very minimum skills in electronic and electrical engineering, and hardware software interfacing programming.

3.1.3 Identify the environment, delivery and instructional strategies

No matter how well the visualization tool was designed, is educationally ineffective if students were not engaged actively in the learning process. Therefore, lab activities which engage various active learning approaches in promoting problem-solving skills will be the delivery and instructional strategy. This will be done in following phase.

3.1.4 Identify the suitable software and hardware

The main concern for beginners should be on understanding the basic programming concepts instead memorizing the rigid syntaxes and rigid commands; simpler command and syntax should be the language of choice for them. Consequently, after gaining experience with these simpler languages, students can move to more general-purpose, commercially available languages more effectively. Therefore, Visual Basic and VB.net would be the language of choice in this study, since it's the simplest and preferable visual programming environment in most of the institutions.

For communicating with computer, the PIC microcontroller would be the choice. The PIC microcontroller uses a component called Universal Synchronous Asynchronous Receiver Transmitter (USART) for serial to parallel conversion. This component will be configured as a Full-Duplex asynchronous system that can communicate with peripheral devices, such as CRT terminals and personal computers. As pointed out earlier, USB would be the port of choice for hardware software communication.

3.1.5 Identify the constraint and quality assurance

Rapid changes in software technology might be a challenge in ensuring the long term relevancy of the kit developed. For that reason, the kit and the lab activities developed do not stress much on specific programming language. The main objective would be on assisting learners in mastering the fundamental skills of hardware software interfacing programming in visual environment.

Enough hardware visualization kit for usability testing on the larger number of samples appeared to be another challenge. The challenge was due to funding constraint. However, this challenge could be tackled by employing presentation or collaborative learning strategy in gathering feedback on usability and performance.

3.2 Design and development

As pointed out in analysis phase, the main concern of the kit developed would be on assisting novice to understand the fundamental of hardware software interfacing. Programming in hardware software interfacing often involves number systems. Binary and hexadecimal appears to be an easy-to-read way of expressing the bit and byte oriented values for addressing in hardware software interfacing programming. Binary is also known as base 2 since there can only be two values that are 0=OFF and 1=ON. Binary representations are useful in seeing the value of each bit in a byte. Numbers representing 0 are not counted. Meanwhile, numbers representing 1 are counted. Hexadecimal or base 16 is another major numbering system, which is easier to work on large numbers. The numbers are counted from 0 to 9 and followed by letters A to F. The letters A through F represent decimal values 10 through 15, respectively. Hexadecimal numbers have either h suffix or 0x prefix. Each character in hexadecimal number represents 4 bits that make hexadecimal numbers a convenient way to express 8 or 16 bit numbers. In particular, the content of ComPort V 1.0 was mainly focused on assisting novice learners in mastering these skills before proceed to programming part, particularly in visual programming environment.

Sweller, Van Merrienboer & Paas (1998) claimed, "Learners often view worked example, rather than explanatory texts, as the primary and most natural source of learning material" (p. 274). For that reason, text explanation was minimized and the worked example approach will be emphasized more. Mostly, this will be tackled in the lab manual which will be designed in the following study. However, the approach was also imposed minimally in the kit developed. Basically, worked example refers to description of how to solve problem, or in other word, states and steps needed for the solution (Caspersen & Bennedsen, 2007). Worked example approach will be followed by engagement and problem-solving approach in sequence to assist novice learners' schema acquisition and automation in a more systematic manner. Considering the limitation of working memory, the above-mentioned tasks would be segmented and presented in different tabs with minimizing the extraneous load in mind. The first tab is brief introduction on addressing; the second tab is binary output and input manipulation; the third tab is hexadecimal output and input manipulation; the fourth tab is algorithm visualization, which consists of one worked example, and learners could practice their own programming as well. The final tab is brief explanation on interfacing in Visual Basic.

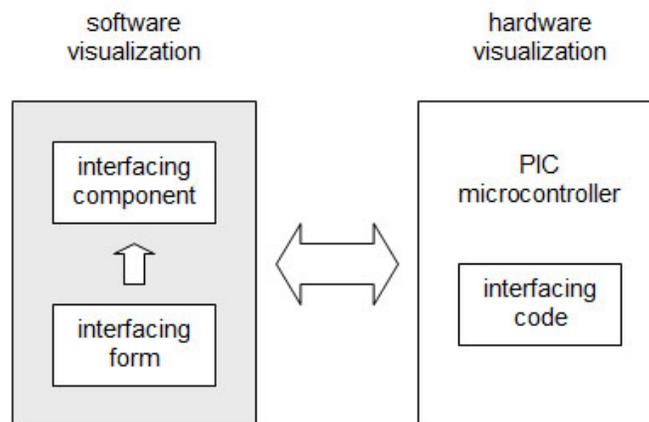
Beside the standard VB commands, customized commands were also developed to minimize the complexity of hardware software interfacing programming (example: *out* to manage output, *inp* to manage input, *goto* to manage looping, *delay* to manage timer). Since, the main concern of the kit is to assist novice programmers in understanding the fundamental concepts, simplified commands are expected to minimize intrinsic load throughout the learning processes. A VB component was also developed for actual interfacing in Visual Basic or VB.net environment. Basically, the software architecture is depicted in Figure 1.


Fig. 1. ComPort v 1.0 software architecture

The design and development of software and hardware visualization were carefully grounded on educational principles gained from literature. Besides the layout, typography, colour and font, and other basic principles such as prevent distraction elements, avoid cluttered information, consistency, several other principles were also employed to improve cognitive economy as proposed in Naps et al. (2003) and Khuri (2001). The completed hardware visualization and software visualization are as in Figure 2 and Figure 3.

Fig. 2. Hardware visualization of ComPort V 1.0

Fig. 3. Software Visualization of ComPort V 1.0

3.3 Implementation and evaluation

Throughout the development process, expert review from both academia and industry was conducted on attribute related to pedagogy and technical as well. Usability study was conducted once the design and development processes were wholly completed. The usability and user satisfaction questionnaire, which was adapted from Post-Study System Usability Questionnaire (PSSUQ), was used to obtain feedback from the participants. Originally, PSSUQ is a research instrument that was developed for use in scenario based usability evaluation at IBM. The modified version of the questionnaire for this study consists of 21 items, which were divided into seven categories namely design/layout, functionality, ease of use, learnability, satisfaction, outcome/future use, and errors/system reliability. The questionnaire's items are 7-point scales with 1 for strongly agree, followed by next numbers in sequence with the end point 7 for strongly disagree.

The research participants were 35 university students, whose ages ranged from 19 to 21, and were enrolled in a Diploma in Games course. The study was conducted during the final session of their first programming course in the curriculum. Therefore, participants have basic knowledge in structured programming. However, they have no experience in hardware software interfacing programming. Moreover, the participants also lack of skills or none at all, in electronic and electrical engineering.

Enough hardware visualization kit for usability testing on a larger number of samples appeared to be a challenge. Adding to this, the participants were beginners, it is impossible for them to explore the kit on their own due to no prior knowledge about the content. Mainly, without the lab manuals with worked examples, that will only be developed in the second phase of the study. Nevertheless, these challenges were tackled by employing presentation learning method in gathering feedback on usability and satisfaction.

The study was performed in the computer lab session that lasted for one hour. The features of ComPort V 1.0 were presented in projected presentation condition. Detailed explanations with several worked examples were given before moving to practice and discussion session. The participants went through the presentation session for about 15 minutes; they were allowed to ask question and discuss throughout the session as well. The discussion session last for around 15 minutes. The session was ended with participants answering the questionnaire.

4. Results and Discussion

Cronbach alpha for usability and user satisfaction questionnaire was .95, indicating that overall the scales had acceptable reliability.

Design/Layout: Overall in design and layout aspects, the learners liked the interface of the kit (M=2.60, SD= 1.26), organization of the information presented was clear (M=2.49, SD=1.22), and the interface was pleasant to be used (M=2.51, SD=1.33).

Functionality: The kit has all the functions and capabilities that the learners expected (M=2.60, SD=1.41), the information retrieved from the kit was effective in helping them to complete related tasks (M=2.4, SD=1.59), and the learners agree that all the features in the kit functions well (M=2.60, SD=1.58). Additional individualized testing is needed to further affirm this claim. This will be done in following phase of the study.

Ease of use: The learners agree that the kit was simple to use (M=2.17, SD=1.69), the information needed was easy to find (M=2.20, SD=1.47), the information provided was clear (M=2.14 , SD=1.29), and overall; the kit was easy to use (M=2.34, SD=1.64).

Learnability; The learners agree that it was easy to learn to use the kit (M=2.22, SD=1.51). They found that, there was too much information to read before able to use the kit (M=2.97, SD=1.65). Even so; they agree the information provided was easy to understand (M=2.56, SD=1.27). According to the written comments by learners, the information appearing in the addressing table, need to be simplified to avoid confusion. Taking this into consideration, in the following study, the addressing table will be simplified with only the related information will be displayed in each respective tab.

Satisfaction: In general, the learners felt comfortable using the kit M=2.57, SD=1.48), they enjoyed exploring it (M=2.29, SD=1.32), and overall they were satisfied with the kit (M=2.51, SD=1.58).

Outcome/Future use: The learners agree that they could become productive quickly using the kit (M=2.17, SD=1.40), they were convinced that the kit could improve their programming skills (M=2.31, SD=1.71), and based on their current experience using the kit; they would use it regularly (M=2.37, SD=1.23).

Errors/system reliability: The learners agree that whenever they made mistake using the kit, they could recover easily and quickly (M=3.17, SD=3.36). They agree that the kit gave error messages that clearly told them how to solve the problem (M=2.86, SD=1.62).

Overall outcome of the questionnaire clearly indicates learners' satisfaction of ComPort V 1.0. However, the outcome of this questionnaire is only limited to projected presentation use of the kit. Further study needs to be conducted on personalized learning condition. By experiencing more challenging hands-on practices, the finding may differ. As discussed in earlier section, for this to take place, more organized lab manuals is needed. Further study on performance will also be conducted in the following research.

5. Conclusions

No doubt, programming appeared to be among the challenging course to be taught and learned, specifically if it involves novices. Combination of adequate teaching strategies, customized teaching aids and suitable language selection, unquestionably plays the potential role in eliminating the problems faced by novices in learning programming. Therefore, this study series intended to design and develop teaching kits to assist programming learning, focusing on hardware software interfacing programming for novice. The first phase of study was mainly concentrated on design and development of hardware visualization and software visualization. The design and development processes were carefully grounded on educational principles to ensure the maximum effectiveness of learning. The outcome of usability and user satisfaction questionnaire clearly indicates learners' liking of the kit developed. Notably, no matter how well the visualization tool was designed, is educationally ineffective if students were not engaged actively in the learning process. Therefore, lab activities which engage various active learning approaches in promoting problem-solving skills will be the aim of second phase of the study.

Usage Of Facebook: The Future Impact Of Curriculum Implementation On Students In Malaysia

Nurulrabihah Mat Noh, Siti Hajar Abd Razak, Norlidah Alias[182], Saedah Siraj, Mohd Ridhuan Mohd Jamil & Zaharah Hussin

Department of Curriculum & Instructional Technology, Faculty of Education, Universiti of Malaya, 50603, Kuala Lumpur, Malaysia

Abstract

Facebook can increase interaction between teachers and students in web-based communication. Many research studies related to the use of Facebook by students and impact on their academic achievement but none of the research focused on futures study related to Facebook in education. The objective of this study was to get consensus on the benefits of the use of Facebook as a tool for teaching and learning in the future, student participation in teaching and learning process, suitability of subject in teaching and learning process via Facebook in the future, the impact of the use of Facebook in skills of students and the impact of the use of Facebook in terms of students' character in the future. In this study, Fuzzy Delphi Method using a seven-point Linguistic scale was used to get consensus of 20 experts consisting of 10 specialist teachers, five IT specialists and five lecturers in the Faculty of Education. This study can be beneficial not only to teachers and students, but also as a reference to the education system in Malaysia to transform education through collaboration with social networking technology in the future. All the domains and subdomains in this study obtained consensus from the experts.

Keywords: Facebook; Fuzzy Delphi; The Future Impact

1. Introduction

Launched in February 2004, Facebook is a social networking service with a mission to make the world more open and connected (Facebook, 2012). People use Facebook to keep in touch with friends and family, to find out what is happening in the world, and to share and express their opinions. Facebook, which is a popular social networking site, is one of the most-used social networking sites today with millions of users (Bicen & Carvus, 2010; Cain, 2008; Mazman & Usluel, 2010; Ross et al., 2009). Facebook has quickly become one of the most popular social sites (Ross et al., 2009). As of October 2012, Facebook has more than one billion monthly active users; about 81% of monthly active Facebook users are outside the United States and Canada, and 552 million active users daily on average in June 2012 and 600 million monthly active users are using Facebook through a mobile device in September 2012 (Facebook, 2012).

Facebook is basically a social networking site online where individuals can share pictures, their biodata and join a group of friends who are online (Buckman, 2005; Cabada et al., 2009). Although many online websites such as MySpace and Friendster are also designed to connect people, Facebook is generally considered the leading social networking site used by college students (Golder, Wilkinson, & Huberman, 2007). For example, in the United States, the use of Facebook is now very popular among the students with the participation of over 90% among undergraduate students, as reported in a number of surveys (Ellison, Steinfield, & Lampe, 2007; Stutzman, 2006). It has also become one of the social networks most used by British students (Madge, Meek, Welles, & Hooley, 2009) and South African students (Shambare et al., 2011).

---

[182] Corresponding author.
E-mail address: drnorlidah@um.edu.my

A motivating factor for popularity of social networking sites among young consumers is that the social networking site provides users with more flexibility and freedom to express their feelings (Shambare et al., 2011). This is because technology use has changed the way we communicate with each other, the way we use language, the way we read and write, the way we think and the way we teach (Crystal, 2008a, 2008b; Johnson, 2009; O'Brien & Sharber, 2008). Thus Facebook is said to have a positive impact on the lives of college students (Munoz & Towner, 2009). By offering virtual office hours through Facebook teachers have a positive impact on student satisfaction as they are able to communicate with students outside of the classroom (Li & Pitts, 2009). This presents a clear opportunity to bring Facebook into education. Students should be given information on the use of Facebook in education because Facebook can facilitate the sharing of information related to school and student learning and students can also have discussion in FB about a difficult topic.

Facebook allows the exchange of information among the students on one hand, and between students and teachers on the other, potentially making it an important educational tool for effective teaching requires educators to guide, nurture, develop and transmit knowledge to students on an ongoing basis (Alger, 2009). To find strength in technological progress along with the development of pedagogy, academics suggest the ideal combination of technology integration in learning and social constructivism in order to achieve the objectives of contemporary education (Koohang, Riley, Smith & Schreurs, 2009; Neo 2010; Sadik 2008). Thus, technological tools such as Facebook can be used to communicate and clarify the concept and content of the course to engage students with information (Solvie & Kloek, 2007). For that reason, it is expected that the implementation of Facebook in the curriculum will enhance the effectiveness of teaching and learning.

Many research studies on Facebook lead to the use of Facebook, the effects of teacher self-disclosure via Facebook on teacher and student relationship and increase academic achievement among Facebook users. Reynol (2011) used the method of statistical analysis to examine the relationship between frequency of use and the students' participation in Facebook. Neil (2009) used qualitative analysis to study the frequency of students using Facebook for educational purposes while Muhammad Kamarul Kabilan et al. (2010) used statistical analysis to examine whether university students assume Facebook is a useful and meaningful tool in the educational environment that can support the learning of English. However, not many studies about Facebook have covered the use of Facebook in implementation of the curriculum. Total study about Facebook is not broad enough, especially about the future studies using Fuzzy Delphi method. Therefore this study was conducted in order to see the use of Facebook among students and its impact on the future implementation of the curriculum in Malaysia using Fuzzy Delphi method.

2. Purpose Of The Study

The purpose of this study was to obtain expert consensus on the impact of the use of Facebook among students and teachers on the implementation of the curriculum of the future.

This study is aimed at answering the following research questions:

1. What is the consensus of experts on the impact and benefits of the use of Facebook in terms of teaching aids in teaching and learning in the future implementation of the curriculum?
2. What is the consensus of experts on the impact and benefits of the use of Facebook in terms of student involvement in the teaching and learning process in the future implementation of the curriculum?
3. What is the consensus of experts on the impact and benefit the use of Facebook in terms of the suitability of the subject in the process of teaching and learning in the future implementation of the curriculum?
4. What is the consensus of experts on the impact and benefits of the use of Facebook in terms of the suitability of the subject in the process of teaching and learning in the future implementation of the curriculum?
5. What is the consensus of experts on the expected impact of the use of Facebook on the skills of students in the future implementation of the curriculum?

3. Methodology

To get future expectations, recommended information collected through the survey data obtained from experts. For example by using the Delphi method (Afghan, 2007). The Delphi method was explored in 1950 by the RAND Corporation (Dalkey, 1969). This method includes survey conducted in two or more rounds. After each round, the researcher will give the results of the previous round so that experts can review or retain their original answers. Questionnaires carried out separately and the experts do not know each other. This method is often perceived to create a good interaction within the group (Rowe, 1991).

Although the Delphi method has been widely used in education, especially in anticipation of the future, this method have its drawbacks. Among the weaknesses of the Delphi method (Saedah Siraj, 2007):

1. Reliability of the data depends on expertise; if the researcher fails to deliver real experts mean the study will lose credibility.
2. Experiments are repeated on a sample and this will cause boredom to the sample.
3. A small number of experts are not able to resolve all the issues studied.
4. Less chance of getting a response from the emotional aspect.

To solve the problem of ambiguity in the consensus of experts, researchers from around the world have created new methods. Murray, Pipino, and Gigch (1985) proposed the application of Fuzzy Delphi Method Teory into semantic variables used to solve the problem of ambiguity in the Delphi method. Kir and Folger (1988) suggests the use of average normalization modes and Ishikiwa et al. (1993) used the maximum-minimum along with the cumulative frequency distribution and scoring for organizing fuzzy expert opinion on fuzzy numbers. Expert prediction interval value is then used to derive the fuzzy numbers that will form the fuzzy Delphi method. Hsu and Chen (1996) proposed a fuzzy aggregate equation. By using this similarity function, the similarity between experts can be collected and fuzzy numbers can be built directly into each expert to determine the degree of agreement between them. Then the coefficient of consensus is used to get value assessment fuzzy numbers for all specialists. If the degree of agreement is too low among all experts then the questionnaire must be administered again.

The advantages of Fuzzy Delphi Method are:

1. Saves time on the questionnaire.
2. Save costs.
3. Reduce the total number of surveys, questionnaires increase the recovery rate.
4. Experts can fully express their opinions, ensure completeness and consistency of opinion.
5. Taking into account the ambiguity that cannot be avoided during the study. This method does not misinterpretate original expert opinion and gives their real reactions.

Therefore this study using Fuzzy Delphi method as the main method of review as the advantage obtained in Fuzzy Delphi method over the Delphi method. Expert questionnaire is a very good tool and is useful in the process of data collection conducted in Delphi method if the method and process of interviewing individuals cannot be done due to time constraints and group composition (Dalkey, 1963). **Data Analysis**

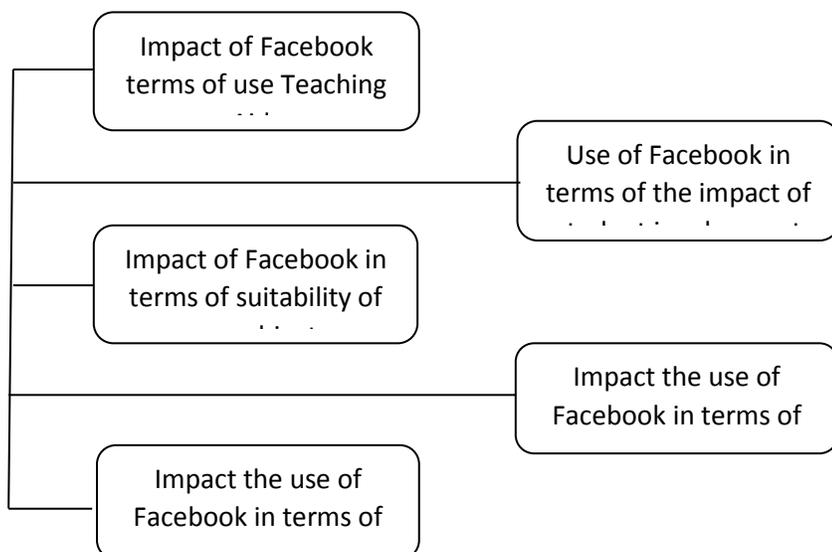
Expert evaluation was collected through a questionnaire survey. A total of 20 questionnaires were recovered and verified. All assessment that measured were converted into fuzzy sets based on expert response using a 7 point linguistic scale for the benefit of the use of Facebook in the implementation of the curriculum in the future from aspects of teaching aids, student involvement in teaching and learning, expectation of suitability to subject for the use of Facebook, for aspects of the students' skills and personality had been analyzed based on the actual response.


Figure 1. The expected impact of the use of Facebook in the implementation of curriculum

The distance between two fuzzy numbers is calculated by measuring the average deviation between the data evaluation experts. From the data analysis of the threshold value is greater than 0.2 then the second round of questionnaires is run. In the second round if the threshold value is less than 0.2 it means consensus from all the experts has been achieved.

In this study, the criteria used to evaluate the group consensus on the basis that the agreement is more than 75% (Chu & Hwang, 2008; Murry & Hammons, 1995). In first round of acceptance of the group is 89.10%. Group consensus estimates in the second round is 91.43%.

After obtaining the consensus of the group, the averages of the Fuzzy number were obtained.

Table 2: Average Fuzzy Number for benefits of implementing the use of Facebook in the future curriculum for aspects of teaching aids

Criteria	Average Fuzzy No
Using a Facebook page for an announcement	(0.81, 0.96, 1.00)
Inform students about homework to do.	(0.71, 0.88, 0.97)
Inform learning objectives that will be implemented.	(0.63, 0.80, 0.94)
Share information about teaching and learning.	(0.65, 0.82, 0.94)
Plan learning activities to be carried out.	(0.64, 0.82, 0.96)
Teacher observations of student homework.	(0.62, 0.80, 0.94)

Table 3: Average Fuzzy Number for benefits of implementing the use of Facebook in the future curriculum for student involvement in aspects of teaching & learning

Criteria	Average Fuzzy No

Building a 'group' for the class being taught.	(0.74, 0.89, 0.97)
Handle or discussion forum online.	(0.74, 0.90, 0.98)
Weekly tutorials conducted.	(0.72, 0.89, 0.98)
Question and answer session conducted in FB.	(0.70, 0.86, 0.96)
Students prepare early after getting information from the teachers through a Facebook page.	(0.67, 0.84, 0.96)
Students who have difficulties communicating in simple class interact in FB.	(0.70, 0.87, 0.97)

Table 4: Average Fuzzy Number for benefits of implementing the use of Facebook in the future curriculum for appropriate subjects

Criteria	Average Fuzzy No
Science subjects (Biology, Physics, Chemistry) and Mathematics	(0.63, 0.82, 0.95)
History and Geography	(0.69, 0.86, 0.96)
Bahasa Malaysia / English / Tamil / Chinese	(0.71, 0.87, 0.97)
Islamic Education / moral.	(0.64, 0.82, 0.95)
Subject Art Education / Physical / Music	(0.69, 0.86, 0.97)

Table 5: Average Fuzzy Number for benefits of implementing the use of Facebook in the future curriculum for the skills of students

Criteria	Average Fuzzy No
Have the skills to find information	(0.68, 0.84, 0.95)
Skills appropriate to the needs of the current job market.	(0.65, 0.82, 0.95)
Have skills in technology.	(0.70, 0.86, 0.96)
Have the skills to think critically and creatively.	(0.68, 0.85, 0.96)
Lack of social communication skills for many students to interact in cyberspace.	(0.74, 0.89, 0.97)

Table 6: Average Fuzzy numbers for the benefit of the use of Facebook in the implementation of the curriculum in the future for aspects of students' character

Criteria	Average Fuzzy No
Increase student motivation.	(0.61, 0.80, 0.94)
Make students self-reliant.	(0.70, 0.87, 0.97)
Students are more interested in their studies.	(0.61, 0.80, 0.94)
Religion and moral values eroded.	(0.60, 0.80, 0.95)
Students take an active part in the discussion.	(0.62, 0.80, 0.94)
Build a sense of having a Facebook account.	(0.70, 0.87, 0.97)

To find out the ranking of each variable, defuzzifying was conducted. Table 7, 8, 9, 10 and 11 show the position or ranking for each of the variables and sub variables.

Table 7: Position for the benefit of the use of Facebook in the implementation of the curriculum in the future for aspects of teaching aids

Criteria	Fuzzy Evaluation	Score	Ranking
Using a Facebook page for an announcement	(16.20, 19.10, 20.00)	18.6	1
Inform students about homework to do.	(11.20, 15.10, 18.30)	14.925	2
Inform learning objectives that will be implemented.	(11.40, 15.10, 17.80)	14.85	3
Share information about teaching and learning.	(10.60, 14.60, 17.90)	14.425	4

Build a sense of having a Facebook account.	(8.80, 12.80, 16.70)	12.78	6

5.Discussion and Conclusion

Based on the results of this study, of the five variables to measure the benefits of the use of facebook in curriculum implementation in the future is accepted by consensus by the experts involved. This shows that the use of facebook in the future implementation of the curriculum is very desirable because it coincides with the advanced technology nowadays where the use of very high virtual space.

Ranking needs in this research is to identify the most important subvgariable for each variable. The aim is to put the variables according to priority, from the highest priority until the lowest priority.

For variable Facebook as teaching aid, the sub variable with the first ranking is "using the Facebook page for an announcement telling" and the final ranking is "Plan learning activities to be carried out". This statement is supported by Mazman & Usluel, 2010; Bicen & Carvus, 2010; Ross et al., 2009; Cain, 2008 stating that Facebook is a social networking site popular nowadays because it is used by millions of consumers; this implies that facebook is a medium suitable for making an announcement to students in the future implementation of the curriculum.

For the second variable, namely aspects of student involvement showed sub variable ranked first is "to build a group of classes taught" and the final ranking is "conducting weekly tutorials". The findings in the first ranking for this second variable is very timely with the opinion of Alger (2009) which states that the ability of Facebook is to promote the exchange of information among the students in one hand, and between students and teachers on the other, and potentially make it an important educational tool for effective teaching requires educators to guide, nurture, develop and transmit knowledge to students. Indirectly, facebook can be used as a tool to build a group in class and tutorials regularly scheduled to be delivered to each group.

For variable suitability subjects, the sub variable that gets ranked first is "Bahasa Malaysia / English / Tamil / Chinese" and the final ranking is the "subjects of science and mathematics". This shows that it is very easy to use FAcebook for subjects involving only theory without involving calculations. Findings ranking for variable findings suitability subjects clearly shows us that Facebook is a tool that is useful and meaningful educational environment that can support the learning of English (Muhammad Kamarul Kabilan et al., 2010).

The fourth variable, namely the students' skills, shows knowledge gets first ranking is "have the skills to find information" and "skills to think critically and creatively" has fallen into the final ranking. It is known that the use of Facebook really is capable of helping students get the information quite easily available from virtual search. But the disadvantage is to produce students who are relatively less use common sense and think to produce an idea.

The last variable is the aspect of students' character. Ranked first show is "build morale to have a Facebook account" and the last is "religious and moral values being eroded". This can be proved by the many social problems arising with the use of control and understanding of facebook. This is proved by Galiffa (2009) which states that the uncontrolled use of Facebook also allows students to engage in immoral activities during the communication process.

The conclusion to be drawn from this scientific research is the use of Facebook is seen as a medium and an effective tool for curriculum in the future. This is supported by the efforts made by the government in creating a free wifi zone in selected areas. This effort is seen as being able to expand and maximize the use of Facebook in the curriculum of the educational system of our country. The respondents from the experts were also seen reaching a consensus agreement that Facebook be made a medium in the teaching and learning process in the future because it is capable of affecting the education system as well as in line with current technology. Apart from the benefits of using Facebook, researchers feel the negative effects also exist, because if students use so much time on social networking sites such as Facebook this will leave them less time to learn and have a negative impact on their studies such as low academic achievement. According Zuwairi (2010), logging on to Facebook a long time can cause active students to turn passive. Therefore, we suggest that the government and experts involved in either of the fields of education and ICT study and create a model that is believed to be able to compensate and prevent the negative effects arising from the use of Facebook in teaching and learning systems for implementation of the curriculum in the future.

Use of Information Communications Technology (ICT) in Malaysian science teaching; A microanalysis of TIMSS 2011

Ling Pick Yieng[183] & Rohaida Mohd. Saat

Institute of Teacher Education, Rajang Campus, Bintangor, 96509, Sarawak, Malaysia
Faculty of Education, University of Malaya, 50603 Kuala Lumpur, Malaysia

Abstract

ICT is a resource that is used by many science teachers worldwide. An evaluation of ICT use in learning science was carried out by Trends in International Mathematics and Science Study (TIMSS) 2011. Resources used by teachers as classroom instruction is one of the major factors that influence students' achievements. The objectives of this paper are to examine the use of ICT in teaching science in Malaysia and the effects on students' achievement based on the TIMSS 2011 results. The results revealed that the average science score of Malaysian Form Two students was 426 which was lower than the international TIMSS scale average and Malaysian Form Two students were ranked number 32 in science among 45 participating countries. This study revealed that 33% of students were taught by teachers who used ICT for science instruction. This was about doubled the international average (16%). However, the percentage of students who had computers available for science lessons was 17% and the use of computers in a month was very low (14-17%). Students seldom use ICT to look up ideas and information, to perform scientific procedures or experiments, to study natural phenomena through simulations, to process and analyze data and to practice skills and procedures. Based on these findings, implications towards science teacher education will be discussed.

Keywords: Student centered; Information and Communication Technology (ICT); Science Education; Malaysian Students' Achievement; Secondary education: TIMSS 2011.

Introduction

Information and communication technology (ICT) includes a wide range of approaches to teaching based on various traditional and innovative instructional theories. Although instructional technology can be used to support student-centered inquiry-based learning, however simply installing computers and using computer software in schools has done little to change the didactic teaching methods that is prevalent instructional approach in schools (Cohen & Ball, 1990; Cradler, 1994; Cummins, 1996; Goodlad, 1993; Lim, 2007; Niederhauser & Stoddart, 2001; Stoddart & Niederhauser, 1993; Van Dusen & Worthen, 1992, 1995).

Malaysia education system has emphasized the use of ICT in classroom. School inspectorates, school management and lecturers of universities and institutes always ensure the use of ICT in the classrooms. All schools were supplied with computers and computer laboratories under *Program Komputer dalam Pendidikan* (Computer in Education Programme) and ICT Literacy Programme for secondary school (Curriculum Development Centre, 2007). Besides that, science and mathematics teachers also received personal laptop and educational software under *Pengajaran and Pembelajaran Sains dan Matematik dalam Inggeris* (Teaching and Learning Science and Mathematics in English hereafter state as PPSMI) policy since 2003. Prior to this, these subjects were taught using the Malay language, the national language for Malaysia. The move from Malay to English as a teaching medium is to take advantage of the vast resources available in English worldwide. To overcome the lack of English proficiency of teachers, Curriculum Development Centre (CDC) of the Malaysian Ministry of Education developed several educational softwares which were teaching courseware. All Malaysian schools were supplied with the teaching courseware and are easy to be accessed by teachers.

According to Niederhauser and Stoddart (2001), educational software can be grouped into two categories. Software that draws on the didactic tradition is grouped in the Skill-based Transmission category, while software that can be used in more constructivist ways in the Open-ended Constructivist category. Two types of traditional skill-based transmission software were identified; namely Drill-and-Practice and Keyboarding. Software included in these categories draw on objectivist behavioural principles of learning aimed at helping students internalize basic facts and skills. According to Niederhauser and Stoddart, this category of software is used to introduce content in hierarchical steps, present stimuli, provide immediate feedback and reinforcement, allow for repetition and practice, and monitor students' progress. There are three types of open-ended constructivist software; namely Interactive and Educational Game, Exploratory, and Tool programmes.

The use of information communication technology (ICT) was one of the instructional activities investigated in *Trends in International Mathematics and Science Study (TIMSS)* 2011. TIMSS is a series of international assessments of students' achievement in mathematics and science and this assessment is done once in every four years among participating countries. TIMSS's report provides vital information on key curricular, instructional, and resource-related factors that can impact teaching and learning process in Mathematics and Science (Martin et al., 2012). Malaysia has participated in TIMSS since 1999.

In 2011, national representative samples of students in 63 countries and 14 benchmarking entities (regional jurisdictions of countries, such as states) participated in TIMSS. Countries and benchmarking participants could choose to participate in the Year 4 assessment or the Form 2 assessment, or both. Forty five (45) countries and fourteen (14) benchmarking entities participated in the Form 2 (Grade 8) assessment. However, Malaysia had chosen to only participate in the Form 2 assessment.

Science assessment framework for TIMSS 2011 consists of a content dimension specifying the subject matter domains to be assessed within science (for example, biology, chemistry, physics, and earth science at Form 2) and a cognitive dimension specifying the cognitive domains or skills and behaviours (that is, knowing, applying, and reasoning) expected of students as they engage with the science content. The content domains differ for the Year 4 and Form 2, reflecting the nature and difficulty of the subjects taught at each level. At the Form 2 level, physics and chemistry are assessed as separate content domains, and receive more emphasis than at Year 4, where they are assessed as one content domain i.e. physical science. The cognitive framework, however, is the same for both levels, encompassing a range of cognitive processes involved in learning science concepts and engaging in scientific inquiry right through the primary and lower secondary school years.

2. Malaysian Science Result in TIMSS

Malaysia average achievement in the Form 2 content domains of biology, chemistry, physics, and earth science showed differing strengths and weaknesses. Although Malaysia has an overall science average scale score of 426 in TIMSS 2011, but we scored higher in physics with a score of 435 (see Table 1). The overall average scores for biology and chemistry were 427 and 426 respectively. The problem was the earth science domain which we only scored 401. Although our content domains score were slightly different, the most important aspect is to analyse the problems in our science education and improve the overall results.

Table 1.Malaysia overall and content domains average scale score

Rank.	Country	Overall Science Average Scale Score	Average Scale Score for content domains			
			Biology	Chemistry	Physics	Earth Science
1	Singapore	590(4.3)	594(4.8)	590(4.7)	602(4.2)	566(4.5)
2	Chinese Taipei	564(2.3)	557(2.5)	585(3.9)	552(4.5)	568(2.9)
3	Korea, Rep. of	560(2.0)	561(2.4)	551(2.2)	577 (2.8)	548 (3.2)
21	Turkey	483 (3.4)	484 (3.7)	477 (4.0)	494 (3.7)	468 (3.5)
27	Thailand	451(3.9)	460 (4.3)	436 (4.6)	430 (4.5)	466 (4.1)
32	Malaysia	426 (6.3)	427 (6.2)	426 (6.6)	435 (6.6)	401 (6.5)
40	Indonesia	406 (4.5)	410 (4.7)	378 (4.9)	397(5.4)	412(5.6)

( ) Standard errors appear in parentheses. Some results may appear inconsistent due to rounding.

There are four domains at Form 2; biology, chemistry, physics, and earth science. The same three cognitive domains; knowing, applying, and reasoning, were used at both the Year 4 and Form 2. Knowing covers the students' knowledge of science facts, procedures, and concepts. Applying focuses on the students' ability to apply knowledge and conceptual understanding in a science problem situation. Reasoning goes beyond the solution of routine science problems to encompass unfamiliar situations, complex contexts, and multi-step problems. (Martin et al., 2012)

In general, participants in TIMSS 2011 with the highest overall science average scale score also had the highest achievement in the cognitive domains, although most countries showed a relative strength in one cognitive domain or another (see Table 2). Malaysian students were strong in the reasoning domain (439 average score), average in the applying domain (424 average score), but weak in the knowing domain. This is quite different from other countries. Malaysian students were found to be able to do higher order thinking, but were knowledgeably weak.

Table 2. Comparisons of Countries' Achievement in Science Cognitive

No.	Country	Overall Science Average Scale Score	Cognitive Domains		
			Knowing	Applying	Reasoning
1	Singapore	590(4.3)	588(4.9)	589 (4.4)	592 (4.5)
2	Chinese Taipei	564 (2.3)	569(2.7)	570(2.7)	551(2.9)
3	Korea, Rep. of	560(2.0)	554(2.9)	561(2.0)	564(2.2)
21	Turkey	483 (3.4)	490 (3.8)	478 (3.4)	483 (3.4)
27	Thailand	451(3.9)	443(4.7)	451(4.1)	453(4.2)
32	Malaysia	426 (6.3)	403(7.0)	424(6.2)	439(5.8)
40	Indonesia	406(4.5)	402(5.4)	398(4.7)	413(5.2)

( ) Standard errors appear in parentheses. Some results may appear inconsistent due to rounding.

Besides students' science achievement in content domains and cognitive domains, TIMSS 2011 also evaluated five assessments and their effects on a student's achievement. The five assessments that were evaluated are: home environment support for science achievement, school resources for teaching science, school climate, teacher preparation and classroom instruction.

This article will focus on the use of ICT in Malaysian science teaching resources. In addition, this article will also discuss other classroom resources and activities employed in science lessons such as the use of textbooks, workbooks or worksheets, and science equipment and materials.

Method

Data were extracted from the results of TIMSS 2011. Only data on the 'types of resources used in science lesson' and 'how computers were used during science lessons' were analyzed. Descriptive statistics was used in the analysis to describe the types of resources used in their science lessons, and the various strategies employed in using computers in teaching science.

Findings

1. Use of computer software for science instruction

The result of TIMSS 2011 revealed that 33% of Malaysian students were taught by teacher using computer software for science instruction. This was about doubled the international average (16%). Please see Table 3. However, the Malaysian students' science achievement was still low (score of 426). From the result, it can be inferred that Malaysian science teachers used computer software for science instruction; however, it appears that only marginal benefits are derived as reflected in the students' achievement.

Table 3.Resources Teachers Use for Teaching Science
Reported by Teachers

Country	Percent of Students Whose Teachers Use							
	Textbooks		Workbooks or Worksheets		Science Equipment and Materials		Computer Software for Science Instruction	
	As Basis for Instruction	As a Supplement	As Basis for Instruction	As a Supplement	As Basis for Instruction	As a Supplement	As Basis for Instruction	As a Supplement
Malaysia	83 (2.5)	16 (2.3)	39 (3.8)	61 (3.8)	40 (3.4)	59 (3.4)	33 (3.8)	59 (3.8)
International Avg.	74 (0.4)	24 (0.4)	35 (0.5)	60 (0.5)	43 (0.5)	54 (0.5)	16 (0.4)	61 (0.5)

( ) Standard errors appear in parentheses. Some results may appear inconsistent due to rounding.

In the classroom resources and activities for teaching science, we found that textbooks were the main resources used by the science teachers as the basis of science instruction. The percentage of Malaysian students (83%) who were taught with these methods was higher than the international average (74%). Science equipment and materials were the next most frequently used with 43% of theinternational average. Workbooks or worksheets were less frequently used (35% of international students on average) but still heavily used in some countries. Computer software was less frequently used as a basis for instruction; which is only 16% on average. All of the following materials except textbooks were popular as supplementary instructional resources at the Form 2 level: workbooks or worksheets, with 60% of students; science equipment and materials, with 54%; and computer software, with 61%.

The result also revealed that Malaysian science teachers were more didactic than their international counterparts in teaching science. Majority of students (83%) were taught with textbooks as the basis for instruction. Less than 50% of the students were taught with workbooks or worksheets, science equipment and materials, and computer software as the basis for instruction. Please see Table 3. These findings showed that Malaysian teachers are influenced by the Confucian education culture where a greater proportion of science lessons are centred on learning from textbooks and memorizing facts. This is different from the Australian education system which has a longer historical influence from social-constructivist theorists such as Bruner and Vygotsky. Teaching in Australian schools involved a greater proportion of activities such as designing and doing science experiments, and working in small groups (Ying et al., 2012)

2. Computer Activities during Science Lessons

According to TIMSS 2011, countries are investing in technology as a way to enhance teaching and learning. Availability of computers and other technology in the science classroom can facilitate successful implementation of the curriculum. According to the Contextual Framework outlined in TIMSS 2011 Assessment Frameworks, computers and the Internet provide students with ways to explore concepts in-depth, trigger enthusiasm and motivation for learning, enable students to learn at their own pace, and provide students with access to vast information sources.

Internationally, on average, less than half (46%) of Form 2 students had computers available during their science lessons, ranging from 12 % in Ghana to 84% in Kazakhstan. Students with computers available during their lessons had slightly higher science achievement than students without computers available. On average, one-third (28–39%) of Form Two students, were asked to do the following on at least a monthly basis: look up ideas and information, do scientific procedures or experiments, study natural phenomena through simulations, process and analyze data, and practice skills and procedures. We found that only 17% of Malaysian students had computers available during their science lessons (see Table 4). Furthermore less than one-fifth (14-17%) of Malaysian Form 2 students, were asked to do the following on a monthly basis: look up ideas and information, do scientific procedures or experiments, study natural phenomena through simulations, process and analyse data.

Table 4. Computer Activities During Science Lessons
Reported by Teachers

Country	Computers Available for Science Lessons			Percent of Students Whose Teachers Have Them Use Computers At Least Monthly				
	Percent of Students	Average Achievement						
	Yes	Yes	No	To Look Up Ideas and Information	To Do Scientific Procedures or Experiments	To Study Natural Phenomena Through Simulations	To Process and Analyze Data	To Practice Skills and Procedures
Malaysia	17 (3.3)	447 (13.1)	421 (6.8)	17 (3.2)	15 (3.0	17 (3.2)	15(3.0)	14 (2.9)
International Avg.	46 (0.5)	481 (1.0)	475 (0.8)	39 (0.5)	28 (0.5)	30 (0.5)	31 (0.5)	33 (0.5)

( ) Standard errors appear in parentheses. Some results may appear inconsistent due to rounding.

Although computer software was used for science instruction, teachers seldom cultivate cognitive skills of their students. Malaysian science teachers used computer software didactically and as a result of this, students are weak in knowing, applying and reasoning (see Table 2).

Discussion

TIMSS 2011 revealed that the science results for Malaysian students dropped drastically when compared to the results of TIMSS 2007. Although PPSMI was abolished in 2012 (Curriculum Development Centre, 2011), many teachers are still using the teaching courseware which were developed by Malaysian Ministry of Education. This could explain the higher average scale score obtained by our teachers in using computer software as compared to the international average score. They used the teaching courseware frequently as it was developed by the Ministry of Education.

Singapore also has its own ICT programme and is called as the Masterplan for ICT in Education (MP1) which was launched in April 1997. Clear objectives were set in the policy. The main goal of MP1 was not only to ensure that schools integrated ICT in their curriculum but also developed a culture of thinking, lifelong learning, and social responsibility (Singapore Ministry of Education, 1997). The ministry emphasized the use of Internet, software designed for the curriculum, open tools such as word-processing, spread sheets, and mind mapping packages, and learning management systems. The use of ICT in Singaporean education then changed from information receiving towards finding, collecting and synthesizing relevant information, and from learning to problem solving and communicating ideas effectively. Singapore teachers supported learner autonomy of the students by providing them with worksheets and checklists, and engaged them in dialogues to scaffold the learning processes. (Lim, 2007)

However in Malaysia, the microanalysis of TIMSS 2011's data on how the students use computers revealed that less than one-fifth (14-17%) of the Form 2 students used it to look up for ideas and information, do scientific procedures or experiments, study natural phenomena through simulations, process and analyse data, and practice skills and procedures. This shows that most teachers did not use the computers to enhance their students' cognitive skills. This could be related that the low average scale score obtained by our students in the science domain. As described by Niederhauser and Stoddart (2001), ICT-based learning, can be used in the didactic tradition and constructivist ways. In the Malaysian scenario, ICT was used as this tradition. On the other hand, constructivism in science teaching was highlighted in many studies (Cheung & Toh, 1992; Yager, 1991). If students construct new knowledge out of the experiences that they encounter, then it makes sense for the teacher to grasp some part of their experience and connect it to the knowledge to be taught. In order to ensure students' understanding requires active involvement, ample opportunities to practice what has been learnt should be given. Though the emphasis is on the student, constructivism does not dismiss the active role of the teacher or the value of expert knowledge. Constructivism modifies that role, so that teachers help students to construct knowledge rather than reproduce a series of facts. The constructivist teacher provides tools such as problem-solving and inquiry-based activities with which students formulate and test their ideas, draw conclusions and inferences, and pool and convey their knowledge in a collaborative learning environment (Toh et al., 2004)

Thus, our students were not trained or instructed to obtain maximum benefit from the use of computer. There are computer softwares such as the tool software programmes (e.g. the spreadsheet, Internet and graphic organizer) that can support learners in their learning as they find, organize, manipulate and present information. However, the instructional value of these programmes lies in how they are used. Students can use the Internet to access information, a spreadsheet to organize data collected in experiments, a graphics package to prepare diagrams and charts, a word processor to organize and present textual information, and a multimedia presentation programme to prepare and present a final report. Such activities promote independent and group interaction in completing tasks (Niederhauser & Stoddart, 2001) , thus support learner autonomy to achieve students' engagement in higher-order thinking.

Conclusion

It is evident that TIMSS 2011 revealed that Malaysian science teachers used computer in their science instruction however they seldom cultivate cognitive skills of their students. Malaysian science teachers used computer software didactically and as a result of this, students are weak in knowing, applying and the skill of reasoning. This issue need to be addressed in the science teacher education programme; both pre-service and in-service level. Besides that, all schools should have sharing sessions of successful or unsuccessful ICT-mediated lesssons at school among the teachers. These sessions can provide ideas to the teachers how to conduct computer-based lessons and motivation that if others people can do it, we can also do it. They need to be trained in using ICT in constructivist ways in order to provide a flexible learner-directed workspace. The computer should be seen as a tool for learning, rather than a teaching machine.

Use of Nonverbal Communication in the Classroom as a Way of Enhancing Classroom Teaching: A Case Study of Solusi High School, Zimbabwe.

Mrs Stella Muchemwa[184]

Solusi University, PO Solusi, Bulawayo, Zimbabwe
bSecond affiliation, Address, City and Postcode, Country

Abstract

Daily classroom teaching is still inefficient although a lot of time and money has been spent on it; one of the main reasons being that some vital aspects of teaching, like nonverbal communication are either neglected or not understood by the teachers. This descriptive study investigated the teachers' use of nonverbal communication in the classroom and how it enhances teacher effectiveness as an instructor and as a disciplinarian. The research combined observation and interview data collection methods. It was established that, although teachers have relatively limited knowledge on nonverbal communication, they use quiet a number of them with positive impact on pupils' learning.

Keywords: Nonverbal; cues, oculesics, haptics, paralanguage; proxemics; disciplinarian; instructor; chronemics

1. Main Text
1.1. Introduction

Teaching is an old profession which is heavily based on social competence and prospective teachers have been trained for decades in the field so that they can effectively teach pupils in the classroom. A lot of teaching assisting technology is also employed in the classroom. However, in Zimbabwe (Solusi High School inclusive) pass rate is still low, for instance, according to Zimbabwe Students Solidarity Trust, for the 172 698 pupils who sat for "O" Level examinations in 2012, only 31 767 passed with at least five subjects which is the "O" Level pass-cut-line.

One of the tools which might seem to be ordinary but can be of great importance for teaching instruction and classroom management is nonverbal communication.

Fie, fie upon her!
There is language in her eyes, her cheek, her lip.
Nay her foot speaks….
Ulysses in Shakespeare's Troilus and Cressida

Shakespeare clearly indicates that messages can be derived from parts of the body movement and behavior.

Nonverbal communication has been defined by Gamble and Gamble (2002) as any communication we communicate without using words. Nonverbal communication, due to the popularity it is gaining especially in the education circles, has spawned a vocabulary of its own which includes proxemics, chronemics, among other terms (Portch 1982). It constitutes most of the communication that takes place between the teacher and the pupils in the classroom. Mehrabian (Undated) from his experiments established that 93 percent of communication among his sample was nonverbal. This means that teaching necessitates, on the part of the teacher, the ability to accurately encode and decode elements of nonverbal communication.

1.2. Statement of the Problem

Although it has been proved by research that most of the communication in the classroom is nonverbal, its value is still underestimated. Some teachers either lack the skill of interpreting the nonverbal cues or they do not value them. As a result, classroom teaching is still inefficient and pass rate, at both "A" and "O" levels, is still low.

This research is therefore geared at answering the following questions:

- Which nonverbal cues do the teachers use in the classroom?

- What is the relationship between teacher-pupil interaction, classroom management and lesson delivery?

- What are the profiles of teachers in terms of age, gender, professional qualifications and teaching experience and what impact does it have in the use of nonverbal communication?

1.3. Purpose of the Study

The study investigated the teachers' use of nonverbal communication in the classroom and how it enhances teacher effectiveness as an instructor and as a disciplinarian.

1.4. Materials for Data Collection

Audio-visual tape recorders, check lists and interview schedules were used. Okon (2011) propounds that the videotaped material captures an unbiased evidence of teacher behaviour and teaching situation.

1.5. Subjects of the Study

All academic ZJC teachers at Solusi High School, Matabeleland South in Zimbabwe were used for this study.

1.6. Research Procedure and Methodology

The researcher obtained written research permission from the following authorities before the research could be embarked on: Solusi University Faculty of Education and Solusi High School Headmaster.

The researcher combined the observation and interviews as tools for data collection. As a nonparticipative observer, the researcher used the ZJC Solusi High School academic subject teachers to find out how teachers use nonverbal cues in their classrooms. She invited audio-video shooting specialists who brought and installed audio-visual tape recorder equipment at strategic positions soon before the lessons began. Each teacher was shot twice on different occasions. The obtained videos were used by the researcher and experts from the Solusi University English and communication Department to fill in the prepared checklist for teachers' nonverbal cues. SPSS was used to analyze data from the check list. Regression was computed in order to find the relationship between teacher-pupil interaction, lesson delivery and classroom management.

An inventory of the information gathered from the observations was strengthened by structured interviews which were conducted to the teachers in question after the last day of observation. The obtained data was synthesized into a coherent description.

1.7. Results and Discussion

1. It was established that teachers used quite a number of nonverbal cues in the classroom with positive impact on pupils' learning and discipline.

- Chronemics (the use of time) was respected by the teachers in accordance to suggestion by Payne (2001) that the way teachers perceive time, structure it and react to it helps set the stage for classroom communication.

- Teachers were also conscious of proxemics (working environment and space) in line with finding by Papa (2008). On the same note, one interviewee exclaimed, "A neat environment facilitates learning".

- However, the absence of haptics (touch) during the teaching-learning process can prove that the Zimbabwean culture, just like the Asian culture (Hybels & Weaver 1997), has a negative attitude toward the touch.

- Professional dressing was valued by teachers since dress is associated with a person's character, dedication, mood and behavior (Manombe, 2009). Teachers also agreed that is important for pupils to be dressed for the occasion, "The smart ones (pupils) seem to be serious with everything including school activities, thus they are likeable", one interviewee echoed.

- Oculesics (facial and eyes expressions) and kinesics (body movement) have pivotal roles to play in both lesson delivery and classroom management. Neil (1989) has similar findings in his research.

- Appropriate use of chalkboard enhances learning. On the part of the pupils' handwriting, two of the interviewed teachers said that it has nothing to do with pupils' performance while the other three concurred that it impacts pupils' performance.

- Paralanguage (nonverbal communication that is associated with a person's use of voice) was mainly depended on. The following table shows the teachers' use of voice for effective lesson delivery. On the table, it can be seen that in almost all the occasions, teachers used their voices to advantage as shown by a fairly high mean of 3.4 to 4.6.

Table 1: Teachers' paralinguistic cues

Description of Teachers' paralanguage	min	max	sum	mean	std
Modulates voice accordingly	4	6	23	4 .6	0.894
Speaks fluently	3	5	19	3.8	1.095
Accents word meaning through tone	3	6	19	3.8	1.304
Speaks rapidly when exited	0	3	5	1	1.414
Vocal qualities contributes to pupils' understanding	3	5	20	4	1.000
Modulates voice to retain pupils' interest	2	5	17	3.4	1.517
Has vocal pauses ("ums", "uhs" etc)that disturbs fluency	0	3	3	0.6	1.342

2. It was also discovered that classroom management was directly related to lesson delivery.

- The relationship between classroom management and lesson delivery, as exposed by regression analysis on Table 2(a) and by partial correlation analysis, Table 2(b) was found to be strong with a coefficient of .855 in both occasions.

Table 2(a): Predictive validity of classroom management on lesson delivery

Mode	R	R Square	Adjusted R Square	Std. Error of the Estimate		Change statistics			
					R Square Change	F Change	Df1	Df2	Sig. F Change
1	.855(a)	.731	.641	.38576	.731	8.136	1	3	.065

F=8.136, Sig=.065

Table 2(b): Partial correlation analysis

Model		Unstandardized coefficients	Standardized coefficients	t	Sig		Correlations	
			Beta			Zero order	Partial	Part
1	(Constant)	.641		-.581	8.136	.855	.8553	.855
	CM		.855	2.852				

Table 2(a) shows an F value of 8.136 and a significant F Change of 0.65, which is fairly high. The Adjusted

R Square is 64.1% meaning that the contribution of classroom management to lesson delivery is 64.1%.

Such a percentage is high and indicates that relationship is true and is not a matter of chance.

This shows that the more the classroom is managed, the more effective is the lesson delivery. This finding i

agrees with that of Sidney (2005) who remarked that there is no learning in a class where pupils misbehave.

- A correlation analysis on teacher-pupil interaction, classroom management and lesson delivery was done
  and the results are shown on the table below.

Table: 3: Correlations of teacher-pupil interaction, lesson delivery and classroom management

		TPI	CM	LD
TPI	Pearson correlation	1	.050	-.384
	sig.(2-tailed)		.936	.524
	N	5	5	5
CM	Pearson correlation	.050	1	.855
	sig.(2-tailed)	.936		.065
	N	5	5	5
LD	Pearson correlation	-.384	.855	1
	sig.(2-tailed)	.524	.065	
	N	5	5	5

The computed correlation analysis showed that there was neither relationship between teacher- pupil

interaction and classroom management (.050) nor between teacher- pupil interaction and lesson delivery

(-.384) as indicated in table above. This means that teacher-pupil interaction does not necessarily enhance

both lesson delivery and classroom discipline.

However, it can be argued that teacher-pupil interaction was nonverbally motivated as shown below.

Table 4: Teacher-pupil interaction

			95% Confidence interval	
TPI	Mean	Std. Error	Lower bound	Upper bound
1	3.240	.279	2.665	4.832
2	3.640	.360	2.897	4.383
3	4.320	.395	3.506	5.134
4	5.000	1.616	1.66	8.334
5	3.400	.342	2.695	4.105

Teacher Five has the highest teacher-pupil interaction mean with a mean of 5.00 while the other teachers

were also doing fairly well with mean ranging from 3.24 to 4.32.

3. It was gathered that teachers' nonverbal competency is affected by age in agreement to Knapp and Hall (2004) who argue that nonverbal signs and signals develops from childhood till the age of 30 and seems to decrease later on in life; but in contrast to Bov'ee and Thill (1997) who assert that age has no effect on nonverbal communication.

4. The study exposed that professional qualifications affects teachers' nonverbal competency in line with Knapp and Hall (2002) who say that the understanding of socially agreed meaning for nonverbal signs is key for effective professional communication and requires proper training. Okon (2011:1) in his study also recommends, "Teachers should learn to use nonverbal communication in order to improve the quality of classroom teaching."

5. Many years of teaching proved not to result in nonverbal competence just as Knapp and Hall (2002) discover that experience (which they termed on-the-job-training) on its own, without proper training, is insufficient for the teachers. However, in contrast to the findings, f Neil (undated) proposed that experienced teachers use nonverbal tactics in a sophisticated way based on their previous teaching knowledge.

6. What proved not to affect nonverbal knowledge and animation is sex. This finding is similar to that of Klinzing and Aloisio (2004) where no significant differences, on different sexes, were found between university students and school principals in Germany. The finding, however, negates that of Hall (1998) and Knapp and Hall (2002, 97) which revealed that women are more effective decoders and encoders than men.

1.8 Implications

Nonverbal cues are powerful tools for both lesson delivery and for class management; hence they should be skilfully used to enhance classroom teaching.

1.9 Recommendations

Finally, based on the findings of the study, it can be recommended that further research on nonverbal communication should be done in Zimbabwe at all levels of education with the hope that, when such information can be available, it can lead to teacher improvement. This is of paramount importance because, currently, very little research in this field has been done.

Using mobile phone texting to support the capacity of school leaders in Ghana to practise Leadership for Learning

Sue Swaffield[a][185], Stephen Jull[a] and Alfred Ampah-Mensah[b]

[a]Faculty of Education, University of Cambridge, 184 Hills Road, Cambridge CB2 8PQ, England
[b]Institute for Educational Planning and Administration, University of Cape Coast, Ghana

Abstract

Several years into a collaborative professional development programme to build the Leadership for Learning capacity of Basic school headteachers throughout Ghana, the challenge is to sustain commitment, deepen understanding and share learning among the school leaders. Employing ubiquitous mobile phone technology, weekly text messages have been sent to the programme's 175 initial participants. During the year of the pilot project different forms of messages have been tried, and feedback from recipients suggests their value. The paper reports experience and findings from the pilot, and considers plans for scaling-up to reach all 18,000 Basic schools across the country.

Keywords: professional development; mobile phone; text messages; SMS; Leadership for Learning; headteachers; school leaders; Ghana

Introduction

Scalability and sustainability are issues central to many educational reform efforts, not least a programme of professional development to support school leaders in Ghana, in the west of Africa. Three years into the programme we started experimenting with mobile phone texting (Short Message System or SMS) as a way of maintaining regular contact with 175 core participants. This paper begins with a brief overview of the programme, followed by a review of literature relating to the use of SMS, before reporting our experience of using text messages in different ways during a year-long pilot. We analyse the types of message sent and the replies received, discuss what we have learnt and consider the possibilities for using SMS to support thousands of headteachers.

1.1 The Leadership for Learning Ghana programme

Internationally headteachers (ie school principals) are recognised as pivotal to school improvement (Robinson, Hohepa & Lloyd, 2007), and research in Ghana (Oduro 2008; Zame, Hope & Respress, 2008) has identified the lack of leadership preparation and ongoing professional development in the country as key issues. Since 2009 the Centre for Commonwealth Education at the Faculty of Education, University of Cambridge (http://www.educ.cam.ac.uk/centres/cce/) has been working in collaboration with the Institute for Educational Planning and Administration at the University of Cape Coast, Ghana to address this need. The Leadership for Learning (LfL) programme in Ghana (MacBeath, Swaffield, Oduro & Ampah-Mensah, 2012) aims to enhance the leadership capacity of headteachers in kindergarten, primary and junior-high schools (collectively known as Basic schools) and thus improve the quality of learning. It is based on a framework developed through an international project (MacBeath & Dempster, 2009) which has at its centre five principles for practice, namely: a focus on learning; conditions for learning; dialogue; shared leadership; and a shared sense of accountability.

15 Ghanaian 'Professional Development Leaders' (PDLs) comprising lecturers from the University of Cape Coast and other higher education institutions, officers of the Ghana Education Service (GES), and a headteacher undertook an accredited course at the University of Cambridge during which they considered the applicability of LfL to Ghana and prepared to lead programme workshops. An initial cohort of 124 headteachers from all over Ghana attended a

---

[185]Corresponding author.
E-mail address: ses42@cam.ac.uk

residential workshop in 2009, reconvening in 2010 and 2011 to share their experiences, provide mutual support and continue learning. Other key groups particularly circuit supervisors and district, regional and national directors were also introduced to LfL, and through these early participants many other headteachers became involved. The GES adopted the LfL framework as national policy and incorporated it into its headteacher handbook. It is estimated that over 3,000 school leaders throughout the country have now attended sessions on the Leadership for Learning principles. While official activity accounts for much of this expansion many of the original cohort of headteachers have also shared their knowledge and experience with local colleagues. We were keen to encourage this organic spread while being concerned that the fidelity of the framework and principles should be maintained as practice adapted to local circumstances. Continued support for the first group of leading edge headteachers seemed essential but more face-to-face meetings were impossible. Printed newsletters (which continue) are welcomed but are infrequent and expensive to produce and distribute.

We therefore began to consider the possibilities of using mobile phone texting to support the capacity of school leaders in Ghana to practise LfL.

The use of SMS to support professional development

Across large proportions of Sub-Saharan Africa people rely on mobile phone technology and in particular SMS for daily communications. In Ghana mobile phone penetration could be described as 100 per cent since subscriptions reached 24.4 million in 2012 (ITWeb Africa, 2012), nearly matching the national population of 25 million. Mobile phones and SMS are the preferred method of communication in Ghana as in other countries in the region, with only 14 per cent hard line internet access (Ghana Internet Service Providers Association, 2013).

SMS has been used to deliver a number of services in developing economies with good success, especially banking services (Porteous, 2006; Peevers & Douglas, 2008) and to support population health programmes and clinical trials (Armstrong et al., 2012; Dean et al, 2012; Ollivier et al., 2009). Education and SMS is notably absent from the research literature, save for a few research projects spanning the last decade and an emerging interest in the opportunities that have, as yet, remained underdeveloped (Kidd & Murray, 2013; Ford & Batchelor, 2007; Traxler & Dearden, 2005; Traxler, 2007; Visser & West, 2005; Valk & Rashid, 2010). The case for integrating SMS in education to support learning and professional development has largely arisen from the work of non-governmental organizations (NGOs) such as Front-line SMS (http://www.frontlinesms.com/) and English in Action (EIA) (Walsh & Power, 2011; Walsh et al., 2013).

Walsh et al.'s (2013) recent paper reviewing the work of EIA highlighted the potential of mobile phones for supporting increased access to professional development, citing the ubiquity and cost effectiveness of the technology as a key rationale. The benefits of using mobile technology and infrastructure for creating professional development opportunities are clear, yet it has not been widely used for this purpose. In part this may be because, as Ramli, Ismail and Idrus (2010) point out, effective professional development is about more than simply providing access to resources (important as they are) and providing a conduit for communication. Practitioners need to be continually applying their learning in practical situations, to adopt a spirit of enquiry, and to reflect on experience, all in the context of collaborative learning. Meaningful interactions among colleagues and with critical friends and supportive frameworks are key. Duncan-Howell (2010) reported teachers participating in online communities teachers spending up to three hours a week engaged with CPD, but as Walsh and colleagues pointed out these web-based discussion forums require easy, reliable and affordable internet access. Similarly, the lack of ICT infrastructure constrains use of the Open Education Resources (OER) available through the Teacher Education in Sub-Saharan Africa project (Harley & Simiyu Barasa, 2012). Accepting that there are differences in what can be achieved through e-learning that includes regular access to email, video content, video conferencing and so forth in regions where this technology is widely available, we imagined that benefits could be achieved through text messaging alone using simple mobile phones.

Piloting text messaging in Ghana

In March 2012 we began sending weekly text messages to core participants in the LfL programme. The recipients comprised 116 headteachers (the original cohort allowing for attrition through death and redeployment), 36 circuit supervisors and 23 others including the Professional Development Leaders, Ghana Education Service Directors, and members of the research teams in the Universities of Cape Coast and Cambridge.

The video, voice and text messaging service Skype was used to send and receive text messages. Skype was chosen as it was a cost effective solution that offered the functionality required of the pilot, namely, to send and receive messages to large numbers of recipients efficiently with the opportunity to maintain a record of activities over time. The messages were typically 30 words / 150-160 characters in length. A Skype account called LfL Ghana was established, enabling recipients to clearly identify the source of messages, and to ensure they could text or call replies.

The pilot study came to an end in April 2013, transitioning to a monthly information sharing service while the outcomes of the pilot were reviewed and a proposal for an expanded and extended SMS programme finalised.

3.1 Messages sent

43 messages were sent during the year's pilot study beginning in March 2012. They were sent on Monday mornings during the Ghanaian school terms.

The focus and wording of the messages were worked out through dialogue among the LfL teams in Cambridge and Cape Coast, with the programme researcher and co-ordinator taking the lead. We agreed that the initial messages would focus on the five LfL principles; thereafter we developed the texts predominantly through experimentation and response to circumstances. The messages created fell into five categories: announcements; prompt to thought or action; request for feedback – open; request for feedback – 'yes'; and sharing participant response. The totals and percentage of each type of message, together with two examples of each type for illustrative purposes are given in table 1.

Table 1. Types, numbers and examples of messages sent (with message number and date)

Category	Example 1	Example 2
Announcements n = 12 ie 28%	SMS5: Welcome to the 3rd term! We hope you had a restful holiday. We wish you the best in Leadership for Learning this term! A new Monday message coming next week. (02/05/12)	SMS41: LfLGhana shared your story at the 'Year of Ghana Conference' in Atlanta, USA. Participants were impressed at your hardwork. Keep it up! Keep the LfL flag flying. (25/03/2013)
Prompt to thought or action n = 9 ie 21%	SMS7: LfL Ghana supports Shared Accountability across the whole school: What are you doing this week to encourage a shared responsibility for learning? (14/05/12)	SMS23: LfLGhana believes in Critical Friendship as a tool for effective school leadership. For this week, we want you to reflect on the qualities of a critical friend. (15/10/2012)
Request feedback – open n = 13 ie 30%	SMS10: LfLGhana wants to know what YOU think is the biggest change in your school/classroom since starting with Leadership for Learning? We'll share results next week! (04/06/2012)	SMS34: Good morning! How could Monday messages help you more from week to week? What leadership topics/issues would you like to discuss or share? (21/01/2013)
Request feedback – 'Yes' n = 3 ie 7%	SMS27: LfLGhana is now in over 2000 schools across Ghana. Reply YES if you have shared your LfL expertise with other Headteachers (12/11/2012)	SMS20: LfLGhana is looking for BIG IDEAS on how to develop shared leadership with teachers. If you have an idea, reply YES and we will contact you. Thank you! (24/09/2012)
Sharing participant responses n = 6 ie 14%	SMS14: LfL Ghana wants to share a msg we received: "The greatest change in my school is teachers' attitude towards work… with BECE results up… 54% to 81% since 2009" (03/07/12)	SMS25: LfLGhana shares this response to last week's msg. I've adopted 2 schs around me. I share the good news with them. I also take advantage to share some good practices with heads I get into contact with. (29/10/12).

The categorisation of messages is a retrospective analysis to summarise the types of messages sent, although the categories are not entirely mutually exclusive. For example SMS8 *'LfL Ghana wants to share this text from an STL[186]: "Use yourself as a practical example to demonstrate leadership and learning for others." What do you think? (21/05/2012)'* both shared a response and prompted thought. Other messages could be classified or interpreted in different ways. This was particularly the case with those messages that were prompts to thought or

---

[186] STL = School Transformational Leader, the term adopted for themselves by the initial cohort of headteachers in the programme.

action (for example SMS7 in table 1 above), which initiated feedback even though this was not their original intention.

As we experimented with different types of messages and responded to circumstances some patterns in the types of messages sent developed. Most obviously, 'announcement' messages were typically sent at the beginnings and endings of school terms, although in addition these kinds of messages were sent as the need or opportunity arose, for example to announce the death of a leading member of the programme and to inform everyone of LfL Ghana programme developments such as workshops for District Training Officers. The first messages sent (SMS1-4 and 6&7) focused on the LfL principles, prompting participants to think about and hopefully extend their current practice. These initial messages were phrased as questions without explicitly asking for responses, and we were pleasantly surprised to receive unsolicited feedback. We therefore started sharing some of the participants' responses (SMS 8&9) and directly requesting their ideas (initially SMS10, 11, 13). Mindful that recipients could only send text replies at their own personal cost we experimented with the form of feedback request, on occasions (SMS 20, 27, 29) asking for a simple 'Yes' reply. The first of these messages asked for ideas about how to develop shared leadership with teachers, and said that a 'yes' reply would initiate contact for further details. The programme co-ordinator in Ghana then made telephone contact with each of the respondents, which proved to be difficult and time consuming. Subsequent 'reply yes' messages were used without a promise of follow-up to seek feedback about (and also indirectly prompt) the prevalence of an aspect of practice (sharing LfL expertise with other headteachers), and to gauge interest in developing the text messaging service (by the opportunity to text other headteachers directly).

3.2 Responses received

All bar two of the 43 messages sent during the year generated text responses from recipients, even though only 16 of the messages (37 per cent) were explicitly designed to do so. In total 390 text replies were received, giving a mean average of nine replies per message. One message (SMS27) elicited 42 replies, the greatest number received in any one week. Not surprisingly this text was in the form 'reply yes', and the other messages that prompted particularly large number of responses (SMS21&31) were the other two of this type. The 13 messages that requested open feedback generated an average of nine replies each, with the totals for individual messages ranging from four to 18. Replies to the ten messages that were prompts to thought or action, and the six that were sharing participants' responses to previous messages were fewer, although as explained above some of these also prompted thought ('... What do you think?') and could also have been interpreted as a direct request for feedback. The 12 announcement messages precipitated a total of 60 replies, an average of five per message although there was considerable variation. 14 people responded to the news of the death of one of the Professional Development Leaders, expressing their shock, condolences, and appreciation of his work.

Responses to announcements were typically expressions of thanks; quite a few people replied to seasonal greetings in similar vein. Two of the open feedback messages (SMS26&33) explicitly asked for programme participants' views about the text messages. The 16 responses were all positive, welcoming the regular texts as reminders of the LfL principles and practices, as in: *'Messages we get from LfL Ghana serve as buck-ups that refresh our minds on the five principles'*. The SMS messages were described as *'... highly inspiring and motivating'*, and for some at least reduced the sense of isolation: *'It also brings us closer to our coordinator/ PDLs even though we are apart'*. Only three participants mentioned anything about short-comings of the messaging system: *'... at times you may not see the message early enough to reply'; 'what is not good is that sometimes it comes in broken messages which entails missing texts';* and *'using SMS much cannot be discussed'*. This latter point resonated with the 31 positive replies received in response to SMS29: *'LfL Ghana wants to know if you would like to have the opportunity to text other Headteachers about LfL through our messaging system. Reply YES if you do'*.

The majority of the 390 replies focused on details of the Leadership for Learning programme and the way the participants were putting the LfL principles into practice: detailed analysis of their content is beyond the scope of this paper. Beyond the one word replies *'yes'* and *'thanks'*, responses ranged in length from a few words, to a sentence or two, to quite extended paragraphs. The longest reply received was 117 words (728 characters).

The patterns of replies from different categories of participants are shown in table 2. 71% of all participants responded at least once, although there were differences among the groups with 66% of headteachers and 69% of circuit supervisors doing so compared with 100% of those in the 'others' category. However, it was among the headteachers that the most frequent respondents were found, with 14% of them replying more than six times and 7% sending more than 10 responses in the year. The most prolific respondents were headteachers, with one replying to 26 of the 43 messages sent.

Table 2. Responses by group

	Headteachers		Circuit supervisors		Others*		All participants	
Number of recipients	116		36		23		175

4. Discussion

A year of experimenting with text messages in the context of the LfL programme in Ghana convinces us of the value and potential of supporting professional practitioners in this way. Our pilot had a number of limitations, not least the lack of an evaluation process that systematically gathered feedback from all the participants and related participation to a range of professional development outcomes particularly student learning. Nevertheless through reflecting on the experience and reviewing data generated we are able to contribute to the small but growing body of research knowledge in the area, and have learnt a number of lessons to inform our continued support of the LfL Ghana programme.

Ubiquitous mobile phone ownership and network coverage throughout Ghana, together with what is now considered fairly basic communication technology, provide the means for cheap and reliable messaging with large numbers of school leaders. There are however practical issues and time requirements for setting up the recipients' phone numbers in the Skype messaging system and for administration. Wording concise messages takes practice, and although the ambiguous nature of some of our messages yielded unexpected benefits (as in alerting us to the readiness of recipients to respond), in retrospect we could have been clearer about the precise purpose of each message and ensured the wording conveyed that purpose. Nevertheless we were able to send weekly messages that had the potential to sustain commitment, deepen understanding and share learning among the 175 core participants of the LfL programme.

Perhaps the most important finding from the pilot is that nearly three-quarters (71%) of participants replied at least once, indicating that SMS is a practical method of communication with school leaders in Ghana. However, we do have to be cautious in drawing conclusions and interpreting patterns of responses. In particular we do not know how to interpret the complete lack or paucity of responses from individuals: it may be that our messages were not received, that the cost of replying was prohibitive, that participants were fully committed to practising LfL in their schools but did not wish to send text messages themselves, or that some school leaders were disengaged. Responses to direct requests for feedback about the messages were overwhelmingly positive, and suggested that the messages provided a sense of community, valued direct and frequent connection to the co-ordinator at the University of Cape Coast, and helpful reminders of key aspect of the programme. Whilst recognising that in any group there will be individual differences we continue to be heartened by the desire of a number of headteachers in particular to communicate, some responding fulsomely even to simple end of term greetings. We are convinced that regular text messaging supports the engagement and commitment of LfL programme participants, aids programme fidelity, and has the potential to enhance learning through the sharing and development of practices.

5. Looking ahead

Our challenge now is to build on the experience of experimenting with text messaging as a means of supporting school leaders and find a way of extending it to many more school leaders across Ghana. We are currently working together with the SHM Foundation (http://www.shmfoundation.org/) to develop a system that is scalable, sustainable, and meets the LfL programme participants' expressed desire to be able to communicate directly with one another. The proposed model is based on considerable work already undertaken by The SHM Foundation in using SMS in this way. Multiple small groups of say 12 headteachers would be established, each with a more experienced facilitator who would be attached to a total of 15 headteacher groups and who in turn would belong to a

support group with 15 others aided by a senior facilitator. This approach would allow approximately 3000 headteachers to join a small support group with whom they could interact directly via SMS, and through the facilitators could be in contact with the LfL Ghana programme co-ordinator, Professional Development Leaders and university teams. A six-fold replication would have the potential to include all 18,000 Basic school headteachers across Ghana.

There is much work to be done to bring this vision to a reality, not least to secure the funding necessary for such a large-scale, albeit cost effective, model of on-going professional development support and LfL capacity building. All our experience, and particularly the dedication, enthusiasm and commitment of educators throughout Ghana and at all levels of the system, suggests the value of the endeavour and prospects for success. The infrastructure, systems and communication habits developed would be a strong foundation for future more multi-media ICT-supported professional learning if smart phones and broadband internet connection become common in Ghana. No doubt there will be considerable difficulties to be overcome, but mobile phone technology could be the key to quality learning in Ghanaian schools where the LfL principles of a focus on learning, conditions for learning, dialogue, shared leadership and a shared sense of accountability are embedded and sustained.

Abstract

Internet is shown among the main ways of learning in many recent research findings. Many masses like personnel and students prefer meeting their need for obtaining knowledge with internet above all. This positive impact of internet on learning can be better increased with the determination and direction of various psychological perceptions of the learners'. One of these psychological traits is attitude towards internet. In this study, 265 undergraduate students', from various departments of Tunceli Vocational School of Tunceli University, attitudes towards internet were investigated. The Attitude Towards Internet Scale was used as the data collection instrument. The opinions gathered with the application of the scale were compared in terms of gender, grade, experience of computer education, age and field of study variables. Some of the findings are as following: the attitude towards internet does not differentiate meaningfully in terms of gender and grade variables; whereas there is a meaningful difference of opinions in terms of the field of study variable.

Keywords: Attitude Towards Internet, Internet, Learning, Vocational School Students

INTRODUCTION

Internet has been widespread in other fields as well as in education. Learners consider internet as the main and initial source of information (Tuncer, Yılmaz and Tan, 2011; Tuncer and Kaysi, 2011). With the spread of internet technology, the tendency of getting information via books or library has become gradually less. About half of the students begin using computers during their undergraduate years, and nearly two-thirds of them make use of internet for educational purposes (Usta, Bozdoğan and Yıldırım, 2007). Thus, it can be claimed that the internet technologies will have an ever-increasing importance as either the source of learning or a part of the learning activity itself in the future. Yet, it should not be thought that internet is beneficial under every circumstance and situation, and can be resorted to regardless of any regulation concerning it. As it is in other kinds of learning activities, the learners' psychological perceptions concerning internet should be known, and thus actions should be taken accordingly. And one of these psychological perceptions is attitude towards internet.

The attitude towards internet is defined as the feelings, thoughts and experiences regarding internet activities (Erkan, 2004; Esgi and Bardakci, 2007). As regards its educational use, the learners' feelings, thoughts and perceptions towards the object are quite significant. And sometimes these psychological properties create an effect as a generalization. For example, Mitra and Steffensmeir (2000) state that easy internet access encourages positive attitudes towards computers. When the fact that internet has already begun to be used in learning environments so frequently is taken into consideration, it is possible that students' negative attitudes towards this technology may be generalized for schools, and thus there could be increases in loss of learning.

This study aims to investigate the vocational school students' attitudes towards internet. As the vocational schools conduct educational activities for any given profession, it is thought that the students receiving education in this departments will be so closer with internet very soon and in their future lives as well. Within this study, it was

---

questioned whether the vocational school students' attitudes towards internet change in terms of gender, grade, experience of computer education, age and fields of study variables.

METHOD

The design of this study can said to be a survey model. As Karasar (2009:76) puts it, it is aimed to describe past or present situations in the survey model. The survey model is resorted to in the case of larger samples differently from other research designs (Büyüköztürk et al., 2008:177).

The Attitude Towards Internet Scale, developed by Nickell and Pinto (1986) and adapted by Tuncer (2012), was used as the data collection instrument. As a result of the adaptation of this 19-items and one-factor scale, it was observed that the scale consists of 15 items and four dimensions. The factors of the scale were labeled as "Internet Anxiety", "Future of Internet", "Internet Facilities" and "Drawbacks of Internet". This four-factors structure accounts for 51.860 % of the total variance. The cronbach's alpha reliability coefficient of the scale is .81.

The sample of the study consists of 265 students receiving education at various departments of the Tunceli Vocational School of Tunceli University. 200 of these students are females (75.5 %), and 65 of them are males (24.5 %). 160 of the students are in the first year (60.5 %), while 105 of them (39.5 %) are in the second year of their study. The students are from 7 different programs. The ages of the students range from 16 to 28, and the age mean is 22.13.

FINDINGS

The attitudes towards internet were compared in terms of gender, grade, and experience of computer education, age and field of study variables. The results of the independent groups t-test which compares the vocational school students' attitudes towards internet in terms of gender variable are given in Table 1 below.

Table 1: Comparison of Attitudes towards Internet in terms of Gender

| Dimension | Gender | n | $\overline{X}$ | SS | Levene's test | | df | T test | |
					F	p		t	p
Internet Anxiety	Female	200	2,58	,98	,852	,357	263	-1,705	,089
	Male	65	2,82	1,02					
Future of Internet	Female	200	3,44	,98	,017	,897	263	1,915	,057
	Male	65	3,17	1,00					
Internet Facilities	Female	200	3,66	,82	5,275	,022	263	-	U=6013,00 p=,303
	Male	65	3,59	,70					
Drawbacks of Internet	Female	200	3,47	,95	5,667	,018	263	-	U=6295,00 p=,612
	Male	65	3,44	,80					
The Whole Scale	Female	200	3,29	,61	3,450	,064	263	,213	,832
	Male	65	3,27	,50					

As can be seen in Table 1 above, the vocational school students' attitudes towards internet do not present any meaningful differences in the sub-dimensions of the scale and in the whole scale itself in terms of gender.

Another variable investigated within the study is the grade variable. The results of the independent groups t-test which compares the vocational school students' attitudes towards internet in terms of grade variable are given in Table 2 below.

Table 2: Comparison of Attitudes towards Internet in terms of Grade Variable

| Dimension | Grade | n | $\overline{X}$ | SS | Levene's test | | df | T test | |
					F	p		t	p
Internet Anxiety	1st Year	160	2,61	,95	2,105	,148	263	-,746	,457
	2nd Year	105	2,70	1,07					
Future of Internet	1st Year	160	3,42	,97	,127	,722	263	,949	,343

	2nd Year	105	3,30	1,03					
Internet Facilities	1st Year	160	3,64	,72	8,979	,003	263	-	U=8114,500
	2nd Year	105	3,65	,89					p=,639
Drawbacks of Internet	1st Year	160	3,47	,90	,514	,474	263	,173	,863
	2nd Year	105	3,45	,93					
The Whole Scale	1st Year	160	3,29	,54	2,821	,094	263	-,022	,982
	2nd Year	105	3,29	,63					

As a result of the analyses, no meaningful difference was found in terms of the grade variable.

There were also comparisons of the internet attitudes of those students who had somehow received computer education before and those who had never received any computer education before. It was tried to identify whether experience of computer education is an effective variable on attitudes towards internet. The results of this analysis are shown in Table 3 below.

Table 3: Comparison of Attitudes towards Internet in terms of Experience of Computer Education Variable

					Levene's test			T test	
Dimension	Experience of Computer Education	n	$\overline{X}$	SS	F	p	df	t	p
Internet Anxiety	Experienced	101	2,48	1,02	,478	,490	263	-2,061	,040
	Unexperienced	164	2,74	,97					
Future of Internet	Experienced	101	3,30	1,03	,810	,369	263	-,932	,352
	Unexperienced	164	3,42	,97					
Internet Facilities	Experienced	101	3,79	,71	4,210	,041	263	-	U=7052,500
	Unexperienced	164	3,55	,82					p=,042
Drawbacks of Internet	Experienced	101	3,56	,79	5,920	,016	263	-	U=7774,500
	Unexperienced	164	3,41	,97					p=,398
The Whole Scale	Experienced	101	3,30	,54	3,492	,063	263	,231	,818
	Unexperienced	164	3,28	,61					

According to the analysis results in Table 4, in the "internet anxiety" dimension of the attitude towards internet scale, a meaningful difference was found in favour of those who had not received computer education before (t(263)=2,061, p<.05). As the distribution was not homogenous, a Mann Whitney U test was conducted, and a meaningful difference was observed in the "internet facilities" dimension of the scale in favour of those who had received computer education before (U=7052,500, p<.05).

Another problem that was scrutinized in this research was whether the internet attitudes change according to age. The Kruskal Wallis H test analyses conducted in order to explain this problem are in Table 4 below.

Table 4: Kruskal Wallis H test comparing Attitudes towards Internet in terms of Age Variable

Dimension	Chi-Square	df	p	Difference
Internet Anxiety	3,238	3	,356	-
Future of Internet	5,292	3	,152	-
Internet Facilities	1,127	3	,771	-
Drawbacks of Internet	2,406	3	,492	-
The Whole Scale	2,093	3	,553	-
Age: (16-19, 59 people), (20-23, 154 people), (24-27, 39 people), (28 and over, 13 people)				

As can be understood from the data in Table above, no meaningful difference was identified in terms of the age variable. The last problem that was scrutinized in this research was whether the internet attitudes change according to the field of study. The Kruskal Wallis H test analyses for this are given in Table 5 below.

Table 5: Kruskal Wallis H test comparing Attitudes towards Internet in terms of field of study

Dimension	Chi-Square	df	p	Difference
Internet Anxiety	9,840	6	,132	-
Future of Internet	10,934	6	,090	-

Internet Facilities	12,848	6	,046	7-1,7-2,7-3,7-4,7-5
Drawbacks of Internet	6,568	6	,363	-
The Whole Scale	8,145	6	,228	-

Field of Studies: (1.Child Development, 120 people), (2.Electricity and Energy, 22 people), (3.Accounting and Tax Practices, 26 people), (4.Fashion and Design, 51 people), (5.Hair Care and Beauty Services, 11 people), (6.Construction Technology, 8 people), (7.Computer Technologies, 27 people)

Upon comparisons in terms of field of study variable, some meaningful differences were found in the "internet facilities" dimension of the attitude towards internet scale between the department of Computer Technologies ($\overline{X}$ =4,04) and the departments of Child Development ($\overline{X}$ =3,65), Electricity and Energy ($\overline{X}$ =3,48), Accounting and Tax Practices ($\overline{X}$ =3,58), Fashion and Design ($\overline{X}$ =3,53) and Hair Care and Beauty Services ($\overline{X}$ =3,45) (X^2=12,848, p<.05).

DISCUSSION

As a result of the study, it was identified that attitudes towards internet do not present any meaningful differences in terms of gender, grade and age variables, but present meaningful differences in terms of experience of computer education and field of study variables. The meaningful difference in terms of experience of computer education is in the "internet anxiety" and "internet facilities" dimensions of the attitude towards internet scale. And the meaningful difference found in the "internet facilities" dimension in terms of field of study is between the department of Computer Technologies and the departments of Child Development, Electricity and Energy, Accounting and Tax Practices, Fashion and Design and Hair Care and Beauty Services.

The find that the attitudes towards internet do not present any difference in terms of gender is compatible with the findings of the researches done by Tuncer and Berkant (2010), Usta, Bozdoğan and Yıldırım (2007), Birişçi, Metin and Demiryürek (2011), Çavuş and Gökdaş (2006), Gezer and Sevim (2006), Tavşancıl and Keser (2002), Tekinarslan (2008), Yıldırım and Bahar (2008) and Zhang (2007). However, Erdoğan (2008) concludes that there is a meaningful difference in terms of gender in the "social interaction" dimension of the attitude towards internet in his study, and Yıldırım and Bahar (2008) find the same result in the "communication" and "Anxiety" dimensions of their internet attitudes scale. Bahar, Uludağ and Kaplan (2009) and Kol (2010) also conclude that the attitudes towards internet change in terms of gender.

The find that the attitudes towards internet do not present any difference in terms of grade variable seems to be compatible with those of Bozkurt, Demirer and Şahin's (2010). Moreover, the find that there is a meaningful difference in terms of fields of study is the same as those of Yanık(2010), Tavşancıl and Keser(2002) and Yıldırım and Bahar (2008).

The fact that internet is utilized so much in daily life makes it more significant to know the users' attitudes towards it. The positive attitudes towards internet contribute to the increase in the success of learning activities. It is especially essential to create and improve a positive attitude towards internet in younger age groups for educational objectives. Families should be informed about the negative aspects of internet environment for young children, and there should be taken some precautions in order for children to perceive the internet as a safe environment. In addition, it should be made sure that teachers and members of other professions develop a positive attitude in this regard with the help of the activities organized by their institutions.

Research of the Web Based Education Awareness: Ege University Example

Web Tabanlı Eğitim Farkındalığının Araştırılması: Ege Üniversitesi Örneği

Assist. Prof Dr. İlknur AYDOĞDU KARAASLAN[188]

ªEge University, Faculty of Communication, Department of Journalism, Bornova/Izmir, Turkey

Özet

Bilgi ve iletişim teknolojilerinin yarattığı değişimler, eğitimi tüm yaşam alanlarına yaymıştır. Uzaktan eğitim; eğitimde fırsat eşitsizliği sorunlarının aşılmasında ve değişen toplumsal koşullarının yarattığı yaşam boyu eğitime duyulan gereksinimin karşılanmasında önemli alan haline gelmiştir. Dolayısıyla web tabanlı eğitimin farkındalığı, günümüzün kendi kendine öğrenmeyi öğrenen, kendi gelişimini ve kariyer planlamasını yapabilen bireylerin yetiştirilmesinde önemlidir. Toplumun genelinde olmasa da, üniversite öğrencileri bu konuda daha bilinçli olabilmektedir. Bu çalışmada, üniversite öğrencilerinin web tabanlı eğitime yönelik farkındalıkları tespit edilmeye çalışılmaktadır. Öğrenciler üzerinde yapılan araştırmada elde edilen veriler, SPSS programı ile demografik değişkenler temelinde sorgulanmaktadır.

Anahtar Kelimeler: Uzaktan Eğitim, Web Tabanlı Eğitim, Web tabanlı Eğitim Farkındalığı.

Abstract

Changes created by information and communication technologies spread education to all fields of life. Distance education has become an important field in fulfilling the need for lifetime education created by changing public conditions and in overcoming the opportunity inequality problems. Therefore, web based education awareness is important in bringing up individuals who can learn self-learning and perform self-development and career planning. Although not common in public, university students can be more conscious about this issue. In this study, the aim is to determine the web based education awareness of university students. Data obtained from the research made on students is questioned by SPSS program in basis of demographical variables.

Keywords: Distance Education; Web Based Education; Web Based Education Awareness.

1.Giriş

Günümüzde bilgi ve iletişim teknolojilerindeki gelişmelerin etkisi eğitim alanına da yansımış ve köklü değişimler yaratmıştır. Web ortamı, bireylerin kendi kendine öğrenme sürecini yönetme olanağı sağlamaktadır. Böylelikle web tabanlı eğitim, yaşam boyu öğrenme de gerekli olabilecek bilgi ve beceriyi kazandırmayı sağlayan uygun yazılıma sahiptir. Söz konusu eğitim uygulamaları, çağdaş eğitim gereksinimlerini karşılayabilecek bir eğitim biçimidir. World Wide Web ve online konferans sistemler gibi teknolojiler, 7 gün 24 saat açık öğrenme ortamları sağladığından üniversitelere, kamu ve özel kurumlara uzaktan eğitimi gerçekleştirme imkanı sağlamaktadır. Böylece uzaktan eğitim kurumlarının sayısı giderek artmaktadır.

Geleneksel üniversite eğitimi eğitmenlerin dersleri ve ders notları ile sağlanırken, bilgi ve iletişim teknolojilerinin hızla artmasıyla, uzaktan eğitim ve e-öğrenme ortamları oluşturulmuştur (Malley,& McCraw,1999). Bu nedenle, web tabanlı eğitimde bilişim teknolojilerinin kullanımı ve farkındalığı eğitimin başarısı için gereklidir. Eğitimin web tabanlı olması, bireyler arasında fırsat eşitsizliğini ortadan kaldırmakta, zaman tasarrufu sağlamaktadır. Çünkü mekan kısıtı olmadan istenilen yerden ve öğrenmeye istekli kişi için uygun zaman aralığında bağlanma özgürlüğü sunmaktadır. Bilgisayar becerilerine sahip olan bireyler web tabanlı eğitime kolaylıkla adapte olabilmektedir. Toplumun diğer katmalarına göre üniversite gençliği, görece bilişim teknolojisine daha çok kullanmakta ve bu alanda daha çok donanıma sahip olmaktadır. Bu durum web tabanlı eğitime girişteki toplumsal ve bireysel engelleri oldukça azaltmaktadır. Eğitimde bu alandaki değişimin yaygınlık kazanmasında söz konusu öğrencilerin

---

farkındalıkları, önemli bir unsurdur. Ancak bu eğitimin yaygınlaştırılması ve bu konudaki bilinçlendirmenin hızla yapılması gerekmektedir.

Öğrenciler arasında bu eğitimin yaygınlaşabilmesi için öğrencilerin web tabanlı eğitim hususunda bilgi düzeyi önemlidir. Bu alan öğrencilere çift dal ve yan dal yapma olanakları sağladığından, eğitimde yeni fırsat alanları sağlamaktadır. Örgün eğitimle ders saatlerinin çakışması ve bu konuda öğrencide farkındalık sağlanamaması ve onlara sunulan fırsatlardan yeterince yararlanamamaktadırlar. Bu nedenle örgün eğitim web tabanlı olarak desteklenirse, eğitimdeki fırsat eşitsizlikleri azaltılabilmekte ve kariyer gelişimlerinde kendilerine yeni eğitim ortamları sunulmuş olmaktadır.

Bu eğitim ortamının yaygın kullanımının arttırılmasında üniversite öğrencileri bilgi teknolojileri kullanım becerileri ve yeniliklere duyarlı olmaları daha yoğun ilgi gösterebilmektedirler. Oysaki tüm üniversiteler başta olmak üzere, lise, ortaöğretim, dershane gibi eğitim kurumlarında söz konusu eğitimle öğrencilere destek sağlanabilir. Öğrencilerin zamandan ve mekândan bağımsız, bireysel gelişim sağlayabilecekleri, sadece okulda değil, meslek gelişim ve e-sertifika programlarında, işyerinde öğrenme ortamlarında web tabanlı eğitimden yararlanabilecekleri farkındalığı sağlanırsa, uzaktan eğitimin anahtarı olan, kendi kendine öğrenme, kendi kendini değerlendirme, iletişim araçlarını kullanma, işbirlikçi öğrenme konularında da bilinçlendirilebilirler (Martens, Bastiaens & Kirschner,2007). Böylece bireyler sadece eğitim hayatlarında değil, iş hayatlarında da yaşamları boyunca yeni bilgi ve beceriler kazanmaya ihtiyaç duyduğunda, değişimlere uyum sağlayabilecekleri eğitim ortamını da tanımış olurlar. Bu nedenle günümüz eğitim sistemi, her yaşta ve özellikteki bireylerin faydalanabileceği şekilde yapılandırılması gerekmektedir (Demiralay& Karadeniz, 2010).Dolayısıyla bireyler için yaşam boyu öğrenme ortamı da sağlanmış olur.

Yaşam boyu öğrenme resmi ve gayri resmi biçimlerde gerçekleşen bir süreçtir. Bir başka deyişle yaşam boyu öğrenme ile hızla değişen ekonomik, kültürel, sosyal ve teknolojik çevreye uyum sağlama adına, gereksinim duyulan bilgilere çeşitli kaynaklardan ulaşma, bu bilgiyi değerlendirme ve kullanma becerileridir. Bu süreci tamamlayan diğer bir unsur da kendi kendine öğrenmedir. Bu nedenle, bilgiye ulaşma ve bilgiyi kullanma becerisi olarak tanımlanan bilgi okuryazarlığı yaşam boyu öğrenmenin de temel taşıdır (Polat& Odabaş, 2008). Web tabanlı eğitim sistemi bireylere kendi kendine öğrenme, bilgiye ulaşma, temel eğitime desteğin yanında kariyerlerini geliştirmek için de bir fırsat sunmaktadır. Söz konusu eğitim, yaşam boyu öğrenmeyi aktif hale getirdiğinden, yükseköğretimin yanında hem kamu hem de özel sektör bu eğitim biçiminde yararlanabilmektedir. Çünkü, söz konusu eğitim ile sadece yükseköğretimde değil, kendini geliştirmek isteyen bireyler mesleki gelişimleri için e-sertifika programlarından da yararlanabilirler.

Web tabanlı eğitimden yararlanabilmek için öğrencilerin söz konusu eğitimden haberdar olma ve farkındalıklarının artırılması gerekmektedir. Yapılan araştırmalarda, üniversite öğrencilerinin bakış açısı farklıdır fakat olumlu yöndedir. Çünkü öğrenciler arasında geleneksel olmayan öğrenci profilleri mevcuttur. Öğrenciler hem çalışmakta hem aile sorumluluğu almaktadır. Bu arada da eğitimlerini tamamlamak istemektedirler. Bu nedenle öğretimde web tabanlı öğretime dönüşümü gerekli görmektedirler. Web tabanlı eğitim ile internet etkileşimi ve bilginin kalitesine erişmek öğrenciler tarafından cazip karşılanmaktadır. Hatta Web ilişkili eğitimsel aktiviteler, öğrencinin motivasyonu nu ve kendine saygısını artırmaktadır. Web tabanlı öğrenme ortamları, öğrenmeyi destekleyen ve teşvik eden içeriği yaratmak için web kaynaklarını kullanmaktadır. Web hem eğitimci hem de öğrenci için de pek çok özellikler sunmaktadır. Örneğin ders kitaplarında veya eğitimci tarafından verilen notlar içerisinde yer almayan çok geniş bilgi zenginliği sağlar. E-posta, konferans araçları, sanal topluluk olan haber grupları yoluyla öğrenciler bilgi, fikir alışverişi yapabilmekte, Web tabanlı eğitim öğrencilerin günün her saatinde eğitimlerini almaları için önemli bir faktör olmaktadır. Bu eğitim formatıyla, öğrencilerin motivasyonunun arttığı düşünülmektedir. Diğer bir öğrenci grubu ise, web tabanlı eğitim ile materyal ve dersten daha çok şey öğrenildiği savunmaktadır. Ayrıca WBE, kendi kendine disiplini ve iyi zaman yönetim becerisini öğretmektedir. Web tabanlı eğitim kullanmayan fakültelerde teknik destek. yazılım, içerik hazırlamak için zaman yetersizliği, öğrencinin bilgi eksikliği gibi bir takım kısıtlar bulunmaktadır (Daugherty & Funke,1998).

O'Malley&McCraw(1999) tarafından yapılan araştırmanın amacı, online ve uzaktan öğrenmenin etkililiğinde öğrenci farkındalığının ve algısını araştırmaya yöneliktir. Diğer bir araştırmaya göre, online öğrenme ve uzaktan öğrenme teknolojilerinin öğrenciler tarafından gerekli bilgi ile ilişkili olmadığı düşünülmesine rağmen, yine de bazı yararlarının olduğunun öğrenciler tarafından algılandığı ortaya çıkarmaktadır.

Geleneksel eğitim sürecinin öğrencinin gereksinimleri, eğitim pratikleri, sosyal değişiklikler gibi bileşenlerle yapısal engellerin söz konusudur Bu nedenle sosyoekonomik özellikleri, personel değişkenliklerini ve iletişim becerilerinin temelinde değişikliğe uğradığının dikkate alınması gereklidir. Uzaktan ve online eğitimin fark dilen

özelliklerin aşılmasında, öğrenci ve ders uyumu, bir takım üstünlükleri içerir. Süreç son olarak, puanlar ve programlar online ve uzaktan eğitimin fark edilen etkiliğinin bölümleridir (Martens, Bastiaens & Kirschner, 2007)

Online eğitimin üniversitelerin lisans, yüksek lisans, doktora programlarında düzenlenmesi giderek artmaktadır. Öğrenciler online erişimi talep ettiklerinde üniversiteler ve kurumlar bu talebi karşılamaya çalışmaktadırlar. Ancak programın gerçekliği ve uygulanabilmesi özellikle öğrencilerin farkındalıklarının artırılması ile mümkün olmaktadır (Song vd.,2004). Bu farkındalık, öğrenenin kendi öğrenmesiyle ilgili olarak inisiyatif ve sorumluluk alıp, öğrenmesini yönlendirebilmesi ve kendi kendine öğrenebilmesi için çok önemlidir. Böylece birey, "öğrenmesini planlayabilme, izleme ve değerlendirme" yeteneği kazanır (Baltacı & Akpınar, 2011). Çünkü, deneyimi olan öğrenciler söz konusu eğitimin verimliliğini bildiği için, eğitimde kullanılan teknolojileri rahatlıkla kullanabiliyor ve dolayısı ile eğitim performansı da artıyor. Öğrencinin web tabanlı eğitim konusunda bilinçlendirilerek motivasyonu sağlanırsa, öğrenme deneyimi daha başarılı olmaktadır. Çünkü farkındalık ve bilinçlenme, öğrencinin kurs materyallerini takibinin devamı için katalizör olmaktadır (Picciano,2002). USA'da 2008 yılında yayınlanan bir araştırma da, farkındalığı yüksek olan öğrencilerin daha fazla söz konusu eğitimden memnun oldukları ortaya çıkmıştır (So& Brush, 2008), Bir başka çalışmada da, online öğrenme de öğrencilerin yüksek öğrenme düzeyleri ve memnuniyetleri, yüksek aktivite düzeylerine bağlıdır. Online öğrenme de başarı için, kendi kendine öğrenme becerisi ve artan ilgi gerekmektedir (Howland & Moore, 2002). Bu nedenle eğitim etkiliği ve web tabanlı eğitimin yaygınlaşması için öğrencilerin farkındalıklarının arttırılması gerekmektedir.

Web tabanlı eğitim uygulamalarının sözel derslerde daha başarılı olacağı düşünülmektedir. Fakat sayısal derslerle ilgili kanaat, eğitim teknolojilerini kullanarak bu derslerin anlatılabilirliğinin kavranamamasından kaynaklanmaktadır. Söz konusu eğitim uygulamalarını gerçekleştirilecek üniversiteler, eğitim hakkındaki kanaatleri olumlu yöne çevirme konusunda çaba göstermelidirler. Eğitimin başarısında, algı ve farkındalık son derece önemlidir. Uzaktan eğitim ile ilgili olumsuz değerlendirmelerin önemli bir kısmının, uzaktan eğitim hakkında yeterince bilgi sahibi olmamaktan kaynaklandığı düşünülürse, üniversitelerin bu alanda yeterli düzeyde bilgilendirme yapmalıdır. Özellikle eğitim teknolojileri ile nelerin başarılabileceği anlatılmalıdır (Antalyalı, 2004).

2. Literatür Taraması

Bu konuda yapılan bir çok araştırma mevcutttur. *O'Malley&McCraw* (2007)'de %54'ü kadın, %46'sı erkek 128 kişi üzerinde yaptığı araştırma da,   öğrencilerin online eğitimin geleneksel eğitimden daha etkili olduğunu düşündükleri online eğitimi geleneksel eğitime tercih ettikleri görülmektedir. Geleneksel eğitim sürecine göre zaman tasarrufu, programlar ile uyum sağlama, öğrenciye daha fazla kur olanakları sağlamaktadır. Online eğitimden çok şey öğrenemeyeceklerini düşünmelerine rağmen, sınıf tartışmalarının da sürece katkı sağlayacağını düşündükleri ortaya konulmaktadır. Online eğitim konusunda istekli olmalarına rağmen, yine de geleneksel kursları tercih etmemektedir. Çünkü uzaktan eğitim yoluyla eğitimin daha yararlı olacağına yönelik tutum içinde oldukları görülmektedir (Martens, Bastiaens & Kirschner, 2007). Dolayısıyla öğrenciler geleneksel ve uzaktan eğitim arasındaki farklılıklar ve web tabanlı eğitim üstünlükleri konularında bilinçlendirilmeleri gerekmektedir.

2006 yılında USA'da 26 öğrenci üzerinde yapılan bir araştırmada, 34 madde Likert ölçeği (1-asla, 2-nadiren, 3-bazen, 4-sık sık, 5-her zaman)ile öğrencilerin uzaktan eğitimdeki algıları araştırılmıştır. Geleneksel, karma ve uzaktan eğitim konusunda öğrencilerin algıları karşılaştırıldığında, öğrencileri tarafından en yüksek oran eğitmen desteğinin geleneksel eğitimde daha etkin olduğuna ilişkindir. Geleneksel eğitimdeki ortalama(4.68) karma eğitimde (4.66), uzaktan eğitimde (3.62) 'dir. Eğitmenler geleneksel eğitimde pozitif ve negative geribildirim sağlar (5), yeterli derecede soruları açıklarlar (5), katılımcıyı cesaretlendirir(5), sorulara zamanında cevap bulunur(4.8), eğitmen ile iletişim kurmak kolaydır(4.4). Öğrenci etkileşimleri ve işbirliği konu olduğunda karma sistemleri daha etkili olduğu düşünülür (Biggs,2006). Ancak web tabanlı eğitim sistemindeki eşzamanlı ve eş zamansız iletişim ve etkileşim araçları göz önüne alındığında söz konusu eğitim geleneksel eğitimden sunduğu fırsatlar da göz önüne alındığında daha fazla tercih edilecektir.

Etkili öğrenme çevrelerinde sosyal etkileşim gereklidir. İnternet ve web'le geliştirilmiş öğrenme çevreleri, iletişimlerin diğer modülleri arasında görece etkili olarak görülmektedir. 2002 yılında USA'da 35 öğrencinin, sınıf etkileşimleri ve memnuniyet farkındalıkları Likert ölçeği ile değerlendirilmiştir. Öğrencilerin %63'ü tüm etkileşimlere katılırken,%59'u grup etkileşimlerine katılmaktadır (Driver,2002). Etkileşim, web tabanlı eğitimin en önemli özelliklerinden birisi olduğundan öğrencilerin sadece grup etkileşimlerine değil, birbirleri ve eğitmenleri ile de etkileşimlerinin artırılması konusunda bilinçlendirilmesi gerekmektedir.

Yüksek öğretimde web tabanlı eğitimlerin yaygınlaştırılmasıyla, en uygun öğrenme çevrelerini sağlamak amacıyla, öğrencilerin deneyimlerini kontrol etmek önemlidir. Howland ve Moore(2002)'nın yaptıkları çalışmada amaç, web tabanlı eğitim hakkındaki pozitif tutumlarını ve kendi kendini yönetmek konusundaki tutumlarını raporlamaktır. Çalışmada, negatif tutumlu öğrenciler, kendi kendini değerlendirmede ve eğitim içeriğini en az anlayabildikleri görünmektedir ve daha fazla yardıma ihtiyaçları bulunmaktadır. Ayrıca, öğrencilerin beklentileri, onların web tabanlı eğitim deneyim ve stratejilerindeki etkiyi tanımlamaktadır.

Yapılan çalışma 48 öğrenci üzerinde üç farklı online eğitim alan karşılaştırılmıştır. 36'sı kadın 12'si erkektir. Öğrencilerin %56'sı için ilk kez online eğitim alırken, %6'sı daha önceden web tabanlı eğitimden yararlanmışlardır. Öğrencilerin %90'ı bilgisayar kullanarak rahatladıklarını ve bu nedenle web tabanlı eğitim aldıklarını belirtmişlerdir. Söz konusu eğitim, kendi kendine öğrenme, kendi kendine güven, öğrenenin beklentilerini doğrulamak Web tabanlı öğrenme deneyimlerinin başarısı için önemlidir. Öğrenciler Öğrenmede daha aktif ve daha bağımsız olmaları gerektiğini farkına varmışlardır. Çok başarılı olarak deneyimlerini ortaya koyan öğrenciler, öğrenmeleri için bağımsızlık ve sorumluluk düzeylerinin daha yüksek olduğu görülmektedir. Diğer taraftan negatif tutumlu öğrenciler, eğitmenleri ile daha fazla geribildirime ihtiyaç duymaktadırlar. Kendi kendini değerlendirmeyi daha az güvenilir bulmaktadırlar. Eğitmenin geribildirimi ve etkileşimi olmaksızın kendilerini terkedilmiş olarak hissedeceklerini ifade etmişlerdir (Howland& Moore, 2002).

2002 yılında 540 online eğitimden mezun olan öğrenciler üzerinde yapılan diğer bir araştırma da , erkek öğrencilerin %55'i, kızların %45'i online eğitimden mezun olmuşlardır. %49.6'sı bilgisayarı çok iyi, % 48.5'ı orta düzeyde, %1.9'sı da az düzeyde bilgisayar kullanabilme becerisine sahiptir. %47.4'ü daha önce hiç online eğitim almamış, %23'ü bir kez, %29.6'sı 2 veya daha fazla online eğitim almıştır (Carswell & Venkatesh, 2002). Öğrencilerin online eğitim alması bilgisayar becerilerine ne kadar sahip oldukları ile ilişkilidir. Çünkü, teknolojiye olan ilgi ve merak bireylerin zamanını kullanma ve yaşa boyu öğrenmeye katılabileceğinin göstergesidir.

2002 yılında 30 kişi üzerinde yapılan bir başka pilot çalışmaya göre, geleneksel ve uzaktan eğitim öğrencilerinin iletişimleri arasında bir farklılık ortaya çıkmıştır. Geleneksel eğitim yapan öğrenciler düzenli olarak haftada bir kez eğitmenleri ile iletişim kurarken, online eğitim alanlar, telefon. video-konferans- e-posta gibi araçlarla daha rasgele bir iletişim sağlamaktadırlar (Wheeler, 2002). Web tabanlı eğitimin zamandan ve mekandan bağımsız oluşu, öğrencilere istediklerinde iletişimlerini artırmayı sağlamaktadır.

2001 yılında Chicago'da 74 öğrenci üzerinde yapılan araştırmaya göre, öğrencilerin hiçbiri daha önce web tabanlı eğitim almamıştır. Öğrencilerin %59.6'sı kadın, %40.4'ü erkektir. Web tabanlı eğitim esnek zaman yönetimi sağlar. Bu özellik öğrenciler kendi kendine disiplinin, aktif öğrenmenin, söz konusu eğitime başlamak için girişimde bulunmaları gerektiğinin farkındalığı için önemlidir. Ancak bu öğrenciler için, işyerinde internet erişimine sahip olma evde geçirilen bilgisayar zamanı önemsiz konulardır. Esneklik ve zaman yönetimi bakımından ders materyallerinin dağıtılması için teknolojinin uygulanmasının faydalı olacağını farkındadırlar. Öğrencilerin cinsiyete ile öğrenmenin elverişli olduğunu düşünmeleri arasında anlamlı bir ilişki söz konusudur. %66 erkek, %34 kadın web tabanlı eğitimi kolay bulmaktadır. Öğrencilerin cinsiyetleri ile e-öğrenmedeki sosyal etkileşim arasında anlamlı bir ilişki söz konusudur. %60 kadın bu fikre katılırken erkeklerde bu oran %40'dır. Eğitimdeki içerikleri dağıtılırken teknolojideki uygulamaların faydalı olduğunu düşünmektedirler. Eğitime katılanların birbirleri ile tartışıp konuşmaları için özellikle önemlidir(Valenta vd.,2001). Ayrıca öğrencilerin eğitmenleri ile yapacakları etkileşimin önemi de göz ardı edilmemelidir. Her zaman yüz yüze iletişim ve etkileşim daha etkili olmaktadır.

2000 yılında Beatty tarafından yapılan çalışmaya göre öğrencilerin yaklaşık %68'i öğrenme materyallerinin kaynağı olarak internet ortamını kullanmalarından dolayı memnunlar. Bu öğrencilerin doyumu web tabanlı eğitime erişme hızlarına, esnekliğe, öğrenci ve eğitmen arasındaki etkileşime bağlıdır (Peters, 2001). Çünkü öğrenci eğitim süreci içinde birtakım teknik sorunlar yaşarsa, bu sorun öğrencinin eğitimden uzaklaşması yönünde bir eğilimin doğmasında etkili olabilmektedir.

Türkiye'de Süleyman Demirel Üniversitesi İktisadi ve İdari Bilimler Fakültesi İşletme Bölümü üçüncü sınıf öğrencileri üzerinde yapılan araştırmada, öğrencilerin uzaktan eğitim algılarını ölçmek için anket uygulaması kullanılmıştır. Öğrencilerin uzaktan eğitim değerlendirmeleri genellikle olumsuzdur. Yapılan korelasyon testinde, sınıf ortamında ders dinlemekten daha fazla verim alanların uzaktan eğitime daha olumsuz baktığı anlaşılmıştır. Bununla birlikte öğrencilerin bilgisayar bilgi düzeyi ile uzaktan eğitim değerlendirmeleri arasında bir korelasyon olmadığı tespit edilmiştir. Dersi uzaktan eğitim ile alan grubun % 51'inin uzaktan eğitim ile ilgili kanaatleri olumlu yönde değişmiştir. Bu da göstermektedir ki uzaktan eğitim ile ilgili olumsuz değerlendirmelerin önemli bir kısmı uzaktan eğitim uygulamaları hakkında yeterince bilgi sahibi olmamaktan kaynaklanmaktadır. Öğrencilerin içerik değerlendirmeleri ile ilgili sorulan soru da bu kanaati desteklemektedir (Antalyalı, 2004). Dolayısı ile farkındalığın önemi bir kez daha ortaya çıkmaktadır.

Gürcistan'da 1998 yılında yapılan araştırmaya göre, Mezun olan öğrencilerin %63'ü, mezun olmayanların %55'i, online aktivitelere katılırken, eğitmenleri ve sınıf arkadaşları arasındaki iletişimin kalitesi ve derecesi hakkında olumlu düşünmektedirler. Öğrencilerin %77'si e-posta hizmetlerini düzenli olarak kullanmaktadırlar. Ancak mezun olmayanların %13'ü, mezun olanların %26'sı, bilgisayara erişim zorluğu ve teknoloji kullanım becerisi eksiklikleri olduğunu ifade etmişlerdir. Mezun olan öğrencilerin %52'si Web tabanlı eğitimin zamandan tasarruf edeceklerini düşünmektedirler (Daugherty & Funke, 1998).

California üniversitesinde yapılan başka bir araştırmada, geleneksel öğrenenlerle, sanal ortamda öğrenenlerin performansları ve algıları karşılaştırılmıştır. 1998-1999 eğitim yılında 151 geleneksel eğitimdeki öğrenciler, 49 sanal ortamda eğitim alan öğrencilerden oluşan 200 öğrenci üzerinde yapılmıştır.%95 anlamlılık düzeyinde her iki grup arasında, cinsiyet, sınıf düzeyi, okul, hem sayısal hem de sözel yetenekleri arasında anlamlı bir ilişki söz konusudur. Çalışma yapılırken, sanal ortamdaki öğrencilerin performanslarının daha yüksek olacağı beklenirken, aksine puanlarında çok az bir oranda farklılık bulunmuştur. Sanal ortamdaki öğrencilerin final sınavlarındaki performansları, cinsiyet, sınıf düzeyi ve etnik kökene göre bir farklılık gösterirken, sosyal, sağlık, fen bilimlerinde okumalarına göre bir farklılık bulunmamaktadır (Navarro & Shoemaker, 2000).

Öğrencilerin bilgisayara erişim özellikleri, olarak adlandırılabilecek evde ya da dışarda kullanma durumunun online eğitimlerine karşı onların tutumlarını etkilemekte olduğu görülmektedir. Bilgisayara evinde sahip olan öğrenciler, uzaktan eğitim aktivitelerini daha elverişli kullanabilirlerken da McMahon vd.(1999) tarafından yapılan araştırmada, öğrencilerin online eğitime karşı tutumlarının değişkenliklerinin %50'si bilgisayara erişimden kaynaklandığı ortaya çıkmıştır. Öğrencilerin erişimlerinin yanında bilgisayar kullanım beceri düzeyleri de online eğitim ilgisi üzerinde etkili olmaktadır.

Online eğitimi negatif olarak yaklaşan öğrencilerin özellikle part –time yada full-time çalışan öğrencilerdir. Evlerinde bilgisayar sahip olmayan öğrencilerin web tabanlı eğitim için bilgisayar laboratuvarını kullanabilmek için ek zamana ihtiyaçları vardır. Bu erişim eksikliği, çalışan öğrencilerin negatif reaksiyonlarına katkıda bulunur. Online eğitim alan öğrencilerin bazıları, belirli zamanda oluşan online sohbet ve eşzamanlı iletişimden hoşlanmayabilirler. Öğrencilerin diğer şikayetleri, online eğitimle ilgili aktiviteleri gerçekleştirmek için e-posta okuyup göndermek için yeterli zamanlarının olmamasıdır (Peters, 2001).

Bir araştırmaya göre insanlar hayatları boyunca öğrendiklerinin %15'ini okulda, %85'ini okul dışında öğrenmektedir (Ersoy, 2009). ABD'de okullarda verilen eğitimin temel hedeflerinin neler olması gerektiğine ilişkin 2000 yılında hazırlanan bir raporda, bilgi toplumunda yaşayan bireylerin başarılı bir iş performansı gösterebilmelerinde gereksinim duyacakları araçlardan biri de yaşam boyu öğrenmedir (Polat & Odabaş,2008).

3.Uygulama

3.1. Amaç ve Yöntem

Çalışma betimsel özellikli bir araştırmaya dayalıdır. Ege Üniversitesi Fen, Sosyal ve Sağlık bölümlerinde okuyan 447 öğrenci üzerinde gerçekleştirilmiştir. Veriler anket tekniği ile elde edilmiştir. Öğrencilerin uzaktan eğitim konusundaki farkındalıkları ve bu konudaki düşüncelerinin bölüme ve bulundukları sınıfa göre değişebileceği varsayılmıştır. Özellikle sosyal bilimlerde okuyan öğrencilerin uzaktan eğitim konusundaki farkındalıklarının ve söz konusu eğitime eğilimlerinin var olacağı düşünülmüştür. Ayrıca öğrencilerin farklı sınıfta olmalarına göre bu konudaki farkındalıklarının eğitimlerinin başlangıcında ve bitişinde etkili olabileceği düşünülmüştür. Bu nedenle bölüm, sınıf ve cinsiyet bağımsız değişkenler olurken, öğrencilerin web tabanlı eğitim konusundaki farkındalıkları ve bakış açıları bağımlı değişkenler olarak kabul edilmiştir. Çalışmada amaçlı örnekleme yöntemi kullanılmıştır. Elde edilen sayısal veriler SPSS istatistik paketi kullanılarak test edilmiştir. Bağımlı değişkenler frekans dağılışları ile analiz edilirken, aynı zamanda cinsiyet, bölüm ve sınıf değişkeni ile öğrencilerinin web tabanlı eğitime yönelik farkındalıkları λ^2 analizi istatistik tekniği ile değerlendirilmiştir.

3.2.Araştırmanın Hipotezi

H_0: Öğrencilerin web tabanlı eğitim farkındalıkları cinsiyete göre değişmemektedir.
H_1: Öğrencilerin web tabanlı eğitim farkındalıkları cinsiyete göre değişmektedir.

H_0: Öğrencilerin web tabanlı eğitim farkındalıkları eğitim formasyonuna göre değişmemektedir.
H_2 Öğrencilerin web tabanlı eğitim farkındalıkları eğitim formasyonuna göre değişmektedir.

H$_0$: Öğrencilerin web tabanlı eğitim farkındalıkları eğitim formasyonu sürecindeki durumlarına(sınıfa) göre değişmemektedir.

H$_3$: Öğrencilerin web tabanlı eğitim farkındalıkları eğitim formasyonu sürecindeki durumlarına(sınıfa) göre değişmektedir.

3.3.Bulgular

Demografik Özellikler

Cinsiyet: Çalışma %56.8 kadın ve %43.2 erkek üzerinde uygulanmıştır.
Bölüm: Araştırmaya katılan öğrencilerden %44'ü Sosyal bilimlerde, %36'sı Fen bilimlerinde ve %20 'si de Sağlık bilimlerinde eğitim görmektedir.
Sınıf: Çalışmaya katılan üniversite öğrencilerinden %62.4'ü bölümlerinde 1.sınıfta, %17.7'si 4. Sınıfta, %17.4'ü 2.sınıfta, %2.5 da 3.sınıfta okumaktadır.

3.4. Web tabanlı Eğitim Farkındalığının Değerlendirilmesi

Web tabanlı eğitimi kullanabilmek için öncelikle bilgisayar becerilerinin ve iletişim tekniklerinin bu eğitimi kullanacaklar tarafından yeterince uygulanabilmesi gerekmektedir. Bu bağlamda araştırmaya göre, gençlerin %75.8'i bilgisayar becerilerini kullanabilmektedir. Bilgisayar ve iletişim günümüzün vazgeçilmesi imkansız araçlarından olduğundan öğrencilerin %91.3 e-posta gibi iletişim araçlarını kullanmaktadır. Günümüzde web tabanlı eğitimin önemi giderek artmaktadır. Ancak bu konudaki eğitim farkındalığı bilinmemektedir. Bu nedenle yapılan çalışmada araştırmaya katılan öğrencilerin %70'i web tabanlı eğitimden haberdar iken %30'u bu kavramı hiç duymadıklarını belirtmişlerdir. Web tabanlı eğitimi duyan öğrencilerden sadece %14'ü bu eğitimden yararlanmışlardır. Ancak yararlanmayan öğrencilerden yaklaşık %28'i bu eğitimi almak istemektedirler. Web tabanlı eğitim almış öğrencilerin %28'i bu eğitimi arkadaşlarına tavsiye etmektedir. Eğitim alan öğrencilerin %7.6'sı lise ,%6.7'si üniversite eğitimlerinden web tabanlı eğitimden yararlanmışlardır. Söz konusu eğitimden haberdar olan gençlerin %37'si web tabanlı eğitimin gerekli olduğunu düşünmektedir.

Çeşitli gereksinimlerle bu eğitim uygulanabileceğinden öğrencilerin %30'u okula gidemeyenler ya da eğitimini yarıda bırakanlar için, %13.4'ü ikinci ve üçüncü bir meslek sahibi olmak isteyenlere, %13.6'sı yeniliklere uyum yapmak ve kendini geliştirmek isteyenlere, %7.6'sı kariyer gelişiminde fırsat yakalamak için, %6'sı bir meslek sahibi olmak için web tabanlı eğitimi uygun bulurken, öğrencilerin yaklaşık %15'i kişinin durumuna göre her zaman kullanabilecekleri bir eğitim şekli olduğunu düşünmektedirler. Öğrencilerin %20'si dershanelerde, %12.1'i liselerde, %25.1'i üniversitelerde, %26'sı ise eğitim kurumlarının hepsinde web tabanlı eğitimi destekleyici olarak uygulanabileceğini düşünmektedirler. Öğrencilerin %25'i eğitim kurumu seçerken web tabanlı uzaktan eğitimin mevcut olması tercihlerini etkilediğini belirtmişlerdir. Çünkü lise, üniversite ve dershaneler gibi eğitimlerinin önemli aşamalarında öğrenciler anlamadıkları konuları zamandan ve mekandan bağımsız olarak tekrar edebilme olanağına sahip olmaktadırlar.

Toplumun eğitim düzeyi o ülkenin gelişmişlik düzeyini göstermektedir. Özellikle günümüzde üniversite mezunu olan gençlerin sayısı giderek artmaktadır. Eğitimli gençlerin artması iş bulmada gençlerin artılarının olması kaçınılmaz hale gelmektedir. Bu nedenle öğrenciler üniversite de okurken kendilerine sağlanan çift dal ve yan dal imkanlarını kaçırmak istememektedir. Ancak örgün eğitimlerinde zaman kısıtı olması nedeniyle bu isteklerini geri planda tutmaktadırlar. Bu bağlamda, öğrencilerin %41'i çift ve yan dal yapmak için web tabanlı eğitimi bir umut olarak düşünmektedirler.

Web tabanlı eğitimi hayatımızın her aşamasında kullanabildiğimizden meslek ve bireysel gelişim için de vazgeçilmezdir. Çünkü birçok sektör işe alınan elemanlarını kariyer gelişimlerini devam ettirmek için bir seri eğitim zincirlerinden geçirmektedir. Ancak bu durum işverene hem maliyet getirdiğinden hem de işgücünün o dönemde eksilmesi nedeniyle web tabanlı eğitimi tercih etmektedirler. Geleceğin meslek sahibi olacak olan gençlerin %30'u iş hayatlarında da eğitimin ve web tabanlı eğitimin uygulandığını bilmektedirler. Söz konusu eğitimi, öğrencilerin %18'i lisans, %6.9'u yüksek lisans, %5.6'sı doktora eğitimlerinde, %12.5'u e-sertifika programlarında, %15.7'si bireysel gelişimlerinde, %13.4'ü derslerine katkı sağlamak için, %11.4'ü meslek gelişim programlarında, %5.4'ü anlaşılması güç programlarda, %6.5'u iş yerlerindeki öğrenme programlarında, %23'ü de her durumda web tabanlı

eğitimin kullanılmasını uygun bulmaktadırlar. Web tabanlı eğitimin zamandan ve mekandan bağımsız olması, zamandan tasarruf sağlaması, fırsat eşitsizliğini ortadan kaldırması nedeniyle herkes tarafından kullanılmaktadır. Çalışmaya katılan öğrencilerin %21.9'u öğrencilerin, %10'u meslek sahibi kişilerin, %8.1'i ev hanımlarının, %13'ü eğitimini tamamlamış iş arayanların, %21.9'u ise açık öğretim de okuyan öğrencilerin%26.6'sı ise herkesin bu eğitimi alabileceğini düşünmektedir. Öğrencilerin %60.4'ü web tabanlı eğitimin örgün eğitimden tamamen farklı olduğunu ifade etmektedir.

Söz konusu eğitimin birçok avantajı bulunmaktadır. Öğrencilerin %18'i mekan kısıtı olmadığından,%18.6'sı zaman kısıtı olmadığından, %15.4'ü ekonomik olması yönünden, %24.5'u tekrar edilebilme özelliğine sahip olduğundan, %11.6'sı istenilen konuya ulaşma imkanı verdiğinden, %7.6'sı sık güncellenebildiğinden, %7.8'i sınırsız bilgi kaynağı olduğundan, %8.1'i devam edilen eğitim kurumuyla eş zamanlı eğitim imkanı sağladığından, %7.8'i bireysel gelişim için, %27'si ise sayılan tüm özelliklerin hepsini kapsadığından web tabanlı eğitimi önemli bulmaktadırlar. Öğrenciler bu eğitimin kullanımını yaşa (%14.5), cinsiyete (%3.8), bölüme(%28.6) göre değiştiğini düşünmekte ve coğrafi bölgelerle de bağlantılı(%8.7) olduğunu belirtmektedirler. Ayrıca %23 öğrenci ise kullanımın belirtilen dört değişkene göre de değiştiğini düşünmektedirler. Gençlerin %7.2'si web tabanlı eğitim ile iş hayatında başarılı bir kariyer, %16.6'sı yaşam boyu öğrenme sağlanabileceğini, %12.8'i fırsat eşitsizliklerinin giderilebileceğini, %10'u eğitimin niteliğin artabileceğini, %16.6'sı öğrencilerin derslerine katkı sağlanabileceğini, %5.1'i eğitimde belli bir standart sağlanabileceğini ifade etmektedir. %23.9 'u ise belirtilen kriterlerin hepsi için web tabanlı eğitim kullanılabileceğinin farkında olduğunu belirtmişlerdir. Öğrenciler web tabanlı eğitimin önemini ve nedenlerini göz önüne alarak, %58.6'sı her eğitimin uzaktan eğitim olarak Web'le desteklenemeyeceğini düşünmektedirler. Öğrencilerin %36.9'u örgün eğitimlerinde destekleyici olarak web tabanlı eğitimi kullanmak isterken, az bir oran olsa da %4'ü şu an bu durumdan faydalanmaktadır.

3.4.1. Cinsiyet ile Gençlerin Web Tabanlı Eğitim Farkındalığı İlişkilerinin Değerlendirilmesi

Öğrencilerin cinsiyeti ile bilgisayar becerilerini uygulayabilmeleri arasında %5 anlamlılık düzeyinde bir ilişki söz konusudur(p=0.001). Erkek öğrencilerin %84'ü bilgisayar becerilerini uygulayabiliyorken, bu oran kızlarda %69.7'dir. Buna göre erkek öğrencilerin teknolojiye daha rahat ayak uydurdukları ortaya çıkmaktadır. Bu konuda kız öğrenciler biraz daha pasif kalmaktadırlar. Cinsiyet ile öğrencilerin üniversite eğitiminin web tabanlı eğitim ile desteklenebilmesi tercihinde de anlamlı bir ilişki söz konusudur(p=0.05). Erkekler(%30.1) kızlardan(%21.3) daha fazla oranda üniversitelerin bu eğitimle desteklenebileceğini düşünmektedir. Ayrıca öğrenciler cinsiyet ile web tabanlı eğitim kullanımı arasında da yine teknoloji kullanımına bağlı olarak bir değişim söz konusudur(p=0.0005).

3.4.2. Bölüm ile Gençlerin Web Tabanlı Eğitim Farkındalığı İlişkilerinin Değerlendirilmesi

Öğrencilerin bölümleri ile her bölüme web tabanlı eğitim verilebilmesi konusundaki farkındalıkları da arasında da anlamlı bir ilişki söz konusudur (p=0.037). Sağlık bölümlerindeki öğrencilerin %20'si, Fen bilimlerindeki öğrencilerin %8.1'i ve Sosyal bölümlerindeki öğrencilerin %8.2'si söz konusu eğitimin her bölüme uygun olduğunu düşünmektedir. Bu oranların düşük olması öğrencilerin kendi aldıkları eğitimle bağlantılıdır. Uygulama eğitimlerinin web tabanlı olarak nasıl verileceği konusunda endişeleri bulunmaktadır.

Çalışmada farklı bölümlerdeki öğrencileri web tabanlı eğitim ile ilgili fikirleri alındığında, bölüme göre öğrencilerin açık öğretimdeki okuyan arkadaşlarının söz konusu eğitim için uygun oldukları düşünmeleri arasında da anlamlı bir İlişki söz konusudur (p=0.04). Sağlık bilimlerinde okuyanların %32.2'si, fen bilimlerinde okuyanların %21.7'si, sosyal bilimlerde okuyanların ise %17.4'ü bu eğitim şeklinin açık öğretim de okuyanlar için uygun olduğunu düşünmektedir. Bu durum eğitimin özellikle sağlık ve fen bilimlerinde okuyan öğrencilerin uygulama derslerinin olması bu farklılığa yol açmıştır. Çünkü kendi bölümlerindeki derslerle açık öğretimde okuyan arkadaşları için empati kurduklarında sadece basılı materyallerle değil, aynı zamanda görsel ve eğitmen desteği, etkileşim ve tekrar olanağını sağlayan web tabanlı eğitime gereksinim duyduklarını düşünmektedirler.

3.4.3. Sınıf ile Gençlerin Web Tabanlı Eğitim Farkındalığı İlişkilerinin Değerlendirilmesi

Üniversite öğrencilerinin okudukları sınıflar ile web tabanlı eğitimi önermeleri arasında da anlamlı bir ilişki söz konusudur (p=0.003). Özellikle 1. ve 2. sınıfta okuyanların %75'i bu eğitimi önerirken, 3.ve 4. sınıfta bu oran %32'ye düşmektedir. Buna göre 1. Ve 2. Sınıf derslerinin temel olması ve bu konuda öğrencilerin tekrar ve yeni

bilgi kaynağının sınırlı olması nedeniyle web tabanlı eğitime yönelerek istedikleri zaman mekandan bağımsız olarak istedikleri kadar tekrar edebilirler. Ancak 3. ve 4. sınıf öğrencilerinin dersleri branşa yönelik uygulamaya dönüştüğünden web tabanlı eğitime o an ihtiyaçları olmadığından önermemektedirler. Oysaki meslek edinimlerinde, kariyer gelişimlerinde ve e-sertifika programlarında çok etkili web tabanlı eğitim kullanılmaktadır.

Gençlerin okudukları sınıf ile web tabanlı eğitimle ne zaman tanışmaları arasında da anlamlı bir ilişki söz konusudur (p=0.001). Öğrencilerin 1.ve 2 sınıfta okuyanların % 73'ü lise eğitimin de web tabanlı eğitim alırken bu oran 4. Sınıfta %26.5'a düşmektedir. Ayrıca 1.ve 2.sınıfta okuyanların % 76.7'si üniversitede uzaktan eğitimi alırken, sınıf ilerledikçe nu oran %23.3 olmaktadır. Çünkü giderek söz konusu eğitim yaygınlaştığından her gelen yeni nesil daha erken bu eğitim şekliyle tanışmaktadır.

Öğrencilerin okudukları sınıf ile hangi eğitim kurumu web ile desteklenebilmesi arasında anlamlı bir ilişki söz konusudur (p=0.027). 1.ve 2. Sınıfta okuyan öğrencilerin %88.6'sı Dershanelerde web tabanlı eğitimi gerekli görürken. 3.ve 4. Sınıftaki öğrencilerde bu oran daha azdır(%19.4).Bunun sebebi, 1. sınıf öğrencileri dershane ortamından yeni çıktığından orada karşılaştıkları güçlükleri bu eğitim şekliyle aşabileceklerini düşünmektedirler.

Sınıf ile öğrencilerin web tabanlı eğitim kullanımı yaşa göre değişmektedir düşünceleri arasında anlamlı bir ilişki söz konusudur (p=0.010). Özellikle 1. Ve 2. Sınıflarda okuyan öğrencilerin %87.7'si, bu fikri desteklemektedir. Kendileri ev arkadaşlarının teknoloji kullanımının farkındalığını bilerek daha çok gençlerin web tabanlı eğitime yönelebileceklerini düşünmektedirler. Genç nesil giderek bilinçlenmektedir. Bu nedenle eğitimin yaşam boyu gerekli olacağının farkındadır. Bu farkındalık öğrencilerin kaçıncı sınıfta okumaları ile yaşam boyu öğrenme sağlandığı düşünceleri arasında anlamlı bir farklılık sağlanır (p=0.013). 3. ve 4. sınıfta okuyan öğrenciler yaşam boyu öğrenmenin sağlanmayacağı fikrine daha az oranda katılmaktadır. Çünkü gelen yeni nesil ve teknolojinin hızla artması öğrencileri daha bilinçli yapmaktadır.

Öğrencilerin okudukları sınıf ile örgün eğitimi destekleyici olarak web tabanlı eğitimi kullanmak istemeleri arasında anlamlı bir ilişki söz konusudur (p=0.012). 1. ve 2. sınıfta okuyan öğrencilerin %84.2'si bu fikri desteklemektedirler. Çünkü, eğitimlerinin başında olduğundan ve temel derslerin daha çok teorik olması nedeniyle bu eğitim şekline ihtiyaç duymaktadırlar.

4.Sonuç

Bilişim teknolojileri öğrencilerin eğitimleri üzerinde önemlidir. Web tabanlı eğitimin geleneksel ve sosyal medya ortamlarındaki mesajlarda popülerliğinin artması geleneksel eğitimlerde online eğitimle desteklenmesi nedeniyle öğrencilerin bu konuda bir ön bilgiye sahip oldukları görülmektedir. Ancak online eğitimin başarısının artması ve eğitime yönelik talebin artması için öğrencilerin farkındalıklarının artırılmasının gerekli olduğu görülmektedir. Bilgisayar okuryazarlığının artmasıyla web tabanlı eğitimine yönelik tutumlarının da öne çıktığı görülmektedir. Dolayısı ile her yaştan öğrenci söz konusu eğitimin avantajlarını öğreniyor ve eğitimde başarılı olmak içinde bilgisayar becerilerini geliştirmektedirler. Ayrıca öğrencilerin bilgisayar sahipliği ve kullanım becerisi, bireylerin bilgisayar tabanlı eğitim farkındalığını etkilemektedir.

Web tabanlı eğitim kendini sürekli geliştirmek isteyen bireyler için birçok fırsat sunmaktadır. Bununla birlikte, eğitim kurumlarının zaman ve mekan kısıtından, kapasite yetersizliği gibi sebepler ile eğitim alamayan bireyler düşünüldüğünde, tek başına uzaktan eğitim, bu tür kitleler için uygulanması zorunlu olan ve gerekli şartlar oluşturulduğunda öğretim açısından geleneksel eğitimin gerisinde kalmayan bir uygulamadır. Ayrıca kendi kendine öğrenme, değerlendirme ve motivasyon online öğrenmede daha önemlidir.

Öğrenciler teknik problemlerden ve deneyim eksikliklerinden dolayı online öğrenmeyi zor bulmaktadırlar. Bazı öğrenciler, dokümanların online ortamda görüntülenmesini, dosya transferlerinin, ne kadar gerekli olduğunun farkında değiller. Ancak bilgisayar becerisi olan ve online kurs deneyimi olan bireyler için web tabanlı eğitim zor değildir. Birçok öğrenci, kurs içeriği eğlenceli ve ilginç olarak hazırlandığında online eğitimin kullanımını kolay olduğunu düşünmektedirler. Zamandaki esneklik ve erişim, görevlerini tamamlamak için kolaydır. Online öğrenmeye pozitif beklenti ile yaklaşan öğrencilerin başarıları daha yüksektir (Peters, 2001). Howland ve Moore(2002)'ın çalışmasında negatif tutumlu öğrencilerin, web tabanlı eğitim içeriğini yeterince anlayamadıklarından yardıma ihtiyaçları bulunmaktadır.

Yapılan çalışmada, öğrencinin çoğunluğu bilgisayar becerilerini kullanmaktadır. Öğrencilerin yarısından fazlası web tabanlı eğitimden haberdar iken, bu eğitimden yararlananların oranı düşüktür. Bu nedenle eğitim yaygınlaştırılmalı, öğrenciler arasında da farkındalığın oluşturulması gerekmektedir. Öğrenciler web tabanlı eğitimin, özellikle eğitimini yarıda bırakanlar için uygun olduğunu düşünmektedirler. Buna karşın çift dal ve yan dal yapmak isteyen öğrenciler web tabanlı eğitim sisteminden yararlanmak istemektedirler. Bireylerin gelecekteki

meslek edinimlerinde ve meslek gelişimlerinde söz konusu eğitim önemli olduğundan herkesin bu eğitimi alabileceğini düşünmektedirler. Ayrıca öğrenciler, web tabanlı eğitimin, cinsiyete, yaşa, bölüme göre değiştiğini ve coğrafi bölgelerle de bağlantılı olduğunu düşünmektedirler. Çünkü bu eğitim şekliyle farklı coğrafi bölgede bulunan için fırsat eşitsizliği de ortadan kalkmaktadır.

California'da Navarro & Shoemaker (2000)'ın araştırmasında cinsiyet, sınıf ve hem sayısal hem de sözel bölümde eğitim alan öğrencilerin arasında anlamlı bir ilişki olduğu gibi bu çalışmada da aynı benzerlik söz konusudur. Erkek öğrenciler daha fazla bilgisayar becerilerine sahip olduğundan web tabanlı eğitime yaklaşımları da daha pozitifdir. Kız öğrenciler bu konuda pasif kalmaktadırlar. Bölümle öğrencilerin web tabanlı eğitimi kimler için uygun görmeleri arasında da anlamlı bir ilişki vardır. Öğrenciler bu eğitim şeklinin açık öğretimde okuyan öğrenciler için uygun olduğu düşünülebilir. Çünkü kendi bölümlerindeki derslerle açık öğretimde okuyan arkadaşları için empati kurduklarında sadece basılı materyallerle değil, aynı zamanda görsel ve eğitmen desteği, etkileşim ve tekrar olanağını sağlayan web tabanlı eğitime gereksinim duyduklarını düşünmektedirler. Öğrencileri okudukları sınıf ile web tabanlı eğitimi önermeleri, farkındalıkları, bu eğitim sisteminden yararlanmak istemeleri arasında anlamlı bir ilişki söz konusudur. Üniversitede alınan temel derslerin sözel olması nedeniyle istedikleri zaman mekandan bağımsız olarak istedikleri kadar tekrar edebildiklerinden söz konusu eğitimi önermektedirler. Ancak 3. ve 4. sınıf öğrencilerinin dersleri branşa yönelik uygulamaya dönüştüğünden web tabanlı eğitime o an ihtiyaçları olmadığından önermemektedirler. Web tabanlı eğitim yaygınlaştığından her gelen yeni nesil daha erken bu eğitim şekliyle daha erken tanışmaktadır. Üniversiteye yeni adım atmış öğrenciler, dershanelerde be eğitimi gerekli görürken, bitirmek üzere olanlar yaşam boyu öğrenme sağlayacaklarından mesleki gelişim ve e-sertifika programları için uygun bulmaktadırlar. Böylece başlangıçta ortaya konulan hipotezler yapılan araştırma ile doğrulanmıştır.

Carswell ve Venkatesh(2002) tarafından yapılan çalışmada %47.4'ü ve Valenta (2001)'nın yaptığı araştırmada öğrencilerin tamamı hiç online eğitim almamışken, Ege üniversitesi öğrencileri'nin %86'sı söz konusu eğitimden hiç yararlanmamıştır. Ayrıca %28'i bu eğitimden yararlanmak istemektedir. Çünkü öğrencilerin bilgisayarlı eğitim farkındalığı olmadığı ve bu konuda bilinçlendirmenin eksikliğinden kaynaklanmaktadır. *O'Malley&McCraw* (2007)'ın çalışmasında da öğrenciler online eğitimi geleneksel eğitimden daha etkili olduğunu düşünüyor ve geleneksel eğitime tercih etmektedirler. Bu çalışmada ise öğrenciler yüzyüze eğitimi tercih ederken, %36.9'u örgün eğitimin web tabanlı eğitim ile desteklenebileceğini savunmaktadırlar.

Dolayısı ile öğrenciler geleneksel ve uzaktan eğitim arasındaki farklılıklar ve web tabanlı eğitim üstünlükleri konularında bilinçlendirilmelidir. Web tabanlı eğitimin yaygınlaşması için öğrencilerin farkındalıklarının arttırılması gerekmektedir. Etkileşim, web tabanlı eğitimin en önemli özelliklerinden birisi olduğundan öğrencilerin sadece grup etkileşimlerine değil, birbirleri ve eğitmenleri ile de etkileşimlerinin artırılması konusunda bilinçlendirilmesi gerekmektedir.

Abstract

The purposes of this research were to firstly construct the web-based Instruction model using the constructionism approach for critical thinking development of undergraduate students. Secondly, to compare critical thinking score between before and after learning via the web-based instruction and lastly to study the student satisfaction toward the web-based instruction that constructed by researcher. Results of the research were shown as follows: the web-based Instruction model using for critical thinking development the constructionism approach should include ten phases: 1) critical preparation, 2) review the issue,   3) elaborate learning, 4) arranging data, 5) thinking and diagnosing, 6) interpersonal communication, 7) verify the solution,   8) implementation, 9) transfer of innovations, and 10) yielding evaluation. It was found that after learning from the web-based Instruction the student's critical thinking score was higher than before learning at .05 level of significance. The student's satisfaction toward the web-based instruction were at the high level.

Keywords: Web-based Instruction Model, Constructionism, Critical Thinking.

Nomenclature	
A	Web-based Instruction Model
B	Constructionism
C	Critical Thinking

Introduction

The critical thinking is an important element of all professional fields especially in the field of education and student's development. In order to achieve the outcomes set out in the school curriculum framework, all the students should obtain the critical thinking skills. Critical thinking is a process of thinking carefully based on the use of knowledge, reflection, reasoning, and experiences in the interpretation, analysis, and rational evaluation. Integration of technology into a lifelong learning process according to constructionism model is one of the teaching and learning method, which requires the students to create knowledge by themselves and complete the tasks. The method focuses on learning by doing to create projects, works and results according to the interest of the learners by using media and technology on a computer network based learning program. The learners will understand themselves, understand the importance of their endeavour and practice on patience and problem solving. The media suitable for this method is one that correlates to the subject matter and can be self-taught. It can be seen that web-based learning is gaining popularity in today's education system through its ability to bridge the knowledge gap between students, especially on the higher education (Tongdeelerd, 2004). Thailand's education system is moving towards a network learning system and the web-based instruction is a teaching and learning method that has been supported by the attributes and resources of the internet. It means that teaching and learning methods on the internet can support the constructionism model. The learners must have the ability to push themselves for self-improvement, control their learning environment and gain support for learning material (Bumrungcheep, 2012). Also, the previous research concluded that web-based instruction with mixed media can help the learner develop and create their own

knowledge base, with the learner being the central focus of critical thinking process (Mai, 2005). Therefore, the author chose to apply the web-based instruction model to develop her teaching method, focusing on constructionism and critical thinking.

Objectives

The objectives of this research were to: 1) to construct the Web-based Instruction model using the constructionism approach for critical thinking development of undergraduate students 2) to compare critical thinking score between before and after learning via the web-based instruction and 3) to study the student satisfaction toward the web-based instruction that constructed by researcher.

Methodology

1. **Population and Sample of Student:** The population was 190 students in 2nd semester, 2012 academic year, Faculty of Education, Kasetsart University. The sample of this experimental research was 28 students selected by simple random sampling.
2. **Content:** The 28 students who enrolled in the course 01173112 Personal and Community Health were selected as the subjects in this research study. This research experiment took 7 weeks and each week the students learn the contents by using the constructionism cycle on the internet and study the materials as planned. In each week, the students will choose one health problem issue that they were interested in, and study through the web-based instruction designed by the researcher. Before the experimental started on the first week and after the experimental was ended on the 7th week, the students were given the critical thinking test.

3.Research Instruments

- 3.1 Web-Based Instruction under Constructionism for Critical Thinking Development
- 3.2 Web-Based Instruction Assessments suitability
- 3.3 Satisfaction questionnaire
- 3.4 Lesson plan
- 3.5 Cornell Critical Thinking Test (Level Z) (Ennis, R.H. and Millman, J. 1985)

The Cornell Critical Thinking Test was developed and translated into Thai language by Asst. Prof. Dr. Panita Wannapirun. It took 50 minutes for 52 questions, 6 skills in critical thinking test (Ennis,1985) as follows:
1) interpretation 2) analysis 3) evaluation 4) inference 5) explanation and 6) self-regulation.

4. Data collection and analysis: Data were analyzed by mean, standard deviation, and Dependent Samples t-test.
The research focus was to develop the Web-Based Instruction model. This research experiments were designed into three phases to achieve the objectives as follows.
Phase 1: Literature review related research studies in the current state in order to find out a way to develop a new form of teaching and learning method. The conclusion of the literature review was for creating a prototype method of the Web-Based Instruction to develop critical thinking skills and then use for discussion among ten experts in a focus group.
Phase 2: Developing Web-Based Instruction under model to develop critical thinking skills (Rampai N. and Sopeerak S. 2011).
Phase 3: Evaluating Web-Based Instruction Model under Constructionism for Critical Thinking Development on the subjects. The research experiment was the One Group Pretest-Posttest Design.

Analysis and discussion

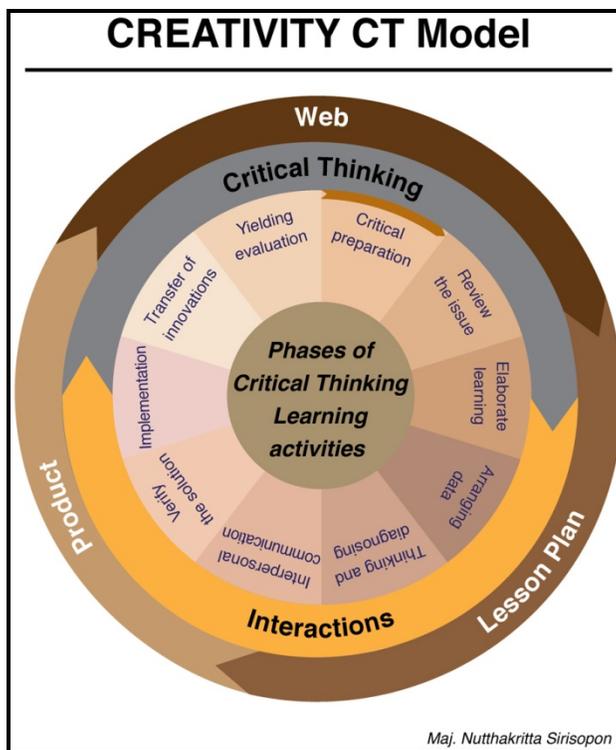
The analysis, synthesis and comparison of the teaching curriculum according to the constructionism method for developing critical thinking was done through a focus group between ten experts. The conclusion of activities can be concluded as follows to be a model for web-based instruction model under constructionism for critical thinking.


**Figure 1** CREATIVITY CT Model
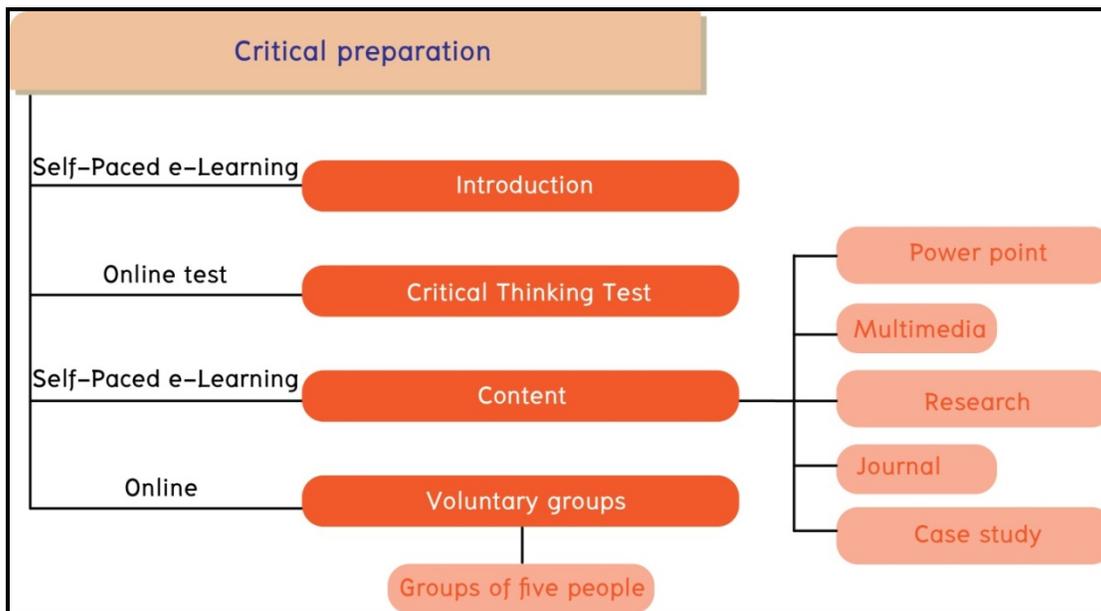

**Figure 2** Critical preparation
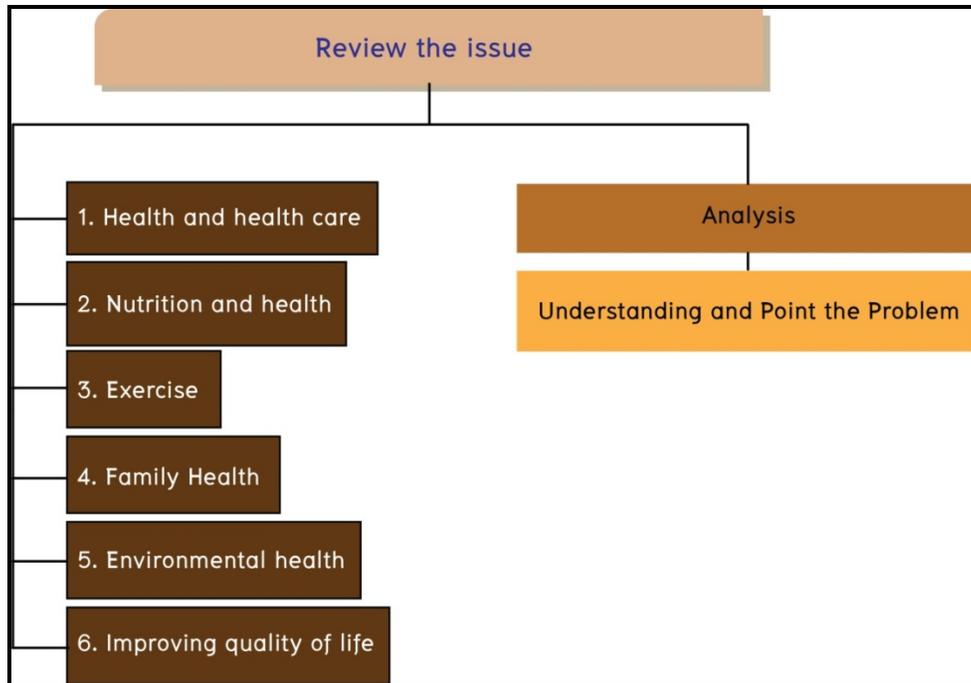

**Figure 3 Review** the issue
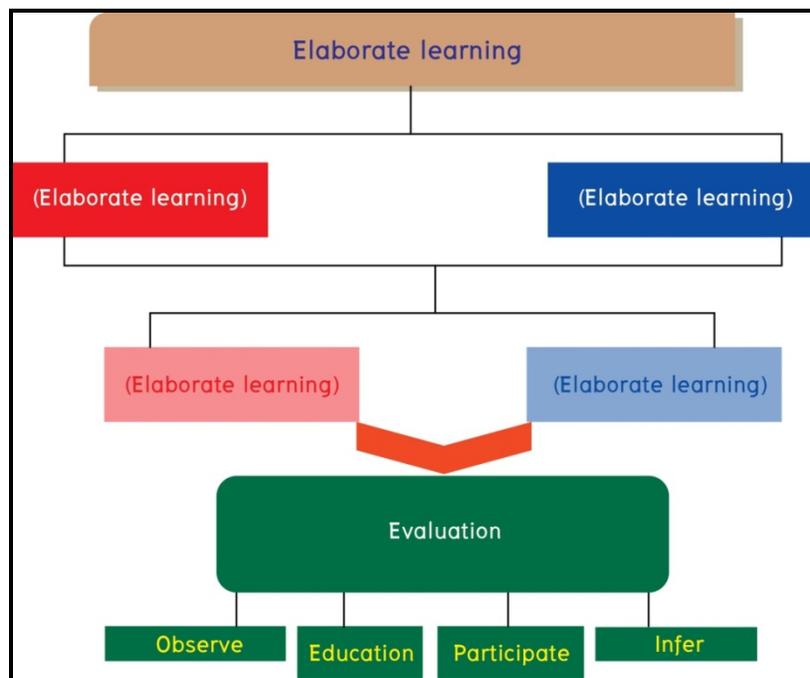

Figure 4 Elaborate learning
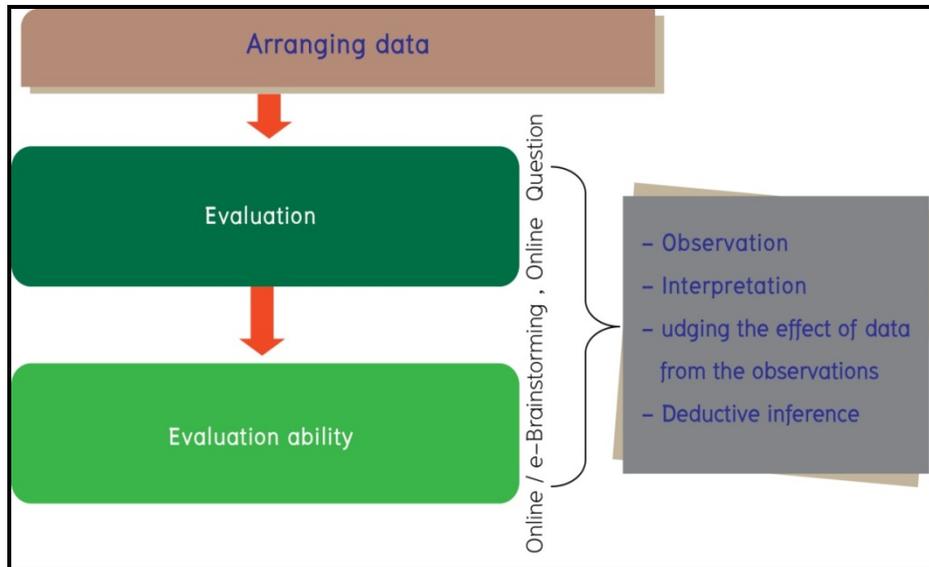

**Figure 5** Arranging data

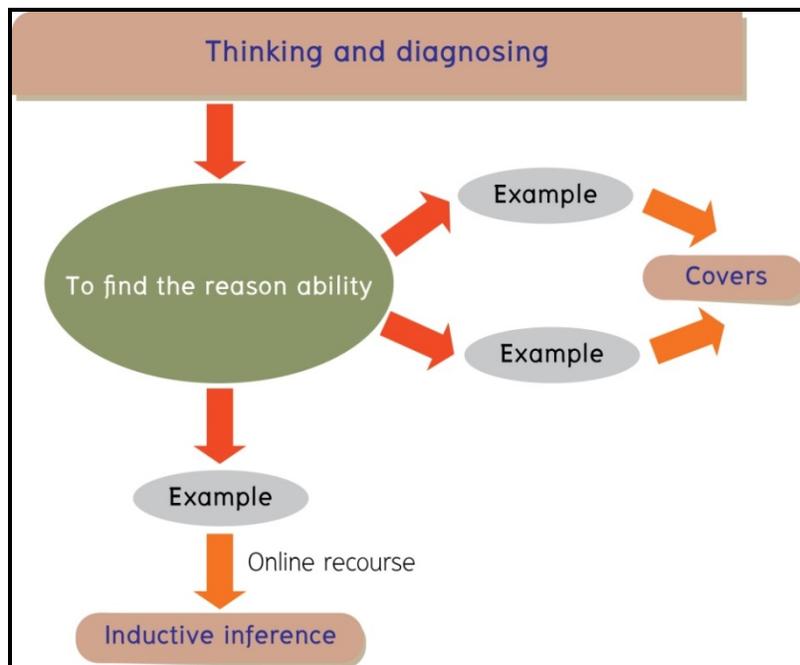

Figure 6 Thinking and diagnosing
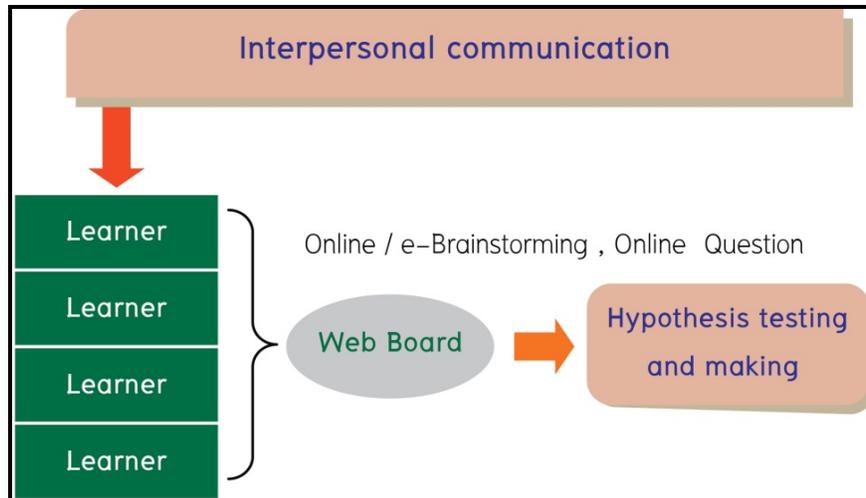

Figure 7 Interpersonal communication

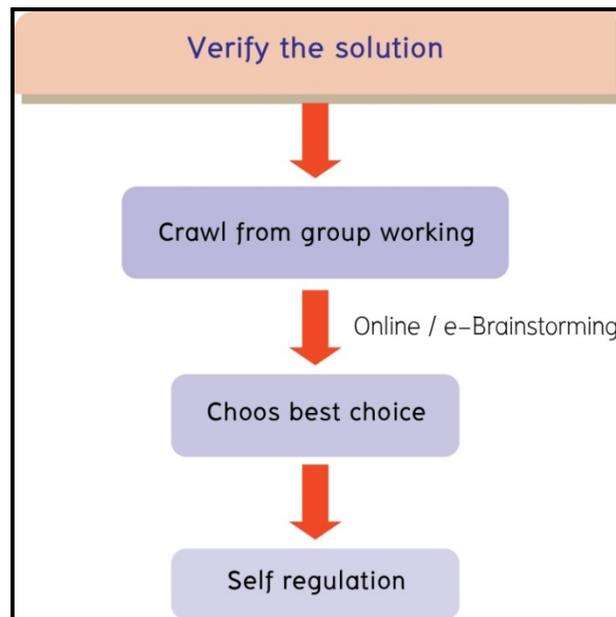

Figure 8 Verify the solution
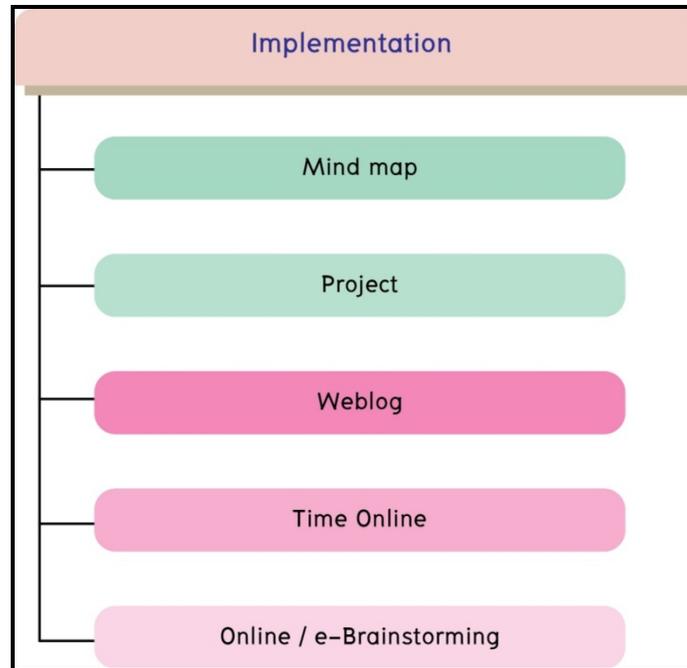

Figure 9 Implementation
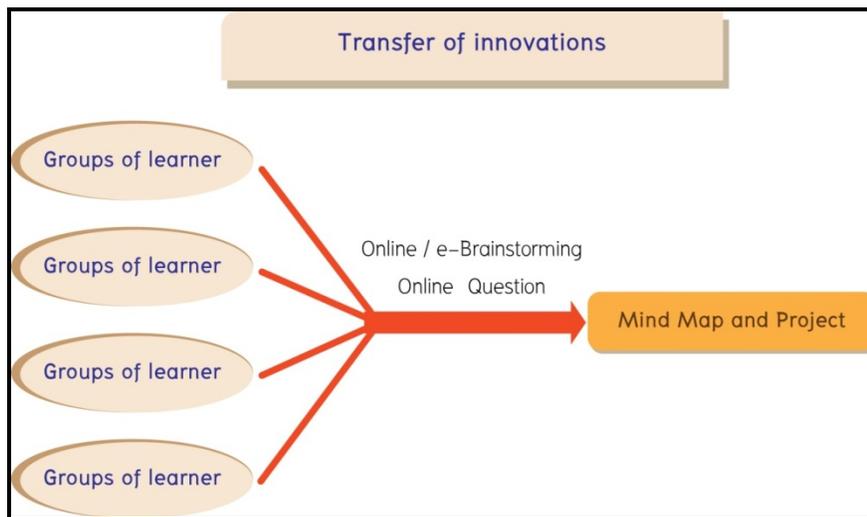

Figure 10 Transfer of innovations
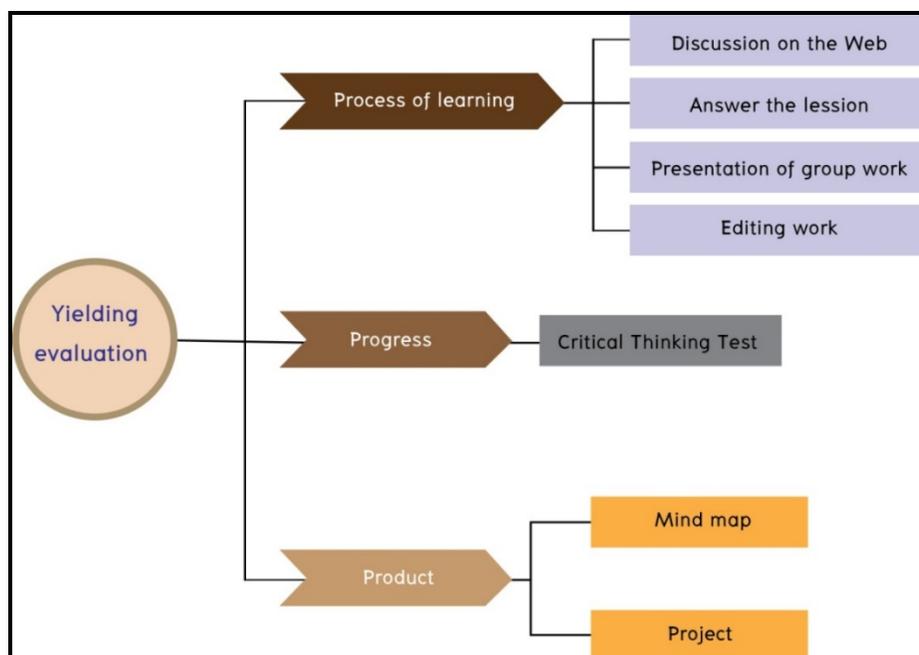

Figure 11 Yielding evaluation

Result CT test	n	$\overline{X}$	S.D.	t	p
Pre-test	28	35.93	4.27		
Posttest	28	42.36	3.42	18.97	0.00

Table 1 Result Critical Think test

Table 1: Depicts the comparison between critical thinking test results before and after going through the web-based instruction model under constructionism for critical thinking. It was found that students achieved an average pre-test score of 35.93 and a post test score of 42.36 from a total of 52 points. Hence, it was found that after learning from the web-based instructions, the students' critical thinking score was higher than before learning at .05 level of significance.

The result of this study for the satisfaction of the students towards the web-based instructions found that the students using the new type of learning method have a satisfaction score of $\overline{X}$ = 4.91. The student's satisfaction toward the Web-based Instruction was at the high level.

Conclusions and recommendation

The process, activities and method of learning that were developed can be improved the critical thinking of the students and can be applied in real teaching environment. The testing and evaluation for each learning program can be done when the learning activities for each process was completed such as assignment completion, activities participation level, class participation during brain storm process and evaluation of six dimension of critical thinking of Ennis (1985) including interpretation, analysis, evaluation, inference, explanation, and self-regulation.

Learning method developed through the web-based instruction under constructionism for critical thinking development has created a web-based learning system that can help the students challenge themselves, satisfy their own need for realization of their learning potential and ultimately improve the learning process of the students.

Abstract

The purpose of this research is to understand in depth the perceptions and lived experiences of the postgraduate students whose lecturers are using PowerPoint in the classroom. The sample of this research is the postgraduate students of the University of Malaya in the Faculty of Education. The sampling is purposive and they have passed at least one semester in the Faculty of Education. This study searched to describe what it was like for a UM postgraduate student in the Faculty of Education to learn through PowerPoint. Data collection was based on focus group and individual interviews. The results have shown that the research participants have opposite feelings toward PowerPoint. Some of the students consider PowerPoint interesting at the beginning of the lecture but boring and tiring a few minutes later. Others feel happy when lecturers refer to PowerPoint in delivering the lecture's content. However, participants hold PowerPoint does not support face-to-face interaction in the classroom. The analysis of the interviews shows that some factors like PowerPoint construction and management, subject knowledge and the teaching skills are potentially effective in using PowerPoint in the classroom.

Keywords: PowerPoint; Postgraduate Student; University; Experience

Introduction

During the last several decades, the application of technology in education has overcome the traditional methods of teaching. One of the most common tools of technology in classrooms is the presentational software Microsoft's PowerPoint (Bates & Poole 2003). Since it was developed in 1990, PowerPoint has been debated as an effective presenter in education. According to Brown and Harlin (2007), PowerPoint became widely available and used for a variety of purposes in today's university and public school classrooms. To Anderson (2004) electronic slides are becoming an important presentation tool in the classroom. They allow advanced preparation of material, improving organization of the presentation and giving a means of showing information-rich content such as complex tables, formulas, programs, and diagrams. Roblyer and Doering (2013), consider three advantages for PowerPoint; organizing thinking about a topic, enhancement the impact of spoken information and providing collaboration on presentations.

However, the positive effectiveness of PowerPoint in classroom teaching and learning has been the main topic of many articles, the ways instructors use it in their classrooms is still limited in research. Some argue that it has negative effects according to the poor use of it. Voss (2004) stated that students feel ignored in lecture halls when the instructor is focusing on the presentation and not paying attention to the class. She also viewed that the instructor may not be able to leave the podium because he doesn't have a remote mouse to advance to the next slide. Young (2006) explained in a survey that a good PowerPoint presentation can enliven a lecture by offering imagery to support key points, and having a prepared set of slides can keep professors from straying off on tangents. Many students also praise PowerPoint slides for being easy to read, noting that professors' chalkboard scrawls can be

---

[190] Corresponding author. Tel.: +6012-308-7803
E-mail address: attaran@um.edu.my

illegible. Nevertheless, students say some professors simply dump their notes into PowerPoint presentations and then read them, which can make the delivery even flatter than it would be if the professor did not use slides. Tufte (2003) disapproved PowerPoint for poorly designed presentations, stating that the program's templates limited the options that presenters have in communicating with their audiences.

PowerPoint in Higher Education

In higher education, lectures are rapidly giving way to PowerPoint presentations. Usually the slide ware is combined with a computer, an LCD projector, and a screen in the classroom setting. So many colleges and universities have rooms equipped with technology necessary for any instructor to display information via PowerPoint presentations (Bartsch & Cobern 2003).Graig and Amernic (2006) have shown that students like to be taught using PowerPoint. Also Bartsch and Cobern (2003) have found that students believed that they learned more from PowerPoint lectures. Despite of the effectiveness of PowerPoint presentations to both teachers and students, they are one of the most easily misused teaching aids (Priya, 2012).

Focusing on teaching, Creed (1997) argued about PowerPoint in several points: first, "You may get less feedback from the class because your eyes and theirs are on the screen rather than looking at each other;" second, students don't have a chance to synthesize what they've heard; and third, the emphasis is on the quality of your presentation rather than your students' learning.

 Bates and Poole (2003) outlined that it is important for any instructor to ask himself before advancing a PowerPoint-based lecture to the students, for whose benefit is the PowerPoint software being used. Is it primarily to help you as the teacher to ensure that you cover the main points and follow the careful preparation you have invested in the lecture or is it to help the students to ensure that they have a record of the main points of the lecture? (p. 110). They also stated that the teacher should care about the amount of the information in the slides and because of large amount of information students become tired of the presentation.Young (2006) has shown that without training professors, good technology will mean bad teaching. The study also stated that students said that some professors simply dump their notes in the presentations and read them, which can make the delivery even flatter than it would be if the professor did not use slides.Cernamo (2011) said that the instructor doesn't have to worry about the design of his presentation; he can leave this to the students. Instead, the instructor has to worry about the content. In this research, we will consider PowerPoint as an educational tool, which would be studied according to its addressees.

Aim and research questions

Most research about the integration of PowerPoint into teaching have focused on satisfaction and/or reaction of the users, whose purposes are mainly to evaluate the result of PowerPoint integration, but in this research the purpose is to understand in depth the perceptions and lived experiences of the postgraduate students whose lecturers are using the PowerPoint in class. The results of this research will be useful for the lecturers to consider learning experiences of their users as a baseline for further improvement. For achieving this aim, the researchers attempt to answer the following questions:

1. What are postgraduate students' experiences in learning through PowerPoint?

2.   What contexts or situations have influenced postgraduate students' experiences in learning through PowerPoint?

The sample of this research is the postgraduate students of the University of Malaya (UM) in the Faculty of Education. The sampling is purposive and they have passed at least one semester in the Faculty of Education.

Research Methodology

The research purpose requires focusing attention on the qualitative aspects of the experience itself. So phenomenology was chosen as an appropriate methodology to answer the research questions. This study searched for a thick and holistic analysis to describe what it was like for a UM postgraduate student in the Faculty of Education to learn through PowerPoint. In this research, phenomenology is an appropriate methodology to answer the research questions. It involves both a descriptive and interpretative analysis of an experience. We have conducted focus group interview and semi-structured individual interviews.

This phenomenological study was designed to investigate students' perspectives of classroom interaction when PowerPoint is used for delivering information about the lecture's topic to them, their feelings when attending a PowerPoint-based lecture and their views on the use of PowerPoint presentations by their lecturers in the classroom. The study also tries to understand if the students perceived as part of their learning in classroom to learn efficiently from PowerPoint about the topic at hand. For data collection, we have used individual and focus group interviews. Thirteen postgraduate students participated voluntarily in this study. The individual and focus group interviews were audio recorded for transcription purposes.

Procedure

Data analysis involves making sense of the text and provides an interpretation of the larger meaning of the data. In this study data was collected through open-ended questions asked to the participants then an analysis evolved from the replies provided by the participants. Multiple level of analysis was done by the researchers from specific to general levels. First, the interviews were transcribed into a text form. Transcriptions were read repeatedly to get some concepts. By concept meant a single thought or idea. Initially concepts like "Boring", "tiring", "irrelevancy", "wordy", "gaining information", "No face to face interaction" etc. emerged.Then the concepts were grouped into categories and the text was analysed by correlating the categorized data to the research questions.

Findings

As part of this study, an attempt was made to discover the main concepts that would come from the analysis of the data collected from the interviews. The study of these concepts was intended to provide a better understanding of the students' experiences in attending PowerPoint-based lectures.

7.1. Experiences of attending PowerPoint based lectures.

Participants considered PowerPoint as a supporting tool for the lecturer but decrease the interaction between them and him/her. Most of them agreed that PowerPoint is so boring in the classroom setting. It can be drawn from participants' responses that they only benefited from PowerPoint in having the information that can be reached at any time needed. Some of the main themes of their experiences are as follow:

PowerPoint as a supporting tool for outlining the lecture:

The focus group participants mentioned that PowerPoint is beneficial in the classroom when it is used to deliver the lecture. They suggested that better way to read the topic is through the PowerPoint slides.

"I feel very happy when we have PowerPoint slides because I know. Ok. That is what we are going to learn. So my mind will not be diverted because we are focusing on the words on the PowerPoint so… PowerPoint gives me a clear idea of what the lecture is about."

Students see that via PowerPoint presentations they can have clear ideas about the topic and the objectives of the lecture. Moreover, it helps them in understanding what the lecturer is talking about.

Susskind (2005) in his study shows that students have positive attitudes about the course and greater self-efficacy with PowerPoint. According Priya (2012) PowerPoint is very easy to be learned and used. PowerPoint encourages and supports teaching by facilitating the material presentation. It is a support to the oral regular lectures as it provides outlines for the discussions. It also gives structure to the lecture by dividing it into several steps. The study of Hill, Arford, Lubitow and Smollin (2012), shows the majority of undergraduates consider slides the most useful when they outline lectures and they believe PowerPoint is the best way to organize and simplify course material.

PowerPoint brings boredom to class and distracts learners

Most of the research participants have negative feelings toward PowerPoint. They consider PowerPoint interesting at the beginning but boring and tiring after a few minutes. One student tells:

"For me PowerPoint seems to be interesting at the beginning of the class but later on it becomes a bit boring because I become tired to get the words and I tend to lose focus and switch off"

Some others think the cause behind the feelings of boredom and the impact of distraction is that some PowerPoint presentations are uploaded with excessive information:

"PowerPoint is too wordy and somehow it distracts my attention, it even makes my eyes tired and I lose focus"

According Hill et al. (2012 students desire presentations which are "not too much text on each slide"(P. 249).

PowerPoint doesn't support Classroom interaction:

Participants hold "It doesn't support face to face interaction in the classroom". Many participants expressed they had limited interaction either with each other or with the lecturer, and they hesitated to ask questions as hardly can find an answer, and interacted only if the lecturer asks a question so they refer to the slides in front to provide answers. They described preferred lecturers as those who present detailed explanations about the topic guidelines in the slides rather than those lecturers who read only. The read only-lecturers leave negative effect on them and may distract them from the main core of the lesson. Instead, participants viewed that it will be interactive if lecturers include some hypermedia to their presentations.

 "PowerPoint doesn't allow for any collaborative learning and basically lecturers use PowerPoint just for presentation but not for any other purposes. Their Presentations are all in a linear basis just bullets and after bullets. If they can merge it with some video files or YouTube videos that are relevant to the lesson it may not be so boring."

Adams (2006), holds, PowerPoint disrupt dialogue between lecturer and students and favours "pre-determined monologue and teacher-centred pedagogy over unpredictable dialogue and other pedagogical forms" (P. 403). According Hill et al. (2012) research in some subjects like sociology, which requires discussion, critical thinking and debate, PowerPoint inhibit the development of these characteristics. Some researchers criticize PowerPoint which, change teaching from conversation into presentation (Adams, 2006).

Also, if we accept the idea of Marambe, Vermunt, and Boshuizen (2012) that Asian culture (including Malaysian culture) discourages the expression of thought, we could tell, PowerPoint stabilize this characteristic of the culture.

Influential contexts on postgraduate students' experiences in learning through
    PowerPoint.

PowerPoint construction and management

Participants feel that they are lacking concentration when the lecturer only read from the slides, as they do not have to follow or to listen to him/her because they can read what is on the screen.

"…because I know later I would read the same slide again, so why do I have to listen".

The majority of the participants commented that the lecturers use the PowerPoint in a boring way, which consequently leads to having a boring and distracting lecture. Some said that the information provided in the slides is sometimes not relevant to the topic of the lecture.

"Some lecturers put in the PowerPoint something that is irrelevant to what we suppose to know so the lecture becomes very boring"

Bartsch and Cobern (2003) study approve this view that PowerPoint can be beneficial, but material that is not pertinent to the presentation can be harmful to students' learning.

While others viewed that the lecturer is only using it as a support tool or a guideline to a boring lecture. For better using PowerPoint one of the students recommends as follows:

"So the PowerPoint is important but not for the entire lesson. Lecturer can use it in part of the lesson but certain parts of the lesson should be group discussions or just simply talking with teacher, answering his questions. It should be used as part of the lecture but not the entire lecture"

Another participant holds that:

"Three-hour lecture is a very long time when the lecturer use PowerPoint and he must check from time to time if his students understand or not the topic of the lecture. For example in my case, my English is not so good so it will be better if he checks our understanding of the lecture"

Young (2009 cited in Roblyer & Doering, 2013) cites a British study that reported students' perceived use of PowerPoint-based lectures among the most boring they experience.

Subject knowledge, teaching skills and the PowerPoint usage

Most participants agreed that the lecturers mainly use PowerPoint for presentation purposes only to demonstrate that the lecturer is using technology in his or her classroom.

"PowerPoint is a one way tool, it is only used to present".

One student who is a college teacher believes, lecturer use PowerPoint because in the evaluation form, one item is application of the technology in the class, so it requires lecturers to use PowerPoint as a symbol of technology. Hill et al research shows some lecturers, particularly" newer lecturer who do not have the security of tenure and are often adjunct or contingents lecturers"(2006 P. 253), use PowerPoint, because teaching evaluation form requires them.

Some researchers think many instructors are hiding behind the slides. Priya (2012) said that teachers could get away with not having an understanding of the subject by presenting pre-prepared presentations on topics, thereby avoiding oral lectures completely.

The study of Yilmazel-Sahin (2009) reported that instructors (a) use PowerPoint as a straight lecturing tool, (b) read directly from slides, (c) present the whole class in PowerPoint, (d) present information on the slide that is directly copied from the textbook. In addition, significantly more undergraduate students reported experiencing PowerPoint overload due to overfull presentations and the rapid pace of instruction.

Also the results research of Burke and James (2008) indicated that (a) students have a significantly less favourable overall view of PPT's influence on cognitive learning and classroom interaction than faculty members; (b) unlike faculty members, students do not believe that posting notes on the Web will decrease their motivation to attend class; and (c) both faculty members and students perceive that PPT has a favorable impact on notetaking quality, content recall during exams, emphasis on key lecture points, and holding student attention during class. The authors offer implications for instructors and future research.

Two different things enrich using PowerPoint. First using all features of this software and not limiting to linear style and words. One student tells:

"I can understand more when the lecturer uses a simple picture to explain the topic. By using the animations or pictures, the lecturer ensures that I still want to listen to his lecture"

Klemm (2007 cited in Roblyer & Doering, 2013) offers several tips for using PowerPoint, better, including showing only a few slides at a time before having students apply the information, having some slides with just images or diagrams. Moving around the room while showing slides, taking the last slide off the screen when moving on to student work, and not giving out hard copies of slides.

One clear message from the participants was that the use of PowerPoint in the classroom overtime switched them off, they lacked attention and could not follow the lecturer but only focus on the words appeared in the slides knowing that later they would read them or just copied them during the lecture. However, they could do some discussions with their peers if the points are cleared to them or at least laid in front of them.

The only thing that participants considered to gain from PowerPoint presentations is the information about the topic.

"I guess I gain from PowerPoint some sort of information".

Participants also expected from PowerPoint attracting them or engaging them in the lecture but they said it was boring and distracting.

Finally it is necessary to mention that according to Hardin(2007), the impact of PowerPoint on students learning is more dependent on instructor variables than on whether PowerPoint was used. In other words, the PowerPoint is more influential if is used by a knowledgeable and skilful instructor.

When it comes to the use of PowerPoint in the classroom, the general feelings of students would like to have more attractive and interactive PowerPoint Presentations. Much can be learned from taking students' views and opinions about their lecturers' use of technology in the classroom. Through students' perspectives on the classroom interaction when technology is integrated, a problem of focusing on the technology and ignore the students always manifest in their discussions.

This study provides particular guide that we need to attract the lecturer's attention that technology is important but might not be the solution for most of the educational problems. The study shows that the views of students are of great importance specifically when the targets are directed towards enhancing the teaching and learning processes.Further study of this issue with a larger sample of students with diverse educational backgrounds and characteristics would give us more insights into the perception of gaining the desired learning outcomes by technology in the different educational settings.

Abstract

With a great potential for enriching and vivifying all kinds of educational applications, web-based instruction is becoming a progressively more impressive apparatus for language learning resource delivering around the world. In this study, a web-based language learning (WBLL) system was employed to support college students' English as foreign language (EFL) learning. Based on the concepts of social cognitive theory (SCT), this study proposes a conceptual model that examines the determinants of college students' learning satisfaction in a web-based language learning environment. The model is validated using a cross-sectional survey of 306 college students. The partial least squares (PLS) method was applied to validate the measurement properties and proposed hypotheses. The empirical findings demonstrate that college students show positive incline towards the use of the web-based language learning system for EFL courses and signify a possible benefit from its use in the long run. The results can provide insight into those factors that are likely significant antecedents for planning and implementing a web-based language learning system to enhance student learning satisfaction.

Keywords: social cognitive theory; learning satisfaction; second language acquisition; web-based language learning

Introduction

Over the past decades, the use of web-based technologies for second language instruction has become a critical issue of interest for language learning since the advent of multimedia computing and the Internet has reshaped the mode of computer use in language instruction (Warschauer et al., 2000; Zhao & Lai, 2008). With either synchronous or asynchronous communication through the Internet, language learners can communicate and interact with other learners or native speakers of the target language throughout the world in a time-saving and cost-effective way (Cavus& Ibrahim, 2009). Given this intensive learning environment, language teachers world-wide encounter a new challenge in how to create effective language instruction through web-based technologies with the goal of preparing students for the new information society and equipping them with the ability to communicate effectively in English via computer networks.

Even though web-based environments provide flexibility in time, space and distance and are well recognized by students, some students report feeling isolated, lacking confidence or lacking support and feedback, which consequently leads to poor language learning performance (Hara & Kling, 2000; Hauck & Hurd, 2005; Yang et al., 2008). This necessitates research in several disciplines to justify what factors actually influence students' satisfaction with the use of the web-based language learning systems, how that influences students' perceptions as well as the causes and effects of such a virtual learning environment. Increasingly, as web-based language learning (WBLL) continues to impact students around the world, it is important to gain a better understanding of the influencing factors to improve teachers' instruction and students' learning activities. Moreover, the integration of Internet technology and language learning curriculum has shifted the focus from a teacher-centered classroom to a learner-centered environment which empowers the learner through control over lesson content and the learning process (Fotos & Browne, 2004). The adoption of web-based systems in supporting language learning has made it significant to probe the crucial determinants that would entice learners to use WBLL systems and enhance their learning

satisfaction. The degree of student learning satisfaction with WBLL courses plays an important role in evaluating the effectiveness of WBLL systems adoption. Hence, comprehending the essentials of what determines student learning satisfaction can provide second language acquisition insights into developing effective strategies that will allow educational institution administrators and instructors to create new educational benefits and value for their students (Zhao & Lai, 2008).

Because WBLL environments differ from typical classroom, a review of previous research in language learning technology shows that there is a lack of studies that have examined the crucial factors that determine student learning satisfaction with WBLL systems, such as individual cognition, technological environments, and the social contexts. There is a need for more in-depth research to understand what determines student learning satisfaction in a WBLL environment and to investigate how these factors influence student perceptions of WBLL contexts and their causal relationships. Drawing upon the perspective from social cognitive theory, in this study, we proposes a nomological network to identify the underlying factors and causal relationships in predicting language students' satisfaction with web-based language learning, the results of this study can enable administrators and faculty members to make necessary improvements. The research questions thereby stand out clearly to address the followings questions: (1) What are the influencing factors of college student's satisfaction with WBLL? (2)What are the relationships among the cognition, technological, and social factors and student satisfaction with the use of a WBLL system?

Theoretical foundation and conceptual model

Web-based Language Learning

A web-based language learning (WBLL) environment integrated the use of multimedia and web-based technologies and became a new method for language learning. Related research (Chang, 2005; Chang & Ho, 2009) indicated that the nature of interactivity and immediate feedback of web-based learning environment has a positive effect on the stimulation of students' interest and ability in language learning. Taylor and Gitsaki(2004) stated that the students participating in web-based activities showed that use of the Web makes the course more interesting because of the varied and current information it provides. In general, the Internet and the WWW contributed to the enhancement of learners' active involvement and satisfaction toward learning in the web-based environment as well as the opportunities for learners to access and share information without the limitation of time and space.

Learners' perceptions and satisfaction regarding technology application in language learning have been the focus of numerous studies (Salaberry, 2001; Wu et al., 2010). Ayres (2002) pointed out that students appreciated and valued the learning process while they experienced using information and communication technologies (ICT). Fotos & Browne (2004) found that students participating in an e-mail exchange program enjoyed their learning because of the reduced fear of making mistakes in English and improved their self-confidence in using English. A survey, conducted by Taylor and Gotsaki (2004), investigated English as a foreign language (EFL) students' attitudes regarding the use of the Internet and web-based activities. It indicated that the use of the Web made the course more interesting and more enjoyable for the students because the Web offered timely and a variety of information. Moreover, the majority of students agreed that they felt comfortable using the Web to find information. As a result, their confidence using a computer increased. As to their intentions to use computer in learning processes in the future, most students indicated that they will continue to use the Web because they recognized the Web as a valuable learning tool and should be integrated in the course.

Social cognitive theory

Social cognitive theory is a widely accepted and empirically validated model for understanding and predicting human behavior and identifying methods in which behavior can be changed. According to Bandura (1986), the symbolic environment occupies a major part of people's everyday lives in modern society. Much of the social construction of reality and shaping of public consciousness occurs through electronic acculturation. The change of focus from teaching to learning has often been called a paradigm shift in education. Bandura's theory of self-regulation and self-efficacy can be seen as a paradigm shift within the individualistic approach, although it emphasizes the social environment in the learning process. The social context is considered as a determinant for the individual human being. The learning environment can be defined as a combination of the environmental determinants and behavioral determinants the learner can be interacting with. The applications of information and communication technologies (ICT) could be educational products that can be distributed via different methods and

media like electronic self-study materials. The cognitive idea of knowledge would lead to developing ICT teaching strategies (Web pedagogy, etc), goals and means to change the schemes of thought in the individual. Several studies have applied it as a theoretical framework to predict and explain an individual's behavior in IS settings. The theory argues that the meta-progress of a human being occurs through consecutive interactions with the outside environment and the environment must be subjected to one's cognition process before they affect one's behavior. It proposes that a triadic reciprocal causation among cognitive factors, environmental factors, and human behavior exists. Behavior is affected by both cognitive factors and environmental factors (Wood & Bandura, 1989). Cognitive factors refer to the personal cognition, affect and biological events. Environmental factors refer to the social and physical environments that can affect a person's behavior.

Research Model and Hypotheses Development

In this study, cognitive factors stand for the college students' cognitive beliefs that influence their behaviors in using WBLL systems. Two main cognitive variables: computer self-efficacy and learning outcome expectations are believed to be the most relevant factors affecting human behavior in using an information system (IS) (Ventkatesh et al., 2003). The social cognitive theory defined learning outcome expectations as the perceived consequences of a behavior and further noted they are a strong force guiding individuals' actions. The learning outcome expectations are derived from individual judgments regarding valuable outcomes that can be obtained through a requisite behavior. Individuals are more likely to perform behaviors that they believe will result in positive benefits than those which they do not perceive as having favorable consequences.

Learning outcome expectations are defined as the degree to which a learner believes that using WBLL systems will help him or her to attain gains in learning performance. Individual attitudes are a function of beliefs, including the behavioral beliefs directly linked to a person's intention to perform a defined behavior (Ajzen & Fishbein, 1980). User acceptance is an important indicator that measures a user's positive attitudes toward the IS and predicts their behaviors while using the system, based on theory of reasoned action. Satisfaction is a good surrogate for user acceptance and is often used to measure learners' attitude in computer-mediated learning studies (Chou & Liu, 2005). Thus, we conceptualize the student's attitude toward WBLL systems as the learning satisfaction with the WBLL systems－defined as the sum of student's behavioral beliefs and attitudes that result from aggregating all the benefits that a student receives from using WBLL systems. Therefore, the following hypothesis is proposed.

H1: A higher level of learning outcome expectations for WBLL systems use will positively associate with a higher level of learning satisfaction with WBLL systems.

We define computer self-efficacy as the confidence in one's ability to perform certain learning tasks using WBLL systems. Prior research has shown that increases in computer self-efficacy improve initiative and persistence, which lead to improved performance or outcome expectations (Francescato et al., 2006), including attitude and behavioral intention (Venkatesh & Davis 2000). In the context of computer-mediated learning, empirical evidence indicates that increases in computer self-efficacy improve students' confidence in their computer-related capabilities, which in turn leads to a perception of positive learning outcome expectations to the learning courses (Santhanam et al., 2008). That is, computer self-efficacy could reduce learning barriers in using WBLL systems. If students have higher computer self-efficacy and can control WBLL systems, they will perceive the systems' usefulness and value, which in turn motivates their intention to use WBLL systems. Accordingly, the following hypothesis is proposed:

H2: A higher level of individual's computer self-efficacy will positively associate with a higher level of learning outcome expectations for WBLL systems use.

System characteristics and digital material functionality have the potential to directly affect perceived usefulness of IS (Hong et al., 2002) that are thought to be similar concepts in learning outcome expectation. Several empirical evidences have argued that both digital material functionality (Zhang et al., 2000) and system characteristics (Pituch & Lee, 2006) affects the effectiveness of computer-mediated learning. That is to say, learners perceiving a higher level of system characteristics and digital material functionality in WBLL systems will lead to a higher level of learning outcome expectations for WBLL systems use. In addition, in the WBLL systems environment, the diverse digital material functionality can be delivered and accessed depending upon the support of appropriate system characteristics WBLL systems facilitated (Pituch & Lee, 2006; So et al. 2008). Thus, we consider that the digital material functionality highly depends on the power and quality of system characteristics of WBLL systems. Therefore, the following hypotheses are proposed:

H3: A higher level of system characteristics of WBLL systems will positively associate with a higher level of learning outcome expectations for WBLL systems use.

H4: A higher level of system characteristics in WBLL systems will positively associate with a higher level of digital material functionality of WBLL systems.

H5: A higher level of digital material functionality in WBLL systems will positively associate with a higher level of learning outcome expectations for WBLL systems use.

H6: A higher level of digital material functionality in WBLL systems will positively associate with a higher level of learning satisfaction for WBLL systems use.

In computer-mediated instructional design, there is an increasing focus on facilitating human interaction in the form of online collaboration, virtual communities, and instant messaging in the WBLL systems context. From the group interactions perspective, social environment factors, such as collaborative learning (Francescato et al., 2006), learning climate (Chou & Liu, 2005) and social interaction (Johnston et al. 2005) are important antecedents of beliefs about using an e-learning system. Prior research shows that social interaction has a direct effect on the usage of an e-learning system. The interactions among students, between faculty and students and learning collaboration are the keys to learning process effectiveness. In addition, the emotional learning climate is an important indicator of learning effectiveness. A positive learning climate encourages and stimulates the exchange of ideas, opinion, information, and knowledge in the organization that will lead to better learning satisfaction. That is, when learners believe that WBLL systems provides effective student-to-student and student-to-instructor interactions and improves learning climate, they will be more satisfied with WBLL systems. Therefore, the following hypotheses are proposed:

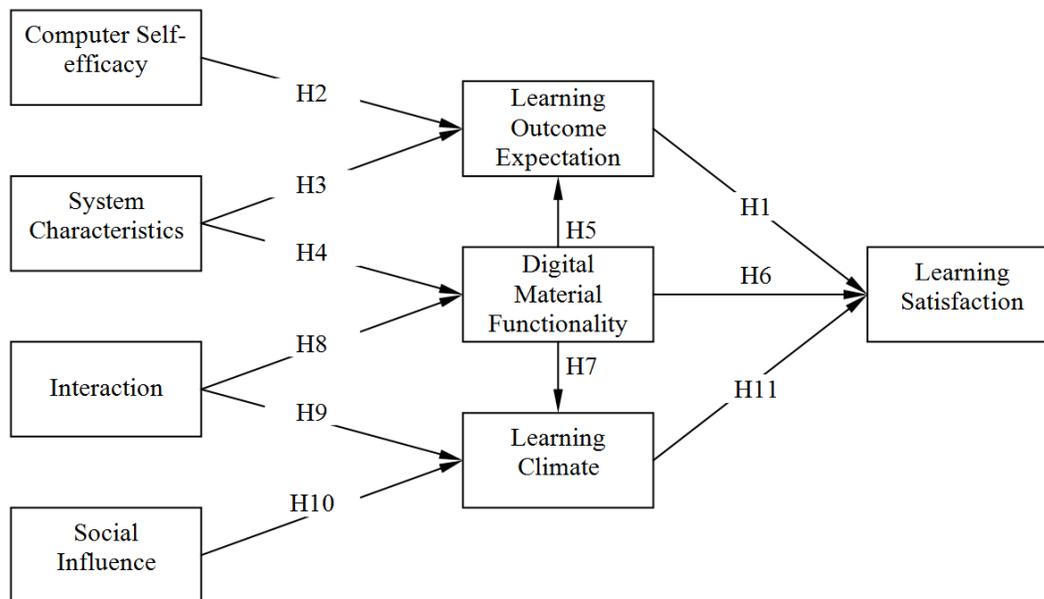
H7: A higher level of digital material functionality in WBLL systems will positively associate with a higher level of learning climate in WBLL systems.

H8: A higher level of interaction will positively associate with a higher level of digital material functionality of WBLL systems.

H9: A higher level of interaction will positively associate with a higher level of learning climate.

H10: A higher level of social influence will positively associate with a higher level of learning climate in WBLL systems.

H11: A higher level of learning climate will positively associate with a higher level of learning satisfaction with WBLL systems.

Based upon the foregoing theoretical underpinnings, we consider that the social cognitive theory is applicable to the WBLL context. The research framework is thus proposed and shown in Fig. l.


35. Fig. 1. The conceptual framework

Research Design

Instrument development

Constructing the survey instrument began with developing the related influencing factors of college students' satisfaction towards the use of WBLL systems and generating the corresponding scale items. Prior research was reviewed to ensure that a comprehensive list of items was developed. Once the item list for the initial questionnaire was generated, an iterative personal interview process (including faculty, teaching assistants, and representative students) was conducted to refine the draft instrument. These interviews enabled the researcher to gauge the clarity of the tasks, assess whether the instrument captured the desired phenomena, and verify that important aspects have not been omitted. This process continued until no further modifications to the questionnaire were necessary. Feedback from the interview processes served as the basis for correcting, refining, and enhancing the experimental scales. For instance, scales were eliminated if they represented the same aspects with only slightly different wording and modified if the semantics were ambiguous in order to enhance the psychometric properties of the survey instrument.

Then, after completing the development of the related scale items, several small-scale pretests were conducted with a small group of respondents to ensure the completeness and appropriateness of the scale items developed. A self-administered survey instrument was then developed and used to collect the data for this study. The finalized questionnaire for the study consisted of two parts including participants' demographic data and their responses to the scale items. The participants' basic information included gender, age, academic major, experience in web usage, experience in language learning and frequency of using the web. The second part recorded the participants' perceptions on the scale items for each latent variable. All items are measured via a seven-point scale ranging from 1 (strongly disagree) to 5 (strongly agree).

Participants

The empirical data was gathered using a self-administered questionnaire. At first, students were comprehensively told to respond to the survey as candidly as possible; there were no right or wrong answers regarding the items in the questionnaire, and that their participation in the survey was irrelevant to his or her final grade for the course. This study was focused on assessing their perceptions regarding usage of WBLL. The participants were self-administered the 36-item questionnaire after the mid-term examination of the WBLL course to ensure that they have actually used the WBLL system. For each question, respondents were asked to circle the response which best described their level of agreement. As mentioned above, the approach taken to test the relationships posited in the proposed research model and the research hypotheses was a field study using a survey methodology for data collection.

The study was conducted at a well known university of science and technology, located in southern part of Taiwan. The targeted population for the study consisted of all students enrolled in the WBLL courses in this college. This WBLL course was a compulsory course for the students in the night college and the affiliated continuous college of this institute. As a result, 763 students in this college had to enroll in the WBLL course. Students taking the course were from different majors including gemology, business administration, early childhood education, information management, beauty science, social work. All of the students who had ever taken the WBLL courses were qualified to be invited to participate in the survey. The potential non-response bias was assessed by comparing the early versus late respondents that were weighed on several demographic characteristics. The results indicated that there were no statistically significant differences among demographics between the early and late respondents. The results indicated that none of the chi-square values were statistically significant ($p > 0.05$, two-tail tests).

Analysis methods

The empirical data collected were analyzed using the partial least squares (PLS) method, which is particularly suitable for identifying the variance and validating the causal relationships between latent variables comprising complex theoretical and measurement models (Chin, 1998). The proposed hypotheses for the predictive and nomological validity of the principle constructs of the research model were simultaneously validated. The PLS method allows for the validation of the measurement model and the estimation of the structural model. The questionnaire we administered in the large-scale survey included items worded with proper negation, and the items were shuffled to reduce the monotony of questions measuring the same constructs. The statistical analysis strategy

involved a two-phase approach in which we first assessed the psychometric properties of all scales through confirmatory factor analysis (CFA), and then validated the structural relationships by bootstrap analysis.

Data Analysis and Results

Measurement properties

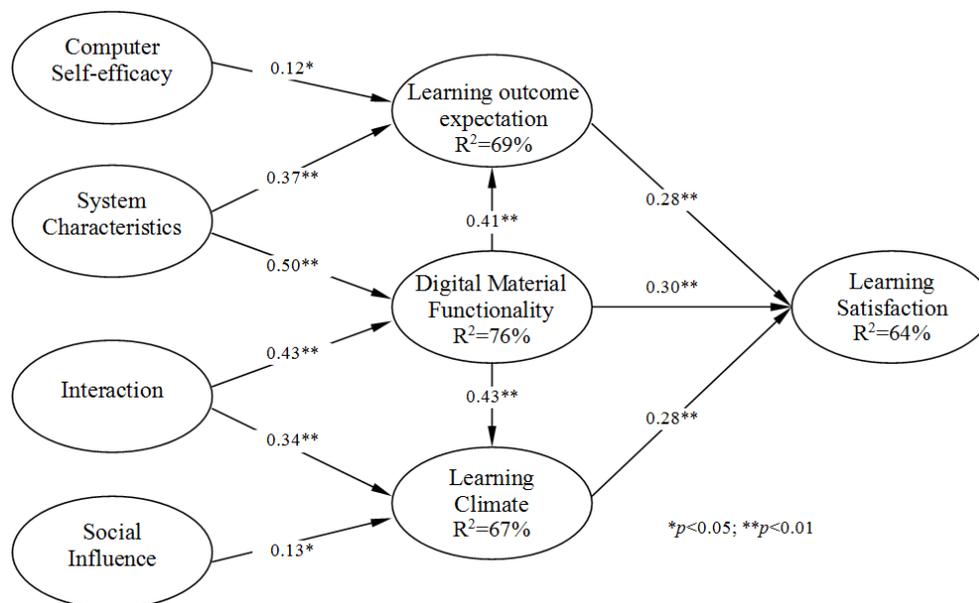
All the constructs in the conceptual model were modeled as reflective and were measured using multiple indicators. The assessment of item loadings, reliability, convergent validity, and discriminant validity was performed for the latent constructs through a CFA. Reflective items should be unidimensional in their representation of the latent variables, and therefore correlated with each other. Factor loadings of scale items should be above 0.707, showing that over half of the variance is captured by the constructs (Straub et al., 2004). Also, all constructs in the measurement model should exhibit good internal consistency as evidenced by their composite reliability scores. The composite reliability coefficients of all constructs and the AVE in the proposed conceptual framework were also checked for the adequacy. The analysis results of CFA show that all constructs exhibit good internal consistency as evidenced by their composite reliability scores. The composite reliability coefficients of all constructs and the AVE in the proposed model are adequate, ranging from 0.93 to 0.97 and from 0.73 to 0.90, respectively.

There are two requirements used in assessing discriminate validity: (1) indicators should load more strongly on their corresponding construct than on other constructs in the model; and (2) the square root of the average variance extracted (AVE) should be larger than the inter-construct correlations (Chin, 1998). The percent of variance captured by a construct is given by its AVE. We also evaluated the discriminant validity of the major constructs of the conceptual framework using the PLS analytical method. The results show that all constructs meet the requirements. The values for reliability coefficients are all above the suggested minimum of 0.7. All constructs share more variance with their indicators than with other constructs. Thus, the convergent and discriminant validity of all constructs in the proposed research model can be assured.

Hypotheses testing

The path coefficients and explained variances for the conceptual model in this study are shown in Fig. 2. T-statistics and standard errors were generated by applying the bootstrapping procedure with 200 samples and the path coefficients were re-estimated using each of these samples. A test of the structural model was assessed to confirm to what extent the causal relationships specified by the research model were consistent with the available data. The PLS method does not directly provide significance tests and path coefficient confidence interval estimates in the proposed model. Hypotheses and corollaries testing were performed by examining the size, the sign, and the significance of the path coefficients and the weights of the dimensions of the constructs, respectively. The statistical significance of weights can be used to determine the relative importance of the indicators in forming a latent construct. We found that all specified paths between constructs in our research model had significant path coefficients. The results provide support for our research model. As shown in Figure 2, the analysis results indicate that the model explained 64 percent of the variance in learning satisfaction. Similarly, 76 percent of the variance in digital material functionality, 69 percent of the variance in learning outcome expectations and 67 percent of the variance in learning climate were explained by the related antecedent constructs. The magnitude and significance of these path coefficients provides further evidence in support of the nomological validity of the research model.

As for the students' cognitive factors, hypotheses effectively drawn from computer self-efficacy to learning outcome expectations (H1) and learning outcome expectations to learning satisfaction (H2) are supported by the significant path coefficients, respectively. That is, students who had higher computer self-efficacy will have higher learning outcome expectations, which in turn will lead to higher learning satisfaction. Regarding to the effects caused by the principle WBLL technological influencing factors, the analysis results also confirm the proposed hypotheses drawn from system characteristics to digital material functionality (H3) and learning outcome expectations (H4). In addition, hypotheses drawn from digital material functionality to learning outcome expectations (H5), learning satisfaction (H6) and learning climate (H7) are also supported by the significant path coefficients. Pertaining to the aspect of social environment factors, the plausible hypotheses drawn from interaction to digital material functionality (H8) and learning climate (H9) are supported, respectively. That is, interaction significantly influences the learning outcome expectations and learning climate. The two hypotheses, drawn from social influence to learning climate (H10) and from learning climate to learning satisfaction (H11), are also

confirmed by the significant path coefficients. Explicitly, social influence will have direct effect on learning climate, which in turn will influence students' perceptions on their learning satisfaction. As a whole, positive learning outcome expectations, superior digital material functionality and high-quality learning climate will have direct effects on learning satisfaction; among them, digital material functionality provide the greatest contribution to college students' satisfaction in the WBLL environment.


36. Fig. 2. Results of PLS analysis.

Discussions and Conclusion

Today, the importance of the applications of web-based technologies into English as a foreign language (EFL) learning has increased significantly around the world. In order for the success and effective implementations of WBLL systems, it is crucial for researchers to cumulate efforts from the continuations of rigorous scientific approaches, educational theories, and well-targeted procedures and techniques in the area of web-based language instruction. This study proposed a comprehensive model to investigate the influencing factors of college students' satisfaction in using a WBLL system, developed measures for these constructs, and validated the conceptual model through a rigorous PLS analysis. Drawn from the empirically results, this study provided interesting insights into the applicability of the related constructs, with respect to explaining perceptions, belief, and satisfaction of EFL students in using the WBLL system.

Although our study provided interesting insights into college students' satisfaction with the use of WBLL systems, it has several limitations that also represent opportunities for future research. This research was conducted in Taiwan, the findings in the study might not hold true in other countries. Thus, the valid instrument was developed using the large sample gathered from only one vocational-technology college in Taiwan, a confirmatory analysis and cross-cultural validation using another large sample gathered elsewhere is required for improving the generalizability of the instrument. Hence, other samples from different areas in Taiwan or other nations should be gathered to confirm and refine the factor structure of the instrument, and to assess its reliability and validity. These issues are worth of further pursuance in the future study. Future research, in different samples and longitudinal studies, are necessary. The validity of a measure cannot be truly established on the basis of a single study. Measure validation requires the assessment of the measurement properties over a variety of samples in similar and different contexts. In the future, an instrument for measuring students' intentions to use a synchronous web-based learning system should also be developed. More attention also can be directed toward understanding the antecedents and consequents of other web-based instruction systems. In addition, the status of gender gap between female and male groups of students in using web-based instruction systems for language learning remains unclear. In view of that, there is a

need for further studies to elaborate upon this issue and enhance our understanding of how gender difference impacts on the adoption and use of WBLL.

By and large, the main theme of this study was to enrich our understanding of college students' satisfaction with web-based language learning. Given the undeniable reality that IT is ubiquitous in all sorts of educational contexts, such research has value for theory development as well as for practice. There is no doubt that the validation of a measure or a conceptual framework concerning the WBLL systems cannot be established only on the basis of this single study. Several avenues for future work remain and the researcher hopes the findings of this study can stimulate others to extend this line of research further. Measure validation requires the assessment of the measurement properties over a variety of samples in similar and different contexts. The future research can place efforts on developing the instrument for measuring students' behavioral intentions to use synchronous or blended web-based learning systems in e-learning environments. Also, more attentions can be heading towards understanding the antecedents and consequents of other web-based learning systems.

Yeni Eğitim Teknolojileri ve Derinliğin Kaybı (Yeni Teknolojilerin Eğitimde Yabancılaştırıcı Etkisi ve Bilginin Metalaşması Sorunu)

Ali Öztürk[192]

Özet:

Teknolojideki büyük gelişmeler tüm alanlarda olduğu gibi eğitim-öğretim faaliyetlerinde de önemli değişmelere yol açmaktadır. Bu gelişmeler bilginin daha kolay ulaşılabilir, anlaşılabilir, sistemli ve denetlenebilir taraflarını güçlendirmektedir. Belki bunlarla birlikte birçok yeni olumlu gelişmeden de bahsetmek gerekir. Ancak eğitim-öğretim faaliyetlerinde yoğun biçimde kullanılan teknolojik mekanizmanın bilgiyi ve onun araçlarını da yeniden düzenlediği, bu yeni sistematiğin ise düşünüldüğünden daha büyük yeni çıkmazlara kaynaklık ettiği gözlenmektedir. Öncelikle bilgiyle-erdem, bilgiyle-derin anlama ve dolaysıyla bu yeni gelişmelerin yüksek muhakeme ve sorgulayıcı aklı dışlayan bir sistematiğe dönük bir yapılanmaya neden olduğu düşünülmektedir. Bu çalışma temelde bu yeni teknolojilerin bu değişime nasıl kaynaklık ettiği ve bu sorunların üstesinden nasıl gelebileceğimize dair temel tartışmaları içermektedir.

Anahtar kelimeler: İmajoloji, Simülasyon, Bilgi, Hikmet ve Yeni Teknolojiler

Giriş

Teknolojinin hayatımızı kolaylaştırdığı, dünyayı küçülttüğü zaman ve mekan mefhumunu başkalaştırdığı ve de bilgiye ulaşmayı herkes için her an imkan dahilinde kıldığı herkesçe kabul edilmektedir. Bu süreç insanlığa birçok yeni imkanlar kazandırmıştır. Nitekim önceleri bilginin -özellikle de batı söz konusu olduğunda- zor ulaşılabilir, imtiyazlı ellerde kapalı işleyişe sahip ve de pahalı ve ulaşılamaz niteliği baskındı. Modern teknolojilerin gelişmesi tüm kültür ve bilgi değerlerinin teknolojik araçlar üzerinden her an ve her yerde ulaşılabilir olmasını sağladı. Bu bilginin yaygınlaşması ve ulaşılabilirliği açısından devrim niteliğindedir. Bu ve benzeri olumlu gelişmelerin yanı sıra teknolojinin bilgiyi kendi tabii halinde bırakmadan onu kendi form ve içeriklerine uyarlayıcı despotik karakteri nedeniyle bilgide özgün ve özgül kayıplar meydana geldiğine ve dahi bilginin dönüşerek yatay bir çoğulluk, dikey bir benzerlik arz ettiği dehşete düşüren bir anlamayla bizi yüz yüze bırakmaktadır. Yani bilgi yaygınlaşmış, çoğalmıştır. Ancak içerik ve mahiyeti fakirleşmiş ve çölleşmiştir. Bilginin plastik makyajı mükemmelleşmiş ancak içeriği byte ve bit düzeneğine göre sezgisel, duygusal, hikmetli, muhakemeye dayalı, insani ve tanrısal olan niteliklerini yitirmiştir. Her tür bilgi Çin malı, ikinci dereceden aynileşen, büyük çokluğa rağmen gerçekte büyük bir yoksullukla karşı karşıya kalmıştır.

Yeni Teknolojiler ve Eğitim

Sanayileşmenin gelişimini tamamladığı ilk dönem açısından insanlar; bilgi ve tipolojilerini sanayileşmenin gerçeğine indirgeyerek anlamlandırmaya çalışmışlardı. Ancak, sanayileşmeye

---

[192]Yrd. Doç. Dr. Bartın Üniversitesi Edebiyat Fakültesi Sosyoloji Bölümü.

indirgenen bilgi ve tipolojik korteksin zamanla, ihtiyaç hissettiği diğer işlevlerini sanayileşmenin sonuçlarını yeniden tasarlayarak, sanayileşmeye indirgenmiş bilgi yerine sanayileşmenin insan tipolojisinin ihtiyaç hissettiği üst kümeye yükselterek cevap bulma yolunu seçmiştir. Böylece insana dair birçok tespiti mekanik ve dijital aletlerin dayandığı kavramlarla rahatlıkla izah edebilmemiz bir tesadüf değildir[193].

Bütün bunlara bağlı olarak üretilmiş şeyler yeni bir anlam kazanarak egonun bireysel ve kolektif kendini yüceltme edimi olarak ürünü, narsist tüketimi, fedakarlık düzeyinde bir ayin formuna dönüştürmüştür. Böylece bireyin kendini tanımlaması sahip olma arzusuna indirgemiştir. Semboller kültürel değerleri kodladığı gibi arzuları da kodlamaya başlamıştır[194]. Artık doğanın bazı karelerini ancak bir takım markalarla özdeşleştirerek algıladığımız söylenebilir[195]. Bu durum sosyal bilimlerin kavramlarını hızla işgal eden tekno-metodik süreçlerle devam edip gitmektedir.

Üretilmiş doğa; yeni bir akıl, yeni bir tipoloji, yeni bir özgürlük anlayışı ve yeni bir medeniyet tanımına geçit veriyordu. Paraya sahip olmayı bilen insandan, parayı farklı harcamayı bilen insana, teknolojinin organikleştirilip ruhlarının pazara çıkartıldığı homojen kaynaklı heterojen davranışlara, bu ekoloji dilediğinizce farklı okuma ve üretme özgürlüğünün kapılarını açıyordu[196].

Bu sürecin gerçekte birçok alanda yaşanan yapısal değişikliğin bir sonucu olduğu da açıkça görülmektedir. Nitekim bu değişimin sosyoloji gibi tümcü sistematikleri önemli ölçüde etkilediği gözlenmektedir. Yapısal bozulma dönemi (Sanayileşme ve Fransız Devrimiyle) ile birlikte önemli yer alan sosyoloji ve dilbilim gibi bilimlerin krallığını sona erdirdi[197]. Batı klasik modern öğretilerle küreselleşmenin sonuçlarını toplamakta güçlük çekeceğinin farkındaydı. Bu yüzden de daha pratik, yaygın, esnek kısmen de kaotik saptamalarla yol bulmaya çalışmaktadır. Stratejilerini besleyen makro, uzun vadeli enstantaneler yerine gündelik kullanıma ait entelektüel beyin fırtınaları daha cazip olmaya başladı. Buna bağlı olarak bilimsel analizler çok kolay bir biçimde talk-show programlarında yer alma imkânı bulabilmektedir. Kavramsal gerçekliğin bu süreçte yeniden üretilmesi, kültür endüstrisi çerçevesinde gerçek bir kültür olmaklığı yok etmiştir[198].

Bu sürece bağlı olarak simgesel olarak farklılaşan ancak diğer tüm yönleriyle benzeşen karşıtlık ilişkisi üzerinden daha çok yıkıcı bir kimlik anlayışıdır. Nihayet sürecin çok önemli başka bir boyutuysa Baudrillard'ın tespit ettiği "simülasyon çağında" gerçekte ne bir öznenin ne de bir kimliğin mümkün olamayacağı bir yabancılaşma biçiminin yaşandığıdır[199].

Gerçekte kültür sanayisi modernitenin mekanikleştirici ve indirgemeci bütününden doğmuştur. Haidegger sanayi toplumunun insanlığı getirdiği bugünkü noktayı şu acımasız ifadelerle eleştirmektedir: Endüstri toplumu, başlı başına öznelliktir. Tüm nesneler bu özneye göre düzene sokulmuştur. Endüstri toplumu kendi tüm nesnelliğinin sorgusuz sualsiz tek ölçüsü durumuna gelmiştir. Endüstri toplumu kendi yarattığı kapatılmışlık içinde var olmaktadır[200]. Böylece aydınlanmanın eleştirel aklı yerine bilinçten yoksun bırakılmış bir toplumsal dönüşümden

bahsedilebilir. Modernitenin en önemli savı olan özgürlüğün kaynağı "özgür irade", bu büyük yeni üretim biçimi kanalları arasında körleşmektedir. İşte bu süreç modern insanın sistem ve ekonomi üzerinden tanım bulan ilgisini kültür ve yaşamsallık üzerinden eleştirilmesine dayanaklar üretti. Nitekim Batılı düşünürler ve okulları "endüstri toplumu" başta olmak üzere Bell ve arkadaşları; "sanayi sonrası" toplumu, Frankfurt okulu bünyesinde "endüstri kültürü"[201]Baudrillard "simülasyon toplumu', "tüketim toplumu", ve birçok düşünür "bilgi toplumu", "kitle toplumu" ve postmodern toplum" gibi yeni tanım alanıyla klasik moderniteden yollarını kısmen ayıracak eleştirel savlar geliştirdiler.

Batıda yaşanan ve her şeyi metalaştıran bu sürecin gerçekte modernitenin savlarına tam olarak aykırı olduğu iddia edilemez. Nihayetinde indirgemeci ve araçla yol bulan insanın yeni macerasına işaret eden bir süreçtir. Gerçekte modernitenin ilk hallerinin daha mitolojik söylemlerle yol bulduğu dahi iddia edilebilir. Belki de büyük paradoks modernitenin ilk halleri geleneğe ait ya da metafiziki olarak addedilen unsurları neredeyse mistik ve metafizik bir formla eleştirirken, post-durumsal söylemlerin geleneksel ve mistik unsurları oldukça şeyleşmiş ya da maddeleştirilmiş bir formda savunduğu gözlenmektedir.

Toplumsal ilerlemede teknik, amacın önüne geçmeye başladıkça değerlerin yerini roller almaya başlıyor. Değerlerin yitiminin sağduyunun yetimini de beraberinde getirmesi kaçınılmaz bir süreç olarak karşımızda duruyor. Yenidünya bize statü ve rolün toplumsal hayatı belirleyen temel şey olduğunu söylüyor. Rol ve statü öne çıkınca o da kendine özgü değer dünyası inşa ediyor. Doğal olarak bu yeni yol imaj yoludur. Buna baplı olarak gelişen imaj oluşturmacılığı veya yapıcılığının profesyonel seviyede işin uzmanları tarafından icrasının yanında; artık insanlar da adeta sözden tasarruf ediyormuşçasına, insanlar arası ilişkilerinde imajlarını konuşturmaktadır. Neredeyse, imaj, çağdaş insanın kartviziti durumuna dönüşmüştür[202]. Böylece soyut düşünmede tutarlılık önemli bir done iken bu yeni soyutlamalar tutarlılığı tarazlıyor. Çünkü artık önemli olan gösterge sayısını artırmaktır. Bu da Baudrillard'ın ifadesiyle diyalektiği yok ediyor ona göre "simgesel evrende diyalektik diye bir şey yoktur[203]"

Bilgisayarlaşma süreci, çizgi film, reklamsal anlam göstergelerinin temel oluşturması, birçok yapıda değişim meydana getirdiği gibi eğitim ve öğretimde de yeniden şekillenmeler doğuracak ve bu çerçevede bilgi özne-nesne ve şey ilişkisinin sorumluluk ve insansal oluş temelinden eğlendirici bir figürasyon evrimine uğradığını daha yakından hissedeceğiz. Belki de artık sınıftaki bir ders ile talk-showlar arasındaki fark kurumsal mekandan başka bir ayrıklık içermeyecektir. Soyut düşünme ve sorgulama biçim ve içerikleri hazır imajsal argümanlara ve grafiklere yerini tamamen bırakacak gibi görünmektedir. Bu da adalet, eşitlik, ahlak vs. gibi insanın sağduyusuna karşılık gelecek temel ve olmazsa olmaz kavramların hayatımızdan hızla çıkıp gitmesine sebep verecektir. Yeni yetişen kuşak için birer nostaljik eğlence argümanlarına dönüşeceklerdir. Daha acımasız olanı ise, insanlar kahkahalar atarak izleyip eğlendikleri dizilerdeki *eğlence kurbanı insanların* aslında kendileri olduklarının farkına bile varamayacak, roldeki kahramanın kendisi olmadığı için de ayrıca üzülecektir. Negatif alanın negatif düzlemdeki paradoksu insan holist seriminin neresinden neşet buluyor; bu ciddi bir araştırma konusu olarak açığa çıkmaktadır[204].

Modern dönemde eğitim tek kanaldan fakat çok elden; sanayinin üretilmesine ve merkezi topluma adaptasyona veya muhalefete yönelik bir hamle iken, II. Modern dönemde eğitim, tek elden fakat farklı kanallardan; psişikleştirilen değerlerin dinamikleşmesine yardımcı olan ya da bu süreçte farklı tarafların oluşturulmasına yönelik bir rekabet alanı olarak tezahür etmekteydi.

Kültür ayrım ve benzerliklerin ayırt edici doneleri olarak, sosyal hayatın biçimlerini ve medeniyetleşme serüveninin formunu etkileyen temel doneler şeklinde tezahür ettiklerine tanık olunmaktadır. Kutsalın açılımının eylemsel düzeyde muayyen ritlere dökülmesi onlara ikonografik ve imajsal bir yüz kattığı söylenebilir. Fakat kutsalın içkinliği imajsal bir içerik ile anlaşılamaz, onun somutlaşmış kimliksel açılımları bu düzlemde değerlendirilmek durumundadır[205].

Tüm bu gelişmeler gerek eğitim kurumları gerekse müfredat ve gerekse eğitime konu olan tüm bireyleri yeni düzenekler üzerinden sistematize etmektedir. Öncelikle bireyin eğitimden beklediği en büyük şey hikmet ve tecessüsüne karşılık gelecek ilmi arayışlar, medeniyet ve kültürüne intisab edecek kültürel ve ahlaki donanım ve kişisel menkıbesinden sıçrama yaratabilecek entelektüel arayışlarına bir cevap bulmaktan çok sertifkasyon ve mekanik sosyo-kültürel ağlar içerisinde pür-pragmaya dayalı gelecek kaygısıyla mücehhez olunan bir mekanizmayı örgütlemektedir. Modern devletlerin inşası esnasında katı ve hantal ideolojik paradigmaların kurbanı olan eğitim mekanizmaları insanın tabii arayışlarına cevap bulacak mekanizmalar kurmazdan hemen evvel günümüz post-modern ve küresel araçlar üzerinden pazara dönük tüketici aklın bir parçası haline gelmiş durumdadır. Bu sosyo-politik gerçeklik tercih edilse bile asıl sorun teknik mekanizmadan kaynaklanan sığlaştırıcı ve sıradan çoğaltıcı yeni paradigmalara imkan tanımayan mekanik bir bilgilenme biçimine yol açmasıdır. Örneğin bir tıp öğrencisi bir hastalığın tüm komplikasyonlarını deneyimleyecek bir birikimle yorumlama yolunu seçmek yerine sıradan bir grafiker gibi ışık oyunlarına bağlı olarak oluşmuş birtakım göstergeler üzerinden teşhisler koymayı daha gerçekçi bulmaktadır. Kuşkusuz bu öğrenme veya araştırma biçimi yadsınacak veya dışlanacak bir biçim değildir. Ancak kastedilen sadece yardımcı bir unsur olacak bir mekanizmanın hemen hemen tek yol olarak anlaşılması ve yaygınlaştırılmasıdır.

Sonuç

Eğitimin işlevlerinden biri de elbette yeni gelişmelere uygun araç ve imkanlar geliştirmektir. Ama bunu yaparken kendi köklü işlevinden tamamen koparak araçsal aklın bir aracı haline gelmemelidir. Eğitim öncelikle insanın erdem arayışını ve ulvi süreçlerinin birer yansıması olarak hizmet görmelidir. Ayrıca medeniyetimizin taşıyıcı rolünü unutmamalıdır. Yeni gelişmelerle birlikte bireyin kişisel menkıbesine katkılar veren imkanlara da yol açmalıdır. Bu da tek başına teknolojik indirgemeci kaynakların kullanımıyla imkansızdır. Teknolojinin amaç haline getirildiği bir uygarlığın insanlığa mutluluk getirmesi de tek başına mümkün değildir. Bu da bazı göstergelerin araçlarını kavrayan okuma biçimleriyle olmaz. Bununla birlikte muhakeme eden duyarlılık gösteren, krite eden, hikmeti önemseyen, değerle bilgi arasındaki ilişkiyi koparmaksızın bilginin ahlakiliği üzerinde titreyen bir mekanizma ve duyarlılık ile mümkündür.

Young Malaysian Children's Silence in a Multicultural Classroom

Hamidah Yamat[1206], Rosalind Fisher[2],Sarah Rich[2]

Abstract
In a multicultural classroom, second language learners' silence has always been related to the lack of understanding the target language or psychological or linguistics withdrawal. However, the findings of the study reported in this paper presented a different explanation. The study employed an ethnographic case study research design exploring the second language acquisition experiences of three six year old Malaysian children who were attending a mainstream multicultural classroom in the United Kingdom. Data were gathered through interviews with the children, their class teacher and their mothers. Classroom and home observations were also carried out as a means of triangulation. Findings from the teacher and parents' interviews illuminated that the silence was due to cultural practices as well as a display of personality. Meanwhile the children's responses as well as observations of their behaviours indicated their silence as a coping mechanism in their language learning process as well as their way of expressing their identity. This implies that teachers of multicultural classrooms need to understand and be aware of the different meanings of silence and be better prepared in dealing with children from different cultural backgrounds.

Keywords: Silence • Multicultural Classrooms•Young Malaysian Children•Identity•Ethnographic Case Study

INTRODUCTION

Silence in classrooms among second language learners are always related to the lack of understanding the target language or psychological or linguistics withdrawal [1]. However, studies also provide culturally related explanation for silence in multicultural classrooms [2; 3]. More recent study illuminated silence as the result of increasing student diversity which caused learners to develop identity in the learning process [4]. These different explanations have an impact on the role of teachers in multicultural classrooms as they now need to be aware of the cultural differences and how these would affect the students' behaviours in the classrooms. It also has impact on the training teachers need to have prior to teaching in a multicultural classroom.

However, according to reviews of research on preparing pre-service teachers to work with diverse students, the cultural gap between teachers and students is growing [5; 6]. This is because pre-service teachers come to multicultural classrooms with little cross-cultural experience and knowledge and tend to have limited visions of what multicultural teaching entails [6].

This phenomenon underpins the purpose of this article which aims to explore what silence in a multicultural classroom means to three young Malaysian children who were experiencing acquiring English as their second language. It illuminates a better understanding of what silence means in a multicultural classrooms from the perspectives of three young Malaysian children aged six, their mothers and teacher. This paper also discusses other studies conducted on students from various cultural background to see what silence means to the different cultures. This paper also provides pedagogical implications for teachers of multicultural classrooms.

MULTICULTURAL CLASSROOMS AND DIVERSITY

A multicultural classroom not only blends students from various countries but also creates a learning environment in which culture is defined by a myriad of things [7]. Although culture generally focuses on ethnicity, diversity can be defined by numerous student characteristics and other factors related to learning. These factors include ethnicity, place of birth, immigration status, age, gender, lifestyle, and educational and career background. These contribute to the cultural diversity in multicultural classrooms.

---

[206] Corresponding author.
email address. hya@ukm.my

Diversity does not exist if all students represent the same background, regardless of the background. In addition, diversity also requires children to cope in a different school environment which may affect their socio-emotional conditions. In other words, children in a multicultural classroom are not only learning new subjects, but they must also acquire the language of instruction; not only for learning purposes but also for communicating and interacting with their peers and teachers. Both tasks are not easy because when the children enter their classroom, apart from their cognitive ability, they also bring along their own language or mother tongue, learning styles, attitude and many other social cultural variables that will have an impact on their learning process in general and language acquisition process specifically. This often ends with children not participating in the communication or learning process. In other words, they become quiet or silent. However, does this mean that they do not understand what they are doing or learning? Or are they not interested in the learning process? Another important aspect is how to manage this silence and maximize its effects on learning? This means that teachers need first to understand what silence means to these diverse learners.

UNDERSTANDING SILENCE

Studies conducted on second language learners from various cultural backgrounds indicate the existence of different uses of silence; that, the use of silence may be differently interpreted in an EFL context [2]. This study on the use of silence among Japanese learners learning English as a foreign language (EFL) illuminated the use of silence for deep thought. While among Chinese students, silence has been associated with the classroom communication behavior of Chinese students studying in American universities [3].

A multi-case ethnographic study on 20 Asian graduates from China, Hong Kong, Taiwan, Korea, Japan and Indonesia revealed that these students' silence were related to five different categories of factors, respectively: cognitive, pedagogical, affective, sociocultural and linguistic [3]. This implies that the linguistic factor is not the most significant factor leading to their silence. It also implies that silence may be a part of their learning style which will have an impact on teachers' teaching style. The match between these two is vital as studies have shown that learning takes place much better if students' learning styles match teachers' teaching styles.

The question now is how a students' learning be enriched with this knowledge and the understanding of silence. The final decision is to what extent and how negotiation between learners and teachers in terms of learning style, teaching style and methods, itself needs to be negotiated in each learning circumstances. It is valuable to be flexible and open to appreciate good aspects of our own and others through the negotiation between learners and the teachers. Also, this is not a matter of winning or losing a better position. Both learners and the target cultures' identity and the way in which people express themselves should be respected in a culturally sensitive way.

Another challenge in managing diversity is related to teachers' readiness or preparedness in dealing with diversity in multicultural classrooms. A review of literature on teacher education for multicultural education reveals that despite the changing demographics that make public schools more culturally and linguistically diverse and the growing body of knowledge on issues of diversity and difference, multicultural teacher education continues to suffer from a thin, poorly developed, fragmented literature that provides an inaccurate picture of the kind of preparation teachers receive to teach in culturally diverse classrooms [5].

As student diversity in the classroom increases, it is imperative that teachers use a variety of teaching methods. Hence, it is recommended that diversity be conceptualized as comprising three main components: input, process, and output. Input refers to the student's background, or what the student brings to the educational setting [7]. Process refers to the educational setting or learning environment where learning is maximized. The interaction of input and process leads to output, measured by student success. Similarly, [8] illuminated the important role of teachers in designing and monitoring learning activities for culturally diverse groups that are perceived as personally rewarding, academically enriching, and professionally relevant.

This could best be achieved by deliberate efforts to constructively capitalise on cultural diversity for raising students' awareness of future workplace demands and by embedding the relevance of intercultural competencies in the context of prospective professional practice. Group learning activities that incorporate cultural dimensions of the professions and that are carried out with continuous, structured teacher support are expected to lead to positive, secure, and rewarding experiences for all students involved. As part of regular teaching, teachers need to be sensitive to and prepared for potential challenges arising in culturally diverse group work.

MATERIAL AND METHOD

The purpose of the study discussed in this paper was to explore young Malaysian children's experiences acquiring a second language; that is English. Three research questions underpinned the whole study. This paper however, presents the findings and discussion on one of the findings related to the first research question: How do young Malaysian children experience Second Language Acquisition in the U.K? This study was qualitative in nature and employed an ethnographic case study design.

An ethnographic case study enables knowledge to be obtained through encounters with the subjects and their views and behaviours are continuously being interpreted to give meaningful explanations [9]. The techniques of data collection in this study were interviews and observations. Three children aged six named Azlan, Hazwan and Aida (pseudonyms), their class teacher and the children's mothers were interviewed and tape recorded. The children were also observed at school and home. All adult participants had given a written consent and their identities were kept anonymous. Parents' consent included their children's participation in the study.

There were three phases of the data collection in a six months time frame. A total of 27 interviews (3 interviews with each adult participant and 4 interviews with each child, and 3 group interviews), 19 classroom observations and 12 home observations were carried out. Copies of the transcriptions were given to the adult participants for correction or addition of information. This was to ensure clarification of what the participants had said during the interviews and to show the interpretations made in deriving the themes which represented the concept or idea that the parents conveyed. Transcriptions of the children's interviews were also given to the parents as a means of validating the children's responses because the children would not be able to remember what they said. The children's responses or answers would indicate the children's perception which the parents would expect of their children. All the transcriptions were analysed according to the principles of grounded theory through constant comparative analysis to derive themes and categories.

The study was conducted in a mainstream elementary school in Devon, United Kingdom. According to the school's population analysis taken in the 2004/2005 session (the time of data collection for the present study), there were 264 children enrolled at St. Peter's Church School. 60 (15%) were non-English as their first language pupils. Some of these children were local families who have come from Vietnam, China, India, Pakistan or the Caribbean. There were also children whose parents were postgraduate students or lecturers at the university such as the children from Malaysia, Iran and Egypt [10] The variety of student backgrounds indicates that the school had its own 'unique' learning context and the children were familiar with cultural and language differences. Meanwhile, the composition of the pupils in the classroom involved in this study was 22 pupils with English as their first language pupils and 11 with English as An Additional Language (EAL) pupils. The EAL pupils were 3 Malaysians, 3 Indians, 4 Iraqis and 1 Japanese pupil.

RESULT AND DISCUSSION

Data from the interviews with the children, their mothers and teacher as well as observations of the children's behaviour are presented in this section and discussed in relation to understanding why these three Malaysian children were silent in their classroom. The observed behaviour such as being quiet, not participating actively or not raising their hands to respond are interpreted as them being 'silent'. These responses and observations were coded as 'characteristics' which was also related to diversity and cultural differences.

According to the teacher, Mrs. Smith (pseudonym), the children "… *are quite reserve… they don't always have their hands up …they tend to understand before they speak … they haven't got the confidence to speak out or to put it in any sentence … this is about confidence in large group… I still wonder if it is a cultural thing, compared to the Iranian who are extrovert and loud all the time … the Malay children are very polite, very considerate … conscientious in their presentations…*" (Interview Teacher Phase 1).

This reflects the teacher's perception and observation that the Malay children may not behave as actively as indicated by them not raising their hands to volunteer answers. Although she believes that this may be due to the children's lack of confidence or attempt to make sense before they speak, the teacher felt that it may be also be a cultural driven behaviour. This is because she compared the Malaysian children's behavior with the Iranian children whom she observed were more extrovert and loud. Also she felt the Malaysian children may be quiet because they

were being polite and considerate. This indicates that the teacher was observing and comparing the children's different behaviours to understand why and how silence may take place. It would be easier for her to understand had she been given the training or knowledge on how children from different cultures behave as well as knowledge on what to expect of them.

As responded by the teacher that she received *no specific training* and that her knowledge was gathered *a lot from experience* (Teacher interview Phase I). Nevertheless, she also admitted that she received *support from teachers and advisor* (Teacher Interview Phase I), From her experience, she concluded that there is a need to have *a good relationship with the children, knowing a bit more of the background of the children because* if [we] know, [we] can see why [the children] are making the error. The teacher also felt that there should be *more dual language text* to help the children in their learning. The teacher's concern was however on the *need to know the difficulty ... is it learning difficulty or language difficulty* (Interview Teacher phase 3). The teacher also described what she did in teaching English to the culturally diverse children in her classroom, She [did not] *have a formal grammar lesson*. However, she used *visual materials, things around the room* and illustrations of pictures – *the words next to the pictures*, *more practical thing ... encourage speaking ... through role play and classroom assistants' model conversations*. These show that a teacher needs to be creative and sensitive teaching multicultural diverse learners.

Meanwhile, according to Azlan's mother, *when the first few months in nursery ... [Azlan] just kept quiet, he just listened... he looked at how people talk... from there he became brave to ask .. he started to practice*. This was interpreted as Azlan's way of trying to make sense of want he was listening. He was actually observing and listening and 'silently' learning and acquiring the language. His mother felt that he started participating or using the language when he became more confident. Perhaps because then Azlan's repertoire of the language was then to him large enough that he was brave enough to participate.

Hazwan's mother on the other hand said that Hazwan *likes to think... he is the type who observes and then thinks back... he will think and then he can do it...* She also felt that Hazwan was quiet in the class *because that's their (L1 students) language... they* (Malay children) *would let others answer the question or respond... they* (Malay children) *do not want to compete.* This shows that Hazwan's mother felt that her son's silence was more related to his characteristics of being observant; not that he was not understanding or not wanting to participate. Similarly, Aida's mother said that Aida *is not a talkative child* but she is *interested in learning English.* Hence, Aida was observed to be very quiet in the class during the lessons.

It may be concluded that the children's mothers felt that their children were quiet and it was not an indicator of them not understanding but as their way of dealing with the learning environment as well as a display of their characteristics. Nevertheless, not raising hands or not being actively participating in classroom discussion is a common scenario in Malaysian as well as other Asian classrooms. The children's responses also indicate similar beliefs. Both Azlan and Hazwan said that they would just *follow what they* (his friends) *do* and *watch teacher first* (said Aida). Interestingly Aida also said *I don't know what that mean ... I don't put up hand.*

When observed, these Malaysian children were quiet in comparison to the other children with English as their first (L1) or another language (EAL). They volunteer less in terms of raising their hands to answer questions. When asked, Hazwan said that he did not put up his hands because *somebody else answer*. There were also instances where he wsas observed whispering answers to Azlan to answer. However, the teacher said that she had *to ask them quite direct questions... address specifically to them* if she wanted these Malaysian children to participate. These responses and observations indicate that the children were silent and the teacher as well as the children's mothers understood this behavior and did not have any negative interpretations. They understood the children's silence.

One interesting finding was of the school observation. It was observed that there were attempts to make the school and all its pupils receptive of other mother tongues by having names of rooms written in English and Arabic (the majority of the children with EAL had Arabic as their mother tongue). The school also employed a Pakistani lady to work as a dinner lady. The
children with EAL were allowed to speak in their mother tongue at school. These were attempts made by the school to create an environment that is familiar and non-threatening to the children. They will feel comfortable as there are many people of different cultural background that are accepted and welcomed in the school. Hence the children will not feel afraid to participate in the classroom as well as the school's activities and no longer be silent.

All these created an environment that was 'friendly' to the children with EAL. The environment also enabled children with English as their mother tongue to be familiar with different cultures and language. This situation reflects the first form of provision mentioned by [11] who identified three potential forms of provision made by local authorities and schools for EAL learners. These forms may be found either exclusively of one another or combined in different ways within a school. The first form is by supporting language awareness in multilingual classrooms. This is where attempts are made to make the school and all its pupils receptive to the various mother tongues the children bring to school. The second form is through community language teaching. This is where the school sets up classes in the languages shared by a certain percentage of pupils within the school and local community. The third form is through bilingual support for curriculum learning. This means that children with English as an additional language have full access to the curriculum through bilingual support to enable them to draw on their full linguistic competencies in the development of their cognitive concepts and knowledge of the different subject areas of the primary education.

CONCLUSION AND IMPLICATION

In conclusion, based on the qualitative data gathered through this ethnographic study, silence in a multicultural classroom carries different connotations for these young Malaysian children, their mothers as well as their teacher. This finding further supports that silence is culturally related – perhaps an identity of the Asian identity. Nevertheless, silence is not perceived as a negative impact or an indicator that the children were not learning or acquiring the language. It shows that they were actually learning or acquiring the language 'silently'. What is more important is that teachers need to understand this and find means to enhance their students' learning experiences. This includes creating a classroom environment that fosters respect and welcomes diverse viewpoints. Parents as well as other members of the schooling community too should understand the diversity in multicultural classroom and support the growth and development of all learners in the classroom. One significant implication is that teachers should be aware and understand the different meanings of silence as perceived by different cultures. This also means that teachers teaching in multicultural classrooms should be prepared and trained to manage these differences. Hence, teacher training should include multiculturalism not as an aspect of differences but rather as a means to manage the differences. More studies from a cultural lens should also be conducted to illuminate other learning aspects that are interpreted differently across cultures.

Using Eye Tracking Method and Video Record In Usability Test of Educational Softwares and Gender Effects

İsmail Tonbuloğlu [a] [207]

aYıldız Technical University & Sakarya University, İstanbul 34349 , Turkey

Abstract

The research examines the usability of gender factor which is important in educational softwares. Math educational software is used in the research and software's level is primary education. Used method in the research is case study with eye-tracking and video record. Eye- tracking technology, screen captures, mouse and keyboard movies and one-way mirror observation used in the research. While students doing their task the application area, students behaviors have been recorded by camera. Study group is consist of six primary education's student. This student's eye movements to be examined while they used the software. The areas are defined where the students looked the longest and the most frequent in the educational software's interface. Heatmap, scanpath and fixation count analyzes are used in the research. Usability researches which used eye-tracking method are limited in Turkey. This research will contribute the literature for developing primary educational softwares. Findings to be discussed and overtured for the educational softwares.

Introduction

Features such as "configurability to facilitate learning" and "quality of software" provide usability (user-friendliness) to educational software. Usability in this context can be defined as easy and effective performance of tasks specified in an application by users defined as target group, under suitable environmental conditions, following provision of required training and technical support. In practice, usability can be defined in terms of measurement of efficiency, effectiveness and satisfaction levels shown by users in the target group, while performing the tasks assigned. Effectiveness reflects the extent of success achieved by users in performing tasks using the application, and in this sense, effectiveness can be measured as the percentage of ability to perform a task. For instance, if the task expected involves finding the location of specific information on a webpage, effectiveness can be expressed in terms of user's success achieved in finding the correct information. Measurement of effectiveness is not alone sufficient to evaluate usability. Other sources (time, cost, etc.) used for performing a specified task are evaluated by measuring the efficiency. In the webpage example, efficiency can be measured by the time spent or by the ways followed by a user to perform a given task, or by the total number of steps taken to complete the task, etc. Satisfaction is the measure of opinions developed by users while using the application (e.g. likes, dislikes, etc.). Satisfaction does not have a critical importance with respect to usability at the same level as the efficiency and effectiveness; it is directly affected by efficiency and effectiveness. Satisfaction can be measured using satisfaction questionnaires prepared for this purpose(Çağıltay and Others, 2006).
According to Nielsen (1993) usability has five attributes:
Learnability: How easy is it for users to perform simple tasks at their first sight of the design?
Efficiency: Once they learn the design, how fast do users perform the tasks?

---

207 İsmail Tonbuloğlu, Sakarya University, Institute of Social Sciences, Phd Student. Tel.:+90 507 692 59 99
 E-mail address: ismailtonbuloglu@gmail.com

Memorability: After some time away from the design, how easily do users use it once they return to it?
Errors: How many mistakes do users make and how easy is it for them to recover from mistakes?
Satisfaction: How much does the design satisfy users?

Methods of measuring usability as seen in the literature include Think Aloud, Cooprative Evaluation, Protocol Analysis, Automated Analysis, Interviews, Questionnaires, Eye-tracking, and Psychological measurement.

Eye-tracking method stands out in that data are obtained from the primary source. Like the example of recording movements of eyes during reading, the eye-tracking method has been used in the field of psychology for approximately 100 years(Schiessl and Others, 2003). This method has been utilized in usability researches conducted on information sharing interfaces such as the Internet, e-mail and video-conference, etc. since the 1990s in the field of human-computer interaction(Benel , Ottens & Horst, 1991; Ellis ve diğerleri, 1998; Cowen,2001). Objective and quantitative data related to how long users look at the target can be obtained utilizing special state-of-the-art devices designed to track the movements of the eyes(Duchowski, 2002). Movements of the eyes provide information as to where individuals focus their attention, what information they disregard, what they are disturbed by the most, etc(Russell, 2005). When the usability studies conducted using eye-tracking method in the literature are examined, one can see many usability studies conducted in many fields such as webpage use, evaluation of the university websites, computer games, and TV programs, etc(Çağıltay and Others, 2006; Byerly, 2007; Russell, 2005). However, there are no studies conducted on usability of educational software, utilizing the eye-tracking method. This study aims to assess usability of Primary Education seventh-grade mathematics course software based on the gender factor, using the eye-tracking method, and to contribute to the literature in this context.

Within the scope of this study, usability of primary education seventh-grade mathematics course software was evaluated based on the gender factor. Answers to the following questions were sought:
1. "Do the scanpaths involve differences, when the gender factor is considered in educational software?"
2. "Do the heatmaps involve differences, when the gender factor is considered in educational software?"
3. "Do the fixation counts involve differences, when the gender factor is considered in educational software?"
4. "Do behaviours involve differences, when the gender factor is considered in educational software?"

Method

Case study was used as the research model in this study. Qualitative and quantitative data collection methods were used concurrently. Quantitative data obtained from eye-tracking processes were used together with the empirical qualitative data. Movements of the eyes of the subjects were recorded during performance of two tasks assigned. After recording the subjects' experiences with the educational software, the eye movements of the subjects were analyzed using the SMI software, and the findings and results are provided in the study.

The study group consisted of primary education students. The study covered six primary education students in total. Written permissions of the guardians of the students were obtained. All participant students had minimum 2-year experience in using computers. The study was conducted at the Human-Computer Interaction Laboratory (HCI Laboratory) of the Marmara University Ataturk Faculty of Education, Department of Computer and Instructional Technologies. The HCI Laboratory is equipped with cameras, eye-tracking devices, test computers, observer computers, observer room, control unit, microphones and amplifier, sound mixer, and sound insulation.

Findings

Subjects used within the scope of the study consisted of three male(subject 1-2-3) and three female(subject 4-5-6) students. Scanpaths of the subjects were recorded and screenshots were captured within the scope of the question "Do the scanpaths involve differences, when the gender factor is considered in educational software?".

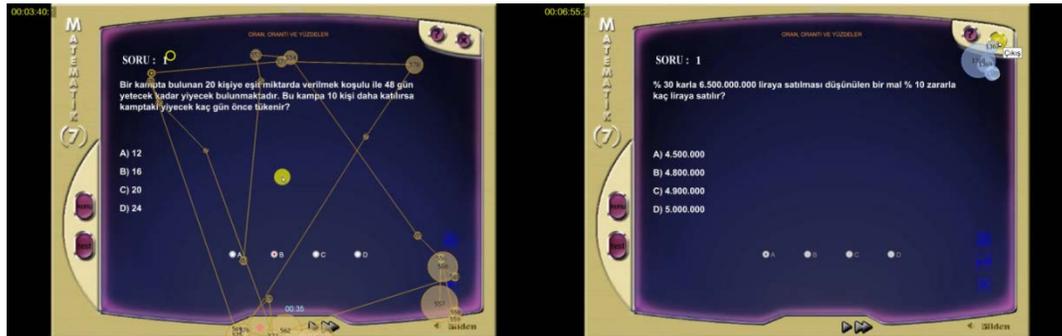
Tasks assigned to the subjects were to "quit the test" and "quit the software" . Findings relating to the scanpaths of the six subjects were as follows.


Figure 1. Subject 4 scanpath figure about "quit the test" task and Subject 3 scanpath figure about "quit the software" task

The following findings were made when the scanpath results for the "quit the test" task were analyzed:
- The Subject 1 looked at the test button, answer card button, and quit test button respectively.
- The Subject 2 looked at the answer card button, test button, quit test button, page change buttons, and quit test button respectively.
- The Subject 3 looked only at the quit test button.
- The Subject 4 looked at the question field, company logo, quit test button, page change buttons, and question field respectively.
- The Subject 5 looked at the answer card button, quit test button, and answer buttons.
- The Subject 6 looked at page change button, quit test button, answer card button, company logo, page change buttons, answer choices, question field, and help button respectively.

The following findings were made when the scanpath results for the "quit the software" task were analyzed:
- Subject 1, Subject 3 and Subject 4 looked only at the quit software button.
- Subject 2 looked at the subject - test buttons, and the quit software button respectively.
- Subject 5 and Subject 6 looked at the answer choices and the quit software button.

Heatmaps of the subjects were recorded and screenshots were captured within the scope of the question "Do the heatmaps involve differences, when the gender factor is considered in educational software?".

Tasks assigned to subjects were to "quit the test" and "quit the software". Findings relating to the heatmaps of the six subjects were as follows

Figure 2. Subject 6 heatmap figure about "quit the test" task and Subject 3 heatmap figure about "quit the software" task

The following findings were made when the heatmaps results for the "quit the test" task were analyzed:
- Heatmaps of the Subject 1 concentrated on the test button, answer card button and quit test button.
- Heatmaps of the Subject 2 concentrated on the answer card button, test button, quit test button, and page change buttons.
- Heatmaps of the Subject 3 concentrated only on the quit test button;

- Heatmaps of the Subject 4 concentrated on the question field, company logo, quit test button, page change buttons and question field.
- Heatmaps of the Subject 5 concentrated on the answer card button, quit test button and answer buttons.
- Heatmaps of the Subject 6 concentrated on the page change buttons, quit test button, answer card button, company logo, page change buttons, answer choices, question field, and help button.

When the heatmap findings relating to the "quit the software" task were analyzed, it was seen that the heatmaps of the Subject 1, Subject 3 and Subject 4 concentrated only on the "quit software" button; heatmaps of the Subject 2 concentrated on subject-test buttons and exit software button, and the heatmaps of the Subject 5 and Subject 6 concentrated on answer choices and exit software button.

Fixation counts of the subjects were recorded and screenshots were captured within the scope of the question "Do the fixation counts involve differences, when the gender factor is considered in educational software?".

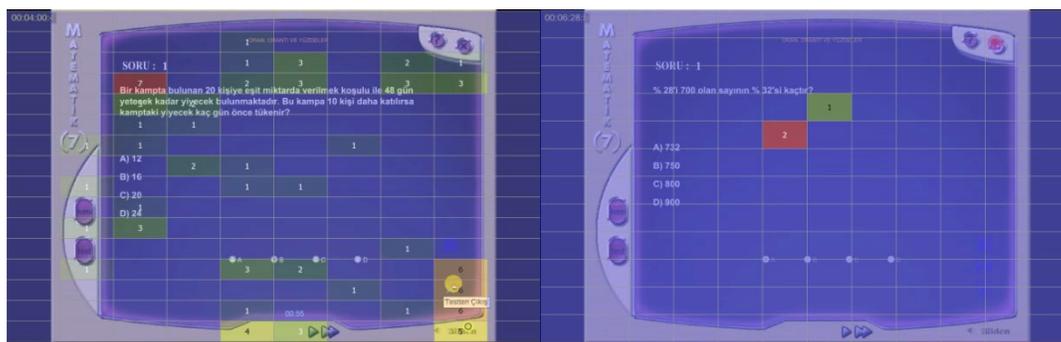
Tasks assigned to the subjects were to "quit the test" and "quit the software". Findings relating to the fixation counts of the six subjects were as follows.


Figure 3. Subject 4 fixation count figure about "quit the test" task and subject 1 fixation count figure about "quit the software" task

The following findings were made when the fixation count results for the "quit the test" task were analyzed:

- The Subject 1 focused on the test button, page change buttons, and the answer card button the most.
- The Subject 2 focused on the quit test button, answer card button, page change buttons, test button and answer choices the most.
- The Subject 3 focused on the quit test button, answer buttons, answer card, and answer choices the most.
- The Subject 4 focused on the question field, quit test button, page change buttons, company logo and answer choices the most.
- The Subject 5 focused on the answer buttons, answer choices, and answer card buttons the most.
- The Subject 6 focused on the page change buttons, quit test button, answer buttons, answer choices and the question field the most

The following findings were made when the fixation count results for the "quit the software" task were analyzed: The Subject 2 focused on the question field, subject button, answer choices, answer buttons and the quit button the most; the Subject 3 focused on the question field and the quit button the most; and the Subject 6 focused on the question field the most. The Subjects 4 and 5 focused on the empty spaces of the page during the task.

Videos of the subjects were recorded and grafics were demostrated within the scope of the question "Do behaviors show differences, when the gender factor is considered in educational software?".

Timeline Area

Timeline of Speaking Color
Timeline of Silence Color (pink)
Timeline of Positive Mimic Color
Timeline of Negative Mimic Color
Timeline of Neutral Mimic Color (orange)

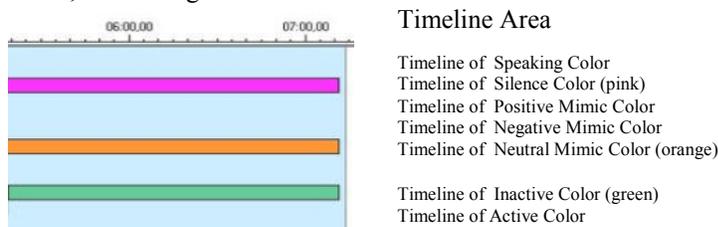
Timeline of Inactive Color (green)
Timeline of Active Color


Figure 4: Graphic of Subject 3's behaviors and mimics about "quit the test" task and "quit the software" task

Subject 3 was doing task silence, neutral mimic and inactive. These findings were similar to eye tracking findings.
.

Timeline Area

Timeline of Speaking Color
Timeline of Silence Color (pink)

Timeline of Positive Mimic Color
Timeline of Negative Mimic Color (green)
Timeline of Neutral Mimic Color (orange)

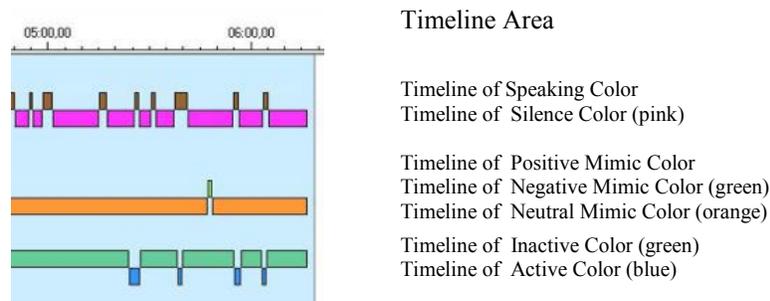
Timeline of Inactive Color (green)
Timeline of Active Color (blue)


Figure 5: Graphic of Subject 6's behaviors and mimics about "quit the test" task and "quit the software" task

During the task, subject 6 was silent in general; however, she sometimes spoke. She displayed neutral mimic and the body was inactive. These findings were similar to eye tracking findings.

Based on the findings obtained from the eye-tracking method, it was seen that the female subjects' fixation spread over a larger area and that they focused in more details compared to the male subjects. Distribution of the fixation and fixation counts relating to the "quit the test" task, and the heatmap findings relating to the "quit the software" task support the interpretation that fixation of females spread over a larger area and in more details compared to males.

Conclusion

Based on the fixation count, scanpath and heatmap findings of this study, it can be said that females have higher scanpath performance and that their fixation counts spread over a larger area on the page. This finding is similar to the findings of the study conducted by Schiessl et al (2003).

The study revealed that similar symbols used for similar tasks caused confusion. It was noticed from the eye-tracking findings that the subjects tended towards the quit test button that was similar to the quit software button, when they were asked to quit the software on the test screen. Likewise, the subjects tended towards the top right section of the screen, which they considered to be the location of the quit button, when they were asked to quit the software on the test screen. It was seen that past experiences and habits with respect to the design of the educational software influenced behaviors of the subjects. Sennersten (2004) included in his findings the opinion that pre-knowledge and experiences influenced behaviors of his subjects.

Recommendations for development and design of educational software:

- Interfaces can be designed based on the differences in eye-tracking results of different genders. Thus, a different interface can be offered to users according to their gender. This would enable development of more personalized and user-friendly software serving the purpose.

Recommendations to researchers:

- Educational software can be designed based on distribution of fixation between genders. Such software can be studied in terms of usability using the eye-tracking method.
- In educational software or other interactive media environments, fixation times, fixation counts and fixation orders on a number of other objects (graphics, text, animation) can be studied in other dimensions such as age groups, gender, etc.

Using 5E or 7E Teaching Model as an Instructional Design Model

Aytekin İŞMAN[a], Şirin KÜÇÜK[b208], İsmail ŞAHİN[b]

[a]Sakarya University, Faculty of Education, 54100, "Sakarya", Turkey

[b]Necmettin Erbakan University, A.K. Faculty of Education, 42090, "Konya", Turkey

Abstract

An instructional design refers to the current plan and procedures for any instruction and serves as a guide helping about the implementation of an instruction. Almost all instructional design models have the same routine with ADDIE process- analysis, design, development, implementation and evaluation. The main goal of the ADDIE instructional design model is to increase the value and efficiency of teaching and training by fitting instruction to jobs while guaranteeing that students learn the knowledge required and get the expertise to do their jobs. 5E model is a helpful framework that guides instructors to provide learning experiences for students which consists of five phases: Engagement, Exploration, Explanation, Elaboration, and Evaluation. In the 5E model, "E" symbolizes every phases of the model. The 7E instructional model which is developed format of 5E instructional model. The proposed 7E model expands the *engage* phase into two components—*elicit* and *engage*. Also, in the 7E model, *elaborate* and *evaluate* phases expand into three components— *elaborate, evaluate,* and *extend.* In this paper, it is suggested that 5E or 7E model can be used as an instructional design model. 5E or 7E teaching model can serve as an instructional design model for future studies conducted in different disciplines. Also, the effects of this type of use of 5E or 7E model can be examined. In conclusion, it is clear that 5E and 7E teaching models are quite suitable for designing the content and the teaching process.

Keywords: Instructional design model, 5E and 7E models

Introduction

An instructional design refers to the current plan and procedures for any instruction and serves as a guide helping about the implementation of an instruction (Baturay, 2008). Reigeluth (1983) defined as instructional design is "a discipline that is concerned with understanding, improving and applying methods of instruction" (p.4). Instructional design is a complex and circular process which is creative and active (Gustafson & Branch, 2002). Many different variations of instructional design models have been described (Dick & Carey, 1996; Kemp, Morrison, & Ross, 1998; Seels and Glasgow, 1998; Smith & Ragan, 1999), however, almost all models have the same routine with ADDIE process-analysis, design, development, implementation and evaluation (Allen, 2006; Baturay, 2008; Gustafson & Branch, 2002). ADDIE is general model for instructional design process also it is not linear, but more of a loop (Özbek, 2009). The main goal of the ADDIE instructional design model is to increase the value and efficiency of teaching and training by fitting instruction to jobs while guaranteeing that students learn the knowledge required and get the expertise to do their jobs (Allen, 2006). The first step of ADDIE model is the analysis phase that is the basis for all other phases (Gillespie, 1998). During this phase, some important areas should be analyzed: identification of instructional needs, recognizing of learner characteristics and capacities, determination of educational goals and purposes (Özbek, 2009). In the design phase, learning objectives and assessment techniques are developed; instructional contents, activities, processes and resources are defined by teachers or designers (Gillespie, 1998). The development phase involves preparing student and instructor materials through the results from the analysis and design phases (Kemp, Morrison, & Ross, 1998). The implementation phase is concerned with delivering of the instruction and achievement of the objectives and goals as a designed previously (Gillespie, 1998). The evaluation

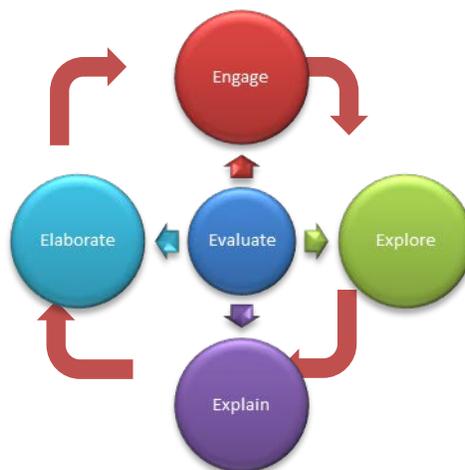
* Corresponding author. Tel.: +90 332 323 82 20; fax: +90 332 323 82 25

E-mail address: sirinkucuk@gmail.com

phase involves both summative and formative evaluations which often appear in various phases of the model (Baturay, 2008). Formative evaluation is used to identify needed revisions of the instruction besides summative evaluation involves collecting data to assess the whole instruction (Gustafson & Branch, 2002).

5E Instructional Model

Constructivism is a dynamic and interactive notion of learning (Ergin, 2012). Based on the constructivist approach, students should construct their own knowledge and understanding by themselves, instead of transfer knowledge to them by teachers. The approach mostly cares about students' real life experiences (İşman, Baytekin, Balkan, Horzum, & Kıyıcı, 2002). In this approach, the use of learning cycle in the classroom helps students redefine, rearrange, elaborate and change their initial concepts through interactions and connect their new knowledge to real-life situations (Bybee, 1997; Duran, Duran, Haney, & Scheuermann, 2011). Constructivist theory can be implemented through many different teaching models or designs, one of these are the 5E instructional model (Ergin, 2012). 5E instructional model grounds on the constructivist approach. 5E instructional model has been modified over time. After the 5E learning cycle model created by J. Myron Atkin and Robert Karplus in 1962 and later modified from the Science Curriculum Improvement Study (SCIS) program in the late 1980s, 5E instructional model was developed as a component of the Science for life and Living curriculum created through the Biological Sciences Curriculum Study (BSCS) (Bybee & Landes, 1990).

In 5E learning cycle, while teacher presents a problem and materials to investigate, students execute their own procedure to solve the problem under the teacher guidance therefore this cycle can be considered like a guided inquiry (Fazelian, Ebrahim, & Soraghi, 2010). 5E model is a helpful framework that guides instructors to provide learning experiences for students (Tanner, 2010). Also, it is the most effective way for engaging students in learning (Ergin, 2012). The 5E model consists of five phases: Engagement, Exploration, Explanation, Elaboration, and Evaluation (Figure 1). In the 5E model, "E" symbolizes every phases of the model. Each phase has a specific function and contributes to the teacher's coherent instruction and to the learner's formulation of a better understanding of scientific and technological knowledge, attitudes and skills (Bybee et al., 2006).


Engagement Phase: The first phase engages students in the learning task (Bybee et al., 2006). In this phase, teacher uses short activities to take attention and generate curiosity about topic of the lesson. The activities should make connections between past and present learning experiences (Bybee et al., 2006). In this way, teacher assesses students' prior knowledge through responses to the questions and helps them to become engaged in new concepts. It also helps students create connections between their prior knowledge and the new learning concept.

Figure 1. 5E model phases (Ergin, 2012)

Table 1. Teacher and Learner Role in Engagement Phase of 5E model (Akar, 2005, p.21)

Teacher	Learner
calls up prior knowledge	poses problems
has an interest	asks questions
experiences doubt or disequilibria	reveals discrepancies
has a question(s)	causes disequilibria or doubt
identifies problems to solve, decisions to be made, conflicts to be resolved	assess prior knowledge

Exploration Phase: While students are engaged in activities and ideas in the first stage, they need time to explore these ideas in this second phase. Students use prior knowledge to generate new ideas, explore questions, and test possibilities (Bybee et al., 2006). Exploration is an opportunity for students to think what they understand or misunderstand in the learning process. Exploration phase involves active participation by students.

Table 2. Teacher and Learner Role in Exploration Phase of 5E model (Akar, 2005, p.22)

Teacher	Learner
hypothesizes and predicts	questions and probes
explores resources and materials	models when needed
designs and plans	makes open suggestions
collects data	provides resources
builds models	provides feedback
seeks possibilities	assesses understandings and processes
self reflects and evaluates	

Explanation Phase: The explanation phase is "to present concepts, processes, or skills briefly, simply, clearly and directly" (Bybee, 1997 p.80). First, students give their own explanation or interpretations which acquire from the engage and explore parts of the lesson after teacher introduces scientific or technological explanations about topic of the study in a direct or formal manner (Bybee et al., 2006). Teacher helps students in understanding the connections between their own explanations and formal facts through uses many multimedia elements (Campbell, 2000). In the end of the phase, students should explain their exploratory experiences with using common scientific knowledge (Bybee et al., 2006).

Table 3. Teacher and Learner Role in Explanation Phase of 5E model (Akar, 2005, p.23)

Teacher	Learner
clarifies understandings	provides feedback
shares understandings for feedback	asks questions, poses new problems and issues
forms generalizations	models or suggests possible modes
reflects on plausibility	offers alternative explanations
seeks new explanations	enhances or clarifies explanations
employs various modes for explanation (writing, art, etc)	evaluates explanations

Elaboration Phase: Students are encouraged to develop broader and deeper understanding and skills, what they have experienced through the above three phases (Campbell, 2000). This phase helps students to transfer of concepts, ideas, explanations or skills to closely related but new situations (Bybee et al., 2006). At this phase, students try to extend the concepts which they already learned before also make connections to other related concepts and apply their understanding on real-life situations. Moreover, students apply elaboration strategies to ask questions, solve problems, projects, experiments and make decisions (Akar, 2005).

Evaluation Phase: Although informal evaluation can be occurring throughout the 5E sequence, this phase especially involves formal assessment (Bybee, 1997). Teacher evaluates students' progress toward achieving the learning outcomes and can complete the formal assessment after the elaboration (Bybee et al., 2006). Evaluation phase encourages students to assess their own progress. In this phase, alternative evaluation techniques can be used

such as performance evaluation, portfolio, concept map, structured grid, project, drama, poster, peer assessment, and individual assessment (Turgut & Gürbüz, 2011).

7E Instructional Model

The 7E instructional model which is the developed form of 5E instructional model by Eisenkraft in 2003. Although the basic steps are the same for the theoretical parts of the two teaching models, there might be some differences between the two teaching models based on their uses (Özbek, Çelik, Ulukök, & Sarı, 2012). The proposed 7E model expands the *engage* phase into two components—*elicit* and *engage.* Also, in the 7E model, *elaborate* and *evaluate* phases expand into three components— *elaborate, evaluate,* and *extend.* The transition from the 5E model to the 7E model is shown in Figure 2.

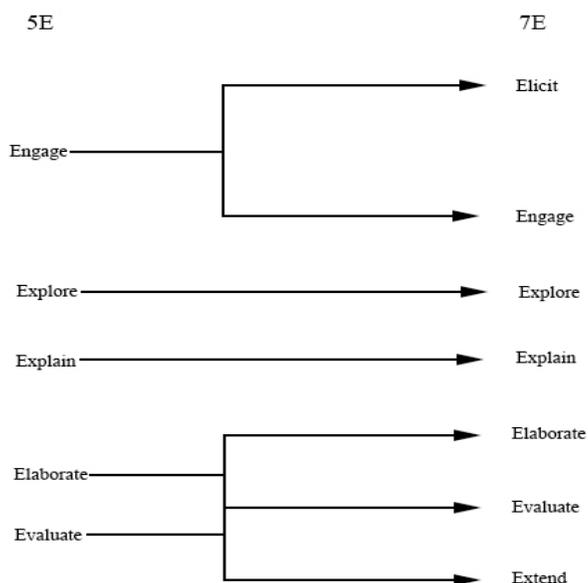


Figure 2. Then proposed 7E learning cycle and instructional design model (Eisenkraft, 2003)

In 7E model, engagement phase does not exchange with elicitation phase and the engagement phase is still a necessary component in an effective instruction. Elicitation is the phase in which the prior knowledge of the learner is elicited through questions and scenarios by teacher (Balım, Türkoğuz, Aydın, & Evrekli, 2012). Students construct new knowledge in relation to existing knowledge, therefore teacher needs to find out existing knowledge in learning process (Eisenkraft, 2003). This phase is helpful to enhance the role of eliciting students' prior knowledge without reducing the engagement phase (Fazelian et al., 2010).

The elaboration phase is called "transfer of learning" in psychology (Thorndike, 1923). The addition of the extension phase to 7E model may encourage students to practice the transfer of learning (Eisenkraft, 2003). In this way, teachers can prepare students to apply their understanding in daily life and adapt their constructed knowledge into other subjects.

Conclusion

In the literature, there are many instructional design models. In the present work, the ADDIE model of instructional design serving as the basis of the design models is mentioned. 5E and 7E teaching models, which are mainly used in science education in recent years (Moseley & Reinke, 2002; Özsevgeç, 2007; Türker, 2009; Temiz 2010; Şahin, 2010) but are not included among these instrucional design models, are presented in this paper. When

the instruction is taught according to 5E model, students activate their prior knowledge, overcome with misunderstanding, and use technological equipment more effectively (Ergin, 2012; Fazelian et al., 2010). Previous studies show that 5E instructional model helps to enhance students achievement, conceptual development and provided positive attitudes towards learning (Bayar, 2005; Özsevgeç, 2006; Sağlam, 2006). 5E instructional model also enhances teachers' classroom behaviors. Besides, it develops students' understanding and achievement (Akar, 2005). When the 5E instructional model is analyzed, it can be concluded that any teaching should have multiple phases and help the instructor build learning environments that are available to all students who may have different learning styles and preferences (Tanner & Allen, 2004). In this paper, it is suggested that 5E or 7E model can be used as an instructional design model. 5E or 7E teaching model can serve as an instructional design model for future studies conducted in different disciplines. Also, the effects of this type of use of 5E or 7E model can be examined. In conclusion, it is clear that 5E and 7E teaching models are quite suitable for designing the content and the teaching process.

Leadership styles in synchronous and asynchronous virtual learning environments

Stefano Ruggieri[a,b209], Stefano Boca[a], Maria Garro[a]

aDepartment of Psychology, University of Palermo, Palermo, Italy
bEuro-Mediterranean Institute of Science and Technology, Palermo, Italy

Abstract

A comparison of the effects of transactional and transformational leadership in synchronous and a synchronous online teamwork was conducted. In the study, groups of four participants interacted in online text chat and online text forum in problem solving tasks. The groups were leaded by a confederate who acted as a transactional or a transformational leader. Satisfaction in the interactions and participations communicative styles were assessed. Results indicated that transformational leadership is more satisfying, and cognitive and metacognitive style oriented than transactional leadership that is more participative style oriented.

With the advent of new media technologies and the recent advances in networking environments and telecommunications, many researchers have improved their study to the proliferations of teams that do not work face-to-face, but interact over a computer-mediated-communication network.

One of the most important characteristics of groups that discuss in virtual and direct interactions is leadership. In the last twenty years research has increasingly focused on leadership in work groups. The growing amount of research on interaction in face-to-face contexts does not correspond to a similar increase in research on groups interacting with computer-mediated-communication.

Leadership in computer-mediated-groups

Zigurs (2003) maintains that virtual groups afford us a unique opportunity to redefine leadership. According to the traditional model, leaders are supposed to offer encouragement, reward, and motivation – mostly through their physical presence or comments – and reinforce the development of relations inside the group. A virtual environment makes it necessary to revise some aspects of leadership, partly due to the fact that interaction now takes place with a machine. One of the fundamental characteristics of this new context is the *recognizability* of the leader's status. In face-to-face interactions, leadership indicators involve body language, vocal inflection, eye contact, clothing, etc., which in a computer-mediated-communication can be difficult to detect. Consistent with the media richness theory (Daft & Lengel, 1984), the medium forces the leader to adopt other indicators to let followers know he/she is in

charge, which include frequency of intervention, small delays between request and responses, being (almost) always available.

Among the approaches to the study of leadership that accurately describe the complexity of the changes under way in our society and in modern organizational contexts, one of the best known is the transformational/transactional framework (Bass, 1985, 1990, 1997).

In this perspective, the leader is the person who not only adapts to various situations, but is also able to transform the reference context. Bass (1990) discusses the difference between a transactional leadership model, in which the leader emerges as the result of transactions and exchanges with group members, whereas a transformational leader is a person willing to adapt to the changes and instability of situations and is also able to involve, motivate, and support collaborators in a manner consistent with the required transformations. The transformational style goes beyond the exchange of incentives and corrective transactions between leaders and subordinates and pushes collaborators out of the individual dimension so as to privilege the group, the mission, and the vision, focusing on long-term objectives and attempting to change existing situations. For Bass (1997) a leader can embody both types and constitute a model of leadership that moves along a continuum ranging from a transactional to a transformational style.

The transactional leadership model considers leaders "negotiating agents" who conciliate and sometimes compromise in order to obtain greater decision-making power within the group. To achieve this goal, leaders perform a series of actions that enable them to influence and convince those individuals who are capable of providing valuable support. Their activity consists in implementing interpersonal transactions in which tasks, expectations, and related awards are indicated and clarified. Followers are motivated by the opportunity to obtain the personal rewards that only the leader can grant, and prefer to replicate behaviors that have been successful and discard unproductive ones (Bass & Riggio, 2006).

Transactional leadership is based on two factors: contingent reward and management-by-exception. The leader administers positive reinforcement, awards, praise, and rewards when pre-determined goals are achieved; he utilizes negative reinforcement like punishment, reprimands, and negative feedback when mistakes and violations or failures occur (Bass & Riggio, 2006). In any case, rewards and punishments aim to ensure that the expected results are achieved and not at a transformation of the followers (Boal & Hooijberg, 2007).

The operational mode of a transformational leader brings individuals to seek rewards within themselves, favoring the personal growth of individuals and groups, as well as their self-awareness (Scaffidi Abbate & Ruggieri, 2008, 2011) According to Boal and Hooiberg (2007), while the transactional leader exploits interest that already exists in a group, the transformational leader tries to change the value system of each individual in order to construct a new one based on common goals. He/she actively engages with followers, obtaining their collaboration and encouraging them to identify with a vision of the job that goes beyond their immediate individual interests.

A way has thus been found to transcend the exchange of incentives and corrective transactions between leaders and followers – indeed, it is a way to amplify interests and raise consensus and awareness of the group's goals. People are encouraged to abandon their individual dimension in order to enhance the group and the organization, concentrating on long-term goals and attempting to change existing situations. This is accomplished by a leader who accompanies his collaborators, acting as a guide and motivator within a process of change and growth.

In general, research focusing on the effectiveness of transactional and transformational leadership within the context of virtual teams is relatively scarce (Hambey, O'Neill & Kline, 2007; Ji & Chuang, 2012).

In virtual teams transactional and transformational leaders are likely to play a vital role in facilitating the attainment of goals by providing structures, motivating and engaging team members, and attending to socio-emotional aspects of the team (Huang, Kahai & Jestice, 2010). By facilitating certain processes, these leaders introduce changes in followers' behaviors and in the way they interact with one another, thereby changing the capabilities of a team. Past research supports this view (Sosik, Avolio & Kahai, 2010), suggesting that transactional and transformational leadership in virtual teams can overcome process-based losses, thereby improving team creativity and strategies. The facilitation enabled by transactional and transformational leadership styles is likely to be more effective when a virtual team faces more challenging situations (Avolio, Kahai & Dodge, 2000; Joshi, Lazarova & Liao, 2009; Purvanova & Bono, 2009).

Moreover, virtual team research based on situational perspectives of leadership suggests that transformational leadership becomes more effective than transactional leadership in situations involving anonymity. Within these groups, transformational leaders are able to establish higher levels of trust, performance and job satisfaction compared to those of transactional leadership, but that the average level of satisfaction is lower than in face-to-face conditions (Hoyt & Blascovich, 2003; Ruggieri, 2009).

In summary, transactional and transformational leaders are expected to play a greater ''process facilitation'' role in virtual teams than established practices for face-to-face teams (Huang, Kahai & Jestice, 2009) .

Communication styles in virtual teams

According to media synchronicity theory (Dennis & Valacich, 1999), there are two types of communication characterizing virtual team interaction: synchronous and asynchronous.

In synchronous interactions team members communicate in real time, such as through teleconferencing, videoconferencing or chat. Synchronous communication media allow individuals to work on the same task, with the same information, at the same time (Baker, 2002). In asynchronous interactions team members communicate at different times, to solve a problem, to play a game or to join a project. The most used media are e-mail or online text forum and threaded discussions.

Comparing several communication media with each other will help increase our understanding of the technologies that allow virtual teams to collaborate most effectively (Baltes, Dickson, Sherman, Bauer & LaGanke, 2002).

Although in recent years there is a growing interest in the use of video (i.e. videoconferencing), the majority of studies that have examined computer-mediated-communication have used text-based systems. Particularly, online text chat and online text forum are the most common media used. A suggested benefit of this type of text-based interaction is that it may allow for more reflection and the ability to choose one's words more carefully than in face-to-face or telephone communication (Wolfe, 2002). Online text-based communication can also allow team members to more efficiently share ideas in brainstorming tasks because everyone can speak at once, thereby minimizing process losses (Griffith & Neale, 2001). Additionally, text-based communication may neutralize the tendency for increased relational conflict often observed in dissimilar groups, because these differences are less salient (Mannix, Griffith & Neale, 2002). Conversation in this medium, however, has also been criticized for lacking focus because multiple group members may be speaking at the same time (synchronous interaction) or overcommunicate (asynchronous interaction). Also, different rates of typing and reading can lead to more or less delayed responses by individuals within the group discussion, and could result in low contributions by some members who could otherwise improve the team's performance (Hambley, O'Neil & Kline, 2007).

In studies of computer conferencing there is a relatively little use of content analysis technique compared to other techniques such as surveys, interviews, participant observation and computer generated statistical manipulations. In the past, the most common methods for assessing the content and outcomes of online forums have been limited to frequency counts, message maps showing numbers of replies and message chains, and other similar quantitative measures. One notable exception to this was Henri's (1992) work, arguably one of the most influential and sophisticated cognitive analysis models for online interaction. Henri was a pioneer in utilizing content analysis to analyze the transcripts of discussions, in order to evaluate the quality of online learning communities. Influenced by this, researchers have been prompted to take up more challenging methods of content analysis in order to answer crucial questions related to social negotiation of meaning in computer-mediated-communication. Content analysis provides an opportunity to reach a better understanding of learning in a computer-mediated-communication environment since it can help to clarify the students' cognitive processes and ways of handling information during studies.

In Henri's (1992) model, a central concept in view of the content analysis instrument is interactivity. The definition of interactivity is borrowed from Bretz (1983), who states that interactivity is a three-step process: (1) communication of information, (2) a first response to this information, and (3) a second answer relating to the first. Her instrument to analyze the transcripts of discussions is based on a cognitivist approach to learning; although she also refers to particular concepts, such as learning in a cooperative mode and to the concept of collective knowledge.

Henri's analytical framework consists of five dimensions of the learning process that can be found in online text messages. Her work has laid the foundation for subsequent research. Particularly, Henri developed a quantitative approach which analyzed messages into units of meaning and attempted to measure social dimensions, interactivity, cognitive skills, levels of processing and metacognitive knowledge and skills.

The participative dimension comprises two categories: (1) overall participation, which is the total number of messages and accesses to the discussion and (2) the active participation in the learning process, which is the number of statements directly related to learning made by learners and educators. As she believes that messages of unequal

length cannot serve as precise measures of active participation, she proposes to divide messages into statements corresponding to units of meaning.

The social dimension comprises all statements or part of statements not related to the formal content of the subject matter. This operationalization is derived from the model of Berger, Pezdek and Banks (1987) that states that social presence is at work in any statement not related to the formal content of the subject matter.

The interactive dimension is first divided in two parts: interactive versus non-interactive (independent) statements. Secondly, the interactive statements can be further subdivided into explicit versus implicit interactions. Furthermore, two different types of interactive messages are distinguished: responses and commentaries. This leads to five categories, namely (1) direct (explicit) responses, (2) direct (explicit) commentaries, (3) indirect (implicit) responses, (4) indirect (implicit) commentaries, and (5) independent statements (Wever, Schellens, Valcke, & Van Keer, 2006).

The cognitive dimension consists out of five categories: (1) elementary clarification: observing or studying a problem identifying its elements, and observing their linkages in order to come to a basic understanding, (2) in-depth clarification: analyzing and understanding a problem which sheds light on the values, beliefs, and assumptions which underlie the statement of the problem, (3) inference: induction and deduction, admitting or proposing an idea on the basis of its link with propositions already admitted as true, (4) judgment: making decisions, statements, appreciations, and criticisms, and (5) strategies: proposing coordinated actions for the application of a solution, or following through on a choice or a decision. Furthermore, surface processing is distinguished from in-depth processing, in order to evaluate the skills identified (Wever, Schellens, Valcke, & Van Keer, 2006).

The metacognitive dimensions comprise metacognitive knowledge and metacognitive skills. Metacognitive knowledge is declarative knowledge concerning the person, the task, and the strategies. Metacognitive skills refer to ''procedural knowledge relating to evaluation, planning, regulation, and self-awareness'' (Henri, 1992, p. 131). Henri does notice however that although the messages can reveal useful information, it is impossible to reveal the totality of the metacognitive processes. This means that ''even if no metacognitive activity was noticed, one could not conclude that the students are weak in this area'' (Henri, 1992, p. 133).

The research

The aims of the present research project was to analyze if and how leadership style and communication medium used, interact with the followers communication style. As mentioned above, the status of group leader is definitely less recognizable in computer-mediated-groups due to the difficulty in the use of implicit indexes of status such as vocal inflection or eyes contact. The medium force the leader to adopt other indicators to let followers know about his/her being in charge: frequency of intervention, small delay between request and responses, being (almost) always available etc. This difference in leader's behavioral style may result in different ingroup dynamics which, in turn, may affect followers' interaction styles and satisfaction. Moreover, these possible difference may vary according to leadership style. In particular, transformational leaders are expected to be more effective in enhancing cognitive and metacognitive styles and job satisfaction.

Participants and design

Ninety-six Web user (51 males and 45 females) took part in this study. Participants' age ranged between 18 and 46 years (mean = 28.6; s.d. = 3.4). They were all enrolled, on a voluntary basis, from face-to-face and online friends, and explicit request in online communities, from two undergraduate students.

The participants were randomly assigned in a two conditions of a 2 (interaction mode: online text chat vs. online text forum) X 2 (management style of the group: transactional vs. transformational) mixed between-within participants design.

Procedure

The experiment was presented as problem solving activity. Specifically, the participants were given the task to a solve a brain teaser in online virtual groups that had to be solved in five days.

The groups use a Computer Supported Collaborative Work (CSCW) context using text chat (for those interacting in synchronous mode) or a forum (for those with asynchronous interaction).

Each group consisted of four participants and one senior expert – the confederate – who directed the group's activity. Every participant took part in two different conditions. On the whole, there were 48 groups composed of four participants plus the senior expert who acted as leader, who did not suggest the solutions, but who helped the groups to find itself. In one half of the groups, the senior expert was instructed to act as a transactional leader, and in the other half as a transformational leader. Instructions were created by following Mindgarden's (2000) Multifactor Leadership Questionnaire and its scales and subscales. Senior experts did not know the real aims of the research.

All activities of the groups (online chat and forum) were recorded. After completing the task, job satisfaction was assessed via self-report questionnaire.

Instruments

Content analysis. The content of the online chat and web-forums was coded according to Henri's (1992) framework. The messages were divided into "message units" for analysis. A message unit can be divided "by words, by a group of words, by proposition, by sentence, or by paragraph" (Henri, 1992, p. 134). Henri also notes that an objective determination of the unit of meaning is difficult to make. In the present study it turned out that message units tended to correspond to paragraphs, as this is the way that written communication is organized. This kind of analysis is considered more effective in analyzing discussion where a message often answers more than a question or presents more phases of the same contribution. Leader's message were excluded from the present analysis.

Job satisfaction. This was measured using the Satisfaction with Job - General (Dubinsky & Hartley, 1996; Italian version translated, validated and adapted by Barbaranelli, Bortone and Di Matteo, 2010), on a seven-point scale (from "very unsatisfied" to "very satisfied"), and specifically, five questions aimed at evidencing a person's level of satisfaction with respect to a performed task.

Results

Manipulation check. In all, 4515 units were coded. Two researcher, independently each other, coded all the messages. The coding reflected a middle-good agreement (for the five dimensions, $0.62 < $ Cohen's $k < 0.74$).

The analysis of univariate effects revealed the existence of significant differences between the effects of transactional and transformational leadership in four of five dimensions of Henri's model. Specifically, it was observed that relating to participative dimension, no differences were observed (p=n.s.). Transactional leaders conditions create higher score in social and interactive dimensions than transformational leaders (social: $F_{(1,4515)}=24.23$; $p<.01$; interactive: $F_{(1,4515)}=22.11$; $p<.01$). Differences also can be found in cognitive and metacognive dimensions. Indeed, transformational leaders generate more messages in this dimensions than transactional leaders (cognitive: $F_{(1,4515)}=18.56$; $p<.01$; metacognitive: $F_{(1,4515)}=19.17$; $p<.01$).

As regards to interaction mode, online text chat and online text forum, no differences were observed in participative dimension (p=n.s.). More messages in social and interactive dimensions were observed in online text chat than in online text forum (social: $F_{(1,4515)}=54.14$; $p<.01$; interactive: $F_{(1,4515)}=15.06$; $p<.01$). On the other hand, more messages in cognitive and metacognitive dimensions were observed in online text forum than in online text chat (cognitive: $F_{(1,4515)}=27.32$; $p<.01$; metacognitive: $F_{(1,4515)}=46.08$; $p<.01$).

No interaction effects emerge between leadership style and media in all five dimensions (p=n.s.).

Job satisfaction was analyzed in the two interaction conditions and the existence of a main effect was found ($F_{(1,96)}=17.3$; $p<.01$), ascribable to an higher level in chat than in forum condition. It was also observed that individuals in situations of transformational leadership possess higher levels of satisfaction with respect to the performed task ($F_{(1,96)}=12.4$; $p<.01$).

Discussion and conclusion

On the whole, these results enlighten a coherent scenario of the functioning of leadership in virtual teams and on the communicative styles which leaders evoke, examining the nature of online interactivity in problem solving processes. Interaction is one of the most important components of any learning experience and it is a crucial concept in online problem solving and education. The approach used, based on Henri's (1992) model of analysis, offered insights to understanding how the online leaders addressed discussions in online context. As Lally (2001, p. 401) points out: "One of the major strengths of Henri's approach to content analysis using categories is that it focuses on the social activity and the interactivity of individuals in a group at the same time as giving a picture of the cognitive and metacognitive processes of those individuals. However, one of its major limitations is that it gives no impression of the social co-construction of knowledge by the group of individuals as a group, in a discussion or a seminar". Although the instrument has been criticized (i.e. Pena-Shaff & Nicholls, 2004), it can be considered as pioneering work and has been the base for subsequent research.

A particularly interesting result concerns the distinction between transactional and transformational leadership. As shown by this study, working in an on-line group on the Web and being led by a leader who seeks the transformation of individual motivations (rather than a simple transaction involving resources) induces an increased level of cognitive and metacognitive communications.

The transformational leader is able to produce behavior that promotes individual potential and inspires an optimistic vision of the future that is oriented towards longer-term goals. These characteristics enable him to provide his group with incentives for self-aware thinking: being aware of one's own thoughts ensures that behavior truly useful for personal growth is adopted. Reinforcing forms of higher-level reasoning thus helps individuals to become more aware of their own untapped capabilities and offers continuous intellectual stimulus, encouraging people to do more than what they expected of themselves in the beginning; all this enhances levels of proactive personality and team identification.

Job satisfaction results are also consistent with what was postulated by Bass (1990) and confirmed by subsequent research on interaction via Web (Hoyt & Blascovich, 2003; Ruggieri, 2009), that is, that a primary characteristic of the transformational leader is his interest in satisfaction and, in particular, the job satisfaction of his co-workers, which also entails holding in high consideration their individual skills and aspirations. The transformational leader has thus the ability to influence the emotional climate of the work group, generating an effect on the job satisfaction of each individual collaborator. McColl-Kennedy and Anderson (2002) maintain that these leaders have a positive impact on the optimistic vision of their followers and also create a pleasant general emotional state in relation to the job itself.

Results show also how the choice of interactive tools for virtual exchanges has a fundamental role in guiding communication within virtual contexts. These media are not however used in a "neutral" and transparent way, but rather are instruments to which communication must adapt; they are therefore able to generate their own domains and relations that are not necessarily analogous to those that occur in face-to-face interaction.

These findings have significant consequences for groups that interact on the Web. Providing incentives for adopting specific models of leadership and media in virtual work groups represents in fact the first step towards creating motivated and effective groups. It follows that a worker who is more satisfied and aware of his own resources can guarantee greater personal success and, consequently, better results for the organization.

Usage Of Thin-Client / Server Architecture In Computer Aided Education

Caghan Cimen, Yusuf Kavurucu, Halit Aydin

Turkish Public College
Tuzla, Istanbul, 34940, Turkey

Abstract

With the advances of technology, thin-client / server architecture has become popular in multi-user / single-network environments. Thin-client is a user terminal in which the user can login to a domain and run programs by connecting to a remote server. Recent developments in network and hardware technologies (cloud computing, virtualization, etc.) have made the thin-client / server architecture more efficient with respect to total cost of ownership, administration, maintenance and security simplicity, and finally efficient power consumption. Therefore, the usage of thin-client / server architecture in computer-aided education has scaled up exponentially since 2010. In this study, we present our architecture in Public College with 270 user terminals and 9 servers. We describe the planning, design, testing and implementation phases of the new architecture and analyze the outcomes of this implementation in regard to students and staff.

Keywords: Computer Aided Education; thin-client / server architecture

1. Introduction

Thin Client / Server Architecture, which has been one of the hot topics in the information systems literature for the last decade, nowadays, becomes a powerful, secure and cost-efficient solution for Health, Finance, Education and other industrial sectors [1]. For instance, several public/private companies/institutions have tendency for cloud computing, virtualization, etc. to keep up with the speed of hardware/software technology development, and this improves the preference of Thin Client / Server Architecture. In addition to this, Thin Client / Server Architecture has different characteristics according to classical personal computer usage, which are described below in detail.

Thin Clients improve information system efficiency at several institutions. In Thin Client / Server Architecture, software and data are stored at the remote server on the network. However, it is possible to communicate and do data exchange with other clients on the network. As there is no local disk or portable media drive on thin client, user data is stored on the remote file servers on the network. Software upgrade is done remotely on the network. Thin clients have more lifetimes according to personal computers as they have less vulnerable hardware parts. Moreover, it is easier to user thin clients as they have standard software and user interface all over the related institution. In addition to this, ease of thin client installation makes recovery in case of system crash faster and lessens the need for technical assistance.

The information and data security can be improved with the usage of thin clients. As they do not have local disks or portable media drives, they are less vulnerable to anti-viruses and spy wares. Users can only store data on remote file servers and cannot copy or move critical data to a portable media. The usage of thin clients in a

domain on the network makes system administration easier and safer with respect to the remote user control and system policy checking in the domain that lessens the system internal threats.

Criteria	P C	THIN CLIENT
Operating System	Manual installation on local disk	Installed on flash memory (DOM). No need for manual installation.
Anti-Virus Protection	Needs anti-virus protection software	No need for anti-virus protection for portable media
Software Upgrade	Needs for manual software upgrade periodically.	No need for manual software upgrade. Only remote software upgrade.
System Recovery	Risk for system crash according to user faults.	Remote system recovery in case of system crash.
Local Drive Crash	Risk for local drive crash (bad sector, etc.)	No local drive and no data loss.
Hardware Upgrade	Needs for hardware upgrade periodically.	No need for hardware upgrade.
Data Backup / Recovery	Needs for data backup periodically in case of recovery after system crash.	Usage of remote file server. No local backup.
Power Consumption	300 - 350 watt. (avg)	8 - 20 watt. (avg)
Technical Assistance	Needs allocated technical staff for frequent hardware/software problems with respect to more portable hardware parts and software on local drive.	Less hardware/software problems and less allocated technical staff with respect to lower risk for system crash.
Emulation	Needs emulation software for connection to servers such as AS/400.	Pre-installed emulation software for connection to several server types.
Cost of Purchase	600 – 1000 $ (avg)	250 – 400 $ (avg)
Noise and Physical Appearance	Works more noisy according to several hardware parts. Needs more space.	Works quieter and needs less space.

Table 1. Comparison of PC and Thin Client with respect to several criteria.

Thin Client / Server Architecture is a cost-efficient information system infrastructure. Thin clients are cheaper, have less hardware parts and more lifetimes. At the same time, system management and maintenance is easier as software upgrade and data storage/backup are done on remote servers. Finally, thin clients have less power consumption than personal computers.According to above-mentioned characteristics, a detailed comparison of thin clients and personal computers with respect to several criteria is summarized in Table 1.

An example total cost of ownership analysis is presented in Table 2 with respect to purchase costs, software license costs, network support costs, desktop support costs, upgrade costs, security costs, power consumption, heat generation and office real estate.

Criteria	PC	Thin Client	Saving ($)
Purchase Cost	650	350	300
Hardware Upgrade (CPU, Memory, Disk etc.)	320	-	320
Software Upgrade (OS, User Programs, etc.)	250	-	250
Virus Protection	30	-	30
Upgrade labor Cost	250	-	250
Technical Staff Cost. (per 100 users)	3 staff = 180.000 (annual) 1800 (per user)	1 staff = 60.000 (annual) 600 (per user)	1200
Data Backup and Storage Maintenance	200	-	200
Power Consumption (watt/h)	350	20	450
Total savings per client after 5 years: 3000 $			

Table 2. Comparison of PC and Thin Client in terms of Total Cost of Ownership.

In the light of above analysis, we conclude that:

* Using thin client instead of PC saves 3000$ after 5 years (50$ monthly). In other words, thin client redeems itself after 7 months.

* In a middle-sized unit, using 100 thin client instead of 100 PC saves 300000$ in total. Besides, the fact that hardware is an imported product and has foreign currency cost shows the contribution of usage of thin client to country's economy.

Thin Client / Server Architecture has a prominent difference in terms of power consumption [1]. Forrester Research Inc. in 2008 shows that thin clients reduce power usage by 24% and carbon dioxide emission by 23% and increases the life span by five to ten years. By replacing the desktops by thin clients, nearly two-thirds of the power consumption can be reduced [2-4].

Thin Client / Server Architecture is used by educational institutions as they allow students to analyze real data in their research without modifying or removing data either deliberately or unconsciously [5]. Also, this architecture disallows unauthorized access to critical data from outside the institution. Moreover, computer-aided education has overlapping characteristics with Thin Client / Server Architecture in terms of multiple usage of digital resources and cost-effectiveness [6].

There are a lot of benefits of Cloud computing in education, (e.g. providing educational resource storage and databases, e-mails, educational applications and tools for students and teachers and clients located all over the world involving in an educational program) and advantages in cost for improve quality of system in terms of Total Cost of Ownership [7]. This encourages the use of thin clients in several implementation areas and has renewed people's interest in the thin client concept [8].

2. Implementation

To make use of Thin Client / Server Architecture in our public college having approximately 1000 students and 500 staff, we install 270 thin clients in total (222 for students and 48 for staff) at the moment. We also install 7 terminal servers and 2 file servers. The network diagram of this architecture is represented in Figure 1.

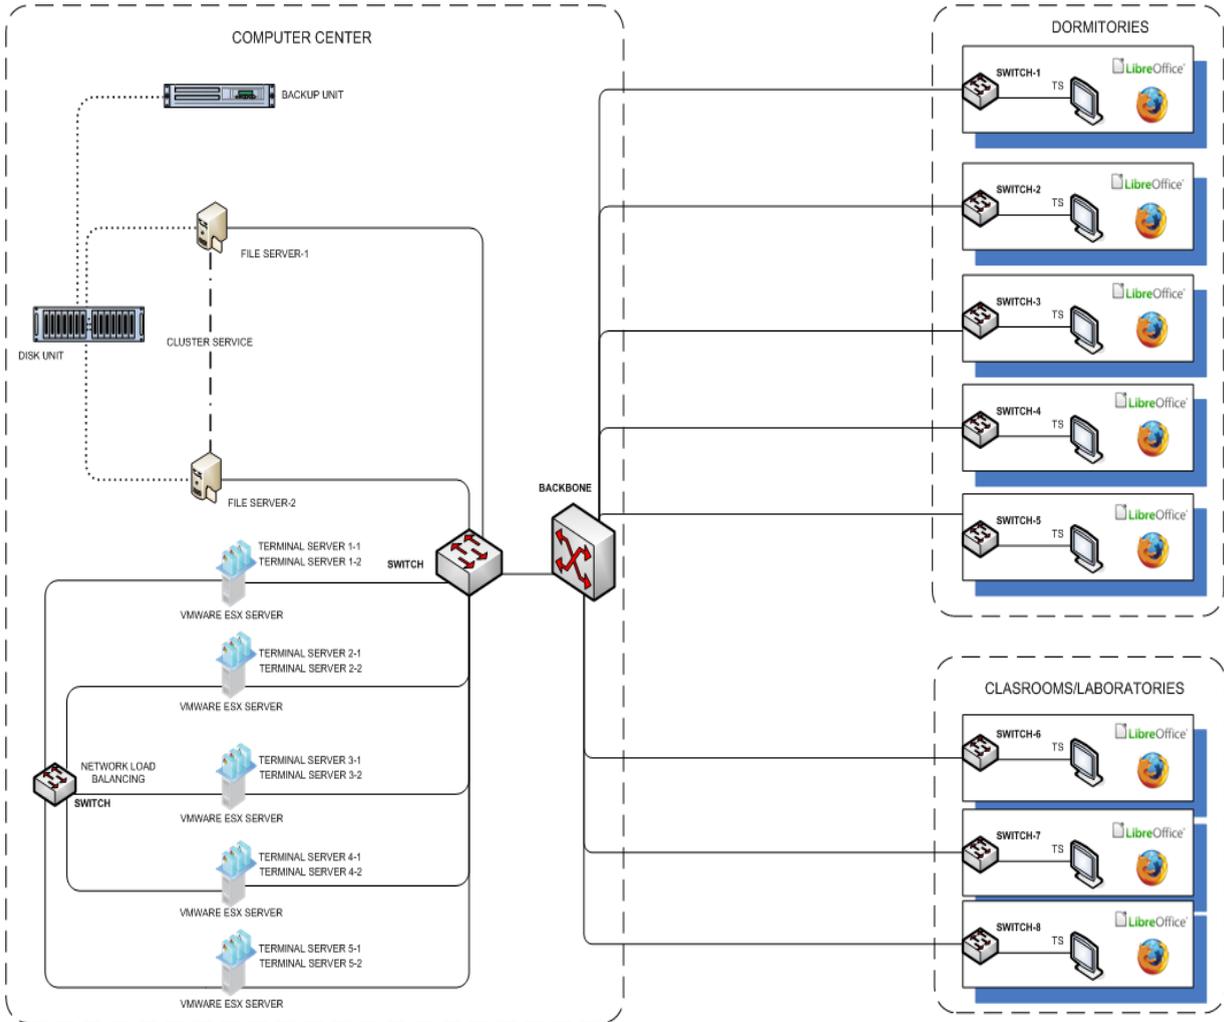

Figure 1. Thin Client / Server architecture in our college

We use thin clients having model as ASTC TA-1381 and terminal/file servers having model as IBM X3650-M3. We utilize VMware ESXi 4.5 software on terminal servers for the purpose of virtualization. We install Windows 2008 R2 Enterprise operating system on the servers. Also, we install Libre Office, Foxit Reader, 7zip, IrfanView, Mozilla Firefox, Thunderbird, Notepad++, VLC player, Eclipse and Dev C++ software programs on the terminal servers for users through thin clients.

We reserve one-gigabyte data storage on the file server for each student and the owner student can only access his/her corresponding data storage. In addition to this, we define roaming profiles for each student so that each student can define and use personal settings (shortcuts, program settings, etc.) on different thin clients without any loss of information.

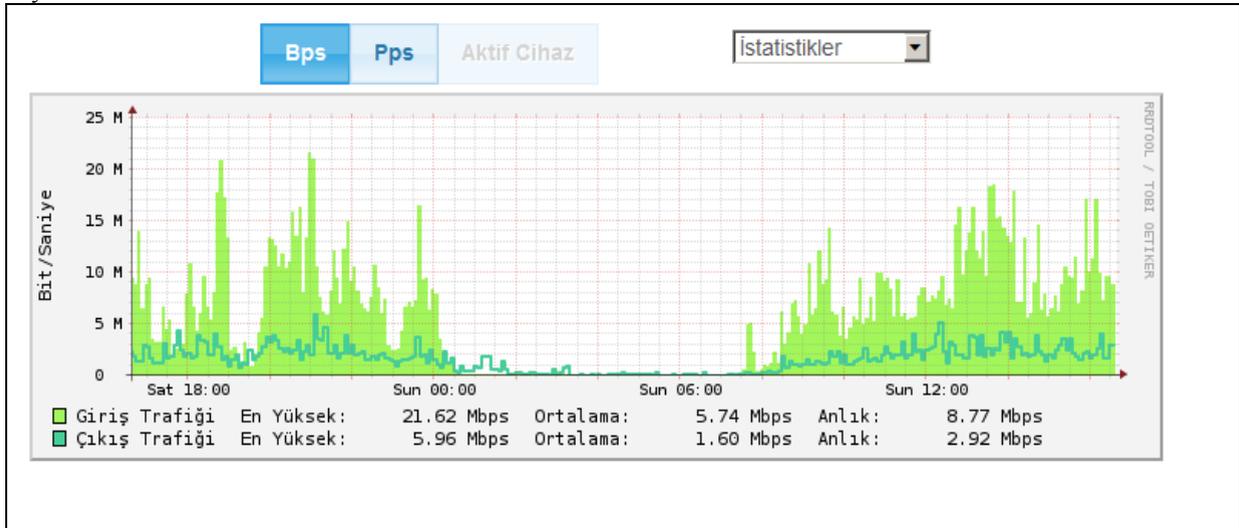

Figure 2. Usage of bandwidth before Thin Client / Server Architecture

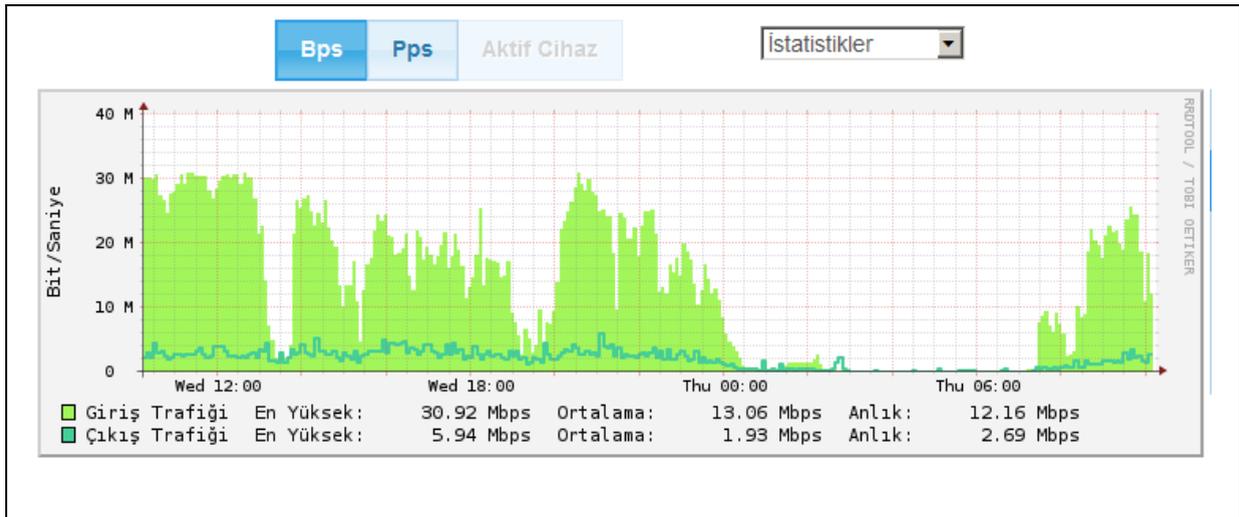

Figure 3. Usage of bandwidth on Thin Client / Server Architecture

We define two different server profiles on each terminal server with the usage of VMvare ESXi virtualization software. The first one is defined for students and the other one is defined for staff use. There are different settings and software programs on two virtual terminal server types. We define different hardware (SPU, RAM, etc.) usage settings on two servers at different times during the day. For instance, we reserve most of the

hardware capacity for staff during working hours as the students are taking classes. And, we reserve most of the hardware capacity for students after working hours as students mostly use thin clients on those times.

After the implementation, 10 hours labor force per daily is needed for maintenance problems. A survey about the new architecture is applied on the users and 91% of them express their satisfaction about the usage of thin clients. In addition to this, we analyze that the usage of bandwidth has increased after the implementation of the new architecture. At the moment, we have 30 Mbit/s Internet connection bandwidth in our college. The usage of bandwidth before this implementation is plotted in Figure 2, whereas, Figure 3 represents the usage of bandwidth on the new architecture.

Consequently, we make cost-effectiveness analysis of the new architecture by using several tools implemented in the literature and web. The overall analysis is described in Table 3.

Tool	Total saving	Period	Parameter
www.xiteb.net	107154 £	Annual	270 PC
www.netvoyager.co.uk	9,614,000$	Five year period	1000 Users
www.2x.com	312660$	Annual	270 PC
www.eu-energystar.org	79595€	For six year	270 Thin Client instead of 270 PC

Table 3. Cost saving analysis of our architecture according to several tools

3. Conclusion

The usage of Thin Client / Server Architecture for the purpose of computer-aided education scales up with respect to developments in the information systems technology. In this study, we present our architecture in a public college in which we install 270 thin clients for students and staff. The increase of bandwidth usage represents the effectiveness of this new architecture on the education in our college.

Students and staff can access to their data from several units (dormitory, lab, library, etc.) by using the same settings and interface (which is more user-friendly) as a result of roaming profile definitions. The need for new software in education can be met easily by installing them on a small number of terminal servers. In addition to this, we adjust the usage of resources by students and staff by using virtualization technologies so that, all users can use thin clients more effectively.

We also apply a survey on the users about the performance of new system and most of the users show their satisfaction through the survey. We also serve **need??** less maintenance labor for the hardware/software problems on the client side.

We analyze the cost of new architecture according to literature and several tools exist on the web. One of the important results is the less power consumption of thin clients, which is approximately 10% of personal computers. This has a big contribution not only to the total cost of ownership but also to reducing environmental impact. This can be seen as a social responsibility. After getting a primary saving and social responsibility contributions by implementing new computer architecture in education, we conclude that, the usage of Thin Client / Server Architecture will become widespread on educational institutions.

Özet

Bu makalede Yüksekte Çalışma İş Güvenliği İçin Yeni Bir Proaktif Eğitim Programı(NOFALL) isimli AB Yenilik Transferi projesinin İhtiyaç Analizi İş Paketinin sonuçları ve değerlendirilmesi sunulmuştur. İhtiyaç Analizi Anketi, Bilgi Ölçümü, Duygu ve Tutum Ölçümü ve Geri Bildirim bölümü olmak üzere üç ana bölümden oluşturulmuştur. Anket, yüksekte çalışma gerektiren İnşaat, Elektrik, Telekomünikasyon ve Maden sektörlerindeki çalışanlara uygulanmıştır. Söz konusu proje kapsamında yapılan İhtiyaç Analizi Anketi çalışmasının sonuçları projeye olan gerekliliği açıkça ortaya koymuştur. Yüksekte çalışma iş güvenliği konusundaki sorunları tespit etmesi, eğitimlere olan ihtiyacı ve bilinç eksikliğini göstermesi bakımından da literatüre sunulmasına gerek duyulmuştur.

1. Giriş

Düşmeler ve Yüksekten Düşen Cisimler sonucu oluşan iş kazaları, kayıtlı tüm iş kazaları içerisinde yaklaşık olarak %30 oranındadır. Bu oran istatistiklere bakıldığında, bir veya birden fazla cisim tarafından ezilmeler, batmalar, kesmeler vb sınıfına giren iş kazalarından sonra ikinci sıraya oturmaktadır. Yüksekte çalışma iş güvenliği konusu Türkiye'de AB üyeliği sürecinde hız kazanan ve yasalaşmaya başlayan bir süreçtir. Türkiye'de son yıllarda yüksekten düşme sonucu gerçekleşen kazalar ve ölümlerin AB ülkelerine göre daha fazla olması durumun ciddiyetini göstermektedir. Gelişmişlik düzeyi yüksek olan ülkelerde, Yüksekte Çalışma İş Güvenliği konusunda ayrı yasal düzenlemeler bulunmaktadır. Bunlar, Yüksekte Çalışma konusunda Risk Değerlendirmesi, eğitim, yeterlilik, ekipman konularında düzenlemeleri açıkça ortaya koymaktadır.

Yüksekte çalışma iş güvenliği ile ilgili literatürde birçok çalışma bulunmaktadır. Bu çalışmalar problemi ortaya koyan ve probleme çözüm üreten çalışmalar olarak iki kısımda incelenebilir. Başta inşaat sektörü olmak üzere meydana gelen iş kazalarının büyük bölümünün yüksekte çalışma esnasında olduğunu gösteren ve problemi ortaya koyan çalışmalar mevcuttur (Türkmen, Şenel, Şam, Üzün, 2005; Dizdar, Toprak, 2012). Bunun yanında çeşitli alanlarda yüksekte çalışma ile ilgili önlemleri ve önerileri içeren çok sayıda çalışma yapılmıştır (Görücü, Müngen, 2011; Naalcosh, 2012).

Yüksekte çalışma iş güvenliği konusunda birçok proje çalışması gerçekleştirilmiştir. Bu projelerden birisi NOFALL projesine de kaynaklık eden, Letonya PSI Darba Medicina firmasının gerçekleştirdiği LV/04/B/F/PP-172012 no'lu "The Development of Occupational Health and Safety Training Programme" isimli B tipi AB projesidir.

Makalenin 2. Bölümünde NOFALL (Yüksekte Çalışma İş Güvenliği İçin Yeni Bir Proaktif Eğitim Programı) Projesi tanıtılmıştır. 3. Bölümde İhtiyaç Analizi İş Paketi Faaliyetleri ve Sonuçları anlatılmıştır. Değerlendirme bölümde ise İhtiyaç Analizi Anketinin sonuçları değerlendirilmiştir.

2. Yüksekte Çalışma İş Güvenliği İçin Yeni Bir Proaktif Eğitim Programı Projesi(NOFALL)

Aralık 2011 tarihinde, Avrupa Birliği Eğitim ve Gençlik Programları Merkezi Başkanlığı, Leonardo da Vinci programı kapsamında, "Yüksekte Çalışma İş Güvenliği İçin Yeni Bir Proaktif Eğitim Programı" isimli Yenilik Transferi Projesi uygulanmaya başlamıştır.

Projenin amaç ve hedefleri şunlardır;
1. Yüksekte çalışma ile ilgili kaza oranlarını/yüzdelerini en aza indirmek,
2. Yüksekte çalışma ile ilgili eğitim programı hazırlamak,
3. Eğitim materyalleri geliştirmek,
4. Internet üzerinden iş güvenliği ve yüksekte çalışma iş güvenliği hakkında teorik eğitim vermektir.

Proje ortaklık konsorsiyumu içerisinde Kaya Yapı Şirketi yürütücülüğünde 4 ülkeden 8 ortak bulunmaktadır. Ortaklar Letonya'dan PSI Darba Medicina, İrlanda'dan EazySafe Learning Center, Almanya'dan Elmoba, Türkiye'den TEİAŞ, Sakarya Üniversitesi Teknoloji Fakültesi, Sakarya Teknik Ve Endüstri Meslek Lisesi, Sivil Toplum Kuruluşu olan MEGVEY Derneğinden oluşmaktadır. Proje, Yönetim, WEB Sitesi, İhtiyaç Analizi,

Adaptasyon, Pilot Uygulama, Ürün, Değerlendirme ve Yaygınlaştırma olmak üzere 8 adet iş paketinden meydana gelmektedir. Proje tamamlandığında elde edilecek sonuçlar şunlardır; proje hakkında bilgilerin paylaşılacağı ve interaktif eğitimlerin verileceği Türkçe, İngilizce ve Almanca WEB siteleri, Eğitim programı, Kitap, DVD, Genel iş güvenliği e-öğrenme modülü, Yüksekte çalışma iş güvenliği e-öğrenme modülü, Proje sonuçları ile ilgili dergi. Tüm bu sonuçlar ayrıca poster, broşür, yerel ve ulusal basın haberleri, çeşitli toplantı ve seminerler, İş sağlığı ve güvenliği fuarları gibi değişik platformlarda yaygınlaştırılacaktır.,

3. İhtiyaç Analizi İş Paketi Faaliyetleri ve Sonuçları

Yenilik transferi projeleri AB ülkelerinde daha önce uygulanarak başarı ile tamamlanan projelerin farklı ülkelerde geliştirilerek uygulanması esasına dayanmaktadır. NOFALL projesinde Letonya'dan PSI Darba Medicina tarafından 2002 yılında tamamlanan LV/04/B/F/PP-172012 no'lu "The Development of Occupational Health and Safety Training Programme" isimli B tipi AB projesinin Türkiye'ye geliştirilerek transfer edilmesi amaçlanmıştır. Projenin 3. adımı olan İhtiyaç Analizi İş Paketine, kaynak proje LV/04/B/F/PP-172012 (The Development of Occupational Health and Safety Training Programme) ve diğer ortak ülkelerde yapılan çalışmaların incelenmesi ile başlanmıştır. Ayrıca AB ülkelerindeki ve ülkemizdeki yasal düzenlemelerle ilgili literatür araştırması da yapılmıştır.

Gerçekleştirilen İhtiyaç Analizi İş Paketinin amaçları şunlardır;
1.Yüksekte çalışma iş güvenliği ile ilgili sorunları tespit etmek,
2. Sektör çalışanlarının iş güvenliği ekipman ve kullanım bilgilerini ölçmek,
3. Sektör çalışanlarının iş güvenliği önlemlerine karşı tutumlarını ölçmek,
4. Sektör çalışanlarının iş güvenliği konusundaki görüş ve önerilerini tespit etmek.

Bu amaçlar doğrultusunda yapılan ihtiyaç analizi anketi üç ana bölümden oluşmaktadır. Bunlar;
a.	Çalışanların ekipman ve kullanım bilgilerini ölçmek için Bilgi Ölçümü bölümü,
b.	Çalışanların iş güvenliği önlemlerine karşı tutumlarını ölçmek için Duygu Ölçümü bölümü,
c.	Çalışanlarını iş güvenliği tedbirleri ile ilgili sorunlarını ve görüşlerini belirlemek için Geri Besleme bölümü olarak belirlenmiştir.

İhtiyaç analizi anketi, yüksekte çalışma gerektiren İnşaat, Elektrik, Telekomünikasyon ve Maden sektörlerindeki onlarca şirket çalışanları, Sakarya Üniversitesi öğretim elemanları ve Meslek Liseleri öğretmenleri olmak üzere toplam 120 kişi üzerinde uygulanmıştır. Anket, çoktan seçmeli sorulardan oluşan bilgi ölçümü bölümünde 15 soru, "Tamamen Katılıyorum, Katılıyorum, Fikrim Yok, Katılmıyorum ve Hiç Katılmıyorum" seçeneklerinin sunulduğu duygu ölçümü bölümünde 15 soru ve görüş ve önerilerin alındığı geri besleme bölümünde 5 soru olmak üzere toplam 35 sorudan meydana gelmiştir.

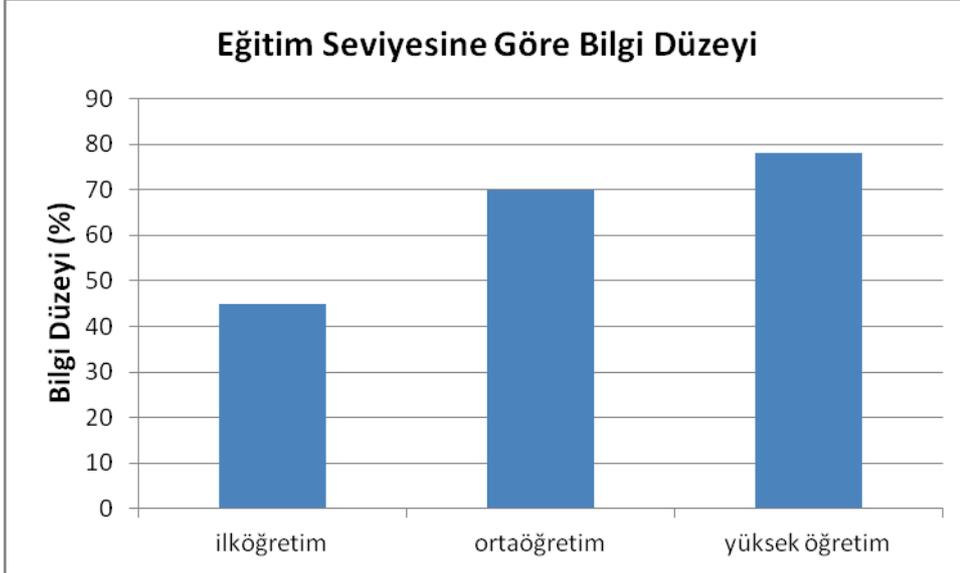
Anket sonunda bilgi ölçümü bölümünden elde edilen sonuçlar şu şekildedir;

- Temel seviyedeki bilgiler %70 civarında bilinmektedir.
- Her dört kişiden biri seyyar merdivenin güvenli kullanımını bilmemektedir.
- Enerji ve Telekom sektöründe her beş kişiden biri hangi donanımları kullanacağını bilmemektedir.
- Her beş kişiden biri düşme riskini ortadan kaldıracak önlemlerin farkında değildir.

- Deneklerin % 55'i Güvenlik ve Sağlık İşaretleri Yönetmeliğini bilmemektedir.
- Her üç kişiden biri emniyetli bağlama tekniğini bilmemektedir.
- Deneklerin % 45'i salınımlı düşmeyi engellemek için yapılması gerekenleri bilmemektedir.
- Eğitim seviyesi düştüğünde bilgisizlik düzeyi artmaktadır. (% 55 İlkokul, % 30 Lise ve % 22 Yüksek Öğretim)

Yukarıdaki sonuçlar Şekil 1 ve 2'de grafiksel olarak sunulmuştur.

Şekil 1. Bilgi ölçümünden elde edilen bilgi düzeyleri

Şekil 2. Eğitim seviyesine göre bilgi düzeyleri


Anket sonunda duygu ölçümü bölümünden elde edilen sonuçlar şu şekildedir;

- Her dört kişiden biri acil nedenlerden dolayı kontrol amacıyla yükseğe çıkan personelin emniyet kemeri takmasına gerek olmadığı düşünmektedir.
    - Her üç kişiden biri işverenin kuralların uygulanmasındaki gevşekliğinin kazalara neden olabileceğini düşünmemektedir.
    - Her iki katılımcıdan biri iş güvenliği donanımlarının yeteri kadar güvenli olduğunu düşünmektedir.
    - Her iki katılımcıdan biri donanımları fiziksel rahatsızlık verdiği için kullanmamaktadır.
    - Her iki katılımcıdan biri yüksekte çalışma iş güvenliği ile ilgili ek mevzuatlara ihtiyaç olduğunu düşünmektedir.
    - Her iki katılımcıdan biri donanımların kullanımında yanlışlık yapmaktadır.
    - İnşaat sektöründe daha iyi bir bilinç vardır.
    - Her dört katılımcıdan biri düşmeyi önlemek için, iş ortamı tecrübesinin ekipmandançok daha önemli olduğunu düşünmektedir.

Anketörler geri besleme bölümünde, sağlam ekipmanların kullanılması, daha fazla eğitim, denetim ve kontrollerin artırılması ve fiziksel düzenlemeler ile ilgili konulara dikkat çekmişlerdir.

1.Değerlendirme

Yüksekte Çalışma İş Güvenliği İçin Yeni Bir Proaktif Eğitim Programı(Nofall) isimli AB Yenilik Transferi projesinin İhtiyaç Analizi Anketi, İnşaat, Elektrik, Telekomünikasyon ve Maden sektörlerinde yüksekte çalışma yapan 120 kişiye uygulanmıştır. Anket, Bilgi Ölçümü, Duygu ve Tutum Ölçümü, ve Geri Bildirim bölümü olmak üzere üç ana bölümden oluşturulmuştur.

Anketin Bilgi Ölçümü kısmından çıkan sonuçlara bakıldığında en temel seviyedeki bilgilerin bile çalışanlar tarafından %30 oranında bilinmediği görülmektedir. Enerji ve Telekom sektöründe çalışan her beş kişiden birisinin hangi donanımları kullanacağını bilmemesi dikkat çekmektedir. Her beş kişiden birisi düşme riskini ortadan kaldıracak önlemlerin farkında değildir. Her üç kişiden birisinin emniyetli bağlama tekniğini bilmemesi ve % 45 oranında kişinin de salınımlı düşmeyi engellemek için yapılması gerekenleri bilmemesi gibi sonuçlar potansiyel düşme risklerini açıkça ortaya koymaktadır. Deneklerin %55'inin Güvenlik ve Sağlık İşaretleri Yönetmeliğini bilmemesi, bilgi eksikliğini gösteren diğer bir sonuçtur. Anketörlerin eğitim seviyesi yükseldikçe bilgisizlik düzeyinin azalması da eğitimlere olan ihtiyacı gösteren önemli bir sonuçtur.

Anketin duygu ölçümü bölümünden elde edilen sonuçlara bakıldığında yüksekte çalışma faaliyeti yapanların iş güvenliği önlemlerine karşı tutum ve duygularında ciddi bir oranda gevşeklik olduğu görülmektedir. Örnek olarak her dört kişiden birisinin acil nedenlerden dolayı yükseğe çıkan personelin emniyet kemeri takmasına gerek olmadığı düşünmesinin ciddi bir risk oluşturduğu açıktır. Her üç kişiden birisi, işverenin kuralların uygulanmasındaki gevşekliğinin kazalara neden olabileceğini düşünmemektedir ki bu çok büyük bir eksikliktir. Her iki katılımcıdan birisi iş güvenliği donanımlarının yeteri kadar güvenli olduğunu düşünmemekte vefiziksel rahatsızlık verdiği için kullanmamaktadır ki, bu da tehlikenin boyutlarını gözler önüne sermektedir.

Anketörler geri besleme bölümünde, sağlam ekipmanların kullanılması, daha fazla eğitim, denetim ve kontrollerin artırılması ve fiziksel düzenlemeler ile ilgili konulara dikkat çekmişlerdir.

NOFALL projesi kapsamında yapılan İhtiyaç Analizi Anket çalışmasının sonuçları projeye olan gerekliliği açıkça ortaya koymuştur. Yüksekte çalışma iş güvenliği konusundaki sorunları tespit etmesi, eğitimlere olan ihtiyacı ve bilinç eksikliğini göstermesi bakımından da literatüre sunulmasına gerek duyulmuştur. Proje ortağı Sakarya Üniversitesi Teknoloji Fakültesi tarafından, anket sonunda elde edilen verilerin ve verilerden elde edilen sonuçların yer aldığı bir sonuç raporu hazırlanmıştır. Sonuç raporunun değerlendirilmesi ve literatüre sunulması amacıyla da bu makale hazırlanmıştır.
